At the beginning of World War II, the thrust of military psychiatry was to screen out those susceptible to psychiatric breakdown prior to their entering the armed forces. Examining stations rejected 1.6 million registrants for mental or educational reasons—a rate 7.6 times as high as in World War I. Nonetheless, soldiers were discharged for psychiatric reasons at a rate 2.4 times as high as in World War I. Salmon's doctrine of forward treatment had disappeared from military psychiatric practice. Not until 1943 did Capt. Fred Hanson, applying Salmon's principles, demonstrate that he could return more than 70 percent of battle fatigue casualties to their units with forty-eight hours of rest in forward areas.

Wartime research revealed that the incidence of psychiatric casualties usually paralleled the number of soldiers wounded; that every man had his breaking point; and that the intensity of combat, duration of exposure, and quality of social supports in the unit were crucial mediating factors. G. W. Beebe and J. W. Appel found that the average soldier's breaking point was eighty-eight days of combat during which his company suffered one or more "casualties. The days need not be consecutive; the effects were cumulative. Concurrently, social psychologists under the leadership of J. A. Stouffer found that cohesive units with

competent and supportive leaders had fewer psychiatric casualties, and soldiers endured longer without breaking down.

During the "Korean War, Col. Albert J. Glass organized a system of forward treatment by battalion surgeons or medical aidmen. In an effort to prevent psychiatric casualties, the Far East command rotated soldiers in combat units out of Korea after nine months of service, and all service members in Korea received at least one two-week rest and recuperation leave during their tours. These measures were effective: psychiatric casualties were few, and 90 percent were returned to duty after forward treatment.

By the mid-1960s, psychoanalytic thinking had penetrated military medicine. But attributing behavior to childhood experiences or unconscious processes was antithetical to military values of responsibility and discipline. Consequently, the primary role of military psychiatrists became examining soldiers prior to court-martial or administrative discharge. Soldiers who voluntarily sought psychiatric treatment were usually discharged; those who wanted to stay in the army learned that it was unwise to acknowledge that they had symptoms.

During the period of major American involvement in the "Vietnam War (1965-72), military psychiatry expanded the range of behavior it addressed. Though the incidence of acute combat fatigue was the lowest in any war up to that time, psychiatrists recognized that substance abuse, some misconduct, and postbattle depression had psychological origins. Alcoholism and drug abuse ceased to be disciplinary matters and were taken over by military medicine. Treatment programs, again reminiscent of those devised by Baron Larrey, were designed for execution by paramedical personnel. Some misbehavior was handled on a quasi-medical basis; soldiers were eliminated from the service administratively rather than being punished. Service members with persistent psychiatric symptoms that were classified as Post Traumatic Stress Disorder were discharged. Many received treatment from psychiatrists in the "Veterans Administration.

With the advent of the "All-Volunteer Force in 1973, senior commanders revised organization, training, and leadership to enhance small-unit cohesion as one means of strengthening resistance to combat stress. To identify lessons to be learned from combat and training events, after-action reviews were developed to draw out all of the participants' actions and perceptions. In some units the reviews included emotions as well, and proved effective in reducing Post Traumatic Stress reactions. Military psychiatrists were not involved in these measures. Most military personnel of all ranks continued to fear psychiatrists.

Since the "Cold War ended in 1991, U.S. forces have conducted an average of one major armed intervention per year. Military personnel were likely to experience repeated exposure to combat in a single enlistment. Research between 1991 and 1996 revealed that short-duration combat experiences and noncombat interventions can produce stress reactions. To preserve the psychological readiness of units, it became essential that mental health professionals come out of the hospitals to practice proactive preventive psychiatry. Some psychiatrists took the initiative in peacetime by consulting with commanders and training mental health specialists to provide outreach services in units. As a consequence, during the "Persian Gulf War, some combat stress control teams achieved moderate levels of accep-

tance in line units. They participated in after-action reviews, conducted post-trauma debriefings for members of units subjected to severe stress, and trained unit leaders in managing homecoming processes to minimize the likelihood of Post Traumatic Stress Disorder.

PSYCHOLOGICAL WARFARE is war propaganda directed at enemy audiences to induce surrender, insurrection, or disruption. It is most effective when based on military realities or likelihoods. It is intertwined with twentieth-century mass media, which allows the dissemination and reception of information behind enemy lines through leaflets, radio, and television. Traditionally, one distinguishes among three kinds of psychological warfare: *white*, *gray*, and *black*. White propaganda openly admits origin, and is disseminated openly by clearly identifiable sources; gray indicates no source; black disguises its source or purports to come from somewhere other than its true source. Black propaganda trades in *disinformation*, that is, misinformation or untrue statements deliberately spread to sow confusion. Today, disinformation has eclipsed black propaganda as a technique of psychological warfare; it works because it plays on recipients' darkest suspicions: it trades in prejudice and bias.

Psychological warfare may be synonymous with the twentieth century, but it is hardly new to the conduct of warfare. The Chinese military specialist Sun Tzu noted in his fourth-century B.C. *Art of War* that "to subdue the enemy without fighting is the acme of skill." In 1400 B.C., Joshua used the techniques of psychological warfare when he marched around the city of Jericho seven times sounding his trumpet to intimidate the enemy. The role of deception in siege warfare is famously part of the Siege of Troy. Thanks to the wooden horse in which Greek soldiers were hidden, we consider the Trojan Horse synonymous with "Greeks bearing gifts." In short, intelligent military commanders have frequently resorted to strategem, particularly in siege warfare, and this is part of what today we consider psychological warfare.

World War I saw the first use of modern propaganda techniques on a large scale. Woodrow "Wilson used the tactics of white propaganda in promoting his "Fourteen Points" (1918) as a basis for ending the war. The enemy was depicted through "atrocities propaganda, as the "Brutish Hun," destroyer of civilization, an enemy who did not scruple to kill innocent women and children in the sinking of the **Lusitania* (1915). Civilians at home, and dough-boys in the trenches, knew it was Germans who bombed the cathedral at Reims. Adolf "Hitler paid careful attention to Allied propaganda successes in some of the shrewdest parts of his autobiography, *Mein Kampf* (1925-26).

World War II led to the advent of "psyops" as a distinct

part of military operations and planning. Correctly understood, psychological warfare does not treat home morale or concern itself with public relations involving friendly countries. It is, rather, concerned with the enemy and enemy-controlled countries. Military force (the alternative to psychological warfare) concerns itself with threats, promises, subversion, and destruction; psychological warfare trades in warnings, alternatives, compassion, and the presumptive surcease of strategic rather than terrorist bombings.

Arguments as to the effectiveness of psychological warfare in World War II turn on what role, if any, these techniques had in persuading the German soldier to surrender before 8 May 1945. Gen. Dwight D. Eisenhower stressed the significance of psyops to modern warfare in an oft-quoted statement in the spring of 1945: "Without doubt, psychological warfare has proved its right to a place of dignity in our military arsenal." Most military historians recognize the import of this statement but feel that the doctrine of "Unconditional Surrender" fatally undermined the possibility of effective psyops in World War II by precluding the effective utilization of alternatives and compassion. One must conclude that we know an enormous amount about tricks and ruses (often concocted by brilliant practitioners) but very little about demonstrable impact.

The *Korean War introduced a new sort of psyops, the concept of *brainwashing*, first mentioned in 1950, a translation of the Chinese term for "thought reform." *To brainwash* is to change drastically someone's outlook. It involves convincing someone thoroughly, usually through nefarious means. Twenty-one American prisoners of war refused repatriation in 1953; *Cold War hysteria in America led many to believe that they were the victims of totalitarian practitioners with superhuman skills in indoctrination. Though the word *brainwashing* is part of everyday speech, today it is used to describe the techniques of those who create religious cults; the American military, after exhaustive analysis, concluded that in terms of troop *morale, there was no such thing as brainwashing; instead, the problem had to do with a captured soldier's inner psychological strength or emotional vulnerability.

The *Vietnam War made substantial—and notorious—use of psyops. Persons trained in civil and political affairs joined Special Operations *Forces to bring about so-called Opacification, and to aid in the defection of the Viet Cong to the South Vietnamese side, all part of Civil Operations and Rural Development Support (CORDS). Certainly, psyops operations were mistrusted by conventional soldiers and their commanders, but Vietnam systematized the phrase coined by Gen. Sir Gerald Templer as the goal of British efforts to undermine guerrilla activity in Malaya in the 1950s, "the battle for hearts and minds"—surely the central concern of psychological warfare in all of its guises.

More recently, the *Persian Gulf War (1991) made stunning use of disinformation as a tool of military policy, suggesting that future psyops will make the control of information a central concern. Gen. H. Norman Schwarzkopf was happy to let television commentators and newspaper correspondents repeat endlessly the inevitability of an assault on Kuwait City from the sea. Saddam *Hussein and his advisers assumed this must be official doctrine and arranged their forces for such an eventuality. When this proved not the case, "the mother of all battles" came to a quick conclusion. Further, the advent of satellite television broadcasting, allowing CNN correspondent Peter Arnett

to broadcast from the enemy's capital while the war progressed, suggests that psyops and information policy are more than ever subjects no modern military commander can ignore. Successes in deception may make fascinating reading, but the real success of psyops entails techniques more white than black in an effort "to subdue the enemy without fighting."

PUBLIC FINANCING AND BUDGETING FOR WAR.

America's great wars—the *Civil War, *World War I, and *

World War II—have been the most important events shaping the federal government's approach to public finance. Along with the political crisis of the 1780s and the Great Depression of the 1930s, these wars created distinctive public finance regimes that were crucial not only to the war efforts but also to the subsequent peacetime expansions of the federal government. At the core of these regimes were distinctive systems of taxation, each with its own characteristic tax base, rate structure, administrative apparatus, and social intention.

To mobilize for wars of unprecedented scale required vast new revenues, and this in turn freed American leaders to reexamine the nation's financial options. In so doing, they faced issues that far transcended the technicalities of war finance. Because each great military crisis involved the meaning or survival of the nation, it stimulated debate over fundamental national values, even as it intensified ideological and distributional divisions within American society. And because each war required the sacrifice of lives as well as treasure, it provoked social division and political conflict, which often centered on issues of taxation. The politics of taxation has, therefore, both expressed contested national values and furnished a means to resolve the social and ideological conflicts intensified by war.

Within the conflicted politics of each wartime emergency, the architects of national mobilization worked to persuade Americans to accept new taxes as a necessary form of sacrifice. In the Civil War and each of the two world wars, federal leaders designed new tax programs both to implement sacrifice and to convince the mass of taxpayers that their sacrifices were fair. In the process, the new tax systems came symbolically to express the goals of American society.

Before the Civil War, a system of low tariffs, a borrowing capability that Alexander *Hamilton's financial program had helped establish, and the enormous landed resources of the federal government had been adequate to finance almost all of the activities of the federal government. Only the *War of 1812, because it disrupted the foreign commerce on which tariffs were based, forced the federal government to adopt temporary excise and property taxes. The financial system of the early republic would probably

have remained adequate, had not a great national emergency intervened.

In no sense was the Civil War more truly a modern war than in its enormous requirements for capital. Union war costs drove up government spending from less than 2 percent of the gross national product to an average of 15 percent, close to the 20 percent level of the early 1990s. This evoked a program of emergency taxation and borrowing unprecedented in scale and scope.

The Union placed excise taxes on virtually all consumer goods, license taxes on a wide variety of activities (including every profession except the ministry), special taxes on corporations, stamp taxes on legal documents, and inheritance taxes on estates. Each wartime Congress also raised the tariffs on foreign goods, doubling the average tariff rate by the end of the war. Finally, the government levied its first income tax—graduated tax reaching a maximum rate of 10 percent.

Taxes funded about 20 percent of the Union's war costs, leaving the government to finance the rest by running deficits and borrowing money through the sale of Treasury bonds. Secretary of the Treasury Salmon P. Chase and Jay Cooke, a Philadelphia banker, marketed the bonds cleverly, by making interest on them payable in gold, and thus giving investors a hedge against inflation; they also reassured the wealthy by keeping income tax rates low. Most innovatively, they sold bonds not just to the wealthy and to financial institutions, but to the middle class. Although banks and rich people in America and Britain bought most of the securities, Cooke's newspaper advertisements and his 2,500 subagents persuaded nearly a million northerners—a quarter of all families—to buy them too. The administration of President Abraham Lincoln pioneered the propaganda techniques that would become essential to funding the major wars in the twentieth century.

In order to persuade Americans to make financial and human sacrifices for World War I, President Woodrow Wilson and his supporters in Congress had to introduce progressive income taxation on a grand scale. Passed in 1916 as a preparedness measure and expanded significantly after American entry into the war, the World War I income tax was an explicit "soak-the-rich" instrument. It imposed the first significant levies on corporate profits and personal incomes, while avoiding the extensive taxation of wages and salaries. In adopting the concept of taxing corporate "excess profits," the United States—alone among the belligerent powers—placed at the center of wartime finance a graduated tax on all profits above a government-specified "normal" rate of return. Excess-profits taxation generated most of the revenues raised during the war. Taxes produced a larger share of total revenues for the United States than any other belligerent, despite the fact that by the end of 1918 the daily average of war expenditures in the United States was almost double that in Great Britain and far greater than that in any other combatant nation. Thus, wartime public finance was based on the taxation that Democratic political leaders, including President Wilson, regarded as monopoly profits—in effect, ill-gotten gains.

Closely related to the Wilson administration's tax program was its sale of war bonds to middle-class Americans. Rather than tax ordinary citizens at high levels, the Wilson administration sought to mobilize their savings, a strategy that Secretary of the Treasury William G. McAdoo called

"capitalizing patriotism." He attempted to persuade ordinary Americans to reduce consumption, increase savings, and become creditors of the state; so that after the war these middle-class bondholders would be repaid by tax dollars raised from corporations and the wealthiest Americans.

Selling bonds directly to average Americans on a multi-billion-dollar scale required marketing campaigns far greater in scope than those used anywhere else in the world. Largely through trial and error, the Wilson administration devised a vast array of marketing techniques, including the sophisticated analysis of national income and savings. Financing by the new Federal Reserve system, which McAdoo turned into an arm of the Treasury, was important, but not as much as McAdoo's efforts to shift private savings into bonds. In promoting the four "Liberty Loans," McAdoo's Treasury armed itself with modern techniques of mass communication, and succeeded in placing its loans deep in the middle class—far deeper than during the Civil War. In the Third Liberty Loan campaign (conducted in April 1918), at least one-half of all American families subscribed. Thus the new public-finance regime installed by the Wilson administration encompassed a revolution in borrowing strategy as well as tax policy.

While the Wilson administration and the military did not always agree on what resources were necessary, the administration never allowed political or economic concerns to influence the setting of financial objectives. By 1918, the financial commitment to the war effort had become substantial; federal military expenditures reached nearly 25 percent of national product. The pay-off would have been even more evident had the war lasted into 1919, as the administration expected.

The most radical tax initiative—excess-profits taxation—did not survive the postwar reaction of the 1920s, but Democratic tax politics retained its "soak-the-rich" thrust into early mobilization for World War II. Like Wilson, President Franklin D. Roosevelt was committed to generating the revenues required to prosecute the war through taxes that bore heavily on corporations and upper-income groups. "In time of this grave national danger, when all excess income should go to win the war," Roosevelt told a joint session of Congress in 1942, "no American citizen ought to have a net income, after he has paid his taxes, of more than \$25,000."

But opposition to radical war-tax proposals strengthened in the face of the revenue requirements of full mobilization. One source of opposition came from a diverse group of military planners, foreign-policy strategists, financial leaders, and economists. One of these was Russell C. Leffingwell, who had been Assistant Secretary of the Treasury during World War I and a partner in J. P. Morgan and Company since the early 1920s. Throughout the turbulence of the 1920s and 1930s, experts like Leffingwell had marshaled the economic lessons of World War I and its aftermath. Now they wanted to mobilize even greater resources, to do so more smoothly and predictably, and to reduce inflationary pressures. They promoted mass-based taxation, based either on a general sales tax or an income tax that produced most of its revenue from wages and salaries. The second source of opposition to Roosevelt's radical tax proposals came from Democrats in both Congress and the administration itself; they worried that stringent corporate taxation might turn a postwar slump into another major depression.

In October of 1942, Roosevelt and Congress compromised by dropping the general sales tax, as Roosevelt wished, and adopting a progressive income tax, although a less progressive one than Roosevelt wanted. The act greatly reduced personal exemptions, enabling the federal government to acquire huge revenues from the taxation of middle-class wages and salaries. Just as important, the rates on individuals incomes—including a surtax graduated from 13 percent on the first \$2,000 to 82 percent on income over \$200,000—made the personal income tax more progressive than at any other time in its history.

Under the new system the number of individual taxpayers grew from 3.9 million in 1939 to 42.6 million in 1945, and federal income-tax collections leaped from \$2.2 billion to \$35.1 billion. By 1945 nearly 90 percent of American workers submitted income-tax returns, and about 60 percent of the labor force paid income taxes, usually in the form of withheld wages and salaries. In 1944 and 1945, individual income taxes accounted for roughly 40 percent of federal revenues. Corporate income taxes provided only about one-third, or half their share during World War I. *Mass* taxation had become more important than *class* taxation.

In making the new individual income tax work, the Roosevelt administration and Congress relied heavily on payroll withholding, deductions that sweetened the new tax system for the middle class, the progressive rate structure, and the popularity of the war effort. It was unnecessary to encourage popular support and sacrifice for the war by redistributing wealth through the tax system: Americans who believed their nation's security was at stake concluded that victory required both personal sacrifice and indulgence of the corporate profits that helped fuel the war machine. The Roosevelt administration reinforced this spirit of patriotism and sacrifice by employing an extensive propaganda program. The Treasury, its Bureau of Internal Revenue, and the Office of War Information made elaborate calls for civic responsibility and patriotic sacrifice, building on the arguments that the Wilson administration had crafted during the bond campaigns of World War I.

Because of the buoyant revenues produced under the new regime, during the last two years of World War II tax revenues covered roughly half of government expenditures. The federal deficit, after increasing from \$6.2 billion in 1941 to \$57.4 billion in 1943, held at about the 1943 level for the remainder of the war. These were impressive feats because the wartime expenditures represented a more massive, faster, and more prolonged shift of resources from peacetime endeavors than had been the case during World War I. The average level of wartime federal expenditures, which increased from 1942 through 1945, amounted to roughly half the national product—more than twice the average ratio during World War I. Moreover, by hitching taxation firmly to expenditure needs and dramatically broadening the tax base, federal policies also restrained wartime price inflation.

Thus, during World War II, as well as in World War I and even in the Civil War, a liberal democratic state demonstrated the fiscal power of a trusting and wealthy public. That trust, nurtured by the federal government, permitted and encouraged the adoption of income taxation—one of the most coercive and statist means of raising revenue. In a fiscal sense, the adoption of mass-based in-

come taxation during World War II, and the victory of a taxpaying culture, represented a triumph for both the republican virtue and the national strength the framers of the Constitution had sought to advance.

Cumulatively, the two world wars revolutionized federal public finance. Policy architects had seized the opportunity to modernize the tax system, adapting it to new economic and organizational conditions and making it a more efficient producer of revenue. (The income tax, for example, enabled the federal government to utilize the financial apparatus of the modern corporation to monitor income flows and collect taxes on them.) No process of "modernization" dictated the selection of options—for example, of income taxation over consumption taxation—but in each crisis policymakers discovered that the organizational maturation of industrial society had created a new menu of feasible options. Exploiting the new tax options during emergencies provided a structure and an administrative apparatus that allowed the federal government to take fiscal advantage of postcrisis economic expansion.

By contributing to the resolution of wartime social crises, the emergency-driven policies of progressive taxation acquired legitimacy and cultural force. The tax regimes of the two world wars did not produce a social revolution but did establish tax policy that was far more progressively redistributive than it had been before World War I, affirmed government's right to redistribute income according to ideals of social justice, and powerfully expressed the nation's democratic ideals.

By creating systems of taxation that had acquired an independent legitimacy and were administratively more robust, each crisis enabled proponents of expanded government programs to advance their interests after the emergency ended. Postwar leaders could forge new expenditure programs—both direct and indirect—without raising taxes or introducing new ones. The popularity of the expenditure programs, in turn, reinforced the popularity of the tax system behind the programs.

The tax system created in World War II proved to have a great capacity for expanding federal programs after the war. Persistent inflation and economic growth helped extend the life of the World War II tax regime by making it highly elastic, allowing the federal government to create new programs without enacting politically damaging tax increases. The World War II tax system paid for the strategic defense programs of the Cold War and, without any general or permanent increases in income taxation, for the Korean and Vietnam War mobilizations as well. Because the size of the defense budget relative to the GNP tended to decline through the 1970s (except during the "Korean and Vietnam Wars"), post-World War II increases in federal revenues went largely for the expansion of domestic programs.

In the absence of a new national emergency, the World War II tax regime remains in place today. Beginning in the late 1970s, however, stagnant economic productivity eroded its fiscal force and an antigovernment movement undermined its political legitimacy. Whether or not Americans will devise a new tax system to replace that created during World War II, the creation of the three great wartime regimes suggests that Americans can embrace drastic changes in taxation and public finance if the right political and economic circumstances converge.

— W. Elliot Brownlee

PUBLIC OPINION, WAR, AND THE MILITARY. The relationship between American public opinion and foreign affairs, particularly the military dimension, can be divided into three aspects. Those aspects are the public's attention—or inattention—to international affairs; the way Americans evaluate and react to wars and international affairs; and the degree to which wars have lingered in the public mind after they are over. Since extensive public opinion polling data are only available for the period since the mid-1930s, the focus is primarily on that era.

Attention. Because of its size and wealth, the United States has been for most of its history an important country, and in the last century at least, a great power by most conventional standards. At the same time, its peculiar geographical position—bordered by militarily weak neighbors, situated in a hemisphere that has seen remarkably little international war (though much revolution and civil war), and separated from militarily significant countries by two vast oceans—has often allowed it the luxury of standing back from clashes that have engulfed other countries.

The American public, not surprisingly, has reflected this reality and has not been inclined to spend much time worrying about foreign and international matters unless there appears to be a clear, present, and direct threat. Moreover, once international problems involving the United States appear to be resolved, the public can turn back to domestic matters with a virtuosity that is impressive.

This can be seen clearly in the results generated by the poll question, "What do you think is the most important problem facing this country today?", which has been asked with considerable regularity since the mid-1930s. In the 1930s, domestic concerns dominated international ones even as war dangers grew in Europe and Asia, and this changed only when war actually broke out in Europe in 1939. International concerns dropped precipitously again at the end of World War II in 1945 but came to dominate domestic concerns two years later when the *Cold War became fully activated. Attention escalated again during the *Korean War in the early 1950s and during various Cold War crises of the 1950s and early 1960s. But when tensions mellowed in mid-1963 with the Soviet-U.S. detente surrounding the signing of the Partial Test Ban Treaty, public attention to foreign affairs again dropped substantially. By 1966, the * Vietnam War came to dominate the public's concerns, but there was some decline in attention by the 1970s as American casualty rates dropped and as U.S. troops began to be withdrawn. Few foreign events have been able to capture the public's sustained attention since. Indeed, at no time since the *Tet Offensive in early 1968—not even during the *Persian Gulf War of

1991—have foreign policy issues outweighed domestic ones in the public's priorities.

Although the media are often given great credit for setting the political agenda, the chief determinant of public concern has usually been the often overwhelming weight and drama of the events themselves. Beyond this, the principal American actor has been the president—who is, after all, in charge of U.S. foreign policy. In particular, when the president orders American troops into action abroad, there is often a "rally 'round the flag" effect. Americans also seem to be influenced by other prominent members of the political leadership. However, even the president's impact can be limited: after the Gulf War, it was clearly to George *Bush's electoral advantage to keep the war and foreign policy as lively political issues during his reelection campaign. But despite his efforts and despite the advantage of his enormous postwar popularity, the public abruptly shifted its agenda, wanting now to focus on the sagging economy. The media might be seen in all this not so much as agenda-setters but rather as purveyors or entrepreneurs of tantalizing information. If they give an issue big play, it may arrest attention for awhile, but this is no guarantee the issue will take hold. Like any business enterprise, the media follow up on those items that stimulate their customer's interest. In that very important sense, the media do not set the agenda; ultimately the public does.

It is often argued that the public is particularly likely to respond to pictures in our television age: the so-called CNN effect. But this suggests that people are so unimaginative that they only react when they see something visualized. Yet in December 1941, Americans were outraged at and mobilized over the attack on * Pearl Harbor weeks—or even months—before they saw pictures of that event. Moreover, the Vietnam War was not noticeably more unpopular than the Korean War for the period when the wars were comparable in American *casualties, despite the fact that the later war is often seen to be a "television war" while the earlier one was fought during the medium's infancy. And, although the deluge of pictures of horrors during the * Bosnian Crisis in the 1990s may have influenced some editorial writers and columnists, there was remarkably little public demand to send American troops to fix the problem. On those rare occasions when pictures have—or seem to have—an impact, people espy the CNN effect. When pictures have no impact, they fail to notice.

Evaluation. In general, the American public seems to apply a fairly reasonable, commonsensical standard of benefit and cost when evaluating foreign affairs and the participation of its citizens in war. Potential American casualties loom as particularly important in its evaluation.

After Pearl Harbor, the public had no difficulty accepting the necessity, and the costs, of confronting the threats presented by Japan and Germany. And after World War II, most Americans came to accept international communism as a threat and were willing to accept increased defense spending and to enter the wars in Korea and Vietnam as part of a perceived necessity to confront that threat. However, as these wars progressed, réévaluation continued, and misgivings mounted about the wisdom of the conflicts—something that appears primarily to have been a function of the accumulating American casualties.

It seems unlikely that there has been an essential change of standards since the end of the Cold War. There is a clear public reluctance to risk lives to police small, distant,

perennially troubled and unthreatening places. But this reluctance does not seem to signal a new isolationist impulse. Americans were willing, at least at the outset, to send troops to risk death in Korea and Vietnam; but that was because they subscribed to the notion that communism was a threat that needed to be stopped wherever it was advancing. Polls from the time make it clear that the public had no interest in losing American lives simply to help the South Koreans or South Vietnamese. Thus, an unwillingness to send Americans to die for purposes that are essentially humanitarian rather than for national defense is hardly new.

Although there is an overwhelming political demand that casualties be extremely low when American troops are sent to deal with a problem that does not seem to be vital or direct, there seems to be little problem about keeping occupying forces in place as long as they are not being killed. There was small public or political support for sending U.S. troops to Haiti in 1994, but almost no protest arose about keeping them there—as long as there were no casualties.

Americans place a high value on the lives of their countrymen, yet their reaction when Americans are killed varies considerably. After Pearl Harbor, the outraged call for revenge against the attackers was overwhelming. At other times, the public has shown a willingness to abandon an overextended or untenable position after American lives have been lost. It accepted, with little regret, the decision to withdraw policing troops from Lebanon in 1983 after a terrorist bomb killed over 200 U.S. Marines, and the killing of 18 U.S. Rangers in a single incident in Somalia in 1993 led to demands for withdrawal, not calls to revenge the humiliation. Unlike the problems in the Pacific War in 1941, the situations in Lebanon and Somalia did not present a wider threat to American interests, and the public was quite willing to support measures to cut losses and leave.

Although Americans are extremely sensitive to U.S. casualties, they seem to be remarkably insensitive to casualties suffered by foreigners, including essentially uninvolved civilians. The Gulf War furnishes an extreme example. Polls make clear there was little animosity toward the Iraqi people, yet this did not translate into much sympathy within the American public for well-publicized civilian casualties caused by bombing attacks. Images of the “highway of death” and reports at the end of the war that as many as 100,000 Iraqis may have been killed scarcely dampened the enthusiasm of postwar celebrations.

Long-Range Impact. The degree to which wars have a long-range impact on opinion varies. Some wars continue to linger in the public consciousness, some vanish almost immediately, some linger and then disappear, and some diminish for awhile but then become revived in memory. Neither the scope nor the objective historical importance of a war seems precisely to determine its long-range impact on opinion.

The best example of an international event that continued uninterrupted to live in memory long after it was over is undoubtedly World War II. It was, of course, a massive affair, affecting all strata of society, and it continued—and continues—to affect popular perceptions. (On the domestic side, something comparable could probably be said for the Great Depression—an event that had a long, lingering impact.)

The Gulf War seems prototypical of international events that subsequently disappear from public memory.

At the time, the gulf crisis often seemed all-consumingly important: on the eve of the war, half of the American people said they thought about the crisis at least once an hour. But when it was over, it quickly lapsed from public recall. In this, opinion may appropriately be reflecting historical judgment: from the standpoint of world history, that war may well prove to have been quite a minor event. However, the Cold War and its concomitant nuclear fears cannot so easily be dismissed as historical sideshows. Yet the Cold War seems already to be picking up a patina of quaintness as it recedes from memory, and few seem any more able to recall the fear “nuclear weapons once inspired as they were brandished by glowering Cold War contestants.

Wars can have a lingering impact in their immediate aftermath, but then fade from view. Cases in point are the Korean War and the much earlier “War of 1812. Korea, the most costly war since 1945, essentially crystallized the Cold War, and it importantly affected public perceptions throughout the 1950s. A century earlier, the War of 1812 ended rather inconclusively, but the Republicans, who had begun it, were able to fashion an appealing myth that the war had been a glorious triumph, something that subsequently helped them and destroyed the opposition Federalist Party. Yet, both these wars, despite their contemporary importance and their resonance in the immediate postwar period, eventually sagged from the public consciousness and both, interestingly enough, have inspired books with titles proclaiming them to be “forgotten” conflicts.

Finally, some wars are neglected for awhile and then come back to haunt the public consciousness. The Vietnam War was the great nonissue of the 1976 election campaign conducted a year after it was over, and it was neglected in most public memory for several years: Americans, it seemed, did not want to think about it. Yet by the 1980s, Vietnam had become a haunting event in the American consciousness, and it seems likely to remain one for a long time. Something similar happened with the “Civil War—probably the most important event in American history. For years after that conflict, as Gerald Linderman observes, there was considerable desire to forget it. But after some twenty years, the building of War “memorials and monuments—and of myths—began, and the war has no doubt become the most popularly memorable event in American history.

PUEBLO INCIDENT (1968). On 23 January 1968, the USS *Pueblo*—gathering intelligence on the military strength of North Korea—steamed into the Sea of Japan outside the twelve-mile territorial limit of the Communist nation. Without warning, North Korean warships converged on the *Pueblo* and ordered her crew to heave to or be fired upon. As crewmen began to burn classified documents, the North Koreans opened fire, wounding several American sailors, one mortally. Commander Lloyd M. Bucher ordered an end to resistance.

The U.S. Pacific Command dispatched air and naval forces into the Sea of Japan, but they arrived too late to help the *Pueblo* and her eighty-two-man crew. Meanwhile, the Communists had boarded the *Pueblo*, confiscated intelligence equipment and documents, and brought the ship into Wonsan port. Washington protested North Korea's brazen attack in international waters, but the North Koreans refused to release ship or crew.

Over the next few months, the Communists tortured Bucher and his men to make them admit "guilt" for spying and violating North Korea's territorial waters. Pyongyang made it clear the Americans would not be released until Washington apologized for infringing on North Korean sovereignty and promised not to do so again.

American diplomats met with Communist officials ashore at Panmunjom, in the demilitarized zone between North and South Korea. Finally, President Lyndon B. Johnson directed his representatives to sign the necessary statement. At the same time, his officials publicly disavowed the document's validity. On 22 December, the North Koreans released the American prisoners and the body of their slain shipmate. They did not return the *Pueblo*. In 1969, a U.S. "Navy court of inquiry recommended that Bucher be court-martialed, but the Johnson administration declined.

PUERTO RICAN UNITS. Puerto Rico has a long history with the U.S. military. Some Puerto Ricans participated as auxiliary troops in the U.S. invasion of 1898. After taking the island from Spain, the United States initiated new units with native personnel: the Porto Rico Battalion (1899) of infantry (cavalry was added in 1900) to assist in repressing armed peasants, and the Porto Rico Regiment, U.S. Volunteers Infantry (1900). This force—U.S. officers and native troops comprising 900 men—replaced the 700 regular U.S. troops sent to help suppress the Philippine insurrection. In 1901, it became the Provisional Puerto Rican Infantry Regiment, which was integrated into the regular army (1908) as the Porto Rican Infantry Regiment, U.S. Army.

During World War I, an enlarged regiment was assigned to protect the Panama Canal. In 1916, an "ROTC program was established at the University of Puerto Rico. In 1917, soon after the Jones Act extending U.S. citizenship to Puerto Ricans, military "conscription was introduced. Some 18,000 Puerto Ricans were drafted or enlisted and a Na-

tional Guard unit was created in 1919. In 1920, the Puerto Rican regiment was renamed the 65th Infantry Regiment, but this colonial unit, similar to the Philippine Scouts, was never fully integrated into the U.S. Army structure.

At the onset of World War II, the 65th Infantry was sent to guard the Panama Canal. In 1944, it transferred to the Mediterranean and European theaters and saw some combat, ' suffering 348 "casualties. More than 65,000 Puerto Ricans served in the U.S. armed forces during the war, most of them as soldiers garrisoning U.S. bases in the Caribbean.

During the "Korean War, the 65th Infantry engaged in intensive combat duty, suffering 743 combat and 186 non-combat casualties in the winter of 1950-51. All told, some 49,200 Puerto Ricans were conscripted or enlisted. Since 1952, when the 65th Infantry was disbanded, Puerto Ricans have served in regular U.S. Army units or the Puerto Rican National Guard. During the "Vietnam War, 23,350 Puerto Ricans participated, suffering 1,300 casualties. Numerous Puerto Rican military personnel also served in the "Persian Gulf War.

PULLER, "CHESTY" [LEWIS B.] (1898-1971), Marine Corps combat leader. Born in the peaceful village of West Point, Virginia, where his father had a wholesale grocery business, Puller was reared on tales of Confederate glory. His grandfather, Maj. John Puller, a heroic cavalryman, was killed in 1863. Determined on a military career, Puller completed one year at the Virginia Military Institute (VMI) before enlisting in the U.S. Marine Corps in August 1918. VMI may have given him the exaggerated military bearing for which he was nicknamed, but it was during more than four years as a Marine NCO and concurrent lieutenant of the *Gendarmerie d'Haiti* (1919-23) that Puller developed his distinctive leadership techniques: perfectionism; mission overachievement; and fearless, inspirational conduct under fire. Varied assignments followed his commissioning in 1924, including two tours in Nicaragua, in each of which he was awarded the Navy Cross. His third and fourth Navy Crosses came during World War II at the Battle of Guadalcanal and at Cape Gloucester on New Britain Island; and the fifth in Korea where Puller commanded the 1st Marine Regiment in the assault landing at Inchon, the seizure of Seoul, and the fighting at the Chosin Reservoir.

Puller was promoted to brigadier general in 1951 and to lieutenant general upon retirement in 1955. During the 1950s, the colorful and outspoken Puller gained attention as a champion of tough, realistic training; a defender of the basic soundness of American youth; and a critic of higher leadership. His legend continued to grow; photographs of his bulldog visage hung in homes and service clubs across the country as a symbol of invincible heroism and fidelity to traditional military standards.

PYLE, ERNIE (1900-1945), American journalist of World War II. A native of Dana, Indiana, Pyle worked on a local paper before joining the *Washington [D.C.] Daily News* in 1923, initially covering aviation and later serving as managing editor. In 1935, Pyle began a syndicated column for the Scripps-Howard organization, describing his experiences motoring around the United States. Over the next four years, his stories focused on the lives of average citizens.

In 1940, Pyle received his first wartime assignment from Scripps-Howard, covering the Blitz in England. Two years later, he started reporting on the *North Africa Campaign and followed U.S. combat troops to Sicily, Italy, and

France. Widely respected by both the public and the average G.I., Pyle succeeded in conveying a sense of the hardship, fear, and endurance of the individual soldier, with a special focus on the combat infantryman. At the height of his fame, his columns were carried by over 400 daily newspapers. In 1944, he won the Pulitzer Prize, and *Time* magazine featured him on its cover.

In 1945, Pyle, at the behest of the navy, shifted to covering the Pacific theater. He was killed by enemy fire on the island of Ie Shima near Okinawa on 18 April 1945.

QUAKERS. The Religious Society of Friends, commonly called Quakers (so dubbed derisively by a seventeenth-century judge who said they quaked before the power of the Lord), has opposed war and violence from its inception, and has sought instead to do away with the causes of war and alleviate the suffering it causes.

George Fox (1624-1691), usually regarded as the founder of the Friends, preached in the 1640s, during the English Civil War, that there was a divine spark within each person, which means that all human beings are infinitely precious in God's sight and no one is justified in taking the life of another.

After the restoration of Charles II in 1660, radical religious groups stirred up rebellion, which led Friends, in 1661, to issue a declaration beginning: "We utterly deny all outward wars and strife and fightings with outward weapons..." Eventually, this Peace Testimony became fundamental to Quakerism.

In 1682, William *Penn founded his "holy experiment" in Pennsylvania, based on the belief that a province that had no army, treated Native Americans as equals, and offered religious liberty could make the Peace Testimony a living reality. Penn published his *Essay Towards the Present and Future Peace of Europe* (1693), which offered a plan for bringing peace and justice. Although Pennsylvania was drawn into two wars between England and France, the colonists avoided deep involvement, and peace returned in 1713 with the Treaty of Utrecht. When the * French and Indian War broke out in 1754, most of the Quaker politicians resigned from government rather than support the war.

Two decades later, at the start of the * Revolutionary War, Friends took a neutral position and were persecuted by both British loyalists and American Whig revolutionaries. Quakers raised money and sent supplies to assist civilians, first in Boston in 1775, later elsewhere. In 1777, seventeen Philadelphia Quaker leaders were unfairly accused of treason and exiled to Virginia by the Whigs, but the following spring the fourteen who survived were released without trial. Several hundred Friends, including Betsy Ross, were strongly drawn to the revolutionary cause, and many of them joined the armed forces, notably Gen. Nathanael *Greene from Rhode Island. When disowned by their Meetings, they organized a new group known as Free Quakers, but this group died out by the 1830s. A few Friends also joined the British cause as loyalists.

Friends turned their humanitarian efforts to opposition to slavery and other reforms, including the peace movement. When the *Civil War broke out (1861), many Quakers were troubled by their desire to use the conflict as a way to end slavery, for such action ran counter to the Peace Testimony. The official position of Quakers remained un-

changed, but some Friends were tolerant toward those who supported the war for the Union and emancipation and allowed members who joined the armed forces to remain. President Abraham *Lincoln's government was more lenient toward * conscientious objection than the Confederate government, but some conscientious objectors (COs) on both sides suffered for their refusal to fight.

After the Civil War, individual Friends were active for peace. Benjamin F. Trueblood served as secretary of the * American Peace Society; Hannah J. Bailey, a New England Quaker, edited magazines for adults and children on peace education; and Albert K. Smiley sponsored the Mohonk Conferences on International Arbitration in New York.

When the United States entered World War I in 1917, Quakers organized the American Friends Service Committee (AFSC) to assist COs and engage in relief work in Europe. The government recognized COs who belonged to traditional peace churches such as Quakers and Mennonites, but they were expected to serve in the army as non-combatants, usually in the medical corps. Many Quaker COs refused. Some were furloughed to do farm work; a few were imprisoned.

Through the AFSC, Quaker volunteers did relief work in France and Germany—eventually feeding 1 million children daily—in Central Europe, and then in Russia during the famine there. Herbert C. *Hoover and other Friends raised several million dollars for such work.

Quaker organizations strongly advocated the Peace Testimony between the two world wars. In contrast to isolationists, they supported the *League of Nations and conducted peace education in churches and schools; they also helped bring persecuted German Jews to the United States. However, the Friends joined other pacifist groups in opposing *conscription, rearmament, and entrance of the United States into World War II.

The Selective Service Act of 1940 included a provision that COs might be assigned to do "civilian work of national importance" in Civilian Public Service units administered by the peace churches under Selective Service regulations. Some 12,000 men worked in forestry camps, agricultural projects, mental hospitals and institutions for the mentally deficient, and as "guinea pigs" in medical experiments. They received no pay and none of the benefits provided veterans of the armed forces. Deeply stirred by outrageous conditions in mental hospitals, some of the COs created the National Mental Health Foundation in 1946, and four years later this body merged with two others to create the National Association for Mental Health.

In 1947, the AFSC and the Friends Service Council of Britain received the Nobel Peace Prize for their work in Europe and Asia during and after the war.

Quakers opposed the nuclear *arms race and the réintroduction of conscription (1948). The Friends Committee for National Legislation lobbied in Washington, D.C., for Quaker principles.

During the *Vietnam War, when antiwar feeling swept over the nation, Quakers, a tiny minority of the "Vietnam Antiwar Movement, sought to prevent violence and the use of force in antiwar protests. Most young Friends of draft age opposed the war, the first time in the twentieth century that the official Quaker position matched the wartime practices of most of its members of military age. Many Friends' organizations strongly supported members who resisted conscription, and offered help to those imprisoned; at the same time, the AFSC and others provided relief and medical supplies to civilians in Vietnam during and after the war. Similarly, they opposed the "Persian Gulf War and aided its civilian victims.

The AFSC and other Quaker bodies continue to support peace and humanitarian work around the world.

QUASI-WAR WITH FRANCE. See France, Undeclared Naval War with (1798-1800).

QUÉBEC, BATTLE OF (1759). In the "French and Indian War, conquest of New France presupposed the capture of Québec, the citadel controlling access to the St. Lawrence River. Late in June 1759, 141 British warships and transports brought nearly 9,000 regulars and provincials, commanded by Maj. Gen. James Wolfe, to challenge nearly 16,000 defenders under Gen. Louis-Joseph, marquis de Montcalm. For more than two months the British bombarded the city, destroyed farms, and attempted landings, without luring the French from their formidable defenses.

On 13 September, a desperate General Wolfe led 4,400 troops in a risky night landing, scaled a 150-foot cliff, and secured an exposed position. On the Plains of Abraham outside the fortress, Montcalm, acting with uncharacteristic haste, attacked with forces that barely outnumbered the British. The battle lasted half an hour and killed 658 British and 644 French, with Wolfe among the dead and Montcalm among the dying, but it proved a British victory.

With British control of the Plains of Abraham, four days later the French surrendered the still-defensible city. Viewed by some as a *coup de grâce* to a crippled empire, and by others as a preliminary victory, the battle is generally seen as the poignant climax of the Anglo-French struggle for North America.

—Ian K. Steele

RACE IN THE MILITARY. *See* African Americans in the Military; Ethnicity and Race in the Military; Native Americans in the Military.

RACE RELATIONS AND WAR. Race relations have helped shape, and in turn have been shaped by, the conduct of American wars; and the dominant pattern of American military race relations was traditionally castelike. Racial status defined how individuals of color were commanded, mobilized, and treated; discrimination has thereby jeopardized military efficiency and claims of "equal" sacrifice. The more inclusive military service was, however, the more it destabilized racial hierarchy and exacerbated racial tensions.

People of color fought for equality and inclusion but usually experienced their opposites. The persistence of castelike approaches, and the conflicts generated, reflected both the power of racism and the important function that military service (or exclusion) played in the development of American society.

Many non-Caucasians demanded inclusion and resisted inequality (or opportunistically asserted their self-interest), while many Caucasians demanded exclusion, white control, and symbolic supremacy. Political and military exigencies resolved this contest. Laws frequently limited participation of non-Caucasians, or mandated segregation; and people of color entered or exited the military differently from Caucasians.

Minorities often were segregated or performed lower-status roles within the military; sometimes they received less pay. They experienced harassment by soldiers and civilians; poor living conditions; prejudicial evaluations of their skill, bravery, and contribution; marginalization at ceremonies; and lack of access to command. Most often serving under white officers, individuals of color, even when commissioned, were frequently prevented from commanding white troops. The assertiveness of soldiers of color challenged the self-image and position of whites, fueling harassment and violence.

Prejudice also affected how many Americans perceived Native American, Latino, and Asian enemies, as well as the military tactics employed and the treatment of American citizens who looked like the "enemy." Compared to European enemies, non-Caucasians were dehumanized and often subjected to harsher tactics. The racial context of warfare sometimes affected the treatment of individuals of color at home (e.g., Japanese Americans in World War II), as well as the willingness of political leaders to employ individuals of color, and the willingness of those individuals

to serve in the military or carry out actions viewed as having racial overtones.

The key periods and their defining characteristics in terms of race relations in the military were 1608-1763: semi-exclusion; 1763-87: revolutionary inclusion; 1787-1862: increasing exclusion; 1862-65: segregated inclusion; 1865-1945: segregation; and 1945-present: increasing integration.

1608-1763: Semi-Exclusion. Blacks and Indians aligned themselves with colonial governments (or enemies) based on self-interest. Governments feared this self-interest, but, needing men, employed troops of color, sometimes unarmed and almost always under white officers. When the need ceased or where fear of servile insurrection became too great, colonies disarmed blacks and Indians or excluded them from the militia. For example, South Carolina enlisted slaves beginning in 1707, but ended this policy after the Stono Rebellion of 1739, in which slaves seized arms, burned plantations, and killed whites. Many colonies, however, modified exclusionary policies to allow non-Caucasians to serve in expeditionary forces as substitutes for white militiamen or as volunteers.

1763-87: Revolutionary Inclusion. Republican ideology, manpower shortages, and British appeals to Indian and black self-interest set the stage for inclusion. Nonetheless, racist and pro-slavery concerns limited the use of black troops everywhere before 1776, and in southern states thereafter.

African Americans, appropriating revolutionary republicanism, enlisted with a self-consciousness reflected in the surnames some of them took: "Liberty," "Freedom," and "Freeman." Although blacks contributed to the early stages of the "Revolutionary War, many revolutionaries opposed their participation, curtailing recruitment until 1775. However, manpower needs and British recruitment of slaves soon caused a policy reversal.

Black and Indian soldiers fought in integrated and segregated units, some serving as volunteers, others as substitutes or draftees. Some states enrolled slaves as well as free blacks; others refused to recruit slaves. Overall, however, the Revolution destabilized slavery. Some slaves achieved freedom by fighting for the Americans, others were freed by the British and emigrated as loyalists. Still others, both free and unfree, applied republican ideology to their social and political struggles.

1787-1862: Increasing Exclusion. Increasing exclusion of individuals of color from the militia and army, and thus from the political and social benefits of military service, marked the early national period. Though the availability of white manpower made it possible to exclude men of

color here, the situation was different in the navy, which employed and integrated black sailors from 1812 through 1862, whenever skilled seamen could not be recruited in sufficient numbers.

Congress excluded men of color from the national militia in the Militia Act of 1792, which defined the militia of the United States as being made up of "white-male citizens." Although federal action did not preclude states from including men of color in state militias, all states did so by 1835. Because some states legislatively, and all states symbolically, linked militia service to voting and citizenship, exclusion barred men of color from legal privileges, as well as from the major public source of military training, civic ritual, male bonding, and social control.

Men of color were excluded from the navy and Marines in 1798. The navy soon admitted black sailors and Congress legitimated this practice in 1813, but the Marines remained "white" until 1942. Army statutes of 1790, 1811, 1812, and 1814 did not contain racial restrictions, but biased practices prevented many blacks from serving. Louisiana, which maintained a black militia until after the war, was an exception. Blacks owning \$300 in property served in the militia under white and black officers, and 600 free blacks served under black line officers in two black battalions during the Battle of New Orleans (1815).

Postwar policy consolidated exclusion. The government banned slaves from navy ships and shipyards in 1816, and Secretary of War John C. Calhoun excluded blacks from the army in 1820. In 1839, the navy instituted a 5 percent quota on black recruits.

1862-65: Segregated Inclusion. The Civil War reversed the exclusionary trend. Black manpower was important to both Union and Confederate war efforts, and the Union's liberal nationalist ideology supported formal equality of sacrifice. Although black and Indian volunteers had been excluded from "a white man's war" in 1861 and early 1862, the new Militia Act (1862) and the Enrollment Act (1863) contained no racial exclusions, while the Confiscation Act of 1862 and the 1863 Emancipation Proclamation supported military use of former slaves. The Union and Northern state governments aggressively recruited black soldiers, sometimes as volunteers or through "conscription, other times through military press gangs that targeted Southern blacks. The Confederacy began to recruit black troops in March 1865.

Black activists demanded the right to fight and played a key role in Northern recruiting efforts, and they also sought equality. Except for the navy, this did not happen. Black soldiers received less pay and fewer bounties than their white counterparts, and were likelier to receive both harsh punishments and assignment to labor duties. Many former slaves also performed work traditionally done by soldiers, but without being accorded the uniforms, status, or perquisites of military service.

Blacks served in segregated units, and contact with white units was controlled. With the exception of Louisiana in 1862-63 and a few units near the end of the war, blacks served under white officers. Most black units were demobilized later than their white counterparts, and none participated in the May 1865 Grand March down Pennsylvania Avenue that symbolized the achievements of the nation's citizen soldiers.

Although unequal conditions limited the willingness of

some black activists to serve or recruit, many African Americans self-consciously fought to end slavery and gain political rights. Black soldiers, veterans, and families faced harassment and prejudice, yet their valor and sacrifice did much to change attitudes and official behavior. In 1864 and 1865, the government equalized pay and started to commission black men as line officers. Black soldiers also played a visible role in the liberation of Charleston, Petersburg, and Richmond, and provided manpower and officers for reconstructed state militias. Black military and militia service contributed to black militancy during Reconstruction.

1865-1945: Segregation. Between 1865 and 1880, conservative forces disarmed most black militia, contained the number of black troops, and curtailed access to command positions. Black troops were removed from the South and their service was limited to four segregated regiments in 1866. By the 1880s, black sailors were refused promotions and increasingly assigned to service duties (where Asians would later join and sometimes replace them). After the Spanish-American War, the army employed Filipinos and Puerto Ricans, treating them similarly to black troops.

Non-Caucasian access to officer positions was rare until 1916. Although the Army Reorganization Act of 1866 lacked racial prohibitions and twelve blacks entered West Point between 1870 and 1886, army examiners rejected all black officer candidates, and black students were segregated and harassed at West Point. Only three graduated. (None of the three blacks who were appointed to Annapolis during the period survived their "hazing.") While the three West Point graduates gained positions within black regiments, there were no more black nominees during the nineteenth century. Some blacks did serve successfully as volunteer line officers during the Spanish-American War, but none was nominated by their colonel for examination for appointment in the regular army. When the army reorganized in 1901, not one of the 1,135 regular army officer vacancies was initially filled by an African American. Only after protests were three black men appointed.

The need for troops and mass support as well as racially inclusive Selective Service legislation structured the employment of troops of color during both world wars. Indians were sometimes integrated into units, and civilian color lines were challenged, but military segregation remained the norm. In spite of protests by black soldiers and civilians, the government created separate training camps for black officers, segregated black and Asian troops, denied promotions to black officers, controlled the number of black troops, billeted blacks away from some southern cities, disparaged black officers and men, and assigned non-Caucasians disproportionately to labor duty. However, black political pressure in the 1940s set the stage for integration: for example, the first black general was appointed one month before the 1940 election, and in 1941, Executive Order 8802 (which prohibited racial discrimination in defense industries, opening up defense plant positions to individuals of color) was issued to prevent a threatened protest march on Washington. While racial segregation remained the policy, the need for infantry replacements led to the inclusion.

1945-Present: Increasing Integration. Increasing civil rights activism, racial tensions within the armed forces, the inefficiencies of segregation, the continued need for manpower, and the challenge of combatting an ideologically

antiracist USSR all propelled integration. The army and navy experimented with integration in 1945; a 1948 executive order mandated equality of treatment; and in 1950, Congress repealed the 1866 law that had mandated four segregated regiments. The armed forces were formally integrated in the 1950s, but prejudice and passive resistance at both the staff and line levels persisted through the "Vietnam War. This resistance (along with civilian racial turmoil) generated anger, violence, and support for "peace and antiwar movements among some soldiers of color.

Slow as it was, military integration proceeded faster than did civilian or even National Guard integration (ten states excluded blacks as late as 1963). Organizational integration required leadership and command accountability. Responding to civil rights investigations, the secretary of war in 1963 mandated command responsibility in civil rights matters. Following outbreaks of racial violence in 1969, the army instituted a program to increase racial harmony, equality of opportunity, and the ability of the army to perform its mission.

The pace of change accelerated in the "post-Vietnam Volunteer Force, and leadership integration contributed to racial integration. A black man, Clifford Alexander, was appointed secretary of war in 1977, and Colin "Powell, another African American, was named chairman of the "Joint Chiefs of Staff in 1989. The percentage of black senior noncommissioned officers rose from 14 percent in 1970 to 31 percent in 1990, and the percentage of black commissioned officers rose from 3 percent in 1970 to 11 percent in 1990. Beginning in the 1980s, the armed forces' military academies and command structure began—at last—to reflect the nation's diversity.

RADAR, an acronym for RAdio Detection And Ranging, is based on German scientist Heinrich Hertz's 1880s discovery that a beam of radio energy that strikes an object of sufficient density will be reflected by it. If that reflected energy is then captured by a receiver at the beam's origin it can be analyzed. Another German scientist, Christian Hulsmeier, patented the first radio echo device in 1904. Because radio energy travels at a constant speed (the speed of light) the length of time between sending and receiving the energy can thus be used to calculate the object's distance. The direction from which the energy is received can be used to determine the object's bearing. Combining distance and bearing indicates the object's location on/above the surface of the Earth. Modern radars belong to one of

two general types. Pulse radars emit a short, intense burst of radio energy, while continuous-wave radars emit a steady signal. The latter, often called Doppler radar, cannot track the range to the object but instead measures the Doppler shift caused by the object's movement, from which the direction and speed of its movement can be determined. There are several other specific types of radars, such as Synthetic Aperture Radar, which electronically focus or shape the radar beam.

The Italian Guglielmo Marconi first demonstrated radio reflection for detection in the 1920s. In the United States, Gregory Breit and Merle A. Tuve discovered the principle of pulse ranging in 1925. Research and development was underway simultaneously in Germany, Great Britain, and the United States by the early 1930s. The Germans initially had better equipment aboard warships that began radar-aided commerce raiding in September 1939. In 1937 the British began deploying the Chain Home early warning network along the Channel coast, which would provide the decisive advantage in the Battle of Britain. Early World War II radars used radio pulses of low frequency and long (a meter or more) wavelength, but these required large antennas, suitable only for large ships or ground stations and were imprecise compared to the next generation radars. With the invention in Great Britain of the cavity magnetron in 1940, however, much smaller sets employing centimeter wavelengths capable of much greater precision were possible. In 1940 Henry Tizard led a mission to the United States that successfully enlisted American industrial aid, and the Germans fell behind, never to regain parity. In the Pacific, the Japanese never even came close to it, and most Japanese radar systems were based on early ones captured from the British and Americans in 1942.

At sea, Allied naval radar was key in the defeat of the U-boat threat in 1943, and radar-directed naval gunfire was decisive in several sea battles, including the Battle of "Leyte Gulf in October 1944, in which US battleships in the Surigao Straits using radar-directed gunfire at night destroyed a Japanese fleet. In the air, the radar struggle between countermeasure and counter-countermeasure was dynamic, deadly, and decisive. In July 1943 the Royal Air Force first used "window" (American term: "chaff"), small strips of reflective tinfoil, to negate German air defenses of Hamburg (Operation "Gomorrh") in a raid that killed approximately 40,000 inhabitants. American bombers equipped with radar jamming transmitters (called "Carpet") blocked German "Wurzburg" anti-aircraft gun-laying radars and assisted in a deceptive spoof on the night of the Normandy landings. Offensively, American and British aircraft carried increasingly sophisticated navigational radars, such as the H2S and H2X ("Mickey") sets that portrayed ground features with greater and greater detail and enabled bombing at night or through cloud cover. Night fighters equipped with small radar sets such as the German "Lichtenstein" hunted enemy aircraft in the darkness and located them entirely by radar. Specialized aircraft ("ferrets") gathered radar intelligence while electronic warfare operators ("ravens") waged an invisible but critical war in what was then called "the ether," and might today be called "cyberspace."

During the Cold War both the U.S. and Russians erected radar networks such as the Distant Early Warning or "DEW" line across Canada to warn of enemy aircraft. Strategic Air Command (SAC) warplans from the 1950s

through the 1980s depended on radar to accurately navigate to and identify targets, and electronic countermeasures (ECM) such as radar jamming and chaff were the key to negating enemy defenses. Intercontinental ballistic missiles forced both sides in the 1960s to develop even more sophisticated radar nets such as the Ballistic Missile Early Warning System (BMEWS) to warn of missile attack. Perhaps the ultimate were radars devised to support anti-missile defenses, capable of not only detecting enemy missiles in space but also of tracking them for interception and destruction by defensive missiles. Radars belonging to the Space Detection and Tracking System (SPADATS) keep constant track of the thousands of objects orbiting the earth.

The air war over Vietnam was dominated by radar controlled air defenses, as North Vietnam successfully employed Russian radar-guided surface-to-air missiles (SAMs) against American air operations. American countermeasures included not only traditional ECM, but also direct attacks on radar control systems. This technique, called "Wild Weasel", had been tried in WWII, but not until the 1960s were detection and homing systems sufficiently advanced to be successful. Anti-radar electronic warfare (EW) was so important by the Persian Gulf War of 1991 that virtually no Coalition aerial attacks were mounted without EW support. Since the 1940s, designers have sought aircraft undetectable by enemy radars. This effort came to fruition with the F-117 "Stealth Fighter" and B-2 "Stealth Bomber", both of which used Low Observable technology to make them almost invisible to enemy radars.

Modern military radars have become increasingly sophisticated, and those mounted in surveillance aircraft such as the Airborne Warning and Control System ("AWACS") or Joint Surveillance and Tracking Radar System ("JSTARS") provide virtually a three-dimensional portrayal of a battlespace the size of a small country. Radar has also had an enormous effect in the civilian world. From radar astronomy, to traffic control, to weather and storm warning, to air and maritime navigation, radar has become an indispensable facet of modern life.

RADFORD, ARTHUR (1896-1973), World War II admiral and chairman of the "Joint Chiefs of Staff (JCS). Born in Chicago, Arthur Radford graduated from the U.S. Naval Academy in 1916. Following his designation as a naval aviator in 1920, Radford was assigned to a variety of aviation-related positions in the interwar years.

From 1941 until 1943, he served as director of aviation training in the Bureau of Aeronautics. In this assignment, Radford skillfully directed a program of intensive expansion of all phases of naval aviation training that enabled the U.S. Navy to fulfill its enormous requirement for combat pilots. Other wartime assignments included command in combat of two different "aircraft carrier divisions.

In 1947, Radford was selected by chief of naval opera-

tions Louis E. Denfeld to be vice chief of naval operations. He quickly gained a reputation as naval aviation's staunchest defender against attacks from other services. In 1949, while serving as commander in chief, Pacific and Pacific Fleet, Radford spearheaded the navy's testimony before the House Armed Services Committee in the so-called Revolt of the Admirals. Although this incident put a temporary cloud over his career, he continued to serve ably throughout the "Korean War as the unified commander in the Pacific.

Having impressed President-elect Dwight D. Eisenhower and incoming Secretary of Defense Charles E. Wilson during their visit to the Pacific in 1952, Radford was appointed the second chairman of the JCS in 1953. In his four years as chairman, Radford served as a strong supporter of Eisenhower's "New Look" defense policy, which relied upon the threat of "nuclear weapons to deter Soviet actions while holding down requirements for larger U.S. conventional forces.

Radford retired from active duty in 1957. He died in 1973. A thoughtful proponent of military preparedness, Radford served ably in positions of increasing trust during World War II and the first decade of the Cold War.

RADIO AND TELEVISION SERVICE, ARMED FORCES. Since 1942, the mission of the Armed Forces Radio and Television Service (AFRTS) has been to provide information, education, and entertainment to U.S. military forces everywhere. AFRTS personnel brought American music, news, and network programming (without commercials) to the front lines during World War II and during the "Korean War, the "Vietnam War, and the "Persian Gulf War. Just as valuable, broadcasters relieved the boredom of peacetime military duty around the world.

Begun as unofficial radio stations before World War II in the Panama Canal Zone, the Philippines, and Alaska, the Armed Forces Radio Service (AFRS) was founded in August 1942, at the direction of the army chief of staff, George C. Marshall. Relying on the advice of movie director Frank Capra, Marshall selected advertising executive Tom Lewis to create a broadcast unit to provide the same information and service Capra was to do with the film series *Why We Fight*. Very quickly, Lewis and his staff concluded he could best attract military personnel for the educational broadcasts by airing the same programs they knew back home. In addition, AFRS produced its own programming in Hollywood, such as *Command Performance*, with the help of the entertainment industry.

Lewis immediately established the principle that AFRTS would not censor news programs (except for security purposes), or broadcast propaganda messages. Consequently, troops as well as foreign nationals have always been able to listen to criticism of the U.S. government. The broadcast service quickly proved a better purveyor of the American way of life than the more propagandistic Voice of America.

Television became an integral part of the operation in the 1950s after Gen. Curtis E. LeMay established a television station at one of his SAC bases in Maine. Since then, AFRTS has followed the troops wherever they were

stationed, carrying the most popular radio and television programs. AFRTS can legitimately be seen as the representative of democracy to the world, as well as the predecessor of Cable News Network (CNN), since foreign nationals have always been able to listen to the over-the-air broadcasts. Most important, AFRTS has provided the U.S. armed forces with a familiar voice and image—whether in the jungles of Vietnam, peacetime Europe, or the Pacific Rim.

RANDOLPH, A. PHILIP (1889-1979), labor and civil rights leader. Born the son of a minister in the African Methodist Episcopal Church, Randolph was raised in Jacksonville, Florida. Graduating from Cookman Institute in 1911, he moved to New York's Harlem, working and attending City College. In response to increasing segregation and discrimination against blacks, Randolph shunned moderate reform and racial integration, as advocated by W. E. B. *Du Bois, and emphasized instead socialism and trade unionism. In 1917, he founded and co-edited the *Messenger*, a radical monthly magazine, which campaigned against lynching, opposed U.S. participation in World War I, urged African Americans to resist being drafted to fight for a segregated society, and recommended that they join radical unions. In 1918, Woodrow *Wilson's postmaster general, Albert Burleson, revoked the *Messenger's* second-class mailing privileges.

During the interwar years, Randolph organized the Brotherhood of Sleeping Car Porters Union. In 1941, when blacks were excluded from many defense industry jobs as the United States prepared for World War II, Randolph threatened a mass protest march on Washington. The demonstration was called off when President Franklin D. *Roosevelt issued an executive order (25 June 1941), establishing the Fair Employment Practices Committee to try to prevent such racial discrimination. In 1948, Randolph's advice helped convince President Harry S. *Truman to issue an executive order banning racial segregation in the military.

RANGERS, U.S. ARMY. "Rangers Lead the Way" is the motto of the U.S. Army Rangers. Traditionally spearhead-ers, raiders, and scouts, they have adapted to quick response airborne operations. (In contrast, Special Forces handle covert missions.) Ranger insignia is the black and gold shoulder tab, though in World War II and Korea, they wore a black, red, and white tab. The Ranger Hall of Fame includes Robert Rogers (*French and Indian War); Francis *Marion, the "Swamp Fox" (*Revolutionary War); and John Mosby (*Civil War), among others. All represented the fearless ranger spirit.

U.S. Army Rangers actually originated during World War II, when Gen. George C. *Marshall, army chief of staff, authorized units comparable to British Commandos. In 1942, William Darby was made commander of the 1st Ranger Battalion—only 450 men—volunteers from U.S. divisions in Great Britain. Commandos trained them and took them on raids against "Fortress Europe." In 1943, rangers landed in Algeria ahead of American forces, and

spearheaded Gen. George S. *Patton's corps in Tunisia.

Darby organized the 3rd and 4th Battalions in North Africa. The three battalions were first to land in Sicily and Italy (1943). The rangers were being used, however, as shock troops, and at the Battle of *Anzio (January 1944), they were overcommitted. The Germans wrecked the 1st and 3rd Battalions and bloodied the 4th; the survivors were shipped home and disbanded.

The U.S.-trained 2nd and 5th Ranger Battalions took part in the invasion of *Normandy (6 June 1944). Under fire, rangers scaled 130-foot cliffs to seize 155mm guns atop Pointe du Hoc at Omaha Beach. These battalions engaged in heavy fighting in Europe—averaging 50 percent *casualties in major actions. In the Pacific, the 6th Ranger Battalion, formed in 1944 in New Guinea, fought in the Philippines and rescued American prisoners of war, survivors of the Bataan Death March.

"Merrill's Marauders" (led by Frank Merrill) in Burma were also recognized as rangers. Trained by British Gen. Orde Wingate, of the "Chindits" (Long-Range Patrol troops), the Marauders were key to the capture of Myitkyina, helping to doom the Japanese in Burma, but were reduced from 3,000 to 600 by combat and disease. They were demobilized in 1945 with the 75th Infantry Regiment when all ranger battalions were deactivated.

Seven Airborne Ranger companies served in the *Korean War (1950-53). The Eighth Army Company was trained in Korea; the others were schooled by the new Ranger Training Command (established in September 1950) at Fort Benning, Georgia. All upheld the ranger tradition. The Eighth Army Company (with the 25th Division) was among the first to engage Chinese troops. Of forty-eight rangers, twenty-eight were casualties, including the commander, Ralph Puckett, who was wounded four times. In February 1951, the 1st Ranger Company (ninety men, with the 2nd Division) stopped a Chinese breakthrough at Chip'yong-ni, but was almost annihilated. The Far East Command disbanded all ranger companies by October 1951. Only the Ranger School survived—as the Ranger Department, Infantry School, now the Ranger Training Brigade.

Initially, there were no U.S. Ranger units in the *Vietnam War. Special Forces dominated, training counter-guerilla units, but "Green Berets" were often also rangers. And as the U.S. advisory role turned into open combat, commands formed Long-Range Patrols and Long-Range Reconnaissance Patrols. Between 1969 and 1974, they were converted to ranger companies of the 75th Ranger Regiment (Airborne).

In the post-Vietnam era, "Desert One" (1980) was a turning point for American irregulars. Delta Force, organized by Special Forces Col. Charles Beckwith (a former ranger), was to rescue hostages held by Iranians at the U.S. Embassy in Teheran. Rangers were poised in Egypt to assist. But Desert One turned to catastrophe when helicopters collided at the desert rendezvous.

The failure emphasized the need for an all-service quick response unit. The army led with SOCOM (Special Operations Command), including U.S. Rangers and Special Forces. The air force and navy organized AFSOCOM (Air Force Special Operations Command) and USNSWC (U.S. Navy Special Warfare Command). In 1987, USSOCOM (U.S. Special Operations Command) was created.

Meanwhile, in 1983, the 75th Regiment (two ranger bat-

talions) participated in the U.S. intervention in *Grenada. In 1984, the 75th got a third battalion. The ranger regiment fought in Panama (1989), but had little part in the *Persian Gulf War (1991) because the commanding general, H. Norman *Schwarzkopf, distrusted irregulars. In December 1991, one battalion parachuted into Kuwait in a show of force. Since then, rangers have been deployed in Somalia (1993), Haiti (1995), and in various *United Nations *peacekeeping missions.

The rangers have risen to prominence in recent years as a ready strike force. In the 1990s, they were vital to the army component—30,000 out of 46,000—of the U.S. Special Operations Command.

RANK AND HIERARCHY. *Armed forces are based on rank and hierarchy, formal structures of positions designed to ensure command, control, and support in the pursuit of the mission. This entry consists of four articles that explain very briefly the structure of ranks from top to bottom in each of the four major services:*

Rank and Hierarchy: Army
Rank and Hierarchy: Navy
Rank and Hierarchy: Air Force
Rank and Hierarchy: Marine Corps

RANK AND HIERARCHY: ARMY

Armies are hierarchical by design, both in terms of organizational elements and in terms of the individuals expected to perform specific functions at each echelon—privates and specialists; corporals and sergeants who lead squads (noncommissioned officers); warrant officers with particular technical abilities; lieutenants who head platoons and captains who command companies (company grade officers); majors and lieutenant colonels who head battalions or act as executive officers, and colonels who command brigades (field grade officers); and brigadier generals who head separate brigades or are assistant division commanders, major generals commanding divisions, lieutenant generals overseeing corps, and generals supervising armies (the executive level). The rank of General of the Armies was created by Congress for John J. *Pershing in 1919 (Pershing accepted the title, but declined the fifth star) and posthumously for George *Washington in 1978. Congress has bestowed the five-star rank of General of the Army upon Dwight D. *Eisenhower, Douglas *MacArthur, George C. *Marshall, and "Hap" *Arnold (all in 1944), and Omar N. *Bradley (in 1950).

Armies are functionally dependent upon chains of command, with appointed leaders at each organizational level. The chain of command is used for disseminating information and issuing directives downward, as well as to receive timely information and reports upward.

The need to identify leaders in the *Continental army and distinguish their ranks was recognized by General Washington from his experience with the British army. In

1775, he ordered the use of stripes to designate rank for officers and noncommissioned officers. Since then, U.S. *Army *insignia have undergone numerous alterations, to include various types and numbers of epaulets to designate rank, as well as colors to designate a functional branch (e.g., artillery red, cavalry yellow, or infantry blue). In 1821, regulations prescribed a cloth stripe or chevron to be worn on the sleeve of the uniform, point upward, to designate noncommissioned officer rank. This method of identifying noncommissioned officers remains to this day for dress *uniforms; for the field uniform, insignia are worn on the collar. Officers wear insignia of rank on the shoulder epaulets of the dress uniform and on the collar of the field uniform.

To attain rank and greater responsibility in the army's hierarchy, a sophisticated military * education and selection process has been institutionalized. To attain a more senior position, defined standards of military training, skills, on-the-job performance, and formal schooling have to be met. Senior noncommissioned officers and officers compete for a limited number of higher-level positions and are chosen by centralized selection boards. Particularly in the twentieth century, seniority has been only one of the many criteria for selection to the next higher rank.

• Mark M. Boatner, *Military Customs and Traditions*, 1976. William Gardner Bell, *Commanding Generals and Chiefs of Staff, 1775-1991*, 1992. Lawrence P. Crocker, *Army Officer's Guide*, 46th ed. 1993.

—James D. Blundell

RANK AND HIERARCHY: NAVY

U.S. *Navy personnel are divided into commissioned line or staff officers, warrant officers, and enlisted ratings. Unrestricted line officers are eligible to assume command at sea or command of aircraft squadrons, fleets, and shore bases; restricted line officers are designated for engineering and other special duties. Staff officers (commissioned officers assigned to a commander's staff) may command designated shore facilities. Naval officers are selected for promotion by promotion boards composed of senior officers.

Officers are ranked as admiral (four stars); vice admiral (three stars); rear admiral (originally the admiral in command of the rear of the fleet) higher rank (two stars) and lower rank (one star); captain; commander; lieutenant commander; lieutenant; lieutenant junior grade; and ensign. The five-star rank of fleet admiral was created in 1944 and bestowed on only four men: William D. Leahy, Ernest J. *King, and Chester *Nimitz in 1944, and William F. *Halsey in 1945. Until July 1862, when Congress established the ranks of rear admiral and commodore, the highest rank held by an American naval officer was that of captain. The status of commodore has changed over time, but is now considered a position, usually held by a captain, in command of a formation of ships.

The navy retains the traditional warrant officer structure. The former warrant officer or W-1 has been eliminated, and all warrant officers in the 1990s were commissioned as chief warrant officers in grades W-2, W-3, and W-4. They are former enlisted personnel selected for their professional ability and demonstrated qualities of leadership, loyalty, and devotion to duty. Warrant officers are specialists in certain areas such as aviation, *communications, supply, seamanship, and engineering. Enlisted personnel are rated from seaman recruit, seaman apprentice, and seaman, to petty officer third, second, first class,

through chief petty officer, senior chief petty officer, to master chief petty officer. In addition to being rated, they are given training at navy service schools to qualify them for various specialty ratings in deck, weapons/ordnance, electronics, and precision equipment, or administrative and clerical categories. Advancement is determined by time in grade and by competitive examinations.

• Leland P. Lovette, *Naval Customs: Traditions and Usage*, 1939. *Bluejackets Manual*, 1990. Naval Education and Training Command, *Basic Military Requirements*, April 1992.

—Barbara Brooks Tomblin

RANK AND HIERARCHY: AIR FORCE

The U.S. "Air Force retained much of its army heritage of rank and hierarchy since it was part of the U.S. "Army until 1947. There were four grades of general officer: brigadier general, major general, lieutenant general, and general; three field grades: major, lieutenant colonel (squadron commander), and colonel (wings commander); and three company grades: second lieutenant, first lieutenant, and captain. All pilots are commissioned officers. However, because of the nature of its technical specialties and missions, the distinction between officer and enlisted personnel in the air force is less pronounced than in the other services. Over time, the air force has adjusted rank and hierarchy to fit its own needs.

The enlisted grades maintained the traditional army enlisted ranks of private through master sergeant. In the early 1950s, the air force created an enlisted grade structure that was a compromise between the position of supervisor and technician. These new grades of airman basic and airman third, second, first class, and senior airman, corresponded to apprentice technicians whose promotion was based on increasing skill in their specialty, and to a lesser extent on military bearing.

The noncommissioned officers (NCOs) in the grades of staff, technical, and master sergeant were expected to be experts in their specialty and front-line supervisors. In 1958, two new grades of senior master sergeant and chief master sergeant were added to the enlisted rank structure. These "supergrades" allowed the other NCO grades to remain focused on technical expertise.

Unlike the other branches of the armed forces, the air force phased out its warrant officer ranks in the early 1960s, arguing that these ranks duplicated both the duties of officers and the supervisory positions of the noncommissioned officer corps. In actuality, the warrant grades significantly cut into the congressional quotas for officers, were far too specialized, and suffered from the stigma of simply not fitting into the air force's rapidly expanding technological environment.

• Mark R. Grandstaff, "Neither Fish Nor Fowl": The Demise of the United States Air Force's Warrant Officer Program," *Airpower History*, 42 (Spring 1995), pp. 40-51. Mark R. Grandstaff, *Foundation of the Force: Air Force Enlisted Personnel Policy, 1907-1956*, 1997.

—Mark R. Grandstaff

RANK AND HIERARCHY: MARINE CORPS

While officially part of the Department of the Navy, the Marine Corps, as a ground force, has an organization and rank structure similar to that of the U.S. "Army. General officer ranks include: general—held only by the commandant and the assistant commandant of the Marine Corps; lieutenant general—held by those selected to hold particu-

lar "type" or specially designated commands; major general—in command of either a Marine Expeditionary Force or division; and brigadier general—held normally by commanders of installations, or brigades.

Colonels in the Marine Corps command regiments, function as chiefs of staff, or hold other key billets. Lieutenant colonels usually command battalions or squadrons. Majors normally serve as battalion executive officers. Captains generally lead companies, while lieutenants are often platoon commanders. Besides these commissioned officers there are warrant officers, promoted to officer rank due to their technical or administrative expertise.

The top enlisted rank is sergeant major of the Marine Corps, who advises and assists the commandant in all matters pertaining to enlisted Marines. Sergeant majors normally will be found at all levels in the Fleet Marine Force and other administrative and technical positions. Other staff noncommissioned officer ranks range downward from first or master sergeant to gunnery sergeant and staff sergeant. Due to the low officer-to-enlisted ratio, staff noncommissioned officers (SNCOs) are considered to be the "backbone" of the Marine Corps.

Noncommissioned officers (NCOs) include sergeants and corporals, who act as squad leaders, section heads, and instructors. Junior enlisted grades include lance corporal, private first class, and private.

—Leo J. Daugherty III

RANKIN, JEANNETTE (1880-1973), pacifist, suffragist, and congresswoman. After successfully leading the suffragist movement in Montana, Jeannette Rankin became the first woman elected to Congress. A progressive Republican and a pacifist, Rankin joined fifty-six other members of Congress on 4 April 1917 in voting against U.S. entry into World War I. This vote contributed to her defeat when she sought election to the U.S. Senate in 1918.

Rankin continued to work for world "peace. In 1919, she served as a U.S. delegate to the Second International Congress of Women in Zurich. In 1929-39, she worked as a Washington lobbyist for the National Council for the Prevention of War. She ran a blistering campaign against President Franklin D. "Roosevelt's foreign policy in 1940; Montana voters returned her to Congress. Still committed to "pacifism, Rankin voted unsuccessfully against the "Lend-Lease Act and Agreements, the draft, the repeal of the "Neutrality Acts, and increased military expenditures. Despite the attack on "Pearl Harbor in December 1941, Rankin cast the sole vote against U.S. entry into World War II, the only member of Congress to vote against U.S. entry in both world wars. She was not reelected in 1942.

After World War II, Rankin decried the "Cold War, opposed the "Korean War, and denounced U.S. involvement in Vietnam. In 1967, a broad anti-"Vietnam War coalition of pacifists, feminists, and students organized the Jeannette Rankin Brigade and urged the eighty-eight-year-old Rankin to run for Congress in 1968. Ill health forced her out of the race, but she continued to speak out against the Vietnam War until her death from a heart attack in Carmel, California, on 18 May 1973.

—Justin D. Murphy

RAPE BY MILITARY PERSONNEL has been notoriously common throughout the history of warfare, leading many to view rape as an inevitable concomitant of war. Gen. George S. *Patton remarked during the American occupation of Morocco in 1942 that "in spite of my most diligent efforts, there would unquestionably be some raping." In recent years, however, change has begun to be seen in American military attitudes and policy on rape. By the early 1990s, each service had announced a policy of "zero tolerance" of sexual assault or harassment by personnel. The long-term effects of such policy change remain to be seen.

Historical Incidence. Relatively little is known about the actual historical incidence of rape by American military personnel. No systematic compilations exist of rape incidence prior to *World War II. However, individual records of rape prosecutions dating back to the earliest years of the republic can be found. George *Washington's notes for 22 July 1780 indicate that a Thomas Brown of the Seventh Pennsylvania Regiment was sentenced to death for rape. The few historians who have commented on the subject suggest that the rape incidence during the *Civil War was relatively low. Rape by non-Americans during World War I has been written about frequently, yet rape by U.S. personnel in that war has not been explored in any comprehensive way.

For World War II, comprehensive statistics of prosecutions of American military personnel are available for the European theater of operations. Those statistics indicate that rape was extensive. Indeed, rape of French women was sufficiently pervasive to cause Gen. Dwight D. *Eisenhower's headquarters to issue a directive to U.S. Army commanders announcing the general's "grave concern," and instructing that speedy and appropriate punishments be administered.

Court-martial statistics are available also for the *Korean War and the * Vietnam War. From 31 May 1951 through 30 May 1953, twenty-three U.S. Army personnel in Korea were convicted of rape, and nine of assault with intent to rape. In Vietnam, from 1 January 1965 to 31 January 1973, twenty army personnel and one air force man were convicted of rape, and fourteen army personnel were convicted of attempted rape or assault with intent to commit rape. In Vietnam (1970-73), one navy serviceman and thirteen Marine Corpsmen were convicted of rape. According to many reports, however, these conviction numbers in no way reflect the actual number of incidents.

During the *Persian Gulf War, twenty-four female American military personnel were subjected to rape, attempted rape, or sexual assault by American military men, according to official records.

Comparing Military and Civilian Rape Rates. To place military rape rates in context, it is valuable to compare them with civilian rates. Comparisons of the crime rates of civilian and military populations during peacetime periods in 1986-92 reveal that contemporary peacetime rates of rape by American military personnel are actually *lower* (controlling for age and gender) than civilian rates. However, the data also indicate that peacetime military rape rates are diminished far less from civilian rates than are military rates for other violent offenses. This "rape differential" is also reflected in the World War II data: U.S. Army rape rates in Europe climbed to several times the U.S. civilian rates for that period, while military rates for other vio-

lent crimes were roughly equivalent to civilian rates. Thus, in both contexts studied, a rape differential exists: the ratio of military rape rates to civilian rape rates is substantially larger than the ratio of military rates to civilian rates for other violent crimes.

Legal Provisions. Rape by military personnel has been criminalized and carried serious penalties, including capital punishment, throughout American history. Rape was specifically prohibited in the English army as early as 1385. The American *Continental army observed the customary prohibition and applied severe penalties, including the death penalty, for committing rape.

From 1950 to 1992, rape was defined by the Uniform Code of Military Justice as "an act of sexual intercourse with a female not [the accused's] wife, by force and without her consent." In 1992, that definition was amended to include rape of a male and rape within marriage. Current military rules of evidence include a rape shield provision that excludes from evidence most testimony regarding the sexual history of the alleged victim.

Despite the clear, long-standing prohibition of rape in military codes, there is anecdotal evidence of some continuing failure to enforce those laws. Witnesses at Senate hearings in 1992 testified that such failures are common. Legislation instituting centralized recordkeeping and oversight of military sexual misconduct cases to ensure consistent enforcement has been introduced in Congress in 1993 and 1994, but none has been adopted to date.

In addition to American domestic law criminalizing rape by military personnel, multiple provisions of international law prohibit rape by military personnel. Rape is incontrovertibly a war crime. Both the fourth Geneva Convention and Protocols I and II to the *Geneva Conventions explicitly prohibit rape, and there is clear movement toward interpreting the Geneva Conventions' grave breach provisions to cover rape. When committed on a mass and systematic basis, rape can constitute a crime against humanity. Rape also can, under certain conditions, constitute a part of the crime of * genocide. In addition to prohibiting rape under international laws of war, provisions of international human rights law, such as the International Covenant on Civil and Political Rights, also proscribe rape by military personnel or others when their acts are attributable to the state.

Historically, rape has not been a focus of international *war crimes prosecutions. Scant attention was paid to rape in the international prosecutions after World War II. Rape was not mentioned in the Nuremberg Charter and was not prosecuted as a war crime at the *Nuremberg Trials. It received some but still rather limited treatment at the International Military Tribunal for the Far East. The International Criminal Tribunals for the former Yugoslavia and for Rwanda are currently beginning their work; there have been indications that these tribunals will prosecute rape vigorously.

REAGAN, RONALD (1911-), actor, governor, U.S. president. Reagan grew up in Dixon, Illinois, in an impoverished family, and worked his way through Eureka (111.) College. From a radio station in Des Moines, Iowa, he left for Hollywood, where he worked as a film and TV actor, 1937-66. A captain during World War II, he made training films for the Army Air Forces. Later, as a TV spokesman for General Electric Company, he became an active Republican. Urged by conservative Southern California business-people, Reagan entered politics and was elected governor of California, serving from January 1967 to January 1975. A champion of the GOP's conservative wing, Reagan defeated Democrat Jimmy *Carter to become president in 1980. He was reelected in 1984.

As president (1981-89), Reagan sought to reduce the federal government's domestic programs. Initially, his administration adopted the "supply side" theory to stimulate production and control high inflation through tax cuts and sharp reductions in federal spending. Following a major recession in 1982, economic growth resumed, fueled in part by massive defense spending and a dramatic increase in the national debt.

Reagan's foreign policy was defined by his antipathy toward the Soviet Union, which he called the "evil empire." He and his security advisers, especially Defense Secretary Caspar *Weinberger, called for preparedness for war with the Soviet Union and its allies on a global scale. Exhorting *patriotism, Reagan presided over the largest military buildup in peacetime U.S. history: probably around \$2.4 trillion on the armed forces, of which an estimated \$536 billion represented increases over previous projected trends for the decade. The largest (in inflation-adjusted dollars) single-year defense budget was \$296 billion in fiscal year 1985.

The massive investment in new weapons systems—from *missiles, ships, planes, and * tanks to the speculative *Strategic Defense Initiative or "Star Wars"—was designed not simply to build American strength but also to push the Soviet Union toward economic bankruptcy. In addition, the Reagan Doctrine offered support to anti-Soviet guerrillas anywhere. CIA director William Casey provided covert aid in Central America, Africa, the Middle East, and Afghanistan. Reagan sent Marines to Beirut, Lebanon, to aid Christian militias, but he withdrew them after a truck-bomb killed 241 persons on 23 October 1983. On 25 October, he ordered the U.S. invasion of Grenada in the Caribbean, where pro-Castro military officers had seized power and were thought to endanger American students. In Central America, Reagan was determined to support the government of El Salvador in its battle with leftist guerrillas and to overthrow the Soviet-leaning Sandinista regime in Nicaragua by providing direct (or, when Congress prohibited this, covert) aid to anti-Communist Contra guerrillas. Congressional hearings in 1987 revealed the illegal "Iran-Contra Affair, in which a group in the "National Security Council covertly sold weapons to Iranians to help finance the Contra operation. Reagan's popularity plummeted.

When he and Soviet leader Mikhail Gorbachev agreed to reduce short- and intermediate-range missiles, much of his popularity was restored. The "INF Treaty (1988) was

the first time the two countries had agreed to destroy an entire category of strategic weapons.

As the Cold War ended, Reagan and his supporters insisted that the Soviet Union collapsed as a result of U.S. military spending and "covert operations, an assertion contested by those who credit, instead, long-term structural problems of the Soviet economy and the reformism of Gorbachev.

RECONSTRUCTION. When the Confederate forces surrendered in April 1865, the U.S. Army embarked on a mission unparalleled in its history: the postwar occupation of a rebellious section of its own country as the enforcer of a politically determined process of reconstruction. No previous war had required such duty. During the "Civil War, reconstruction had begun haltingly in 1862 in those parts of Louisiana, Tennessee, Arkansas, and Virginia under Union military control. However, Abraham "Lincoln's "ten percent" plan for the restoration of individual loyalty and government functions was at best experimental. Military efforts remained focused on victory rather than post-war expectations.

Confederate surrender changed the picture entirely. Many parts of the South had by now experienced the presence of Union troops. Neither soldiers nor civilians knew how long that presence might last, nor what policies would govern the relationship between victor and vanquished. The Constitution, not having anticipated a breakup of the Union by force, gave little specific guidance for the aftermath of such an effort. Federal statutes were equally uninformative on the peacetime use of military power in support of federal political processes. The American tradition of civil control of military institutions was well developed, yet that tradition would not provide clear answers to the many specific questions of power soon to arise. Other complicating factors were the clamor of volunteer troops to go home as soon as possible; the legislative need to establish a peacetime size for the regular army; the resumption of patrol and Indian-fighting duties in the West; and the need for troops to support diplomatic moves against the French presence in Mexico.

During the twelve years of Reconstruction (1865-77), the army's experience in the South evolved significantly as its powers, functions, and problems changed. Five distinct phases can be identified. An initial period of six weeks extended from mid-April 1865 to the end of May. The Confederate national government had collapsed and in many states there were no civil governments functioning. Legislators, governors, judges, aldermen, sheriffs, and other local officials were not at their posts. Thus the army, by default, assumed the task of local government.

Applying to civil government its familiar pattern of military administration, the army established departments, districts, and subdistricts throughout the South. Commanding officers of troops doubled as executive officers of government, or sought to find loyal and trustworthy civil-

ians whom they could temporarily appoint to vacant positions. Considerations of workload as well as personal ability led army officers to prefer a pattern of civilian officeholders working under military orders.

The broad category of regulation called the police power, focusing on the health, safety, welfare, and morals of the community, came under military supervision. Specific subjects varied widely depending on local conditions. Typical regulations applied to collection of garbage, disinfecting alleys and streets with lime, naked children in public, dogs running at large, public profanity, speed limits for carriages, whitewashing of tree trunks, vagrancy, prostitution, distribution of food relief, and reopening of schools. Some commanders required proof of having taken the loyalty oath as a qualification for certain services, including receipt of mail or obtaining a marriage license. Approximately 250,000 troops remained in the South in the weeks immediately following the surrender. They performed a wide variety of different duties without adequate training. Commanding generals, some of whom were not regulars, often had to act on their own judgment or a highly general letter of instruction from superiors. The war had ended with a military surrender, not a treaty of peace, and the future policy of the government was initially unsettled.

On 29 May 1865, President Andrew "Johnson issued two proclamations that would begin a period of "presidential Reconstruction." One prescribed a loyalty oath, established the terms of a general amnesty, and specified a process whereby those excluded from the general amnesty could apply for individual pardon. The second appointed a provisional governor for North Carolina and set forth a process for the reestablishment of a permanent state government and election of local officials. Thus began the second phase of the army's role in the South, which would extend until December 1865. Johnson shortly issued proclamations establishing provisional governments in South Carolina, Georgia, Florida, Alabama, Mississippi, and Texas. In Tennessee, Arkansas, Louisiana, and Virginia, the provisional governments established during the war continued.

The army's presence in the South now had a specific focus. The provisional governors were to reestablish civil government by the participation of loyal voters. The army was to "aid and assist the said provisional governor in carrying into effect this proclamation." Johnson also ordered soldiers "to abstain from in any way hindering, impeding, or discouraging the loyal people from the organization of a State government." Yet much remained unclear. A provisional governor of a state appointed by the president was an anomaly in American constitutional practice. A military force placed to whatever degree at the call of such an official was equally anomalous.

Controversies were bound to occur. Governors wrote to President Johnson complaining about military interference. Officers wrote to the Commanding General, Ulysses S. "Grant, asking for instructions about the limits of their authority. In Mississippi, Governor William L. Sharkey and Gen. Henry W. Slocum clashed over the governor's desire to form a state militia independent of military control. A widespread subject of controversy was military arrests: Could commanders arrest civilians on their own initiative, or only in pursuance of a request from civilian officials for aid in effecting an arrest in a dangerous area? Law enforcement was made more complex by jurisdictional conflicts among (a) military commissions, (b) special Freedmen's

Bureau courts designed to resolve labor contract disputes, and (c) local courts reopened by provisional governors. General Grant and Secretary of War Edwin M. "Stanton supported the army in these conflicts, while President Johnson often sided with his political appointees, the provisional governors.

By September 1865, the number of troops in the South was down to 187,000. Distribution varied from 8,700 in Florida to 16,000 in Tennessee to 24,000 in Louisiana to 45,000 in Texas. A growing problem was the desire of white volunteer regiments to be mustered out, which left an increasing proportion of black regiments, organized late in the war, with a year or more left on their enlistments. By the end of 1865, when total troop strength had dropped to 88,000, black regiments outnumbered white ones by 11 to 1 in Mississippi, 6 to 1 in Tennessee, and 9 to 5 in Louisiana. There was a slight preponderance of black troops in Arkansas and Florida, and equal numbers in Alabama and Texas. Complaints from governors about mutual racial antipathy as well as negative reports about discipline from some commanding generals led to an increased discharge rate for black volunteer regiments during 1866.

In December 1865, Congress (which had been out of session since March) met for its new term, expressed dissatisfaction with the results of Johnson's program, and refused to readmit any seceded states to representation. This initiated a legislative struggle with Johnson over control of policy that lasted until March 1867. In consequence of the confusion in Washington, the army's role entered its third phase. The provisional governments remained in place, but congressional Republicans wanted more military supervision of them. Conflict with governors over appointment and removal of local officials increased. Passage of the Freedmen's Bureau Act meant continued military aid for that agency. Passage of the Civil Rights Act, signifying a congressional desire to supersede discriminatory state legislation and judicial practices, meant greater use of military courts, or at least military protection, for former slaves and white unionists. All the while numbers declined, from 39,000 troops in the South in April to 20,000 at year's end. In 1866, the total peacetime strength of the regular army was set at 58,000.

On 2 March 1867, Congress passed the First Reconstruction Act over Johnson's veto, thus establishing a program of "congressional Reconstruction." The army's role entered its fourth phase, which would continue in each state until such time, between the summer of 1868 and the spring of 1871, as the particular state gained readmission to Congress. During this phase, the army's direct power over civil affairs and southern politics reached its greatest extent. The First Reconstruction Act superseded all of the existing state governments, required the election of conventions to rewrite state constitutions, and mandated a new registration of voters under specified qualifications and the election of new governors and legislators. This political process occurred under total military supervision. Congress established five military districts and required the president to assign an army general to the command of each district.

That officer had the duty "to protect all persons in their rights of persons and property, to suppress insurrection, disorder, and violence, and to punish, or cause to be punished, all disturbers of the public peace and criminals." In a clarification of previous uncertainties, the commanding

generals had specific permission to try civilians by military commission. Subsequent legislation allowed the generals to appoint the registration boards and control other aspects of the electoral process. They could also remove any civil official and need not accept the U.S. Attorney General's interpretation of their powers under the law.

Gen. Philip H. *Sheridan in Louisiana and Gen. John Pope in Georgia removed governors as well as lesser officials. Pope gerrymandered electoral districts in order to control the results and sought to regulate the press by requiring official notices to be published only in papers that did not oppose congressional Reconstruction. The administration of Gen. John Schofield in Virginia was by comparison much less contentious.

By this legislation as well as other contemporary provisions, Congress had assigned the army an overtly political function. It had also made certain that the army would implement its views on Reconstruction and not those of the president. During the summer of 1867, Johnson removed Generals Sheridan, Pope, and Dan *Sickles from their commands. His subsequent efforts to get Edwin M. *Stanton out of the War Department led to his impeachment.

Congress readmitted several states to representation in the summer of 1868. Others followed in 1870 and 1871. Readmission began the fifth and last phase of army duties in the South, which would continue until the inauguration of Rutherford Hayes in the spring of 1877. Troop strength dropped from 18,000 in October 1868 (one-third on the Texas frontier) to 6,000 in the fall of 1876 (half in Texas). In 1869, a retrenchment-minded Congress once again cut the size of the regular army to less than 40,000 men.

Duties were more intermittent than continuous. Detachments went out to accompany federal revenue officers in search of illicit whiskey stills. General suppression of crime was also a task for the army, but now only at the request of civil authorities, federal or state. The amount of discretion left to the army in honoring these requests caused controversy; often the requests ended up in Washington for review and approval. In 1871, Gen. Alfred H. Terry reported that in the six states of his command, there had been more than 200 expeditions in aid of law enforcement that year. The army also provided the force behind a major effort to break the Ku Klux Klan in South Carolina during 1870-72. Around election time, military activity increased as small detachments visited troubled areas of the state to guard polls and discourage intimidation of voters. Congressional Reconstruction brought Republican state regimes to power, which often called for military aid in the period following readmission. The most continuous use of troops for this purpose was the protracted party struggle in Louisiana from 1872 to 1877.

The twelve years of Reconstruction saw frequent changes in policy, and with them, changes in the army's legal powers and functions. As an institution, the army was able to adjust to these changes, largely because officers saw themselves as administering policy rather than establishing it. This fit the established American tradition in civil-military relations, in spite of the executive-legislative conflict over army control in the Johnson years. The * Posse Comitatus Act of 1878, reflecting the Reconstruction experience, further limited military enforcement of civil law. On the whole, military administration of federal policy was creditable to the institution of the U.S. Army despite errors of judgment and highly unusual circumstances.

RECRUITMENT. The military manpower policy of the United States has been marked by sharp contrasts between principles and realities. Universal service has often been the ideal, but the militias and conscript armies have never been equally representative of society.

America's early military traditions were heavily influenced by Great Britain's, and included a predisposition toward militia organization and a distrust of centralized standing peacetime forces. The militias—military organizations composed of civilians enrolled and trained as defensive forces against invaders—developed from medieval notions of the duty of all free men to help the king defend the realm. The colonists, threatened by Native Americans and rival colonial powers, organized as *citizen-soldiers in order to protect themselves and their interests.

When troops were needed for a campaign, legislatures assigned quotas to local militia districts. Local officials then called for volunteers and could draft men when necessary. Thus, the militia—in theory composed of all able-bodied free white men—served as the *mobilization base for the colonies, with volunteers, usually called *provincials*, providing the troops for campaigning. A considerable proportion of the citizenry was exempted from service by over 200 militia laws. For instance, the Massachusetts Militia Act of 1647 exempted officers, fellows, and students of Harvard College; church elders and deacons; schoolmasters; physicians; surgeons; captains of ships over twenty tons; fishermen employed year-round; people with physical problems; and many others. When the militia failed to produce a sufficiently large number of volunteers, or when legislative calls for additional volunteers failed to expand the force sufficiently, men could be drafted, or *impressed*. During the colonial period, impressment was rarely successful, and avoided in most provinces because of its potential to create desertion or even riot. For this reason, impressed men were always given the option of paying a fine or hiring substitutes to serve in their stead.

During the * Revolutionary War, the Continental Congress allocated manpower quotas for the *Continental army to the states, and left *conscription policy up to them. At the conclusion of the war, George *Washington urged Congress to accept the principle of universal national military obligation and establish a small peacetime army backed by a national militia. Congress declared that standing armies in times of peace were inconsistent with the principle of republican government, and discharged virtually the entire Continental army.

This tug-of-war between national military need and national thought on standing armies has influenced the whole of military history. One day after it had dismissed the Con-

tinental army, Congress requested that the states of Connecticut, New Jersey, New York, and Pennsylvania recruit a total of 700 militiamen for a year of service on the frontier. The term of frontier service was extended to three years, and then the militiamen were replaced by regular soldiers.

With the adoption of the Constitution, the federal government acquired the power to raise and support armies, to provide and maintain a navy, and to make rules for the regulation of the land and naval forces. The right of the states to control their militias was confirmed, and the state forces were to be the country's major land force in the event of a crisis.

A standing army did not fit naturally into the ideological landscape of the new republic. Necessary or not, the armed forces were typically kept small and often suffered from neglect. Soldiers were often untrained, poorly housed and fed, and not always paid. In 1812, as America faced a war, the regular army consisted of less than 7,000 men and was dispersed throughout the expanding country. Older regiments were commanded by aging revolutionary veterans, training was lax, and supply and staff were inadequate even in peacetime. The war effort was built upon volunteer companies and the amorphous state militias behind them. Congress approved enlistment bounties totaling \$40 for regular recruits plus three months pay in advance and 160 acres of land. The next year, Congress invited members of volunteer militia organizations to join the regular army for one year. The actual turnout was disappointing. In order to raise necessary manpower in wartime, Congress created the U.S. "Volunteers, locally raised troops for national service for the duration of a conflict.

Recruitment suffered from all the impediments to men leaving their homes for war. Popular indifference always hampered raising and supporting troops. In the early years of the republic, there was strong opposition to any exercise of armed force on the part of the United States—opposition that arose from the fear that the government would come to depend upon the force and from disagreement over whether the Constitution actually allowed it. Historically, the quality of men who would sign up with the army, in a country of expanding economic opportunities, was poor. Until the turn of the nineteenth century, visitors to army posts spoke of the men's low intelligence, loose morals, and habitual drunkenness, and described frontier posts as dirty, dusty, and remote. Desertion was common. The army was barely growing, promotion prospects were dismal, and there was no retirement system.

The patriotic angst that brought the "Civil War fueled its armies as well, composed primarily of U.S. and Confederate volunteers. In a few weeks, "nationalism produced the first mass armies in American history. The U.S. Army grew to twenty-seven times its original strength in the four months following the capture of "Fort Sumter (1861). Both Federal and Confederate forces swelled with volunteers in the early months—and both turned to conscription to augment their mass armies.

Conscription was rationalized on the grounds that the rights guaranteed to the individual by the government implied an obligation upon him to defend his rights by defending the government that assured them. Exemptions were commonplace and the hiring of substitutes remained lawful.

In 1916, with eyes on the war in Europe, Congress passed the National Defense Act, which provided for an ex-

panded peacetime regular army—the National Guard—a reserve force, and a volunteer army to be raised in time of war. That summer, mobilization of the National Guard failed to recruit the Guard to full strength. This convinced the Wilson administration of the inadequacy of voluntary enlistments to raise an army for the Great War. A conscription bill, the Selective Service Act of 1917, was passed immediately after the declaration of war. The regular army and the National Guard continued to recruit volunteers, and the draft was held to remedy any deficiencies.

Having learned lessons from the Civil War, for "World War I there were no substitutes and no bounties. Students under the age of twenty-one, however, were able to defer service by enrolling in the Student Army Training Corps for three years. Otherwise, each eligible person was required to register as an obligation of citizenship or residence in the United States. Conscription was based on the principle of universal obligation to service. The World War I draft supplied close to 67 percent of the total force. It acted as a spur to voluntary enlistment, and the enlistment rate fluctuated with conscription policy. The draft lapsed at the end of the war, and precedents were set not only for a national draft and for student deferments but also for those deferments to expand into exemptions from service.

Although distinctly concerned by the onset of "World War II, the Roosevelt administration hesitated to ask for conscription before a declaration of war for fear of arousing isolationist sentiment. In the summer of 1940, however, public and congressional sentiment outran President Franklin D. "Roosevelt and conscription was enacted. Later that summer, a joint resolution called for "mobilization of the National Guard and reserves.

With the end of World War II and the onset of the "Cold War, the whole landscape changed. Neither life nor war would ever be the same again. Many Americans, including some in the armed forces, believed that an atomic monopoly had brought an end to the era of mass armies. "Demobilization proceeded at great speed: by 1948, the army's combat effective strength was reduced to two and one-third divisions. In June 1948, however, in response to growing tensions between the United States and the Soviet Union, Congress passed a new Selective Service Act, with a two-year limit. The revival of the draft encouraged voluntary enlistments among men who wished to choose service and branch rather than to leave themselves at the mercy of local draft boards. The act was extended for the "Korean War. As voluntary enlistment increased, inductions under Selective Service dropped, from more than a third of accessions during the mid-1950s to less than 10 percent during the early 1960s.

Had it not been for the "Vietnam War, the draft might have been phased out a decade earlier than it was. Opposition to the war and the draft, and the perceived inequities of Selective Service, contributed significantly to the advent of the "All-Volunteer Force in the early 1970s. Critics of the force warned that it would weaken "patriotism, attract the economically disadvantaged, and attenuate the relationship between the armed forces and civilian society. In January 1973, peacetime conscription ended in the United States.

The resulting All-Volunteer Force has surpassed all national concerns. Solely dependent upon volunteers, the force has attracted recruits from across a broad social spectrum, is well trained, well equipped, and well led.

To paraphrase a contemporary recruiting slogan, it is all that it can be.

RED CLOUD (1822-1909), Oglala Sioux leader. Born near the forks of the Platte River, Nebraska, Red Cloud became a leader (shirt-wearer) in the "Bad Faces" military lodge for his exploits against enemy Pawnees, Utes, and Crows. Concerned about white encroachments, he launched "Red Cloud's War" in 1866-67 against the army's Bozeman Trail posts. During several engagements, especially the annihilation of William J. Fetterman's eighty-man column outside Fort Phil Kearny, his followers proved a match for the bluecoats.

In the Treaty of Fort Laramie (1868), the government conceded to Red Cloud's demands that the Bozeman Trail forts be abandoned. Thereafter he adopted a more conciliatory stance, apparently convinced that his people stood little chance of winning a war against the United States. Made a "chief" by federal officials, he was in 1876 stripped of this position, only to regain government recognition the following year after helping to convince "Crazy Horse" to surrender. Red Cloud sought to maintain traditional ways among his people while demanding that the U.S. government honor its treaty obligations. Controversial for both his decision to abandon military methods and his stubborn determination to preserve tribal customs, his diplomacy was aimed at mitigating the effects of the Oglalas' transition to reservation life.

RED CROSS, AMERICAN. The American Red Cross has served the U.S. military since 1898. Founded on 21 May 1881 by Clara "Barton, who had done humanitarian work in the "Civil War, the society is part of the more than 175-member International Red Cross and Red Crescent movement.

The movement was born in Geneva, Switzerland, in October 1863. Despite centuries of war in Europe and the Civil War raging in America, the humanitarian aspects of war had been largely ignored by most governments. Swiss entrepreneur Jean Henri Dunant brought about a change in that attitude when he volunteered to help the wounded, after a battle between French-Italian and Austrian armies in northern Italy in June 1859. His *Memory of Solferino* (1862) graphically portrayed the agonies of the 40,000 neglected wounded, influencing governments to consider establishing voluntary relief societies to supplement the work of army medical units.

In February 1863, the International Committee for Re-

lief to the Wounded, precursor to the International Committee of the Red Cross (ICRC), was established. In October 1863, the first Red Cross societies were formed and a red cross was adopted as a neutral symbol; and in 1864, twelve governments signed the first Geneva Convention. The United States acceded to the treaty in 1882 after years of lobbying by Clara Barton.

The four "Geneva Conventions protect the wounded and sick on the battlefield (1863), shipwrecked military personnel (1906), "prisoners of war (1929), and civilians (1949). Protocols added in 1977 protect civilians caught in internal conflicts. ICRC primarily monitors the conventions.

The International Red Cross and Red Crescent movement follows seven fundamental principles: *Humanity, Impartiality, Neutrality, Independence, Voluntary Service, Unity, and Universality*. In addition to the societies, it consists of the Geneva-based ICRC and the International Federation of Red Cross and Red Crescent Societies, which was founded in 1919 by American Henry P. Davison to address peacetime needs.

During the "Spanish-American War, American Red Cross nurses and volunteers served in Cuba, the Philippines, and at U.S. camps. In 1911, President William H. Taft authorized the organization as "the only volunteer society" to render aid to the military in wartime. The U.S. Army began providing transportation and subsistence for attached Red Cross personnel in 1912. The Red Cross sent 8,000 workers to Europe during World War I, providing medical, recreational, and welfare services. It operated fifty-eight domestic and overseas base hospitals for the military, twenty-four of them in France. Eight million volunteers at home provided welfare services and produced supplies.

During World War II, the American Red Cross collected 14 million units of blood and produced blood plasma, but provided no other medical services. Aided by 7.5 million volunteers at home, some 40,000 staff worldwide supplied emergency "communications, welfare and recreational services, and produced 28 million food packages for U.S. and Allied prisoners of war.

Similar services were provided during the "Korean War and the "Vietnam War, with the military meeting its own blood needs in Vietnam. The Red Cross continues to staff U.S. bases in Europe and elsewhere; it accompanied military units on missions to Somalia, Haiti, the Persian Gulf, and Bosnia.

In 1998 the American Red Cross had over 1,300 volunteer-led chapters, providing disaster relief, meeting half of the nation's blood needs, and conducting community programs designed to help Americans prevent, prepare for, and respond to emergencies. Over 30,000 staff and 1.4 million volunteers supplied support. The nongovernmental, nonprofit organization has had a congressional mandate since 1900 to provide disaster relief, and emergency communication between the military and their families. A fifty-member board of governors, eight appointed by the U.S. president, governs the American Red Cross. Past presidents include Clara Barton, William Howard Taft, and George "Marshall.

REED, WALTER (1851-1902), medical officer and research scientist. After receiving his M.D. degree in 1869 from the University of Virginia and spending several years working in the field of public health in New York City, Reed joined the Army Medical Department (1875). In 1898, he headed a board that identified typhoid fever as the cause of much sickness and death at the camps where troops gathered to train for the *Spanish-American War. By establishing human waste as the source of contamination, the board made possible effective public health measures to prevent future epidemics. When, in 1900, another board headed by Reed proved that yellow fever, much dreaded by soldiers sent to Cuba, was carried by a mosquito and identified the specific mosquito, successful efforts to reduce this threat to public health also became possible.

Reed's accomplishments resulted not only from his personal skills as a research scientist but from the disciplined world in which he worked: medical officers were often better able than their civilian counterparts to conduct the studies necessary to identify both major diseases that threatened public health and the means by which they spread in civilian and military communities alike. The Walter Reed Army Medical Center in Washington, D.C., is named for him.

REENACTMENTS, MILITARY. The vibrant subculture of battle reenactment is too often thought of as merely a hobby or as activity unworthy of sustained analytical attention. Americans have commemorated wars in a number of ways. Patriotic rhetoric, for example, reinforces the primal themes of patriotic orthodoxy: war as holy crusade that brings new life to the warrior and the nation. It asks the living to rededicate themselves to the ideals for which the warrior died. Monument building is designed to instill the lesson of sacrifice in the civic consciousness, and preservation of battlefields is designed to "freeze" the message in a commemorative environment. Battle reenactment claims to offer participants—and to a lesser extent observers—imaginative entry into a heroic past. Such reenactments are important cultural rituals, and the activities and motivations of reenactors—ranging from those who offer "impressions" of *Revolutionary War and *Civil War soldiers in public events to those who participate in reenactments of World War II battles on abandoned military bases—deserve serious attention, as does the impact of such spectacles on audiences.

There were many kinds of battle reenactment in the late nineteenth century. At commemorative events, Confederate veterans subsequently retraced their steps in the Pickett-Pettigrew charge during the Battle of *Gettysburg, but shook hands with Union veterans at the angle, the High-Water Mark of the Confederacy. Such events would become an enduring feature of *Gettysburg National Military Park commemorative events, celebrating the ideology of reconciliation between white veterans of both sides. The U.S. *Army occasionally used Civil War battlefields for war games, and in the early twentieth century—the era of great historical pageants—battle reenactments were common.

The modern era of battle reenactment, with its emphasis on large numbers of participants (10,000 at the 125th anniversary of Gettysburg in 1988) and on historical accuracy in troop movements, * uniforms, and other details of nineteenth-century life, was sparked by the centennial of the Civil War (1961-65), and subsequently by bicentennial celebrations of 1776 in 1976. Experienced reenactors recall the first major reenactment of the Civil War—the First Battle of *Bull Run in July 1961—as lacking in accuracy, but by September 1962 and the reenactment of the Battle of *Antietam, specific units—the Ninth New York Zouaves, for example—had begun to appear, and attention to historical detail had improved. By the mid-1970s, reenactors had formed the Brigade of the American Revolution, and distinct groups within the reenactment community had formed, distinguished by their commitment to authenticity. "Farbs" (reenactors who practice twentieth-century behaviors during reenactments) were looked upon with contempt because of their "weekend warrior" attitude, specifically their failure to attend to historical accuracy. More diligent reenactors would study their unit's battle tactics and activities, while still others were concerned with "absolute" authenticity, including minute attention to detail in clothing and equipment.

The large-scale reenactments that have occurred since the Civil War centennial of the 1960s have sparked controversy. An eminent historian of the war, Bruce Catton, worried that such spectacles both romanticized war and obscured the issue of slavery over which it was fought. Likewise, John Hope Franklin, prominent historian of African Americans, viewed such activity as a form of memorialized forgetting. Much of Civil War commemorative activity, he believed, celebrated glorious battles and heroic lives of the nineteenth century, while enduring forms of racism continued to shatter lives in the present.

There are revealing cultural attitudes encoded in battle reenactments. Southern events celebrated the ideology of the Lost Cause, and at least some Confederate reenactors offer an implicit objection to modern racial integration. Similarly, commemorative events at the site of the Battle the *Little Bighorn—which would often include reenactments—solidified the classification of Native Americans as barbarians and savages, while George Armstrong *Custer and his men were celebrated as sacrificing themselves for the opening of the West. In 1976, the Confederate air force sparked widespread controversy in the United States and in Japan when during their World War II Airpower Demonstration in the United States, they offered a simulation of the dropping of the atomic bomb on Hiroshima before 40,000 spectators.

Reenactors believe their activities are valuable for a number of reasons. Some offer a "civic virtue" argument, emphasizing educational merit and the opportunity to spark the public's imagination. Some speak of the opportunity for personal transformation, to enter into the world of the past, if only briefly. Some speak of reenactment as a form of commemorative respect, to recall and honor the sacrifice of those who died. Clearly, battle reenactment can mean all of these things to participants, and it may signify yet another protest against modernity and the concomitant urge to recover an illusory and idealized past.

REFERENCE BOOKS ON WAR, PEACE, AND THE MILITARY. A field as large as military history and the study of war and peace has many specialized reference tools. This provides an introduction. The present writer's *American Military History: A Guide to Reference and Information Sources* (1995) offers a longer, selectively annotated guide.

Among bibliographies, Jack C. Lang, *America's Military Past: A Guide to Information Sources* (1980), while including reference books, has more annotated entries for monographs, journal articles, and government documents. Robin Higham edited a collection of bibliographic essays, *A Guide to the Sources of United States Military History* (1975, with supplements in 1981, 1986, and 1993). The best guide for military periodicals is the extensive and annotated *Military Periodicals: United States and Selected International Journals and Newspapers* (1990), edited by Michael Unswoth. Lenwood G. Davis and George Hill compiled *Blacks in the American Armed Forces, 1776-1983: A Bibliography* (1984). On peace history, John Lofland compiled *Peace Movement Organizations and Activists in the U.S.: An Analytical Bibliography* (1990).

Journal articles are often difficult to locate. Useful in locating pertinent ones are the quarterly *Air University Library Index to Military Periodicals* (1949-), and the quarterly *America: History and Life* (1964-), which abstracts many history journals.

Atlases are especially valuable in military history. The best general one for this subject is Vincent Esposito, *West Point Atlas of American Wars* (1995). For the naval history, see Craig Symonds, comp., *The Naval Institute Historical Atlas of the U.S. Navy* (1995). There have been many reprint editions of the U.S. War Department's *Official Military Atlas of the Civil War* (1983 repr.). On World Wars I and II, see Anthony Livesay, *The Historical Atlas of World War I* (1994) and *The [London] Times Atlas of the Second World War* (1989).

Chronologies list events; for example, Walt Lang, *United States Military Almanac* (1989), lists military events from 1636 to 1988. James W. Atkinson compiled *The Soldier's Chronology* (1993), which provides details about changes in "uniforms, weaponry, regulations, and other aspects of military life. Developments in the U.S. Navy and Marines are listed in Jack Sweetman, *American Naval History: An Illustrated Chronology of the U.S. Navy and Marine Corps, 1775-Present* (2nd ed. 1991). For some specific wars, see E. B. Long and Barbara Long, *Civil War Day by Day: An Almanac, 1861-1865* (1971); Randal Gray with Christopher Argyle, *Chronicle of the First World War*, 2 vols. (1990-1991); Robert Goralski, *World War II Almanac, 1931-1945: A Political and Military Record* (1981); and John S. Bowman, ed., *The Vietnam War: An Almanac* (1985).

Biographical dictionaries provide useful information. The most complete is the three-volume *Dictionary of American Military Biography* (1984), edited by Roger J.

Spiller, et al.; although see also Stewart Sifakis, *Who Was Who in the Civil War* (1988). On peace leaders, see Harold Josephson, ed., *Biographical Dictionary of Modern Peace Leaders* (1985).

The most used reference works are encyclopedias and historical dictionaries. A global approach is Trevor N. Dupuy, ed., six-volume *International Military and Defense Encyclopedia* (1993). For the United States, Charles R. Shrader, *Reference Guide to United States Military History* (1991-94), has five volumes, each of which covers developments within a particular time period. John E. Jessup and Louise B. Ketz have edited the three-volume *Encyclopedia of the American Military: Studies of the History, Traditions, Policies, Institutions, and Roles of the Armed Forces in War and Peace* (1994), which contains extended essays. Charles D. Bright has edited the *Historical Dictionary of the U.S. Air Force* (1992). For individual histories of particular ships, see the U.S. Navy's official *Dictionary of American Naval Fighting Ships*, 8 vols. (1959-81).

"Peace and disarmament encyclopedias include Christine A. Lunardini's *ABC-Clio Companion to the American Peace Movement in the Twentieth Century* (1994) and Richard Dean Burns's three-volume *Encyclopedia of Arms Control and Disarmament* (1993).

For particular wars, the following are useful reference works: John Mack Faragher, ed., *The Encyclopedia of Colonial and Revolutionary America* (1990); Richard L. Blanco, ed., *The American Revolution, 1775-1783: An Encyclopedia*, 2 vols. (1993); Patricia L. Faust, et al., *The Historical Times Illustrated Encyclopedia of the Civil War* (1986); Benjamin R. Beede, ed., *The War of 1898 and U.S. Interventions, 1898-1934: An Encyclopedia* (1994); Anne C. Venzon, ed., *The United States in the First World War: An Encyclopedia* (1995); Norman Polmar and Thomas B. Allen, eds., *World War II: America at War, 1941-1945* (1991); I. C. B. Dear and M. R. D. Foot, eds., *The Oxford Companion to World War II* (1995); James I. Matray, ed., the *Historical Dictionary of the Korean War* (1991); Stanley I. Kutler, ed., *The Encyclopedia of the Vietnam War* (1995); and Sheikh R. Ali, ed., *Encyclopedia of the Persian Gulf War* (1994).

—Daniel K. Blewett

REGIONALISM AND THE MILITARY. Regional differences involving the military have been related to attitudes as well as other circumstances. Along the eastern seaboard, colonial governments in the English North Atlantic responded to Indians and rival Europeans by building forts and training white males to become the "citizen-soldiers of their local militias. Yet, over time, militiamen in New England faced different circumstances from their southern and western counterparts, and by the "Revolutionary War, competing military traditions had arisen. In the South and landlocked West, the army was a preferred form of military service, whereas maritime New England emphasized the navy.

In the colonial era, the whole eastern seaboard faced European and Native-American threats. In the South, however, the danger of hostilities lasted several decades longer, and outbreaks of warfare were more frequent than in the North. Until the Spanish crown received Louisiana in 1763, the French had long threatened southern borderlands. Thereafter, Spanish occupation of Florida, Mexico, and Louisiana posed a constant threat until Florida's annexation in 1821. Beginning with a series of Anglo-

Powhatan wars in seventeenth-century Virginia, campaigns against southeastern Indians did not cease in the South until the "Seminole Wars ended in 1842. Most Indians successfully resisted dispossession until they were forcibly removed to Oklahoma in the 1830s. Black slavery and the concomitant necessity for whites to control black slaves sustained violence in the culture and the need for active militia as slave patrols. The southern landowning aristocracy's emphasis on martial virtues also contributed to the inclination for the army tradition.

Northerners faced entirely different circumstances. After a series of colonial wars with French Canadians and Indians, the Seven Years' War (1754-63) ended the threat. Lacking a need for slave patrols, and with Indians already removed from their domain, the northern militia lost its chief functions. After the "Revolutionary War, volunteers for the newly formed national army and navy drew upon their past experiences. In New England, this prior training occurred as Atlantic seafarers—fishermen, whalers, and merchant seamen—pursued their livelihoods on the open seas. Although the American navy was small, its ranks were largely drawn from these New England sources. In like fashion, southern militiamen and aristocrats were natural candidates for army service. With their stress upon the ethic of honor, southerners often aspired to the titles of general and colonel, and considered leaders such as Andrew "Jackson to be the highest representation of military valor. To that end, southerners attended college military academies such as the Citadel in South Carolina.

Until the "Civil War, the two traditions became ever more entrenched in regional life. Army officers were predominantly southern or western, while navy officers were mostly from the Northeast. In proportion to their percentage of the national population, southerners were over-represented by a third at West Point. Southerners and westerners also had regional interests in supporting the military. They rejoiced at the chance to support Texan independence in the Revolution of 1836 and eagerly joined the U.S. Army to conquer territory from Mexico in 1846 to expand the borders of a slaveholding empire. The tendency of southerners to outnumber northerners in the army continued to the outbreak of civil war. In the 1850s, southerners served as two of the three brigadier generals and all but one of the commanders of the army's geographical divisions.

Once the Civil War began, the regional divergence of military interests became apparent. Several army officers who were trained at West Point and raised in the South, such as the Confederate generals Robert E. "Lee and Joseph E. "Johnston, chose between the competing loyalties created by birth and fostered by training. Few naval officers faced such a conflict. With rare exceptions, the officers and enlisted men of the navy swore their allegiance to the Union. Not surprisingly, the first Confederate cities to fall were taken from the water, and the Northern strategy relied heavily on "blockades of Southern ports.

Unlike the North, the West initially followed a pattern similar to the South. With concerns for Indians and western outlaws continuing throughout the nineteenth century, the West and its cycle of conquest became a society deeply embedded in the military. Army forts and posts, crucial to the defense and settlement of the frontier, dominated the region's social and economic life. Often they served as trading posts and points of defense. The military

was not only a solution to the violence associated with the frontier—it was also a respectable outlet for it.

In the twentieth century, regional correlations to the armed forces continued, but they have not remained as strong. In 1910, however, 93 percent of army generals' officers still had a southern heritage, and during World War II, southern enlistment in both the army and navy exceeded the national average. New Englanders continued to serve disproportionately in the navy, but their commitment to the military remained weaker than the South's. In the West, where the aviation industry refocused the region's martial spirit, a new regional tendency has emerged. When the Air Force Academy was established in Colorado in 1954, westerners turned to the air force in disproportionate numbers.

Recently, the regional connection to particular branches of the military has diminished. The nationalization of American culture, increased migration among regions, the modernization of the South, and the desegregation of the military have all diminished if not eliminated the old regional patterns. The federal government has ended many of the sectional divisions through its intervention into regional development, and its recruiting quotas and strategies.

RELIGION AND WAR. Religion has played many, often contradictory, roles in the history of American warfare. With the conquistadors came Roman Catholic priests and brothers to bless, or challenge, Spanish attacks upon indigenous peoples. Two of the most notable of those clerics based enduring theoretical contributions on their knowledge of colonial warfare: the Dominican Bartolomé de Las Casas (1474-1566) concerning the humanity of Native Americans, and his fellow Dominican Francisco de Vitoria (1483-1546) concerning the ethics of international relations. Warfare between the first generation of English settlers and Native Americans brought out the worst and the best in the colonists' religious leaders. The much respected first minister of Cambridge, Massachusetts, Thomas Shepard, could yet herald "the divine slaughter of the Indians at the Hand of the English" after battle with the Pequots of Connecticut in 1637; the Rev. John Eliot of Roxbury, Massachusetts, experienced his finest hour as "apostle to the Indians" in defending his converts from reprisals after "King Philip's War (1675-76). During the eighteenth century, Moravian Brethren carried out humanitarian missionary work in Pennsylvania, New Jersey, and the Ohio Territory, where they repeatedly tried to shield their converts (usually pacifists like themselves) from the ravages of war.

Deep, if ambiguous, connections between war and religion continue to the present day. Religious values supported American ideology in the "Cold War and offered President Ronald "Reagan a vocabulary to define the Soviet Union as the "evil empire." Religious motives often fueled opposition to the "Vietnam War, as with the Baptist senator from Oregon, Mark Hatfield, or the efforts of the Catholic

priest Daniel Berrigan, the Jewish rabbi Abraham Heschel, and the Lutheran minister Richard John Neuhaus, who in 1965 founded Clergy and Laity Concerned About Vietnam. On the other side, religious motives also led Francis Cardinal Spellman, Catholic archbishop of New York, and the Protestant evangelist Billy Graham to support the war. In the *Persian Gulf War, President George *Bush consulted the leaders of his own Episcopal Church and invited his longtime friend, Billy Graham, to the White House the night before hostilities commenced. The Episcopalian bishops leaned against considering the conflict a "just war"; Graham offered general support.

Religion Affecting Warfare. The most visible connection between war and religion in American history is the intensification of commitment that religious faith brought to combatants and the promoters of war. This link was a particular bequest of the Anglo-French wars that began in 1689 and ended only with the final defeat of Napoleon. As Linda Colley argues (1992), warfare with France raised the Protestant identity of the British empire to remarkable salience. During King George's War (1744-48) and the * French and Indian War (1754-63), colonists from Massachusetts (like the Congregationalist Thomas Prince) to Virginia (like the Presbyterian Samuel Davies) joined their compatriots across the Atlantic in picturing the military struggle as an apocalyptic contest between the universal truth of Protestantism and the corrupt tyranny of Catholicism. With such preparation, it was a relatively easy matter for patriots in the 1770s to depict the struggle for American independence as, in the words of the Presbyterian Abraham Keteltas, "the cause of heaven against hell—the of the kind parent of the universe against the prince of darkness" (*God Arising and Pleading His People's Cause*, 1777). Loyalists were usually somewhat more restrained in rhetoric, but colonial Anglicans like Charles Inglis of New York and Jonathan Boucher of Maryland were just as convinced that their cause was the cause of God. In hundreds of sermons during the * Revolutionary War, Americans became skilled at interpreting biblical passages as types, or anticipations, of realities fulfilled on contemporary fields of battle.

Religious convictions supported political ideology in all major national conflicts through World War I. During the *War of 1812, New England Congregationalist ministers could show how Scripture called warmaking into question, while their Protestant confreres in southern and western states could show just the reverse. Before the * Civil War, Protestants of both the North and the South sanctified sectional controversy with theological rhetoric; during the war itself, a host of rhetorically accomplished ministers, led by Henry Ward Beecher in the North and Robert Lewis Dabney in the South, grounded their respective causes in universal scriptural imperatives. In World War I, fundamentalists and modernists alike linked German aggression to religious error. According to the revivalist Billy Sunday, "If you turn hell upside down, you will find 'Made in Germany' stamped on the bottom." By comparison with these earlier conflicts, the religious support for World War II was muted. In all American wars, the practice of "civil religion," especially when presidents employ a general religious vocabulary to reassure or inspire their fellow Americans, has always flourished.

Much less frequently, the universal values of religion have worked against rather than for the military purposes

of a particular conflict. During the Revolutionary War, the "father of American Lutheranism," Henry Melchior Mühlenberg, denounced the armies of both sides for sacrificing Christian principle to military expediency. At the start of the Civil War, the Northern Presbyterian theologian Charles Hodge was called a heretic for suggesting that the formation of the Confederacy was not sufficient ground for expelling Southern Presbyterians from the denomination. At the end of that same war, an anonymous correspondent to a Jewish periodical, *The Occident*, generated a storm of controversy among his fellow religionists when he wrote that, although Abraham * Lincoln was a worthy president, he hardly deserved to be compared with Moses as several rabbinical memorials had recently done.

Beyond acting to sanction or check national bellicosity, religion has frequently influenced strategy and policy. In early 1776, the Continental Congress sent two Roman Catholic cousins, John Carroll and Charles Carroll, with Benjamin Franklin on a mission to Montréal to persuade the Catholic Québécois to join the revolt. The effort failed, in large part because Catholics there were satisfied with the provisions of Britain's Quebec Act (1774), which guaranteed certain traditional privileges to their church. During World War I, the presence in America of both Protestants and Catholics of German stock complicated Woodrow *Wilson's diplomatic maneuvering. The international humanitarianism that determined Wilson's war aims originated in nineteenth-century liberal Calvinism.

Religious influences on the direct experiences of war have often featured the ministry of chaplains. From 1775, when the Continental Congress authorized chaplains for the army and the navy, through the Civil War, when the chaplaincy began to look like a profession, to World War II, when the four army chaplains (two Protestants, one Catholic, and one Jew) who sacrificed their lives to save servicemen at the sinking of the *Dorchester* in February 1943 inspired the nation, and finally to the efficient mobilization of the chaplaincy in the *Vietnam War and the Gulf War, chaplains have largely avoided the glare of publicity while offering a wide range of spiritual and humane assistance to troops on active duty. During the Civil War, an unusually intense series of revivals spread through the camps of both Northern and Southern armies. According to many participants, these revivals acted as an antidote to dissipation, and—especially in Southern armies during the last eighteen months of the war—to despair.

Warfare Affecting Religion. The impact of war on American religion has, if anything, exceeded the effects of religion on war. The American Revolution, and the revolution in social values it accelerated, crippled the Episcopal Church and substantially hindered the Congregationalists, the two major denominations in colonial America; Methodists, Baptists, and indigenous denominations soon prevailed as the nation's most numerous churches. Insofar as the Revolution lay behind the Constitution and its First Amendment guaranteeing religious freedom, that war was also responsible, however inadvertently, for opening up the United States to peaceful settlement by non-English-speaking Protestants, non-Protestant Christians (especially Roman Catholics), non-Christian adherents of other religions, and finally the nonreligious.

The long-term religious effects of the Civil War were different. As two authors, George M. Frederickson (1965) and Anne C. Rose (1992), have shown, disillusionment

with traditional Protestant faiths and an openness to skepticism grew rapidly among Northern intellectuals as a result of the war. The war's failure to usher in the millennium, as many on both sides had hoped, also contributed to the expansion of otherworldly forms of pietism where the emphasis shifted from the Christianization of society to a fascination with speculative prophecy or a concentration on private as opposed to public morality.

World War I played a direct role in fomenting the fundamentalist-modernist controversies of the 1920s. George Marsden (1980) has demonstrated that the intensity of that war mobilized populist revivalists who felt that a crisis had been reached in the progress of Christian civilization as well as in the integrity of the Protestant churches. In response, they mounted a defense of endangered "fundamentals," eliciting outrage from moderates and liberals who hardly appreciated being lumped with the kaiser.

Religious responses to warfare have created institutions of enduring significance. For the profession of nursing, still in the nineteenth century very much a religious vocation for Protestants and Catholics, the Civil War provided a decisive impetus. During World War I, American Roman Catholics founded their first permanent national organization, the National Catholic War Council. This institution later became the National Catholic Welfare Conference (1922-66), which in turn made way for the two federal structures of Catholic organization that exist today, the National Conference of Catholic Bishops and the United States Catholic Conference. For more sectarian and traditional Protestants, World War II hastened the formation of the National Association of Evangelicals (1943) by adding a concern for representation in the chaplaincy to longstanding disquiet with the theological drift of the more ecumenical Federal Council of Churches. More broadly, the massive commitment of American military forces around the world led to the establishment of a host of U.S.-based mission and relief agencies.

Because it tends to inflame passions and demand action, warfare only occasionally deepens theological perspective. In the aftermath of World War I, and sometimes as an act of expiation for jingoism, several important religious thinkers, including the Protestant Harry Emerson Fosdick and the Catholic Dorothy Day, published provocative arguments against warfare in any of its modern forms. Another important voice won to virtual pacifism in the wake of World War I was Reinhold Niebuhr; he would, however, return to a defense of just war theory because of the Fascist threats of World War II and the anti-Communist crusades thereafter. Reactions to the Holocaust have produced painful theological reflection for Jews and many others. Among Roman Catholics, the experience of both bloody fighting and Cold War nuclear deterrence led to a concentration of sophisticated ethical reasoning that culminated in the Bishops' Pastoral Letter on War and Peace of 1983. That document's acceptance of nonviolence on a par with traditional "just war" claims was controversial among Catholics, in the same way that, among Protestants, the pacifism of John Howard Yoder and careful defense of just war from Paul Ramsey and James T. Johnson were controversial. What these proposals shared was serious ethical reasoning, first-level theology, and intense analysis of twentieth-century warfare.

The most notable instance of American warfare deepening theology, however, comes not from an academic the-

ologian or a synod of bishops, but from the sixteenth president of the United States. Abraham Lincoln, who was never a church member, did not espouse traditional Christian faith; yet during the Civil War, his thought grew in biblical depth until, at his second inaugural address in March 1865, he could articulate a more sublime trust in divine providence, and a more charitable attitude to his foes, than virtually any other public figure of his day.

Religious Rejection of War. Rejection of warfare also enjoys a long American history. During the Revolutionary War, neutralism prevailed among New England immigrants in Nova Scotia because the revivals of Henry Alline created what amounted to a pietist pacifism. In the thirteen mainland colonies, Mennonites, German Brethren, some Moravians, and numerous Quakers remained faithful to their pacifist principles, despite fines, imprisonment, and confiscation of property. What would later be called "selective conscientious objection" was also at work among some Methodists, Anglicans, Congregationalists, and Baptists, who concluded that neither patriots nor loyalists convincingly demonstrated the necessity for conflict. A similar phenomenon occurred among some Reformed Presbyterians and Calvinist Baptists in the American South during the Civil War.

The most prominent voices raised against warfare in American history have come from the historically pacifist denominations. World War I proved a particular trial to Mennonites, Quakers, and the German Brethren, since it combined a universal draft with inflamed public sentiment. Members of newer American denominations, including Seventh-Day Adventists and some Pentecostals, also refused induction and support of the war effort in this same conflict. During World War II, the Selective Service System granted conscientious objection to military service from members of the historic peace churches, but dealt more harshly with newer religious bodies. Members of the Jehovah's Witnesses, who refused both to register for the draft and to swear allegiance to the United States, met with especially severe reprisals. Definite enumerations are elusive, but as many as three-fourths of the perhaps 6,000 Americans imprisoned for failing to register for the draft or report for military service were Jehovah's Witnesses.

The Vietnam War, which began without the clear-cut call to arms that the attack on Pearl Harbor provided for World War II, and which occurred during a period of cultural unrest, produced much religiously grounded opposition to warfare. Yet questions about the legality of this particular war, a resurgence of selective conscientious objection, and arguments for the recognition of conscientious objection not based on religion, at once magnified public debate concerning the morality of war and obscured specifically religious considerations.

Since the Vietnam period, historians have joined other academics in documenting the breadth and depth of anti-war sentiment in American history. Nonetheless, religious support for warfare, or the accommodation of religious beliefs to the exigencies of war, has been much more common in American history than religiously inspired rejection of war.

RELIGION IN THE MILITARY. For more than 220 years, religion and religious leaders have provided a source of strength and faith for a total of 55 million Americans who have served in the military forces of the United States. The rigorous demands of military duties—separation from friends and family, training in remote locations, battle, and the possibility of violent death—have mandated support for those who serve and who may potentially lay down their lives for their country.

The initial involvement of chaplains as voluntary, non-combatant religious leaders within the American military was an answer to the pressing needs of commanders and soldiers. Religion provided moral direction and spiritual assurance to those who bore the burden of the nation's wars. When George Washington assumed command of the "Continental army on 2 July 1775, he found twenty-three regiments of soldiers, with fifteen chaplains among them, posted around Boston. From the service of the 220 chaplains of the "Revolutionary War to that of the 12,000 chaplains of World War II and the 5,000 U.S. Army, Navy, and Air Force chaplains who today perform pluralistic ministries at U.S. bases in 65 countries around the world, religion has been a traditional support and a guaranteed right for American military personnel.

The organization of the military chaplaincy began in July 1775, when the Continental Congress appropriated funds to pay officers in the army. Chaplains were authorized \$20 a month. Chaplains received no military training, were not eligible for regular promotion above their pay grade of captain, wore no standardized "uniforms, and were endorsed by no particular ecclesiastical agency except the congregations and soldiers they served. After 1776, when Benjamin Balch became the first chaplain in the "Continental navy, chaplains performed their tasks on sea as well as on land.

With the advent of the "Civil War in 1861, ministry in the military widened its base. In 1862, the army authorized the first Jewish chaplains, the first African American chaplains, the first Native American chaplain, and the first hospital chaplains. The navy adopted the Latin cross as the cap insignia for Christian chaplains in 1863, the first faith-specific insignia approved for wear in the U.S. armed forces.

When 2,300 army chaplains volunteered for duty during the early months of World War I, it became clear to Gen. John J. "Pershing and to Congress that a large chaplaincy in a world conflict required more centralized direc-

tion than could be provided by unit commanders. In 1920, the National Defense Act reorganized the armed forces and provided for chiefs of chaplains to direct ministries in each of the services. President Woodrow Wilson selected Chaplain John T. Axton as the first army chief of chaplains and Chaplain John B. Frazier as the first navy chief of chaplains. Although three chaplains had performed duty in the air-service in 1918, it was not until after World War II that the air force chaplaincy was established as a separate service. President Harry S. Truman appointed Chaplain Charles I. Carpenter the first air force chief in 1948.

Historically, American soldiers and sailors have reflected about the same degree of religious commitment as the civilian communities from which they came. Units that were recruited in areas characterized by strong religious institutions tended to include larger numbers of religious servicemen. In a U.S. Army survey taken in 1994, some 80 percent of the soldiers polled stated that they believed in God and had a specific religious preference. More than 100 religious denominations and faith groups were represented among soldiers, with Protestants and Roman Catholics constituting 85 percent of the total number. Chaplains from an equal number of separate denominations provided ministry for these soldiers.

Religious life in the military centers on opportunities for voluntary worship, counseling, religious education, moral leadership training, pastoral support, religious retreats, child and youth ministries, and holiday observances. Religious activities for military personnel, in garrison or in the field, are approved by the commander of the unit involved. The chaplain serves as a staff officer, qualified by education, ordination, and endorsement to implement the command religious program for the welfare of service members and their families, and to facilitate the free exercise of religion guaranteed to them by the First Amendment.

Worship services are held in a wide variety of settings. Military chapels, mess halls, decks of ships, aircraft hangars, tents, and open field assembly areas are frequently utilized. Chaplains may encourage service members to participate as lay readers, choir members, eucharistic ministers, and ushers, as well as in other roles. In combat, services are frequently conducted in small groups with abbreviated orders of worship. Most chaplains have combat kits available that contain worship supplies suitable for field services. Enlisted chaplain assistants in the army, chaplain service support personnel in the air force, and religious program specialists in the navy, Marine Corps, and Coast Guard assist chaplains in performing their duties.

Since 1973, when the navy commissioned Lt. Dianna Pohlman as its first female chaplain, women have provided increasing religious leadership in the military. By 1993, thirty female chaplains were serving on active duty in the army, navy, and air force. According to some estimates, women perform as much as 65 percent of the volunteer religious work accomplished on military installations.

Since 1775, more than 400 chaplains have given their lives for their country, 7 have been awarded the Congressional Medal of Honor, and hundreds have been decorated for bravery and outstanding service. Recent interest by former "Warsaw Pact countries in developing military chaplaincies based on the U.S. model maybe evidence of the respect other nations have for the way religion functions in the American military establishment.

RESERVE FORCES ACT (1955). President Dwight D. *Eisenhower's "New Look" defense strategy emphasized nuclear-armed air power, stronger reserve forces, and a greater reliance on conventionally-armed allies. To correct the weaknesses of all of the reserve components of the U.S. armed services, his administration convinced the Congress to pass the Reserve Forces Act of 1955. It amended the * Armed Forces Reserve Act of 1952 and the Universal Military Training and Service Act of 1951. The 1955 legislation increased the size of the Ready Reserve from 1.5 million to 2.9 million personnel and authorized the president to mobilize up to 1 million ready reservists in a declared national emergency without congressional action. For those who agreed to spend two years on active duty and four years in a reserve component, the total military commitment was reduced from eight to six years. The legislation required all those who entered the armed forces after 9 August 1955 to participate in reserve training following completion of active service and authorized specific sanctions for those who failed to participate. It also allowed direct enlistments in the reserve components for nonprior service youths as an alternative to the draft and established a system of continuous screening for members of the Ready Reserve to ensure their availability for active duty. The act did not authorize universal military training, mandatory basic training with the active forces for National Guard recruits, or authority to induct men into the reserve components if sufficient numbers could not be obtained voluntarily. Despite his own grave misgivings about those omissions, President Eisenhower signed the bill on 5 August 1955.

The 1955 act failed to produce the highly capable reserve forces its proponents envisioned. While the numbers of drill pay reservists and Guardsmen climbed dramatically, use of * conscription (or the threat of it) often filled the ranks with less than enthusiastic soldiers, sailors, Marines, and airmen. Funding, equipment, and training remained below par for most of the reserve components until the 1980s. To deal with that problem Secretary of Defense Robert S. *McNamara attempted to shrink the size of the nation's large reserve establishment and merge the federal reserve components of the army and air force into their National Guard counterparts in the early 1960s. When those efforts were blocked on Capitol Hill, he used his administrative authority to create a selected reserve force in each of the military services that was given priority access to training beyond what was normally authorized for Guard and reserve units. McNamara's program provided most of the nation's strategic military reserve in the

continental United States while a growing portion of the active duty force was engaged in the *Vietnam War. Although successful, the program was shelved in the early 1970s for budgetary reasons.

With the elimination of the draft and the *Cold War's end, the Reserve Forces Act of 1955 lost much of its relevance. Although the basic legal structure of the reserve components remains unchanged, economics has replaced the draft as the principal incentive for providing reserve components manpower under the all-volunteer force. The president was granted additional authority by the Congress during the 1970s to involuntarily recall limited numbers of Guardsmen and reservists to active duty for specified periods without either a declaration of war or a national emergency. The size of the ready reserve had shrunk to barely over 1.45 million personnel by 30 September 1997 due to the end of the Cold War and cuts in defense expenditures.

REVOLUTIONARY WAR (1775-83): CAUSES

The roots of the Revolutionary War ran deep in the structure of the British empire, an entity transformed, like the British state itself, by the Anglo-French wars of the eighteenth century. After the fourth of these conflicts, the Seven Years' (or *French and Indian) War, the British government tried to reform the now greatly expanded empire. The American colonists resisted, creating a series of crises that culminated in the armed rebellion of 1775.

The Imperial Background. With the Glorious Revolution (1688), England's foreign policy took the anti-French path it followed until 1815—a path that led to four wars before 1775. These conflicts spawned a British nationalism with powerfully anti-Catholic overtones. They also transformed the British state into the most powerful fiscal-military agency in Europe.

Britain's greatest weapon was its funded national debt, which harnessed private savings to military ends. British financiers, managing the joint stock corporations—the Bank of England, the South Seas Company, the East India Company—loaned the government money in wartime; the government used postwar tax revenues to pay interest on what became a perpetual debt. The demand for

revenues stimulated the growth of another fiscal engine, the Treasury. A "Real Whig" (or "Country") political ideology emerged, which denounced this powerful state as the enemy of liberty, stressed the dangers of standing armies, and insisted that consent to taxation was the property holder's sole bulwark against "enslavement" by would-be tyrants in the government. "Country" ideology dominated the language of political opposition, but barely slowed the growth of the state. Each war's demands—and the stability of a securities market underwritten by tax monies—overrode the objections of those who feared expansion of state power.

The third Anglo-French War (1739-48) brought America back in to British strategic calculations for the first time. New England colonists attacked Canada, conquering Louisbourg, the naval base that controlled access to the St. Lawrence. This prevented French reinforcement and resupply, and would have led to the conquest of Canada, had not merchants in Albany traded overland with Québec and kept New York neutral in the fighting. This independent foreign policy outraged British administrators, especially Lord Halifax. Between 1748 and 1754, Halifax and his associates at the Board of Trade planned reforms to ensure that in future wars the empire would function as a unit.

The Seven Years' War (1754-63) Destabilizes Imperial Relations. The French and Indian War, which became the Seven Years' War in Europe, created unprecedented problems of finance and control for Britain. In the war's early years, before 1758, the colonists traded with the enemy and refused to pay for British military operations. The ministry of William Pitt (1757-61) solved the first problem by offering to reimburse the colonies for part of their war expenses; the second solved itself as Britain conquered French colonies in Canada and the Caribbean. Pitt's victories and policies, however, doubled the national debt and made his successor determined to contain costs and reform the empire.

Beginning with George Grenville in 1763, a series of British ministers tightened the bonds of empire while trying to spread some of the costs of imperial defense to the colonies. They revived Halifax's plans to increase metropolitan supervision over imperial trade and the internal politics of the colonies, but also responded to the urgent legacies of war. As early as 1762, Whitehall planned to station fifteen regular army battalions permanently in America, with the colonists paying the bill. When the Peace of Paris in 1763 added all France's holdings east of the Mississippi River to the empire, the army became the *de facto* administrator of the conquests.

Ministerial efforts to stamp out illegal trade (which resumed after the peace treaty returned to France its richest sugar islands) coincided with attempts to subordinate the colonies to the metropolis. Colonists who believed that Anglo-American cooperation and shared sacrifice had achieved the victory were outraged, and the patriotic fervor of the war evaporated in the face of postwar reforms. Chaos ensued when Parliament tried to extract money directly from the colonies with the Stamp Act of 1765.

The Stamp Act protests expressed outrage at British control. Adapting "Real Whig" ideology to their own needs, Americans insisted that as long as they remained unrepresented in the House of Commons, Britain had no right to tax them; submission to taxation without consent would enslave the colonists to whatever faction controlled Parliament. In the face of virtual anarchy, Parliament re-

pealed the Stamp Act in March 1766, but rejected the American understanding of taxation. According to British constitutional conceptions, taxation was a function of sovereignty (the state's ultimate power to take property and life), which the Glorious Revolution had vested in the king in Parliament. Parliament made its claims explicit by asserting its sovereignty over the colonies in a Declaratory Act that preceded the Stamp Act repeal.

After 1766, Parliament searched for ways to assert its authority. A new set of trade regulations and taxes, the Townshend Duties—named for Chancellor of the Exchequer Charles Townshend, one-time protégé of Lord Halifax—aroused a second wave of colonial opposition beginning in 1767. Deliberation and nonviolence marked this phase of resistance as radical leaders in several provinces clarified American political principles and promoted intercolonial cooperation. The result, a reasonably effective boycott of British imports in 1769, demonstrated the colonies' ability to dispense with the empire.

Unable to retreat in any way that would grant the validity of colonial arguments, Parliament in the spring of 1770 opted (at the urging of a new prime minister, Lord North) to repeal all but one of the Townshend Duties. Retaining a single tax, on tea, kept up Parliament's claim to authority while conciliating the colonists. This concession came none too soon.

On 5 March 1770, the same day North proposed partial repeal in Parliament, a squad of British soldiers fired into a taunting Boston crowd, killing five men. Troops had garrisoned Boston since October 1768 to protect customs officials, and had encountered little opposition before this so-called "Boston Massacre." To people who accepted the "Real Whig" maxim that standing armies were tyrants' tools, the "massacre" proved Britain's determination to rule by force. In the face of uncontrollable riots, Gen. Thomas "Gage," the British commander in chief, handed over the soldiers for trial and withdrew the troops from Boston.

Before trials could be held, news arrived of the partial repeal of the Townshend Duties. Merchants jumped at the chance to end the unprofitable boycott; by fall, when the juries returned verdicts of manslaughter against two soldiers and acquitted the rest, the nonimportation movement had dissolved. The colonists continued to boycott tea, but otherwise business as usual resumed within the empire.

Yet business as usual in 1771 was not what it had been in 1750. The conquests—Canada, East and West Florida, and the vast trans-Appalachian realm that stretched to the Mississippi—beckoned land-hungry Britons and colonists alike. The Proclamation of 1763, the crown's attempt to separate white settlement from Indian country by a line drawn at the crest of the Appalachians, had failed; western army units had been withdrawn to the seaboard colonies until by late 1771 only one significant detachment remained, in Illinois. Squatters swarmed into the Ohio Valley, and Indian-white relations drifted ever closer to war.

The growing chaos in the west revealed an empire in disarray. Yet empires can exist for centuries in decayed forms without creating revolutions, and British authority in North America might merely have declined indefinitely had not seeds of imperial conflict, planted by the Seven Years' War, borne fruit.

The Tea Crisis and the Dissolution of Empire: 1773-75. British army and naval forces, together with the

East India Company's private army, had seized France's East Indian trading stations during the war; thereafter, the company opportunistically gained control of northeastern India. The costs of government and defense, however, outran the company's revenues, and by 1773 it faced bankruptcy. This would wreck British financial markets, but the Treasury had no funds to bail the company out. The only solution was to turn the company's vast inventory of tea into money, so the ministry granted the company a monopoly on tea sales in America.

But colonists saw the Tea Act of 1773 as an effort to force them to consume a taxed commodity, and no colonial port would allow the tea to be landed. Bostonians actually destroyed three shiploads on 16 December 1773, an action that goaded North's ministry into regarrisoning Boston and proposing a set of Coercive Acts. As passed by Parliament in May and early June 1774, these measures closed the port of Boston until the town paid for the tea; rewrote the Massachusetts charter to give the governor great power over local affairs and protect royal officials—including soldiers—from prosecution in colony courts; and authorized the quartering of troops in private homes. General Gage was appointed governor of the province.

Meanwhile, Parliament also tried to sort out the problems in the west by attaching much of trans-Appalachia to the province of Quebec. The Quebec Act protected Roman Catholicism within the province and sanctioned French legal procedures in its courts, which made it look as if thousands of western settlers would be governed by a cryptopapist regime. The Protestant colonists lumped the Quebec Act and the Coercive Acts together as "Intolerable Acts" and resolved to stand fast.

The result was the most effective intercolonial resistance movement yet. On 5 September 1774, representatives of the colonies convened in a Continental Congress to protest the Intolerable Acts and create a nonimportation measure called the Continental Association. The association empowered local committees of safety to enforce the agreement, creating a crude intercolonial union and vesting police powers in radical hands. Agreeing to meet again on 10 May 1775 if the British government had not yet repealed the Intolerable Acts, Congress adjourned on 26 October.

By then, Massachusetts patriots had created an extralegal government called the Provincial Congress, taken control of the province's arms, and organized self-defense forces. The ministry ordered General Gage to take military action to forestall rebellion. Receiving these orders too late to capture the Provincial Congress, Gage tried to seize munitions stockpiled at Concord. This triggered the Battles of "Lexington and Concord on 19 April 1775, and grew into a general New England uprising. When Congress reconvened on 10 May, its only alternatives were to disavow rebellion and disband or to take control of the incipient war on behalf of all thirteen colonies. It chose the latter course, adopting the New England forces as a "Continental army and appointing George Washington as commander in chief on 15 June 1775. Although it would be a year before the colonies declared independence from Britain, the Revolutionary War had begun.

REVOLUTIONARY WAR (1775-83): MILITARY AND DIPLOMATIC COURSE

In proportion to contemporary population and wealth, the Revolutionary War destroyed more lives and property than any American conflict except the "Civil War; in duration it exceeded all American wars until the one in Vietnam. It was also highly complex. It was a civil war, a war for political independence, and finally a European war conducted on a global scale. Only as a struggle for independence could it be said to have had merely two sides. As a civil war, its active parties were British and German ("Hessian") regulars, American loyalist militias, and British-allied Indians, who fought American patriot regulars (the "Continental army), American patriot militias, and some American-allied Indians. The uncommitted, however, comprised approximately two-fifths of the population, and the outcome of the war ultimately depended on them. As a European conflict and a worldwide war for empire, Britain opposed the United States, France, Spain, and the Netherlands. American social conditions and British strategy shaped the course and determined the outcome of the civil war; but logistical and diplomatic factors governed the war's global phase, and these would strongly influence the nature of American independence.

By 1775, the population of British North America was doubling every twenty-six years. High birth rates and heavy immigration bespoke easily available land, widely distributed among the farming population. The colonists' dispersion and ethnic diversity helped produce the fragmentation and political instability that became pronounced as populations spread westward after the "French and Indian War (known in Britain as the Seven Years' War). The easy availability of land weakened American elites; lacking the ability to live off rents, gentlemen also lacked a secure economic and political base. The southern colonies had stable aristocracies, based on slave ownership; but even the greatest planters lived in fear of slave rebellions. Nor did colonial institutions create stability: governments were small, poor, unbureaucratized, and lacked permanent constabularies; neither a unified market economy nor a universally established church existed. Institutional weakness magnified American parochialism, and most colonists were suspicious of any authority not rooted in their own localities. Americans both distrusted and envied Europe, emulating British styles and institutions while resenting British sophistication. As provincials, colonists saw themselves as morally superior, yet culturally inferior, to the English.

British officers who had served in America during the Seven Years' War believed these conditions made Americans leaderless, lazy, and militarily ineffectual. Remembering the high rates of desertion and mutiny among provincial troops in 1755-60, in 1775 British commander assumed a lack of toughness in the rebels, who—they thought—would collapse at the first application of force.

A CIVIL WAR AND A WAR FOR INDEPENDENCE: 1775-78

Popular Insurrection and a Failed Police Action: 1775-76. From the tea crisis of 1774 through the evacuation of Boston in March 1776, the British faced massive popular

resistance among New Englanders. Insofar as even patriot leaders lagged behind public opinion after the so-called "Intolerable Acts," it is not surprising that the British commander in chief, Gen. Thomas *Gage, failed to understand that the thousands of men who turned out on 19 April 1775 were not armed mobs, but property holders and their sons, who represented communities convinced that the British intended to enslave them. So popular was the rebellion that within a week of the Battles of *Lexington and Concord, 20,000 New England militiamen were besieging the British in Boston, without anyone ordering them to do it.

When news of the fighting in Massachusetts reached the Second Continental Congress at Philadelphia, the delegates assumed responsibility for the New England militia—which on 15 June they designated a *Continental army—and appointed a commander in chief from Virginia, George *Washington. Provincials to the core, the delegates wanted a European-style regular army to conduct a civilized war. The last thing they—or Washington—wanted was for *guerrilla warfare to continue.

Meanwhile, Gage and his officers assumed that they were conducting a police action against agitator-inspired mobs. Thus, when the Americans fortified a Charlestown hilltop on 17 June, the British decided to attack frontally. As Maj. Gen. John *Burgoyne explained, they believed government authority "depends in a great measure upon the idea that trained troops are invincible against any numbers or any position of untrained rabble; and this idea was a little in suspense since the 19th of April." The ensuing carnage and the realization that the rabble had not dispersed, but reorganized, compelled the British to reassess their assumptions. Between the Battle of *Bunker Hill and the evacuation of Boston (17 March 1776), British commanders lost the illusion that they were involved in a police action, and the British ministry replaced Gage with Gen. William *Howe, who understood the war as a confrontation between opposing armies. Howe's plans for 1776 ushered in the second stage of the war, which would last until Burgoyne's defeat at the Battles of *Saratoga (September and October 1777).

Conventional War and Failed Negotiations: 1776-77. Howe moved his base of operations in New York to regain the initiative against Washington. If he thrashed the rebel army, he reasoned, most Americans would return to the imperial fold; as popular enthusiasm waned, Congress would become willing to make peace. Howe wanted negotiation more than outright victory because he was not only commander in chief but (together with his brother, Adm. Lord Richard Howe) peace commissioner in America. This schizoid role handicapped him both as military leader and as diplomat; yet events of summer and fall 1776 suggested that he would succeed.

After the British evacuated Boston, defeats and disaster filled the rest of 1776. The army Congress had sent to invade Canada in June 1775 collapsed in the summer of 1776. After capturing Montréal, the Continentals failed to take Québec, and were forced to raise their siege when British reinforcements arrived by ship in May. By July, the Americans had retreated to Lake Champlain and—desperately hoping to slow the advance of Gen. Guy Carleton's powerful army on New York—built a small fleet of gunboats. At the Battle of Valcour Island (10 October 1776), Brig. Gen. Benedict *Arnold succeeded in stalling Car-

leton's invasion, but had to withdraw to Fort Ticonderoga.

Meanwhile, the fervor of 1775 faded as General Washington tried to transform the Continentals into a regular army capable of holding New York against Howe. He had less than 20,000 troops on Long Island, Manhattan, and the lower Hudson on 25 June 1776 when Howe landed at Staten Island. Howe tried first to negotiate, but found that Congress* representatives, Benjamin Franklin and John

* Adams, would settle for nothing less than independence. Howe then used his 32,000 troops, together with his brother's fleet and 10,000 sailors, to drive Washington off Long Island (27-30 August). Following him to Manhattan in mid-September, Howe attacked again in October, compelling Washington to withdraw to White Plains. In November, Howe captured the critical posts of Fort Washington, New York, and Fort Lee, New Jersey. Washington retreated across New Jersey with a disintegrating army. He crossed the Delaware on 7 December with perhaps 5,000 troops fit for duty, and most of their enlistments would expire on 31 December.

Howe's strategy seemed to have worked brilliantly. The Continental army was collapsing; colonists in New York and New Jersey were eagerly swearing allegiance to the king, provisioning his forces, and enlisting in loyalist units. Howe saw popular support for the Revolution evaporating and assumed that Congress would soon negotiate. Yet two features of his campaign were about to produce the opposite effect. First, Howe's troops—particularly the Hessians and the loyalist irregulars—had handled civilian populations roughly. Every incident of rape and theft helped to crystallize popular opposition. Second, on 13 December, Howe sent his men into winter quarters, scattering them across central New Jersey in small cantonments—and thus exposing them to attack.

Venturing everything, Washington used what was left of his army to attack enemy units at Trenton, in late December 1776, and Princeton, in January 1777, and thus began to restore Continental morale. Howe, realizing the mistake of dispersing his units, reconcentrated them in the Lower Raritan Valley, allowing patriot militia to regain control of the province and nullify his recent successes. Howe did not yet see how counterproductive his approach had been, however, and planned to pursue Washington through Pennsylvania in 1777. The ministry, meanwhile, authorized Burgoyne to renew the invasion from Canada. Howe and Burgoyne assumed that loyalist support would emerge wherever the redcoats appeared. They were mistaken.

Burgoyne captured Fort Ticonderoga on 5 July, then pursued the fleeing Continentals through the woods south of Lake Champlain rather than proceeding to the Upper Hudson Valley via Lake George. Reaching the Hudson, he found that his Indian and Hessian allies had turned New Yorkers against him. When the supplies and loyalist supporters he expected never materialized, he found himself trapped. The northern Continental army under Maj. Gen. Horatio *Gates, reinforced by militiamen from New England and New York, defeated Burgoyne at the two Battles of Saratoga (17 September and 5 October 1777). On 17 October, he signed a Convention that allowed him to return to England, but left his army prisoner. Saratoga cost the British over 6,000 casualties and captives. The prisoners of war, called the Convention army, were shifted from colony to colony for the rest of the war.

Meanwhile, Howe defeated Washington in Pennsylvania

at the Battle of the Brandywine (11 September 1777), but again failed to destroy his army. He seized Philadelphia at the end of September. Washington counterattacked unsuccessfully at Germantown (4 October), then lost the Delaware River forts that commanded Philadelphia's water approaches (15-21 November). Unlike the previous year, defeat did not threaten to dissolve the army, which went into winter quarters at Valley Forge on 11 December. Thanks to Friedrich Wilhelm von *Steuben, who improved the army's training during the winter, and to Nathanael *Greene, who as quartermaster general reformed the supply system, the Continentals emerged from Valley Forge tougher and better organized than ever.

Thus, Howe's conventional war strategy failed again. Congress refused to negotiate; redcoat, loyalist, and Hessian abuse of civilians reanimated popular resistance; and patriot militiamen controlled whatever territory the British could not occupy.

Howe failed because he misinterpreted civilian attitudes. What he took for incipient loyalism was no more than the reluctance of many Americans—in the Middle Colonies probably a majority—to take sides. He never understood how the very arrival of the British army (and especially its loyalist, Hessian, and Indian auxiliaries) drove neutrals into alliance with the patriots. By contrast, Washington used enormous restraint in dealing with civilians, refusing to confiscate food and clothing even when his men at Valley Forge were starving. Above all, he deferred to Congress's wishes in order to demonstrate the army's subordination to civil authority.

State governments employed their militia forces with similar restraint. On the whole, prosecutors and militia units tolerated neutral behavior as a manifestation of localism, not loyalism. Knowing that Americans distrusted centralized power, they required only minimal support: anyone who paid his taxes, kept his mouth shut, and turned up for militia duty would be left alone. The practice of allowing men drafted for military duty to hire substitutes, and the parsimonious, quasi-legal use of force in making examples of notorious Tories helped win the acquiescence, if not the hearts and minds, of neutrals. Finally, governments retained the goodwill of property holders by hesitating to confiscate supplies for the army. This restraint had two effects: the Continental army remained chronically undermanned and undersupplied; and neutrals were not driven to loyalism.

THE FRENCH ALLIANCE AND A WORLD WAR: 1778-83

Turning Point: 1777-78. Howe's indecisive campaign and Burgoyne's spectacular defeat convinced the French, who heretofore had offered only covert aid, to enter into open alliance with the United States. Congress had first sent delegates to Paris in 1776; Benjamin Franklin and his colleagues had raised money and publicized America's cause, but France's foreign minister, the comte de Vergennes, had remained cautious. The events of 1777, however, changed his mind. On 17 December 1777, France recognized the United States diplomatically, and soon thereafter it presented drafts of two treaties to the American commissioners. The first of these, the Treaty of Amity and Commerce, offered the United States preferential trading privileges in France. The second, the Treaty of Alliance, was to take effect at the beginning of hostilities between France and Britain; it promised that France would not press any fur-

ther claims to Canada, would refrain from negotiating peace with Britain on any grounds other than American independence, and guaranteed to the United States any territories French troops might conquer in North America during the war. Signed on 6 February 1778, both treaties were ratified in Congress on 4 May 1778.

Hoping to nullify the alliance, the British ministry dispatched the earl of Carlisle to negotiate with Congress. The Carlisle Commission could promise anything short of independence, but Congress would settle for no less. While Carlisle made overtures until November 1778 and military activity in North America came to a standstill, naval warfare broke out between France and Britain. War in Europe transformed a colonial fight for independence into a larger—ultimately worldwide—struggle that the British could not win.

From June 1778 onward, the British had to defend the home islands against invasion, protect Gibraltar, and shield the valuable, vulnerable West Indian sugar islands (especially Jamaica) from attack. This meant that Howe's successor, Gen. Henry *Clinton, would have fewer men and bigger logistical problems than ever, and that he could no longer assume the Royal Navy's superiority in American waters. His response, a new strategy, reflected these new circumstances, as well as his estimate of American social conditions.

Conquest, Pacification, and Civil War in the South: 1778-81. Clinton knew that in Georgia and South Carolina, low country rice planters lived in fear that their slaves (two-thirds of the population) would rebel, and that long-standing animosities divided lowland whites from the poorer, more numerous backcountry farmers. This convinced him that his best hope of victory lay in the Lower South; he also understood that to retain control of even this region, he would have to win the support, or at least the compliance, of the uncommitted population. Clinton therefore decided to move the war to the South, using loyalist units *not* as auxiliaries in conventional operations, but as pacification forces. Once the regulars cleared the countryside of rebels, loyalist units would organize local self-defense forces to keep the patriot militia at bay. When law and order had been established, they would hand control over to civilians, who would reinstitute civil government under crown auspices.

Pacification began promisingly with the invasion of Georgia in the winter of 1778-79. Savannah fell to a 3,500-man British force under Lt. Col. Archibald Campbell on 29 December 1778; hundreds of Georgians volunteered as loyalist irregulars, and quickly garrisoned what the regulars conquered. Redcoats took Augusta on 29 January 1779, then stood off two Continental attempts to retake the town. American forces withdrew to Charleston. By the end of July 1779, royal government had been reinstituted under a civilian governor. A Franco-American force under Admiral d'Estaing and Maj. Gen. Benjamin Lincoln besieged Savannah in October 1779, but d'Estaing soon withdrew to the West Indies and Lincoln returned to Charleston. Georgia became Clinton's base for carrying the war to South Carolina.

The invasion began in the spring of 1780 with a spectacular success: Clinton came from New York with over 8,000 men to direct the campaign, trapping Lincoln in Charleston, which fell on 12 May. The surrender of Lincoln's 2,600-man garrison obliterated the Continental

presence in the Lower South. Clinton established outposts throughout the countryside and recruited loyalists to hold them, making every effort to avoid repeating past mistakes. After forbidding looting and appointing an inspector general to keep the loyalists in line, he left Charleston in early summer, taking a third of his troops back to New York.

Clinton did not know it, but his pacification program would engulf the Lower South in a sanguinary civil war. He had already alienated most of the planter gentry by encouraging slaves to run away to the British lines and offering them refuge; he even permitted a black unit, the Carolina Corps, to be formed of ex-slaves, alarming Southern whites fully as much as Burgoyne had alarmed New Yorkers by employing Indians as auxiliaries. Thus even before he left for New York, Clinton had begun to alienate would-be neutrals, and had given patriot planters a reason not to lay down their arms and sit out the remainder of the war. The bands of patriot partisans who retreated to the swamps and mountains could no more be rooted out than the loyalists could be restrained from settling old scores. Patriot irregulars like Thomas Sumter and Francis Marion made terrorist attacks on loyalists and regular detachments, and the Tory legions of Banastre Tarleton and Patrick Ferguson answered terror with terror. Patriot militiamen, for example, massacred many of Ferguson's loyalists after the Battle of "King's Mountain" (7 October 1780), retaliating for Tarleton's earlier massacre of patriots at the Battle of Waxhaws (29 May); these were, however, only the best known atrocities in a savage guerrilla war.

Loyalist attacks swelled patriot ranks with former neutrals throughout the backcountry during the summer and fall of 1780. Meanwhile in the low country, Clinton's policy of encouraging slaves to run away brought tens of thousands of them to British camps in search of freedom. Planters lost sympathy with the British as their labor forces vanished. By year's end, pacification was doomed in low country and backcountry alike. Clinton was perhaps the last to know. Back in New York he expected an attack by the French fleet and an expeditionary force under the comte de Rochambeau, France's new commander in chief in America.

Clinton had left behind about 8,000 men under the command of Lord Charles "Cornwallis, whose inability to control a chaotic region intensified his dislike of Clinton and pacification. He preferred action, and with a field army of about 4,000 men responded decisively when a Continental force under Horatio Gates attempted to invade South Carolina. After routing Gates at the Battle of Camden (16 August 1780), Cornwallis concentrated on defeating the next Continental general to appear, Nathanael Greene.

Greene assumed command of a shattered Continental force at Charlotte, North Carolina, on 2 December 1780, and immediately took the offensive. He daringly divided his 2,000 Continentals and militiamen into two bodies, taking about 1,500 men under his own command and assigning the rest to Brig. Gen. Daniel "Morgan. Morgan struck southwest into the backcountry and defeated Tarleton's loyalist legion at the Battle of "Cowpens, 17 January 1781; then he retreated to North Carolina and rejoined Greene at the Catawba River. Cornwallis gave chase; Greene withdrew northeastward toward the Dan River, near the Virginia border. Cornwallis lacked the boats to cross the Dan and halted on 17 February 1781, turning to-

ward Hillsborough to replenish his provisions. Greene crossed back into North Carolina and sent detachments to harass his enemy. On 25 February 1781, the cavalry legion of Lt. Col. Henry "Lee ("Light-Horse Harry") annihilated a loyalist unit at the Haw River, leading Cornwallis's loyalists to abandon him. When Greene finally joined forces on

15 March at the Battle of "Guilford Courthouse, Cornwallis had just 1,600 redcoats to attack 4,450 Continentals and militia.

Cornwallis's superbly disciplined regulars carried the day at Guilford, but a third were killed or wounded while Greene sustained losses of perhaps 10 percent. Cornwallis headed for Wilmington, where he could be resupplied by sea. After a brief rest, he marched north to Virginia. There he hoped to trap the Continentals of the marquis de "Lafayette, who had been fencing with a 3,000-man British force under the turncoat American general, Benedict Arnold. (Arnold had accepted a British command and a large payment in return for his promise to hand over the fortress of West Point, New York, in 1780. The plot failed, but Arnold escaped to fight for the British.) Arnold had picked up substantial loyalist support, and Cornwallis convinced himself that taking Virginia would somehow secure the Carolinas and Georgia. Greene, he assumed, would move to support Lafayette.

But Greene returned to South Carolina and attacked the scattered British garrisons there. Thus, while Cornwallis pursued Lafayette, British commanders in South Carolina and Georgia found themselves forced to withdraw to the coastal enclaves of Wilmington, Charleston, and Savannah. Behind them, patriot militia units reasserted control over the countryside.

Clinton sent troops from New York, giving Cornwallis over 7,000 men to bring Lafayette's 1,200 Continentals (and variable numbers of militiamen) to bay. When Lafayette refused to be trapped, Cornwallis used cavalry units and loyalist auxiliaries to attack rebel property. The more successful these raids were—and some, like Tarleton's Charlottesville raid in June and his 400-mile swing through the Southside in July, were spectacular—the more Lafayette's support grew. Reinforced by Continentals from Pennsylvania, Lafayette shadowed Cornwallis down the York peninsula in August, as he moved to establish a base with access to the sea: Yorktown.

After three years of bungled or thwarted operations, the French Navy finally exerted a decisive effect on land operations. From the beginning of the alliance, French admirals had preferred to cruise the Caribbean whenever possible; they entered North American waters only when the hurricane season made West Indian operations hazardous. Rochambeau's expeditionary force, in America since July 1780, had so far sat in Newport, Rhode Island. Washington and Rochambeau had planned to attack New York, but the arrival of Admiral de Grasse's fleet and the news that Cornwallis had moved to Yorktown changed everything. When de Grasse announced that he would operate in the Chesapeake until 15 October, Washington decided to trap Cornwallis. He marched south with half his army and most of the French expeditionary force on 20 August. On 14 September, he joined forces with Lafayette on the York Peninsula.

De Grasse had already debarked troops and sailed back to the bay's entrance. There, on 5 September, he met the British fleet of Adm. Thomas Graves. In the ensuing battle

off the Chesapeake Capes, de Grasse repelled Grave's fleet, inflicting damage that forced it back to New York. This decided the outcome of the campaign, and—in a sense—the war. Within days, Admiral de Barras's squadron arrived from Newport with supplies and siege artillery. Cornwallis was doomed.

The Franco-American army marched to Yorktown on 28 September and prepared to lay siege. Formal operations opened on 6 October and lasted until Cornwallis had endured a week of bombardment. When he surrendered on 20 October, the allies took charge of a quarter of the British army in America—8,000 troops—and a mountain of equipment.

The Battle of "Yorktown did not deal a death blow to British military strength, but it made the ministry's position in Parliament untenable. The prime minister, Lord North, had long hoped to resign; he left office early in 1782. Clinton was recalled and replaced by Gen. Guy Carleton. Pressed by demands in other theaters, Whitehall suspended military activity in America.

Endgame: 1782-83. Carleton reached New York in May 1782 and ended offensive operations until the political settlement could be negotiated in Europe. The British had already abandoned Wilmington (January 1782); they would soon evacuate Savannah (July) and Charleston (December). Washington observed Carleton from his Hudson River fortifications, but took no further action.

Meanwhile, the war went from bad to worse for Britain. Following Yorktown, de Grasse had sailed up the Caribbean, where he seized Nevis, St. Christopher, and Montserrat. In April 1782, he threatened the grand prize of all, Jamaica; and although Adm. George Romney thwarted that attempt in a battle off the Isles des Saintes near Guadeloupe, it remained possible that a combined Franco-Spanish force would mount a new invasion once the hurricane season had passed. Spain, indeed, had become a critical actor in the war. Following the declaration of war in June 1779, Spanish forces had attacked British posts in West Florida, taking Natchez (5 October 1779), Mobile (14 March 1780), and Pensacola (8 May 1781). Worse, from Britain's perspective, was Spain's conquest of Minorca (5 February 1782) and its repeated threats to Gibraltar. After blockading the fortress in 1779-80 and 1781-82, Spanish naval and land forces besieged it in 1782, trying to storm it in September. The attack failed, but Spain could still seal the straits and starve out the garrison. Finally, Dutch trade had been so valuable to America, Spain, and France that the British had declared war against Holland in December 1780. Dutch belligerency made it virtually impossible for the Royal Navy to operate in the North Sea and raised the possibility that Holland's East Indies fleet would aid the French against British forces in India, where by 1782 the situation looked grave.

Peace commissioners met in Paris as early as April 1782, but only in October did Britain's representatives agree to recognize American independence. Thereafter, the U.S. commissioners—Benjamin Franklin, John Adams, and John Jay—quickly agreed on articles with the British. The French, nearly bankrupt, were also willing to make peace, having revenged the humiliation of 1763 by depriving Britain of thirteen valuable colonies. Spain, however, refused to parley while it might still take Gibraltar, and it was not until 20 January 1783 that preliminary articles were signed. On 4 February, Britain announced the ces-

sation of hostilities. Congress ratified the treaty on 15 April; the formal articles were concluded at the Peace of Paris on 3 September.

The peace treaty strongly favored the United States. Britain recognized American independence, agreed to boundaries between the Great Lakes and the 31st parallel as far west as the Mississippi River, recognized American fishing rights off Newfoundland, and promised to evacuate its posts on American territory "with all convenient speed." The United States in turn agreed to pay all debts due to British creditors and compensate loyalists for their confiscated property. The states proved slow to compensate the loyalists, and the British retained posts in the Northwest until 1796; but in other respects the peace restored amity with remarkable speed, given the length and ferocity of the war.

It was not British benevolence but desperation that accounted for the character of the Peace of Paris. Reeling militarily and isolated diplomatically, Britain faced severe financial peril and a public sick of war. In the end, Britain made peace on generous terms because it needed to trade with its former colonies, just as the United States—bankrupt and facing economic collapse—needed to reestablish the commercial connections war had severed.

Wherever the British army went between 1775 and 1781, it invariably alienated the people whose support it needed most, the neutrals. When the fighting started in 1775, only New England had a patriot majority; elsewhere, local minorities of armed patriots intimidated smaller loyalist minorities, and most colonists avoided committing themselves. No British commander in chief ever found a way to turn the neutrals into active supporters—or keep his troops from providing endless object lessons in British "tyranny."

Thus, over a long and bitter war, the neutrals dwindled in number everywhere. No matter how many battles the British army won, it could not maintain control—and protect its supporters—outside of ports like New York, Charleston, and Savannah. Whenever the army left an area, its collaborators had to choose between fleeing as refugees and remaining to face the patriot militias that reasserted control as soon as the last redcoat had departed. Clinton's recognition of this pattern led both to his southern pacification plan and to the opening of the war's most destructive phase, which nullified the promise of his strategy. Even before Yorktown, Americans were war-weary; but even the most apathetic of them could see that the British government would never sustain its presence in America, and sooner or later the patriots would return. Thus the war educated Americans in the practical politics of self-interest and survival. Ultimately, the neutrals, and many loyalists, chose patriot rule over exile.

This is not to minimize the role of republican ideology in influencing the shape of Revolutionary events, but only to contextualize it. Far from being an autonomous intellectual construct, revolutionary republicanism was a dynamic ideological response to changing conditions, and was itself shaped by the war—particularly insofar as the coercion of populations by armed force gave immediate meaning to the concept of tyranny and encouraged patriot leaders to take stringent steps toward subordinating military to civil authority in the postwar era.

Nor does the recognition of the war as decisively shaped by social factors diminish the importance of French inter-

vention. Even in the indecisive first years of the alliance, the French Navy denied the Royal Navy supremacy on the Atlantic, making the American war difficult to sustain; French matériel and money enabled the Continental army to survive overwhelming difficulties. By denying Cornwallis his escape route, the French Fleet allowed a Franco-American army to besiege Yorktown; French cannon, fired from emplacements laid out by French engineers, persuaded Cornwallis to surrender. The imminent threat of further losses to French, Spanish, and Dutch forces gave British opposition politicians sufficient leverage to end the war. French participation thus determined when and how the war ended; but it did not make the difference between winning and losing for the British. American society itself had rendered the Revolutionary War a fight that Britain could not win.

REVOLUTIONARY WAR (1775-1783): DOMESTIC COURSE

The War of Independence, the *Pennsylvania Centinel* suggested in 1785, had removed that “great reluctance to innovation, so remarkable in old communities.” The *Centinel* did not exaggerate. Between 1776 and 1783, American patriots had to organize new governments, raise and supply a substantial army, create a system of public finance, and manufacture goods once imported from Europe. Beyond these sizable tasks, they had to deal with pressing problems: tens of thousands of loyalists ready to fight for their king; 500,000 enslaved Africans and African Americans, who might themselves revolt for liberty; and a farm economy increasingly dependent on the labor of women and youth. The task was formidable; the stakes high. The war might be fought by soldiers and generals, but it would be won or lost by civilians and civic leaders.

Political Innovation and Conflict. Patriot leaders acted swiftly to establish the legitimacy of their rule. On 10 May 1776, Congress urged patriots to suppress royal authority and establish institutions based on popular rule. By the end of 1776, Virginia, Maryland, North Carolina, New Jersey, Delaware, and Pennsylvania had written new constitutions, and Connecticut and Rhode Island had transformed their colonial charters into republican documents by deleting all references to the king.

The Declaration of Independence stated the republican principle of popular sovereignty, and the Delaware Constitution interpreted that to mean the exercise of political power: “the Right of the People to participate in the Legislature.” But most patriots gave a narrow definition to the political nation, restricting voting and office holding to propertied white men. Conservative patriots were more

adamant, denying that popular sovereignty meant rule by men who owned only a little property.

In the heat of revolution, radical patriots embraced a democratic outlook: every citizen who supported the rebellion—property owner or not—had “an equal claim to all privileges, liberties and immunities,” declared an article in the *Maryland Gazette*. This democratic republicanism received* fullest expression in Pennsylvania, where Scots-Irish farmers, Philadelphia artisans, and Enlightenment-influenced intellectuals cooperated to create the most democratic institutions of government in America or Europe. The Pennsylvania Constitution of 1776 abolished property owning as a qualification for political participation, giving all men who paid taxes the right to vote and hold office.

Pennsylvania’s radical constitution alarmed leading patriots in other states, who feared that ordinary citizens would use their numerical advantage to levy heavy taxes on the rich. They insisted on constitutions that would keep the “better sort” in power. Thus, the New York Constitution of 1777, written chiefly by John Jay, used property qualifications to exclude one-half of the white men from voting for the governor and the upper house of the legislature, while the South Carolina Constitution of 1778 restricted membership in the state legislature to the richest 10 percent of the white population.

Nonetheless, the Revolutionary War democratized American politics. The new states constitutions apportioned seats in the legislatures on the basis of population, giving yeoman farmers in western areas more equal representation. Moreover, republican ideology raised the political consciousness of ordinary Americans. During the war, many patriot militiamen claimed the right to elect their officers; subsequently, many veterans, whether or not they had property, demanded the franchise. And when they voted, they chose different sorts of leaders. Before the war, about 85 percent of the assembly were wealthy men; by 1784, however, middling farmers and artisans controlled the lower houses of most northern states and formed a sizable minority in the southern states.

Political innovation also took place on the national level as the Continental Congress devised the first national constitution. The Articles of Confederation, approved by Congress on 15 November 1777, provided for a loose confederation in which “each state retains its sovereignty, freedom, and independence” and all powers and rights not “expressly delegated” to the United States. The Confederation government had the authority to declare war and make peace, to conclude treaties with foreign nations, to borrow and print money, and to requisition funds from the states “for the common defense or general welfare.” The body charged with exercising these powers was the Congress, in which each state had one vote, regardless of its population. Because of disputes among the states over the title to western lands, the articles were not ratified until 1781. Threatened by the army of Gen. Charles “Cornwallis, Virginia finally ceded its land claims to Congress in 1781, and Maryland, the final holdout, ratified the articles.

Wartime Finance. Congress’s main problem was not land but money. Because opposition to taxes had fueled the independence movement, patriot officials hesitated to impose taxes. To finance the war, the states first borrowed money, in gold or silver or British currency, from wealthy individuals. These funds quickly ran out, so the states ere-

ated a new paper currency—the dollar—and issued notes with a face value of \$260 million, using it to pay soldiers and purchase supplies. Since the new notes were printed in huge quantities and not backed by gold or silver or by tax revenues or mortgages on land, they quickly depreciated. Indeed, North Carolina's paper money came to be worth so little that the state government itself refused to accept it.

The monetary system created by the Continental Congress collapsed as well, despite the efforts of Robert Morris, the Philadelphia merchant who became superintendent of finance in February 1781. To raise domestic loans, Congress borrowed \$6 million from France and pledged it as security; wealthy Americans promptly purchased \$27 million in Continental loan certificates. Congress also financed the war by printing money—some \$191 million to 1779. By that time, so much currency had been printed that it took \$42 in Continental bills to buy goods worth \$1 in gold or silver. And things got worse, with the ratio increasing to 100 to 1 in 1780 and 146 to 1 in 1781. At that point, not even the most virtuous patriot farmers would sell food to the American army.

The failure of wartime finance nearly doomed the patriot cause. In 1780, Gen. George Washington called urgently for a national system of taxation, warning that otherwise “our cause is lost.” However, unanimous consent was required to amend the articles, and in 1781 Rhode Island rejected Superintendent Morris's proposal for a national tariff, an import duty of 5 percent on foreign goods. Two years later, New York blocked another proposed national tariff.

Consequently the war was financed through inflated currency, a hidden system of taxation that bore particularly hard on the farmers, artisans, and soldiers who received paper money for supplies and military pay. As soon as these men or their families received the currency, it lost purchasing power—literally depreciating in their pockets. Individually, these losses were small, amounting to a tiny “tax” every time an ordinary citizen received a paper dollar, kept it for a week, and then spent it. But collectively these “currency taxes” paid for the struggle for independence.

The Limits of Republican Virtues. Patriots knew that winning the war depended on “patriotism, and were at first optimistic that their republican ideology would inspire public virtue and self-sacrifice. “The word republic,” wrote Thomas Paine, “means the public good, or the good of the whole.” And, continued Philadelphia patriot Benjamin Rush: “Every man in a republic is public property. His time and talents—his youth—his manhood—his old age—nay more, life, all belong to his country.”

But rhetoric could not create an army. Because yeoman farmers and militiamen preferred to serve in local units near their fields and families, few propertied Americans volunteered for service in the enlisted ranks of the “Continental army. Consequently, except for the officers, most of its recruits were drawn from the lower ranks of society. For example, most troops commanded by Gen. William Smallwood of Maryland were either poor American-born youths or older foreign-born men—British ex-convicts or former indentured servants. Historians continue to debate motivation for enlistment and continued service—the roles of economic gain (a bonus of \$20 cash and the promise of 100 acres), belief in the cause of liberty and republicanism, and psychological commitments to their

comrades. Confronted by a reluctant citizenry and a lack of funds, Congress fell far short of its goal of a regular army of 75,000 men; the total Continental force never reached half that number.

As economic hardship brought the war closer to home, civilians also lost their zeal for self-sacrifice. The British naval blockade nearly eliminated the New England fishing industry and cut off the supply of European manufactured goods to American consumers. Domestic trade and production declined as well. The British occupation of Boston, New York, and Philadelphia put thousands of people out of work; the population of New York City declined from 21,000 in 1774 to less than half that at war's end. In the Chesapeake, the British blockade denied tobacco planters access to European markets, forcing them to turn to the cultivation of wheat, corn, and other foodstuffs. All across the land, ordinary commercial activity slackened as farmers and artisans adapted to a war economy.

The scarcity of imported goods brought a sharp rise in prices and widespread appeals for government regulation. Consumers decried merchants and traders as “enemies, extortioners, and monopolizers.” In 1777, a convention of New England states tried to limit the price of domestic commodities and imported goods to 175 percent of their prewar level. To enforce this directive, the Massachusetts legislature passed an “Act to Prevent Monopoly and Oppression,” but so many farmers and artisans refused to sell at the established prices that consumers had to pay the market price “or submit to starving.”

The upward movement of prices—for grain and meat as well as manufactures—stimulated the economy. Army contractors roamed the countryside, offering farmers high prices for food, horses, and wagon transport. State governments encouraged artisans and entrepreneurs to manufacture military clothing, guns and gunpowder, and other scarce items—and with good results. By the end of the war, artisans in the town of Lynn, Massachusetts, were producing over 50,000 pairs of shoes each year. As Alexander Hamilton noted, the northern countryside had become “a vast scene of household manufacturing.” With financial self-interest supplementing republican virtue, Americans laid the basis for economic as well as political independence.

Women and the War Effort. Women workers played a large part in the expansion in production, particularly in the cloth industry. When the war cut off imports from Europe, government officials requisitioned clothing directly from the people. In Connecticut, officials called upon the citizens of Hartford to provide 1,000 coats and 1,600 shirts, and assessed smaller towns on a proportionate basis. Soldiers added their own pleas. Capt. Edward Rogers lost “all the shirts except the one on my back,” at the Battle of Long Island and wrote to his wife, “the making of cloath ... must go on.”

Patriot women stepped into the breach, increasing production of homespun cloth. One Massachusetts town claimed an annual output of 30,000 yards of cloth, while women in Elizabeth, New Jersey, promised “upwards of 100,000 yards of linnen and woollen cloth.” With their husbands and sons away, many women also assumed the burden of farm production. Some went into the fields themselves, plowing fields or cutting and loading grain. Others supervised hired laborers or slaves, acquiring a taste for decision making in the process. “We have sow'd our oats as

you desired," Sarah Cobb Paine wrote to her absent husband; "had I been master I should have planted it to Corn."

Some upper-class women also entered into political debate, filling their letters and diaries (and undoubtedly their conversations) with opinions on public issues. "The men say we have no business [with politics]," Eliza Wilkinson of South Carolina complained in 1783; "they won't even allow us liberty of thought, and that is all I want." Other women, such as Abigail Adams, asked men to create a republican legal order to replace the common law rules of coverture that completely subordinated married women to their husbands. And a few women, inspired by revolutionary ideology, repudiated prevailing assumptions of women's inferiority. In 1779, Judith Sargent Murray, daughter of a wealthy New England merchant, wrote "On the Equality of the Sexes." In this essay, Murray systematically compared the intellectual faculties of men and women, arguing that women had a capacity for memory equal to that of men, and more imagination; any inferiority in judgment and reasoning, she argued, was due to lack of training.

A few men paid some attention to women's requests for greater social and legal equality. In Massachusetts, the state's attorney general persuaded a jury that girls had equal rights under the state's constitution and should not be deprived of schooling. Benjamin Rush, in his *Thoughts on Female Education* (1787), advocated the intellectual training of women, so they would "be an agreeable companion for a sensible man." Rush likewise praised "republican mothers" who instructed "their sons in the principles of liberty and government." But most patriots viewed women as inferior and subordinate. Politics remained a male preserve, with most state constitutions explicitly restricting suffrage to men. Because of deeply ingrained cultural assumptions of female inferiority, women entered the new republics as second-class citizens.

Slavery Weakened. For enslaved African Americans, as for women, war and republicanism brought new opportunities. Taking advantage of the disruptions of war, many blacks fled from their patriot owners and sought freedom behind British lines. Two white neighbors of Richard Henry Lee, a signer of the Declaration of Independence, lost "every slave they had in the world," as did nearly "all those who were nearly the enemy." More than 5,000 blacks left Charleston, South Carolina, with the departing British army. Other enslaved African Americans used wartime loyalty to their patriot masters to bargain for their liberty. Under a Manumission Act of 1782, Virginia planters granted freedom to more than 10,000 slaves.

Equally important was the intellectual attack against slavery. In Virginia, a Methodist conference declared slavery "contrary to the Golden Law of God on which hang all the Law and Prophets, and the unalienable Rights of Mankind, as well as every Principle of Revolution." Such arguments prompted black emancipation in the northern states, where there were relatively few slaves. By 1784, Massachusetts, Connecticut, and Rhode Island had abolished slavery. To protect white property rights, the Pennsylvania Emancipation Act awarded freedom only to slaves born after 1780—and then only after they had served their mothers' masters for twenty-eight years. Such economic concerns among whites, as well as racial prejudice, prevented emancipation in the South, where slaves accounted for 30 to 60 percent of the population and represented a huge financial investment. But those blacks who had won

their freedom during the Revolutionary War began to develop churches, social institutions, and a partly autonomous African American culture.

The Fate of the Loyalists. Even as most free African Americans chose to remain in the land of their birth, tens of thousands of loyalists emigrated to Canada and other British possessions. As early as 1765, many wealthy Americans—and thousands of ordinary colonists—had feared that resistance to Britain would end in mob rule, and the violent activities of the Sons of Liberty seemed to prove the point.

Once war came, it quickly turned into a civil conflict. Patriot committees of safety backed by armed militiamen collected taxes, sent food and clothing to the Continental army, and imposed fines or jail sentences on those who failed to support the patriot cause. "There is no such thing as remaining neutral," declared the Committee of Safety of Farmington, Connecticut, and mobs of New England patriots beat suspected loyalists or destroyed their property. In the Middle Colonies, the contest between loyalists and patriots was more even. In New Jersey, most New Light members of the Dutch Reformed Church—enthusiastic Protestants—actively supported the American cause, but the more conservative Old Lights became loyalists. As the British and American armies marched back and forth across the state, those with reputations as patriots and loyalists fled from their homes to escape arrest—or worse. Soldiers and partisans looted farms, seeking plunder or revenge. Beginning in 1778, British strategies relied heavily on southern loyalists, mobilizing recent immigrants, such as the Scottish Highlanders in North Carolina, and using them to hold territory won by the British army. Their strategy turned the South into an arena of bitter partisan warfare, with "atrocities on both sides."

As the war turned in favor of the patriots, loyalists feared for their lives—especially since more than 55,000 loyalists had fought for the British as regular soldiers or militia. More than 100,000 loyalists emigrated to Canada, the West Indies, or Britain. Those who moved to Canada—where they became known as the United Empire Loyalists—assumed the leadership of the English-speaking colonies of Nova Scotia, New Brunswick, and Ontario.

Some patriots wanted to confiscate the property of the departed "traitors," and the passions of war lent urgency to their arguments. When the British army invaded the South, the North Carolina assembly confiscated loyalists' estates outright. Officials in New York also seized loyalists' lands and goods. However, many patriots opposed these seizures as contrary to republican property rights. Consequently, most states seized only a limited amount of property—that owned by notorious loyalists—so that, unlike France after 1789 or Russia after 1917, the revolutionary upheaval did not drastically alter the structure of American society.

Still, the loyalist exodus disrupted the established social order in many states as upwardly mobile patriot merchants climbed to the top of the economic ladder. In Massachusetts, the Lowell, Higginson, Jackson, and Cabot families filled the vacuum created by the departure of the Hutchinsons and Apthorps and their friends. Small-scale traders in Philadelphia and its environs likewise stepped into vacancies created when loyalist Anglican and neutral/pacifist Quaker mercantile firms collapsed during the war. These changes replaced a conservative economic elite—one that invested primarily in foreign trade and urban real estate—

with a group of more entrepreneurial-minded republican merchants.

In economic life, as in politics, finance, and gender and racial relations, the Revolutionary War was just that: a dramatic disruption of established life that demanded innovation and changed forever the course of American history.

REVOLUTIONARY WAR (1775-83): POSTWAR IMPACT

The new nation still faced critical unresolved issues even after the peace was signed in the Treaty of *Paris in 1783. Some were social and political issues opened in the decade before the war broke out, such as who should vote or what defined the public good, occasionally raising questions for long-term consideration such as the future of slavery or the place of women in society. Others were problems created by the war itself. Effective control over much of the landmass ceded by Britain had yet to be achieved; acceptance by the nations of the world required diplomacy and a clear articulation of American national interests; economic adjustments had to be made to compensate for lost privileges in the British market; and internal differences of opinion about how best to govern the nation had to be resolved. The American Revolution entered its final phase with both leaders and the people asking themselves what kind of country they wanted and how best to achieve it. The ringing phrases of the Declaration of Independence promised much, but what did they mean?

All of the nations involved in the Revolutionary War—both the allies and the adversaries of the United States—made the postwar adjustment difficult. The British were eager enough to end the war; indeed, British public opinion demanded it. But in surrendering the vast terrain south of the Great Lakes, and west of the Appalachians to the Mississippi River, the British negotiators signed away the very land *George III, in his famous Royal Proclamation of 1763, had promised to protect as Indian hunting grounds. Britain's Indian allies, a decided majority of the Indians who chose sides in the Revolutionary War, felt betrayed. When American settlers, unchecked by the United States, began streaming across the Appalachians into the Ohio, Kentucky, and Tennessee regions even before the war ended, bitter clashes with the Indians ensued. Claiming that they sought only to maintain order on a lawless frontier, the British reneged on their treaty promise and maintained British troops on American soil. They remained at Detroit and other western forts until the mid-1790s, encouraging the Indians to believe that they would protect them against the American onslaught, and arguing that the trade in skins and furs (to which the British were entitled) required policing.

America's allies were almost as difficult. France and Spain both hoped that the United States would get less than it got: the French were dissatisfied with the privileged position given American fishermen in the North Atlantic cod fishery, while the Spanish resented the American western boundary at the Mississippi. Spain insisted that Americans had no right to navigate the Mississippi River, and tensions persisted between the two nations until 1795, when a compromise was reached. Meanwhile, Spain, behaving like the British in the Northwest, encouraged Indians on the southwest frontier to defy the Americans.

The United States dealt with these issues both militarily and diplomatically. Even though Congress had disbanded the "Continental Army, reduced the military establishment to the 1st American Regiment, and sold off the ships of the navy, troops were assigned to the frontier, where they negotiated the first new treaties with the western Indians. For their part, the Indians sought compromise and retention of their land rights and created a confederacy to present a united front. But the contradiction between official American promises and unrestrained settler violence created divisions among the native leaders, and in the end the war hawks on both sides won out. The task of bringing peace to the Northwest forced Congress to increase the size of the army, and, in a series of frontier battles, to resolve the matter by force of arms.

Meanwhile, American diplomats, led by Thomas "Jefferson and John "Adams, promoted American interests in Europe. Jefferson went to France (where he remained until the early months of the French Revolution), working to preserve the outward friendship of the wartime alliance, while retaining American freedom of action. With Jefferson's help, France became the chief trading partner of the United States. Adams arrived at the Court of St. James in 1785 as the first American official to confront George III on behalf of the new nation. Both Jefferson and Adams disliked European social distinctions and economic disparities, but each also formed strong attachments to which they later clung, and which helped define their subsequent political followings in the United States, especially in the 1790s when Americans responded to the progress of the French Revolution.

The relations of the United States with the rest of the world depended in large measure on American success in adjusting to new economic imperatives. In 1783, a good many Americans hoped to restore their economic links with Britain, and for a few months after the war, trade was reopened and vigorously pursued. But the British ministry soon decided to cut Americans out of the preferential marketplace of the British empire while merchants tightened credit when it became apparent that Americans lacked the cash to pay for British manufactures. Congress struggled with the problems of economic adjustment. From his position as superintendent of finance, Robert "Morris tried to reorganize credit in the country by establishing a Bank of North America (BNA) as a private bank with a public mandate to serve the Congress and the nation as a central bank. The first American banks were chartered in several states during the 1780s, although the BNA itself ran into trouble politically and financially and lost its Pennsylvania charter before the decade was out. Alexander "Hamilton of New York argued that Morris had taken the right track, and that the United States must solve its economic problems by consolidating the national debt and creating a national bank. Meanwhile, Congress sought most-favored-

nation treaties with European nations, and individual merchant houses pressed to open new markets that included the Far East.

The problems of economic adjustment created antagonisms among Americans themselves, and contributed substantially to the political and social division eventually expressed in a debate over the constitution. Nationalists who were to become identified as Federalists argued that the central government needed strengthening, and eventually they insisted that only a new constitution could give the United States the energy it needed to attain economic stability and national respectability. Localists who preferred the decentralized structure provided by the Articles of Confederation rejected the notion of complete constitutional revision and became Anti-Federalists, although most agreed that Congress might need additional powers to tackle the difficult problems of the time.

These were more than superficial disagreements over how best to govern a young republic experiencing short-term economic problems. The divisions represented fundamental differences of opinion about what the American Revolution was about and what independence was meant to accomplish. The war had created some of the divisions and sharpened others. In many states, local antagonism toward Tories or loyalists persisted; 60,000-80,000 loyalists fled the United States as refugees, and legislatures were divided over whether to let Tories return. Most that had confiscated Tory estates refused compensation. States denied Tory and British creditors the right to collect old debts, despite the article in the peace treaty requiring it and Congress's urging the states to comply. The U.S. "Army itself was divided at war's end between an officer class that had sought and won promises of a postwar pension, and men in the ranks who had been paid in depreciated government script and vague promises. When, after the war, the officers organized the Society of Cincinnati to promote their right to a commutation, or lump-sum payment in lieu of pensions, many Americans, including rank-and-file "veterans, complained about the emergence of aristocracy in American society. The war had created other tensions not easily dissipated: wartime shortages of provisions, inflation caused by the printing of paper money, and fears about the manipulation of prices by hoarders and forestalled pitted rural against urban dwellers and farmers against merchants. After the war, a short-lived burst of consumer spending fueled by loose credit arrangements set the stage for bitter social resentments when merchants suddenly contracted credit and called for payment of debts. Many states saw violent demonstrations against debtor courts in 1785-86; Massachusetts faced armed rebellion.

What has been called "Shays's Rebellion, an armed protest by farmer-regulators in western Massachusetts in the fall and winter of 1786-87, was in reality only the most visible sign of a widespread discontent. Forced court closures were common throughout New England; in New Hampshire, protestors for a short time held the legislature hostage; and throughout Massachusetts, farmers complained to the legislature about tax laws, the shortage of money, and the greed of merchants. But only 2,000 or so actually took up arms in the Connecticut River Valley towns of western Massachusetts, and were forcibly suppressed by a hastily recruited government force of about 5,000 under Benjamin Lincoln. Capt. Daniel Shays, a veteran of the Revolutionary War, and other leaders of the up-

rising, managed to escape into neighboring Vermont, and the rest of the rebels were dispersed. The Massachusetts government eventually provided reprieves or pardons for all, but the experience left Americans divided.

It is too simple to equate the divisions of Shays' Rebellion with Federalist-Anti-Federalist divisions over the Constitution of 1787, but a good many Americans at the time did so; both sides used divisive rhetoric and identified antagonistic interests. Federalists claimed to be merchants, creditors, and commercial farmers, all sound money people who sought order and stability both in the economy and in the larger society, and portrayed their opponents as poor farmers, debtors, or localists who failed to understand the needs of a nation. Anti-Federalists saw themselves as honest husbandmen who were up against rapacious merchants and monied holders of public securities. America's urban-rural split curiously lumped a good many commercial farmers on the urban side of the divide, but also united urban artisans with merchants in the Federalist effort to strengthen the American economy through a revitalized national policy. Even if the divisions were not as precise as contemporaries suggested, the debate over the Constitution shows that there were divisions in American society created or perhaps sharpened by the American Revolution, and in particular by the war. Writing in the famous *Federalist Papers*, James "Madison was to argue that the new Constitution made sense in such a society: it was designed to steer conflicting interests into reasoned debate and compromise.

In practice, not even the new federal Constitution could resolve all of the questions the Revolution had opened. It did, however, provide a democratic framework for resolving such issues in the future, and as Madison envisaged it, it provided a forum for the enormous diversity of condition and opinion that already existed in the United States and was to continue. George "Washington's first administration and the statesmen of the First Congress strengthened popular acceptance of the new Constitution, convincing Americans that their diverse views were fairly represented in government and that their rights were adequately protected. The Revolution, however, had also left a legacy of healthy skepticism about government. Americans argued variously that evangelical religion held better answers, that families must protect values, that women had a special role in nurturing "virtuous" citizens, that both public and private education must be expanded, or that the complexities of modern life required an informed citizenry well served by a free press. There was paradox in the new American culture; there was also vibrancy and excitement and enormous optimism.

REVOLUTIONARY WAR (1775-83):
CHANGING INTERPRETATIONS

It has been argued that the American Revolution is the central event of American history, and it has occasioned more scholarship than any other episode save the *Civil War. Yet, when former President John * Adams asked Thomas McKean in 1815 who would write the Revolution's history, he posed a challenge that historians still confront. The secret sessions and debates, now lost along with other critical information that vanished when the participants died, leave many vital gaps in our understanding. What was the real story?

Historians, of course, have not hesitated to offer accounts of the Revolution. Several key questions have defined their interpretations. How and when did the Americans come to consider themselves a nation different from Great Britain? Was the Revolutionary War inevitable? To what degree was the Revolutionary War a civil war? Was there a struggle for power among the factions in the United States during the war? Why independence? Could the British government have prevented the separation? Why did the British pursue the measures they did?

Military historians have often focused on George "Washington's overall strategy and have debated whether the American victory could have been achieved without the "Continental army, which was its centerpiece. Was the French Alliance critical, or not? To what extent did British strategy and tactics work against an imperial victory by politicizing the American population? Why did the British devastate so much of Scotland in warfare thirty years earlier but do so little, comparatively, to the rebellious colonies in North America?

Finally, how should we interpret the U.S. Constitution? Was it a counterrevolutionary document created to serve the class interests of its framers, or did it realize and embody the ideological promise of revolutionary republicanism? Perhaps most intriguing of all, why did the Revolution not turn upon itself and devour its own as in so many other revolutions? There was no terror—once the war ended, its violence was soon forgotten, and its effects dissipated; unlike most other revolutionary peoples in the Americas, those of the United States escaped militarization or dictatorship by their War of Independence.

The Revolution's first historians witnessed the events they described. Their highly colored, contingent, localized, and biased narratives made impassioned arguments for the justice of their cause, whether loyalist or Whig. Two valuable loyalist accounts are Peter Oliver's violently partisan *Origin and Progress of the American Rebellion* (1781; published 1961), and the third and fourth volumes of Thomas Hutchinson's *History of the Colony and Province of Massachusetts Bay* (1767, 1828), which provide a more balanced and insightful view. Their Whig counterparts are Mercy Otis Warren's three-volume *History of the Rise, Progress and Termination of the American Revolution* (1805), which gives a contemporary woman's view of politics and a relatively balanced account; and Dr. David Ramsay's *History of the American Revolution* (1789), the only contemporary narrative to focus on the Revolution outside New England. The most significant work published in the immediate post-Revolutionary period, Mason Locke Weem's *Life of Washington* (1809), treated Washington's as an exemplary life, and fictionalized shamelessly to make its

points. It influenced more Americans than any of the other early accounts.

The first significant school of interpretation on the Revolution, the Nationalist school, emerged in the mid-nineteenth century. These historians collected thousands of documents and built the first archives of Revolutionary writings; their narratives stressed the inevitability of the American victory and endowed the story with providential significance. Jared Sparks, the librarian of Harvard College, was the first great figure of this school, publishing some 100 volumes on the Revolutionary period, including a 12-volume *Life and Writings of George Washington* (1833-39) and a 10-volume *Works of Benjamin Franklin* (1836-40). The dominating writer of Nationalist history, George Bancroft, published a ten-volume *History of the United States* (1834-74), the last six volumes of which detail the events of the Revolution. For the Nationalists, the Revolution was above all a moral tale, acted out by great men whose virtue ensured America's progress toward its destiny of freedom.

The first academic interpreters of the Revolution, the Imperial school, appeared at the end of the nineteenth century. Writing principally from British documents and employing the critical methods pioneered by the German historian Leopold von Ranke, the Imperial historians scorned the providentialism of the Nationalists. Their version of the Revolution emphasized institutional factors and tended to empathize with the British; the most ardent among them regarded the Revolution as the result of a series of unfortunate misunderstandings—a colossal mistake. The most important figures and works in this school include Charles McLean Andrews, *The Colonial Background of the American Revolution* (1931); Lawrence Henry Gipson, *The British Empire Before the American Revolution*, fourteen vols. (1936-69); and Leonard Woods Larabee, *Royal Government in America* (1930).

Twentieth-century historians can be grouped into three major schools: the Progressives, the Neo-Whigs, and the Modernists. The Progressives emphasized social science methods, embraced the frontier theory of Frederick Jackson Turner, and tended to explain the Revolution in terms of class conflict—a struggle not only for home rule but over who (as Carl Becker put it) "should rule at home." They rejected the institutional focus and anglophilia of the Imperial historians and created a Revolution that was preeminently a struggle between common men with democratic aspirations, and their aristocratic, would-be masters. Charles A. Beard, *An Economic Interpretation of the Constitution of the United States* (1913), Carl Becker, *The Declaration of Independence* (1922), Arthur M. Schlesinger, Sr., *The Colonial Merchant and the American Revolution* (1918), John Franklin Jameson, *The American Revolution Considered as a Social Movement* (1926), and John C. Miller, *Samuel Adams* (1936) are some of the more significant works by members of this school.

The post-World War II generation of scholars, called Neo-Whigs, reacted against the Progressives' class conflict-based interpretation and described a revolutionary movement that emerged from a broadly shared republican (or "Real Whig") political ideology. Concerned with decision making and explaining human behavior in conflict situations, these historians generally view the Revolution as a conservative movement to protect American rights from the acts of Parliament after 1760. The most influential figure in this school, Bernard Bailyn, has

produced several books and essays, most notably *The Ideological Origins of the American Revolution* (1967) and *The Ordeal of Thomas Hutchinson* (1974). Other significant representatives include Daniel Boorstin, *The Americans: The Colonial Experience* (1958); and Edmund and Helen Morgan, *The Stamp Act Crisis* (1953), Bernhard Knollenberg, *Origins of the American Revolution* (1960), Pauline Maier, *From Resistance to Revolution* (1972), Richard D. Brown, *Revolutionary Politics in Massachusetts* (1970), and Jack Rakove, *The Beginnings of National Politics* (1979).

Modernists carry on the interpretative debates of earlier historians. Gordon S. Wood, in two of the most important works on the era, *The Creation of the American Republic* (1969) and *The Radicalism of the American Revolution* (1992), synthesizes the Progressive argument for a counterrevolutionary Constitution with the ideological analysis of the Neo-Whigs, and argues that the Revolution represented a real change in colonial society, not a conservative reaction. In *A Struggle for Power* (1996), Theodore Draper provides a detailed synthesis covering the ten years before the war began, and explicitly downplays the ideological quality of the Revolution in favor of the political pragmatism of the revolutionaries. Draper's lack of interest in ideology as opposed to power mirrors the earlier work of James Kirby Martin, *Men in Rebellion* (1973).

The war itself has received increasing notice as an agent of revolutionary change. John Shy's suggestive essays in *A People Numerous and Armed* (1976), first pointed the way toward interpreting the Revolution as dynamically related to the War of Independence; two other distinguished collections of articles edited by Ronald Hoffman and Peter Albert, *Arms and Independence* (1984) and *An Uncivil War* (1985), offer valuable case studies of the war in local contexts. E. Wayne Carp explains the roles of localism and political culture as they influenced the supply and support of the Continental army in his *To Starve the Army at Pleasure* (1984). Charles Royster describes the interactions between the war, republicanism, and the Continental army in *A Revolutionary People at War* (1979). R. Arthur Bowler explores an important cause of the British failure to crush the rebellion in *Logistics and the Failure of the British Army in America* (1975), while Sylvia R. Frey describes the British army's social character in *The British Soldier in America* (1981). In *The Military Experience in the Age of Reason* (1988), Christopher Duffy develops a clear perspective on how war and society intertwined in the eighteenth century. Other significant works on the British forces and the war include Piers Mackesy, *The Way for America* (1964); John Shy, *Toward Lexington* (1965); William Seymour, *The Price of Folly* (1995); John Tilley, *The British Navy and the American Revolution* (1987); and Nathan Miller, *Sea of Glory* (1974). The secret and intelligence aspects of the war are covered in John Bakeless's *Turncoats, Traitors and Heroes* (1959) and Carl Van Doren's *Secret History of the American Revolution* (1941).

One notable trend in modern scholarship is to include the story of common people and minority groups. Sylvia R. Frey's *Water from the Rock* (1991) and *Slavery in North Carolina* (1995) by Marvin L. Michael Kay and Lorin Cary explore the African American role in war and society. *The Price of Nationhood* (1994), by Jean B. Lee, studies Charles County, Maryland, as transformed by the war; while Robert Gross, *The Minutemen and Their World* (1976), examines Concord, Massachusetts. David Hackett Fisher recounts the coming of the war in Boston in *Paul Revere's*

Ride (1994). John Selby, *The Revolution in Virginia* (1988), and Richard Buel, *Dear Liberty: Connecticut's Mobilization in the Revolutionary War* (1981), are strong colonywide studies of the war's impact.

Two classics in the history of Revolutionary-era women are Mary Beth Norton, *Liberty's Daughters* (1980) and Linda Kerber, *Women of the Republic* (1980); Ronald Hoffman and Peter Albert, eds., *Women in the Age of the American Revolution* (1989), collects several excellent essays.

Native Americans have lately received notable treatments in Richard White, *The Middle Ground* (1991); Gregory Evans Down, *A Spirited Resistance* (1992); Tom Hatley, *The Dividing Paths* (1993); and Colin Calloway, *The American Revolution in Indian Country* (1995), all of which depict Native Americans not as mere victims, but historical actors.

In general, there are two areas where further scholarship is needed. Apart from works on diplomacy and Lee Kennett's *French Forces in America* (1977), the French role remains largely unexplored. Finally, the hidden war that John Adams hinted at remains to be researched. Though its sources are few, it is now, as then, the greatest gap in our knowledge of an era that marks a turning point not only in American history but in the history of the world.

REVOLVERS. See Side Arms, Standard Infantry.

RICKENBACKER, EDDIE (1890-1973), born Edward Vernon Rickenbacher in Columbus, Ohio, changed the spelling of his name in 1918.

A famed racing car driver before World War I, he joined the army after the United States entered the war in 1917. After serving as Gen. John J. "Pershing's" personal driver and an engineering officer, he became a combat pilot. Rickenbacher shot down twenty-two German planes and four balloons and became America's Ace of Aces. To younger aviators, "Captain Eddie" loomed an intriguing hero, neither cold nor overly friendly, one who inspired by simple grace in action. As commander of the famous 94th ("Hat-in-the-Ring") Squadron, he flew against Baron Manfred von Richthofen's "Flying Circus."

After the war, Rickenbacher worked with automobile companies and shared ownership of the Indianapolis Speedway (1927–45). He became president of Eastern Airlines, 1938–59, and chairman of their board of directors, 1954–63.

A civilian air base inspector during World War II, Rickenbacher toured overseas installations. On one of these missions in 1942, his plane went down in the Pacific. He and six others survived for twenty-four days on rafts before being found.

Rickenbacher wrote two autobiographical books, *Fighting the Flying Circus* (1919) and *Seven Came Through: Rickenbacher's Full Story* (1943).

—Frank E. Vandiver

RICKOVER, HYMAN G. (1900-1986), U.S. naval officer. Hyman George Rickover is generally known as the "father of the atomic submarine," having been head of the U.S. Navy's nuclear submarine program from 1948 until his retirement in 1982.

Born in Makow (now Maków Mazowiecki), Poland, then a province of Czarist Russia, Rickover came to America at age four, his family settling in Chicago. A good student, he earned an appointment to the U.S. Naval Academy. Although Jewish in a highly prejudiced service, he was generally liked at the academy. (Later, would he renounce Judaism and become an Episcopalian.) He graduated in 1922 and as a young officer served in a destroyer and then a battleship. He received a postgraduate degree in electrical engineering and in 1929 entered the submarine service. Though qualified to command a submarine, Rickover was not given a command and in 1935 returned to surface ship duty.

For less than three months in 1937, he commanded a minesweeper operating in China. He then became a specialized engineering duty officer. Rickover was assigned to the Bureau of Ships in Washington, D.C., in August 1939, and remained there through World War II until mid-1945, most of the time responsible for the electric equipment installed in navy ships.

After the war, Rickover was one of several naval officers and civilian engineers sent to Oak Ridge, Tennessee, to study nuclear energy. Returning to Washington, he was assigned to the navy's nuclear propulsion program (began as early as 1939). On 4, August 1948, Rickover was named head of the nuclear power branch in the Bureau of Ships. The following February, he was also appointed director of naval reactors in the new Atomic Energy Commission, making him "double-hatted" in naval terminology.

Under Rickover's direction, the navy developed the world's first nuclear propulsion plant, which was installed in the submarine *Nautilus*. She got underway for the first time on 3 January 1955, and in 1958 became the first ship to reach the North Pole (traveling submerged under the arctic ice pack). Rickover subsequently directed a large number of nuclear submarine and surface ship projects.

After being passed over for selection to rear admiral by navy selection boards, Rickover used the press and his congressional contacts to force his selection to rear admiral (1953). He was subsequently promoted to vice admiral (1958), and when he reached the statutory age for retirement, he was retained on active duty by order of the secretary of the navy. He was later promoted to full admiral (1973).

Rickover took exclusive control of the selection and training of all officers for nuclear-propelled submarines and of engineers for surface ships. His interviews became notorious, often pitting a four-star admiral against a midshipman or junior officer in his twenties. The admiral was frequently bombastic and rude as he sought to determine what made the candidate "tick." Answerable to no one because of his support in Congress, the admiral attacked his peers when their programs threatened funding for his own; he also attacked members of the administration, seniors in the Department of Defense, and even officials of the shipyards that built the nuclear fleet.

His efforts resulted in a high degree of safety in the U.S. submarine force and, initially, a high degree of innovation as new designs and concepts were developed and innovative nuclear submarines were built. Rickover-trained offi-

cers and enlisted men were soon in high demand by America's nuclear power industry. His close relationship with members of Congress who had submarine shipyards, submarine bases, or nuclear facilities in their states led to extensive support and funding of navy nuclear programs.

Under Rickover's direction the United States initially led the world in nuclear submarine development. However, in the 1960s, following the loss of the U.S. nuclear submarine *Thresher*, Rickover became increasingly conservative in his approach to submarine design. Subsequently, the Soviet Union overtook the United States in numbers of submarines and in many areas of submarine technology.

Rickover's self-centered, petulant, and tactless attitudes earned him the contempt of many naval officers and officials of the government. After the retirement of most of his congressional supporters, the Reagan administration in 1981 ended Rickover's tenure. He left active duty on 31 January 1982 after sixty-four years of naval service.

Rickover received numerous citations for his efforts in the field of nuclear propulsion. He was awarded a Gold Medal by Congress (1959), was the first nonengineer to receive the prestigious Enrico Fermi Award from the Atomic Energy Commission (1965), and was a recipient of the Presidential Medal of Freedom (1980), as well as numerous military decorations, including the Legion of Merit for his wartime work in the Bureau of Ships. The main engineering building at the Naval Academy is named Rickover Hall (1974) and a nuclear-propelled submarine is named the *Hyman G. Rickover* (1983).

RIDGWAY, MATTHEW B. (1895-1993), general, World War II and Korea; Supreme Commander, *NATO; presidential adviser. Ridgway graduated from West Point in 1917 and rose through the ranks as an infantry officer. He served in a score of military and diplomatic assignments, graduated from the Command and General Staff School (1935) and the Army War College (1937), and was on staff with George C. Marshall, army chief of staff, in 1941.

During World War II, General Ridgway commanded the 82nd Airborne Division in Europe (1943-44), dropping at Sicily, on *D-Day, and at Bastogne. In 1944, he assumed command of the Allied XVIII Airborne Corps. After the war, he served in a variety of command and staff positions, and in 1950 was appointed deputy army chief of staff. In December 1950, he assumed command of Eighth Army during the *Korean War when *United Nations forces were being attacked by the Communist Chinese. His wearing of hand grenades on his jacket symbolized his determination to resist.

Ridgway moved quickly to provide motivation and halt the Chinese south of Seoul. In "Operation Meatgrinder," he counterattacked and established line Kansas, the United Nations' main line of defense across Korea. In April 1951, he replaced Gen. Douglas *MacArthur as commander of UN forces. Reluctantly accepting the stalemate in Korea, Ridgway decided it would be too costly to

take the war into China. Under orders from Washington, he initiated the truce talks which, in 1953, produced the armistice.

Ridgway succeeded Dwight D. "Eisenhower as Supreme Commander, NATO, in May 1952. Later, as chief of staff, U.S. Army (1954-55), he advocated a strong ground army, warning against Eisenhower's emphasis on airpower and "nuclear weapons. He was an opponent of America's early involvement in Vietnam (1954) and again in the 1960s. As one of President Lyndon B. "Johnson's "Wise Men" in 1968, he advocated U.S. withdrawal from the "Vietnam War.

A highly successful, if often underrated, military officer, Ridgway was a gifted organizer, strategic planner, and political-military coalition leader.

RIGHTS IN THE MILITARY, CITIZENS'. In 1962, Earl Warren, then Chief Justice of the United States, lectured at New York University on "The Bill of Rights and the Military" and expressed his conviction that the guarantees of the Bill of Rights were not antithetical to military discipline. In doing so, he acknowledged that military service would affect the exercise of those rights, and he also alluded to a perennial problem: deciding who would be subject to military law and thus within the jurisdiction of courts-martial.

The military codes and justice systems were intended to ensure discipline in the land and naval forces. What of civilians accompanying the forces? British tradition, carried over into American law, provided that "retainers to the camp, and persons serving with the army in the field," although not enlisted, were in time of war subject to military discipline. These provisions were routinely applied in all American wars until Vietnam, when two of the three members of the U.S. Court of Military Appeals ruled that the "war" had to have been formally declared by Congress. This ruling was extended to civilian paymasters' clerks and other navy employees who had been traditionally subject to military law as "persons in the naval service." Since the 1960s, civilian employees of the Department of "Defense, and of government contractors, have not been subject to military trial for offenses committed overseas, even though the offense was committed in a designated war zone like Somalia or the Persian Gulf. Precedent for this decision was a series of 1950s U.S. Supreme Court rulings which held that the military could not court-martial dependents of American military personnel for crimes committed overseas. The same series of decisions prohibited the recall from civilian life and court-martial of persons who had committed crimes while in military service. These decisions relied on World War II precedent, which held that U.S. civilians in Hawaii could not, in the years following the attack on "Pearl Harbor, remain subjected to martial law. The World War II martial law cases relied in turn on the precedent of *Ex parte Milligan*, a "Civil War-era decision in which the Supreme Court ruled 5 to 4 that military

tribunals could not exercise their jurisdiction over civilians as long as civil courts were open. Thus, in the past century, the classes of persons subject to military law—and whose civil rights are therefore limited—have been severely curtailed by judicial decisions.

The focus here is on members of the armed forces who are indisputably subject to court-martial jurisdiction and who have asserted claims either that their military status should protect them from some consequence of civil law or that civil rights doctrines should protect them from the military. Cases in the first (immunity) category are rare. In *Little v. Barreme* (1804), the Supreme Court ruled that immunity would not protect a naval officer who had relied on President Thomas "Jefferson's illegal orders and seized a neutral ship. Congress has, on occasion, provided that service members be indemnified for civil legal liability, as it did when Andrew "Jackson, then military governor of New Orleans, was successfully sued for imprisoning an editor without legal authority. In 1940, Congress passed the Soldiers and Sailors Civil Relief Act, which still protects service members from some civil actions, and in 1988 Congress provided that the United States, not government employees (including members of the armed forces), would be civilly liable for official acts of those employees. Thus, service members gain few rights by virtue of their status.

When members of the armed forces claim a violation of rights, they point either to a statute that grants the right or to the U.S. Constitution. If the right is based on a statute, courts have routinely "second-guessed" the military's interpretation of the law and protected the right. In *Brooks v. United States* (1949), the Supreme Court rejected the government's interpretation of the Federal Tort Claims Act, which would have precluded service members' claims; but in *Feres v. United States* (1950), the Court ruled that claims incident to service were barred by the Tort Claims Act. In *Bell v. United States* (1961), the Court concluded that the military could not refuse to pay "Korean War "turncoats" as "prisoners of war otherwise eligible under the Missing Persons Act.

The most difficult cases arise, however, when the service member claims the protection of a constitutional right. The Constitution itself speaks only once of the rights of members of the armed forces. The Fifth Amendment, which grants the right of a grand jury indictment for serious crimes, makes an exception for courts-martial. Therefore, all other constitutional claims involve assertions by the individual that members of the armed forces should have the same civil rights accorded other citizens, while the executive branch argues that military requirements warrant disparate treatment. Nineteenth-century constitutional challenges that claimed that a court-martial had failed to grant the petitioner the due process guaranteed by the Fifth Amendment uniformly failed. The Supreme Court ruled that as long as the court-martial had jurisdiction over the person and the offense, and the power to authority to impose the sentence, civil courts should not interfere.

In the aftermath of World War II, several subordinate courts did question the fairness of a serviceman's court-martial conviction. The Supreme Court routinely rejected such collateral attacks. Similarly, claims—particularly common during the "Vietnam War—that the armed forces were infringing on a service member's constitutional rights of speech and worship were consistently rejected by the Supreme Court on the rationale that "due deference"

should be given to commanders' discretionary judgments because the judiciary was ill-suited to second-guess those decisions. The military was seen as a "separate community," which would appropriately be judged by standards different from those applied in the civilian world. Deference reached its apogee in *Goldman v. Weinberger* (1986) when, by a 5-4 vote, the Supreme Court sustained the conviction of a Jewish officer who had violated regulations by wearing his yarmulke while in uniform. Deference may also grant certain benefits, as in *Katcoff v. Marsh* (1985), in which an intermediate appeals court concluded that the Constitution's establishment clause was not violated by funding and support for military chaplains.

There have, however, been exceptions to the doctrine of deference. On occasion, as in *Anderson v. Laird* (1972), when a subordinate court held that compulsory chapel attendance at the service academies was unconstitutional, the Supreme Court would not hear the government's appeal. In others, deference will not be granted because the judgment involved was neither military nor discretionary. In *Frontiero v. Richardson* (1973), the Supreme Court decided that a congressional pay statute which discriminated against military females claiming compensation for dependents was unconstitutional. In *Ryder v. United States* (1995), the Court ruled that the Coast Guard acted in violation of the appointments clause of the Constitution in staffing its Court of Military Review.

Any historical survey of service members' rights must conclude that the Supreme Court has consistently deferred to executive branch judgments that did not violate a statute or regulation but that would have been unconstitutional had a civilian been affected. Pending constitutional challenges to the military's treatment of homosexuals must be evaluated in that light.

RIGHT TO BEAR ARMS. See Arms, Right to Bear.

RIO PACT. See Inter-American Treaty of Reciprocal Assistance (1947).

RIVALRY, INTERSERVICE. Clearly, the chief adversary of a nation's army should be another nation's army. But in practice, it often seems that the chief adversary of a nation's army is that nation's own navy or air force, and vice versa. Military services engage not only in international rivalry but also in interservice rivalry. These latter conflicts are fought not with lethal arms or over territory, but through lobbying and over "turf"—over the allocation of military roles, missions, and budgetary shares; they are fought not with weapons but over weapons; and they are fought not just in wartime but in peacetime as well.

Interservice rivalry has existed as long as there have been different military organizations employing different means of fighting. It has been especially pronounced, however, in maritime powers, where the navy has long been equal to or superior in status to the army. These were joined in the twentieth century by a third independent service, the air force. In the United States, interservice rivalry has been further institutionalized by the peculiar nature of the American political system, particularly the separation of powers in the federal government, which has given the services opportunities to protect their rival interests. Each U.S. military service has been supported by particular constituencies in Congress and in American society.

Traditionally, support for the army was centered upon the South, with its military bases suitable for training throughout the year, and upon the Midwest, with its heavy industry producing artillery, tanks, and military vehicles. Support for the navy, conversely, was centered upon the East and the West Coast, with their ports and their shipbuilding industries. The air force was centered upon the Southwest, the location of the best bases for all-weather flying and of the majority of the major aircraft manufacturers. During the long "Cold War era, however, these regional distinctions largely faded, and the military services became more national in their constituencies.

Interservice rivalry has been most intense in the immediate aftermath of a major war, when the large wartime military budgets are contracting but the large wartime scale of the military services is still in place. In addition, the development of new weapons technologies that occurred during wartime has had unequal impact upon the different services, and this has shifted the balance of power between the services or even within them. Interservice rivalry was intense after both wars and has revived since the Cold War.

During World War II, the U.S. military services fought the war against Germany and Japan according to their own doctrines. Each had its own version of the war. The army focused on a "Europe-first" strategy, a ground war against the German Army; the navy's role was transporting and supporting the army. Conversely, the navy focused on a "Pacific-first" strategy. There, the navy would be the dominant service, with the army in a peripheral role of conquering islands, a role that could be duplicated by the Marines, "the Navy's Army." The U.S. Army Air Corps used the experience of World War II as an opportunity to obtain its independence from the army. In 1947, it became an autonomous third military service. Its emphasis in the 1930s had been on strategic bombing—seen as a war-winning strategy—rather than on tactical airpower, which would make it primarily a ground support arm.

The aftermath of World War II was an especially intense period of interservice rivalry. Within three years, the gigantic military forces and military budgets of the United States were reduced by more than 80 percent. In this context, the struggle between the services over roles and missions was fierce, consuming far more of their time and energy than the emerging Cold War struggle with the Soviet Union.

With the full and formal independence of the U.S. Air Force in 1947, the army lost its major air mission. Indeed, in the "Key West Agreement among the services in 1948, it lost any fixed-wing combat aircraft and was left with only helicopters. For a time, the army sought to compensate

for this loss of air combat forces by achieving a monopoly of land combat forces, that is, by seeking to eliminate the Marines. The Marines, however, were solidly entrenched in public opinion and Congress and were able to maintain themselves, although on a reduced scale. Throughout the 1950s, the army tried to reenter the realm of airpower by exploiting the new technology of ballistic "missiles. It had some initial success, but this route back into airpower was finally blocked by President Dwight D. "Eisenhower, who canceled the army intercontinental ballistic missile program, giving land-based missiles solely to the air force.

In the same postwar period, the navy saw the air force's aspirations to a monopoly of airpower and the delivery of nuclear and conventional "bombs and warheads to be a threat to its "aircraft carriers, which had become the core force of the navy. It quickly moved to make carriers capable of the strategic bombing mission by proposing a super-carrier, the USS *United States*. But, deferring to the air force, President Harry S. "Truman canceled this ship in 1949, leading to public protests and enforced resignations of several top-ranking naval officers, an episode that was dubbed "the Revolt of the Admirals."

The air force was the chief winner in these interservice conflicts of the late 1940s. During the next decade, through the Strategic Air Command (SAC), it continued to monopolize the strategic bombing mission, and under the Eisenhower administration it normally received fully half of the defense budget. The air force was supported by the new and politically influential aerospace industry. But the navy's development in the late 1950s of the submarine-launched ballistic missile (SLBM) broke the air force monopoly of strategic "nuclear weapons.

Similarly, the army's development in the late 1950s of a conventional war doctrine for the defense of Western Europe (termed "*Flexible Response*") was aimed at breaking the air force monopoly of ways in which to defeat the Soviet Union. President Eisenhower rejected the new doctrine, leading to the public protests and forced resignations of its principal advocates, Gen. Maxwell "Taylor and Gen. James Gavin, or a "Revolt of the Generals." This revolt and its doctrine, however, had powerful supporters, first the leading Democrats in Congress and later the next president, John F. "Kennedy, and this gave final victory to the army. These successes by the navy and the army in their struggles with the air force meant that since the early 1960s the budgetary shares of the three services have proved far more equal.

The aftermath of the Cold War produced renewed interservice rivalry over allocation of roles, missions, and budgetary shares. The army rapidly sought to become the premier service in the new conflicts characterizing the post-Cold War era, again seeking to reduce its combat competitor, the Marines. The intervention in Panama (1989) was commanded and largely monopolized by the army. The "Persian Gulf War (1991) was also fought under army command, with that service largely monopolizing the ground war and delegating a peripheral role to the Marines. The air war was largely monopolized by the air force, with the navy playing a peripheral role (via cruise missiles). Once again, the air force claimed to have made the other services obsolete.

It is now a half century since the modern tripartite allocation of roles and missions—what might be termed the *military constitution*—in the aftermath of World War II.

Although there were a few major amendments to that constitution in the course of the Cold War (the navy acquiring a strategic nuclear mission with its SLBMs; the army briefly acquiring in the late 1960s a missile defense mission with its antiballistic missile system and in the 1990s seeking it again with ballistic missile defense), the fundamental structure has remained the same, firmly institutionalized, grounded in the support provided by Congress and by the economic interests and political associations of the wider society. The prospects are that interservice rivalry in the foreseeable future will be conducted on the margins of budgetary shares.

The existing balance of power between the services is largely a product of military technologies that date from World War II and the early Cold War. However, the services are now developing and deploying new weapons systems that are based upon the most advanced integration of computers, telecommunications, and "lasers. In the future, these weapons systems will integrate and even transcend the old distinctions between land, sea-, and airpower, and they may not readily fit into the old services of the army, navy, and air force.

Predictably these established services will seek to master the new technologies, and each will try to demonstrate that it is more suited to shape the future than its rivals. But the victor is likely to discover that the price of nurturing such a radical new technology may be utterly to change the nature of the service itself.

RIVER CRAFT. Small, shallow draft vessels have played supporting roles in virtually every American conflict since the "Revolutionary War. Pole boats, said to be 60 feet long, 8 feet wide, and drawing 2 feet or less when fully loaded, ferried George "Washington's army across the Delaware.

In the "Civil War, Gen. George B. "McClellan's Army of the Potomac was saved, barely, by Union gunboats pushing up the James River to cover his retreat from before Richmond in the ill-fated Peninsula campaign. On the western rivers, small steamboats outfitted with cannon, mortars, and protective armor contributed greatly to Union victories at Fort Henry, Fort Donelson, Island Number 10, the Battle of "Shiloh, and the Siege of "Vicksburg.

The first three Union gunboats on the Mississippi were converted side-wheelers, averaging 180 feet in length, with 42-foot beams, and drawing about 6 feet of water. They carried 8-inch and 32-pounder guns. These were followed quickly by seven stern-wheelers (Eads boats or "Pook's turtles"), armored at the bow and outboard of propulsion machinery by 2.5-inch iron plate. These had a length of 175 feet, 51-foot beams, and also drew 6 feet—the maximum thought practical for operations on the upper rivers. This was the nucleus of the Union's western flotilla, a river

fleet that would number in the hundreds by war's end and include boats outfitted with monstrous 15-inch siege guns.

An interesting variant of the Union river gunboat was the "tin-clad," armored with thin sheets of iron for protection from small-arms fire. It carried 24-pound howitzers and a small number of sharpshooters. About seventy of these were built; they were used primarily to patrol the smaller tributaries of the Mississippi.

The South, seriously deficient in shipbuilding facilities, machine shops, and mills capable of rolling iron plate, still managed to put scores of gunboats on the western rivers. Virtually all were converted from civilian use. Some Confederate boats were "cotton-clads" whose crews and vital engine spaces were shielded by tightly compressed bales of cotton. Armed rams achieved the most notable of the few Southern successes in the losing campaign for control of the Mississippi basin.

In the *Vietnam War, river craft were assigned a more prominent role than in any war since the one on the American western rivers a century before. In the virtually roadless Mekong Delta, whoever controlled the waterways controlled the land, and the U.S. "Brown Water Navy" patrolled a vast network of rivers and canals throughout the country, from the demilitarized zone in the North to the Ca Mau peninsula in the South.

River craft that saw service in Vietnam fell roughly into two categories: World War II *landing craft conversions; and new construction patrol boats adapted from commercial designs.

The LCM (landing craft, mechanized) provided the hull and machinery for a wide variety of "heavy" boats assigned to the Riverine Assault Force, the naval arm of the joint Army-Navy Mobile Riverine Force. These 56-foot, diesel-powered craft displaced more than 60 tons and had a draft of about 3.5 feet. On the rivers they could make little better than 6 knots, a terrible handicap when operating in adverse currents and tides. The LCM conversions included the "monitor," the armored troop carrier (ATC), and the command and control boat (CCB).

The monitor, so called because of its slight resemblance to the Civil War ironclad, carried a 40-mm cannon and a .50-caliber machine gun in a forward turret. An 81-mm mortar and two M-60 *machine guns were mounted amidships, with one 20-mm cannon and two .50-caliber and four M-60 machine guns aft. A few monitors had powerful *flamethrowers mounted forward—from the name of the popular cigarette lighter, these were called "Zippo" boats.

The ATC was designed to carry forty fully armed combat troops. It mounted two 20-mm cannon and two .50-caliber and four M-60 machine guns. Some ATCs were decked over to permit the landing and takeoff of *helicopters. Several carried water cannon capable of washing away bankside bunkers; these, inevitably, were nicknamed "douche boats" by the sailors who crewed them.

The armament on the CCB closely paralleled that of the monitor. Sometimes called a *commandement* (a name borrowed from an earlier French boat), it was designed as an afloat command post and came equipped with additional communications and *radar gear.

The 50-foot assault support and patrol boat (ASPB) was the only new construction craft built for the Riverine Assault Force. It displaced about 35 tons and could make 15 knots in ideal water conditions. It mounted one 20-mm

cannon, one 81-mm mortar, two .50-caliber machine guns, and two automatic grenade launchers. Due to low freeboard and numerous other design flaws, the ASPB was not well received by the Brown Water Navy.

The principal craft employed by the navy's River Patrol Force was the 31-foot patrol boat, river (PBR). Adapted from a recreational design, its fiberglass hull had a 10-foot, 6-inch beam, and it drew only 9 to 18 inches. It was powered by two 220-horsepower diesel engines driving Jacuzzi high-speed jet pumps. Having neither rudder nor screws, the PBR was maneuvered by altering the direction of the jet nozzles; its speed rated at 25 knots. It carried twin .50-caliber machine guns forward and .30-caliber machine guns and a grenade launcher aft.

As U.S. participation in the Vietnam War drew to a close, virtually all of the river craft comprising America's Brown Water Navy were transferred to a Vietnamese Navy ill-prepared and ill-equipped to receive them. Relatively few are still operational, either in the U.S. Navy's inventory or in that of the victorious Communist government of Vietnam.

RIVERS, L. MENDEL (1905-1970), South Carolina congressman and House Armed Services Committee chairman. Rivers, raised in poverty, was a lawyer with the U.S. Justice Department during the depression. In 1940, he began a thirty-year career representing Charleston, South Carolina, and surrounding counties in the U.S. House. He was a member of the Armed Services Committee for most of that time, serving as chairman from 1965 until his death. Rivers was an enthusiastic proponent of a strong military and was unmistakably "hawkish" in the political debates of the *Cold War. He was unrestrained in his advocacy of increased military expenditures and the use of American power, including support for all-out prosecution of the * Vietnam War.

Rivers's constituents were well rewarded with a large number of military bases placed in his district. At the height of his career, at least one-third of all income in the First District came from the military and defense-related industries. Critics labeled his efforts "pork barrel" politics with little regard for actual national security needs.

Rivers was a traditional segregationist, though the one-time Dixiecrat had reconciled with the national Democratic Party by the time he became Armed Services chairman.

RODMAN, THOMAS JACKSON (1815-1871), U.S. *Army officer and ordnance innovator. Born near Salem, Indiana, Rodman graduated seventh in his class at West Point in 1841. He entered the artillery. Distressed by the fatal bursting of the USS *Princeton*'s flawed experimental "Peacemaker" cannon, he proposed in 1845 a novel system

of casting smoothbore heavy ordnance. Unlike conventional castings, which cooled from the outside in, Rodman cast cannon on a hollow core, cooling from the inside out. As the outer layers cooled, they compressed the inner layers, giving the cannon greater tensile strength. After initially dismissing the idea, the army's Ordnance Bureau finally approved it in 1859. The United States and European nations immediately adopted it as the method of choice until the 1880s, when steel cannon became too large to cast in one piece. Rodman also introduced mammoth, perforated cake powders, whose larger grains burned more uniformly than earlier gunpowders. He published his work in *Reports of Experiments on the Properties of Metals for Cannon, and the Qualities of Cannon Powder* (1861). During the Civil War, while the Union army made a number of "Rodman guns," Rodman himself supervised the government's Watertown Arsenal. He commanded the Rock Island Arsenal after the war and died on active duty, having reached the rank of brevet brigadier-general.

ROGERS, ROBERT. See Rangers, U.S. Army.

ROMMEL, ERWIN (1891-1944), German general. Born in Germany, Rommel served with distinction in World War I, winning the coveted Pour le Mérite medal. Rising from infantry captain in 1918 to general during the interwar years, the author of a best-selling book on infantry warfare, and increasingly an admirer and favorite of Adolf Hitler, Rommel commanded the Führer's headquarters in the Polish campaign of 1939. As commander of the Seventh Panzer Division in World War II, he then performed brilliantly in France in 1940, and commanded the Afrika Korps from February 1941 to March 1943 in the North Africa Campaign. Having achieved the position of a highly decorated and much admired field marshal, Rommel was finally defeated by Gen. Bernard Law Montgomery at El Alamein, and was recalled from his post before his corps were wiped out in May. In July 1944, Rommel was put in charge of German forces along the "Atlantic Wall" in the Netherlands, Belgium, and France. He disagreed with his superior, Field Marshal Gerd von Rundstedt, advocating impregnable beach defenses rather than reliance upon a mobile reserve to repel the threatened Allied amphibious invasion. The Germans tried to do both. Following the successful Allied invasion of Normandy, Rommel was severely wounded in an aerial attack in mid-July. Partly implicated in the plot against Hitler, Rommel committed suicide on 14 October to avoid trial and was buried with military honors as a German hero.

Like many of his generation, Erwin Rommel was a gifted, ambitious, patriotic, and politically naive officer. As long as Hitler seemed to offer him personal glory and to lead Germany toward national greatness, Rommel followed him enthusiastically. Belatedly recognizing the looming catastrophe, Rommel halfheartedly communicated with the conspirators. Made into an immensely popular figure of German soldiering by Nazi propaganda, Rommel was preserved from the humiliating fate of the more decisive plotters. For several decades after World War II, Rommel's reputation as a brilliant tactician, the "Desert Fox," and a staunch anti-Nazi made him into something of

a cult figure among military historians in Britain and the United States. More recent studies have shown him to have been much more typical of the majority of the Wehrmacht's generals who knowingly employed their professional skills in the service of an odious regime. He remains a partly tragic, partly pathetic figure who played a major role in Hitler's savage war on civilization. Rommel lacked the strength and courage to act decisively against the regime even when it had clearly become both militarily and morally bankrupt.

ROOSEVELT, ELEANOR (1884-1962), first lady, diplomat, journalist, and activist. Eleanor Roosevelt struggled to reconcile an intense abhorrence of war with a realpolitik commitment against totalitarianism. This caused her to weigh deeply held but often conflicting beliefs. In World War I, as wife of Assistant Secretary of the Navy Franklin D. Roosevelt, she worked with shell-shocked sailors at St. Elizabeth's Hospital and the American Red Cross Canteen, and this introduced her to some of the ravages of war. Later she joined the Women's International League for Peace and Freedom and chaired the Bok Peace Prize Committee. Her second monograph, *This Troubled World*, was a plea for economic deterrence instead of war. However, by late 1939, Adolf Hitler's actions led her to support U.S. military intervention in World War II. As the wife of the president, she urged women to enlist and join defense industries, corresponded with hundreds of military personnel, and used her daily newspaper column to defend the war effort while supporting civil liberties at home. She was a strong critic of Japanese American internment and the administration's policy of limiting the acceptance of refugees, and publicly supported those conscientious objectors who chose medical service and jail over enlistment.

After her husband's death in office in April 1945, as the European War ended, the former first lady urged full employment, a comprehensive veterans benefit package, and a strong United Nations. She supported the atomic bombing of Hiroshima but was silent about Nagasaki. Appointed a UN delegate by President Harry S. Truman, she orchestrated support for the Universal Declaration of Human Rights and oversaw refugee policy. Opposing Truman, she urged early recognition of Israel and UN oversight of the Marshall Plan, and only reluctantly supported the creation of NATO. As the Cold War intensified in the 1950s, she supported an economic rather than a military emphasis on containment, and in the 1960s, she opposed U.S. military involvement in Vietnam and lobbied against the stockpiling of nuclear weapons. She died still convinced that effective democracy was the most effective deterrence to both communism and war.

ROOSEVELT, FRANKLIN D. (1882-1945), thirty-second president of the United States. Born to the Hudson River aristocracy of upstate New York, Roosevelt attended Groton, Harvard College, and Columbia Law School before marrying his distant cousin Eleanor "Roosevelt" in 1905. Following election to the New York State Senate (1911-13), he served as assistant secretary of the navy in Woodrow Wilson's administration (1913-21). A devotee of Alfred T. "Mahan's writings, the young FDR championed "Big Navy" preparedness prior to American entry into World War I, instituted "Naval Plattsburg" battleship cruises to recruit civilian reservists, and advocated a system of universal military training. After a three-month tour of the battle zones in 1918, he said that "the last thing this country should do is ever to send an army to Europe again."

An unsuccessful candidate for vice president in 1920, Roosevelt overcame crippling polio to win the New York governorship in 1928 and attain the White House in 1932. Espousing isolationist views during his first two terms, FDR gave priority to New Deal reforms over foreign policy, accepted congressional revision of neutrality laws, and reacted hesitantly to Axis aggression in Asia and Europe. Notwithstanding his "Arsenal of Democracy" speech in December 1940, he had urged moderate rearmament until Adolf Hitler's conquest of France and supported the Selective Service Act of 1940 only after political opponents had introduced it. While promising to protect the hemisphere from war, he employed the neutrality patrol, the "Destroyers-for-Bases Agreement, Lend-Lease, and economic embargoes primarily to assist potential Allies (Britain, China, Soviet Union) in steps short of full belligerency. Emphasizing naval power and airpower instead of a second "American Expeditionary Force, FDR proceeded to "wage war, but not declare it."

After Japan's attack on "Pearl Harbor in December 1941 catapulted the United States into World War II, some isolationist historians later charged that Roosevelt had provoked the Japanese into firing the first shot so as to overcome American "isolationism and thus ensure support, via the Pacific "back door," for war against Japan's ally, Nazi Germany. Most scholars reject conspiracy and explain Pearl Harbor as the consequence of intelligence errors, missed clues, overconfidence, and plain bad luck. Nonetheless, Japan's attack and Hitler's subsequent declaration of war gave FDR the political leeway to implement a "Europe-first" military strategy. Fearful that mounting American "casualties in the Pacific would focus public resentment against Japan, the president reaffirmed Anglo-American plans to defeat Hitler first. Against recommendations of the "Joint Chiefs of Staff to concentrate forces in England for a cross-Channel invasion by spring 1943, he accepted Winston S. Churchill's alternative plan, Operation Torch, for the "North Africa Campaign in November 1942. This decision led logically to the invasion and conquest of "Sicily and "Italy in 1943 and effectively postponed the liberation of "France (Operation Overlord) until 1944. Apart from Roosevelt's desire for Americans to fight Germans somewhere in 1942, British strategy predominated in the two years after Pearl Harbor because England had fully mobilized, whereas America had not, and any combined operation had to depend largely on British troops, shipping, and casualties.

Despite the European emphasis, Roosevelt did reinforce the Pacific theater after victories at the Battle of "Coral

Sea and the Battle of "Midway (1942) and oversaw a controversial two-prong strategy in which the navy and Marines "leapfrogged" toward Tokyo across Micronesian atolls while U.S.-Australian forces under Gen. Douglas "MacArthur battled northward from New Guinea to the Philippines. FDR's expectation that China would figure decisively in defeating Japan and policing postwar Asia was undermined by Japan's conquest of Burma and internal bickering between Chinese Communists and Nationalists.

Because Roosevelt sought to win the war with minimal American casualties, the country never fully mobilized its population for military service. With no threat of invasion and the bulk of Axis forces engaged in Russia and China, the president gambled that "an air war plus the Russians" meant that ninety U.S. Army divisions would be sufficient for military and political goals.

Such calculations increased dependence on Soviet Russia. With the Red Army "killing more Axis personnel ... than all other twenty-five United Nations put together," Roosevelt sent the Soviets \$11 billion in Lend-Lease supplies, made promises for an early second front, and used personal diplomacy at Teheran (November 1943) and Yalta (February 1945). "Unconditional Surrender" assured a suspicious Josef "Stalin that there would be no separate peace with Hitler or his underlings. It also underscored FDR's belief that Germany deserved punishment for Hitler's crimes, including permanent partition, demilitarization, and dismantling of heavy industry. The president's postwar plans envisaged a disarmed, decentralized, and decolonized Europe initially policed by British and Soviet armies; U.S. forces would patrol the western hemisphere and replace Japanese power in the western Pacific. Because Red Army victories guaranteed Soviet hegemony over Eastern Europe, FDR urged "open" spheres and free elections and hoped that increased contacts would make the Russians "less barbarian."

Aiding the Soviets reflected Roosevelt's military advice. Despite "assured Russian military dominance" after the war, the joint chiefs invariably opposed "get tough" policies because of military necessity, including the need for Soviet help against Japan. According to Secretary of War Henry L. "Stimson in 1945, "in the big military matters the Soviet Government have kept their word." Only after the end of the war did the predominant U.S. military view of the Soviet Union change from ally to adversary.

That the cooperation with the Kremlin had limits was shown in the "Manhattan Project, the secret Anglo-American effort to acquire an atomic weapon before the Germans. Despite Danish physicist Niels "Bohr's plea in 1944 that the Russians be brought into the partnership to prevent a postwar nuclear "arms race, Roosevelt and Churchill chose to maintain their monopoly, partly as a hedge against Russian misbehavior.

The booming U.S. economy (the gross national product had jumped from \$90.5 billion in 1939 to \$211.9 billion in 1945) also provided insurance against future uncertainties, as did FDR's support for new international institutions—the "United Nations, "World Bank, and International Monetary Fund—designed to maintain peace and prosperity after the war.

The commander in chief died of a cerebral hemorrhage in April 1945, shortly after the "Yalta Conference, on the eve of final victory.

ROOSEVELT, THEODORE (1858-1919), assistant secretary of the navy, governor of New York, vice president, and twenty-sixth president of the United States. Born to a wealthy New York family, a puny, asthmatic, and near-sighted child, Theodore Roosevelt seemed destined for a sheltered life. Instead, he developed his body and an appetite for public service in an obsessive quest to prove his masculinity and to assert his independence. He became a dynamic political leader.

Roosevelt embraced things military from an early age. Two years after graduating from Harvard in 1880, he published *The Naval War of 1812*, reflecting the navalist thinking later codified by Capt. Alfred T. Mahan. Roosevelt developed his political skills as a New York State legislator, U.S. Civil Service Commissioner, and New York police commissioner. In 1897, he became assistant secretary of the navy in the McKinley administration.

An ardent advocate of the *Spanish-American War, Roosevelt used his political connections to secure an appointment in 1898 as lieutenant colonel in the First U.S. Volunteer Cavalry regiment, the "Rough Riders." His friend Col. Leonard Wood commanded the unit initially, but he left for a higher command. Roosevelt's most famous military exploit came when he led a charge in the Battle of *San Juan Hill (actually Kettle Hill) outside Santiago, Cuba. The well-publicized exploit helped him win the New York governorship in 1898 and vice presidency in 1900.

Roosevelt became president in September 1901 after President McKinley's assassination. A moralist in tone but realist in practice, Roosevelt worried about competition with Germany in the Caribbean and, later, about tensions with Japan. Diplomatically, he acted as a mediator and won a Nobel Peace Prize for negotiating an end to the Russo-Japanese War in 1905.

A fervent believer in the Mahanian doctrine of sea power, Roosevelt paid particular attention to the U.S. Navy as the first line of defense and a primary instrument of American foreign policy. He used the navy to signal American concern during the Venezuelan crisis of 1902-03 and deployed naval forces to block Colombian suppression of the Panamanian revolt in 1903, clearing the way for construction of the Panama Canal. Roosevelt operated in effect as his own secretary of the navy. A competitor in the international naval *arms race of the day, he won congressional approval for sixteen *battleships, including new, powerful dreadnoughts, and he increased the naval budget by 60 percent.

Roosevelt also pushed for more realistic and frequent training exercises. He united the navy's battleships in a true fleet formation and then sent the "great white fleet" on a world cruise from 1907 to 1909 to test its ability to operate coherently and to demonstrate U.S. naval power.

With Secretary of War (and later State) Elihu Root, Roosevelt also sought to enlarge and modernize the army.

He supported the *General Staff Act, endorsed larger unit training, elevated able officers, and approved reform legislation in 1903 and 1908 to make the National Guard a more reliable federal reserve. He also pushed for the development of aviation and the machine-gun service.

Roosevelt left office in 1909 and lost a bid for the presidency in 1912 on the Progressive Party ticket. As a former president, he played a leading role in the military "Preparedness" movement in 1915-17 for universal military training and for a larger navy. He assailed Woodrow *Wilson's foreign and military policies, urging the United States to enter the war after the sinking of the **Lusitania* in 1915. Upon American intervention in 1917, Roosevelt asked to lead a volunteer division, but President Wilson refused. During World War I, Roosevelt denounced dissenters and urged a postwar coalition with Britain. He died shortly after the end of the war.

ROOSEVELT COROLLARY TO THE MONROE DOCTRINE (1928). Threats by European powers to occupy the customshouses of defaulting governments in such nations as Venezuela and the Dominican Republic, coupled with the specter of foreign acquisition of military bases in the western hemisphere, led President Theodore *Roosevelt to declare in his annual message of December 1904 that "chronic wrongdoing" or "impotence" on the part of neighboring countries might force the United States to exercise "an international police power," his so-called Corollary to the *Monroe Doctrine.

Roosevelt proceeded to exercise such power in Santo Domingo without injury to the national reputation, and William Howard Taft did the same in Nicaragua. But when Woodrow *Wilson mounted successive military interventions aimed at installing democratic government in Mexico and elsewhere, U. S. prestige began to erode.

Wilsonian intervention left hard feelings on both sides of the Rio Grande contributing to the *isolationism of the 1920s, and one casualty of this shift in sentiment was the Roosevelt Corollary. Impugned by Republicans on the basis of a technicality as outlined by Herbert Hoover's Undersecretary of State, J. Reuben Clark, in a memorandum of December 17, 1928, it was further repudiated by sweeping Democratic pledges of non-intervention at Montevideo (1933) and Buenos Aires (1936).

Disinterested benevolence was the order of the day. However, the principal reason for the Corollary's demise was geopolitical. No longer was it a matter of forestalling an Anglo-German naval demonstration such as had occurred in the Caribbean during the years 1902-03 to force payment of the Venezuelan debt. New international machinery for the adjudication of default was in place; Berlin had tasted defeat and London was friendly. The problem facing Franklin *Roosevelt and his successors was how to deal with socialist subversion based on a portrayal of the

United States as grasping and overbearing. Since such a threat was covered, at least indirectly, by Monroe's original dictum (1823), latter-day intervention by Lyndon B.

• Johnson and Ronald * Reagan could be carried out without reference to, or revival of, the Roosevelt Corollary. And so it was.

ROOT, ELIHU (1845-1937), Wall Street lawyer, secretary of war, secretary of state, U.S. senator. Root was a Wall Street lawyer, familiar with corporate reorganization and international law, when President William *McKinley appointed him secretary of war in 1899. In the wake of the *Spanish-American War, McKinley wanted a secretary who could handle the complexities of administering the new overseas possessions in the Caribbean and Pacific and also reorganize and modernize the War Department following the chaotic mobilization of 1898.

This conservative Republican proved to be not only a competent administrator of Colonial policy in the Philippines and *Cuba, but also a reformer who propelled the U.S. Army into the twentieth century. The "Root Reforms," accomplished while he was secretary of war (1899-1904) under Presidents McKinley and Theodore *Roosevelt, mark him as one of the most important secretaries of war in United States history. Responding to modernizers in the officer corps, Root expanded the army's postgraduate schools, organized them into a coherent system, and established the Army War College in 1900. He also enlarged the peacetime army to meet overseas responsibilities; rotated officers assigned to the War Department's staff bureaus to freshen departmental administration; and helped modernize the National Guard according to federal standards. Finally, he led the legislative campaign for the *General Staff Act to provide for central army direction and planning, which Congress approved in 1903.

He later served as Theodore Roosevelt's secretary of state (1905-09), as Republican senator for New York (1909-15), and as president of the *Carnegie Endowment for International Peace (1910-25), winning the Nobel Peace Prize in 1912. He was a delegate (1921-22) to the conference that led to the Washington Naval Arms Limitation Treaty and an advocate of the World Court.

ROOT REFORMS. See General Staff Act (1903).

ROSECRANS, WILLIAM S. (1819-1898), Civil War general, businessman, and politician. Ohio-born and largely self-educated, Rosecrans graduated from West Point in 1842. Resigning his commission after twelve uneventful years, he pursued a variety of unsuccessful business ventures. Rejoining the army in 1861 as a brigadier general in the Civil War, he conducted the critical operations that ejected Confederate forces from western Virginia. In 1862 he moved to the western theater, leading part of the *Union army that seized Corinth, Mississippi. Thereafter,

as a district commander, he held his own in the indecisive battles of Iuka and Corinth.

Promoted to major general, Rosecrans assumed command of the Army of the Cumberland in late October 1862. Charged with regaining middle and eastern Tennessee for the Union, he advanced from Nashville in December and precipitated the Battle of *Stones River. After two days of intense fighting, he successfully held the field, thereby winning the Union's only military triumph at the end of 1862.

Six months later, Rosecrans resumed his advance toward Chattanooga, Tennessee. Clearing middle Tennessee in the masterful Tullahoma campaign, he next lunged across the Tennessee River into Georgia, driving Confederate forces from Chattanooga. Incautiously continuing his advance until confronted by a reinforced Army of Tennessee, he was attacked on Chickamauga Creek—the Battle of *Chickamauga—in late September. Nearing exhaustion, he issued a faulty order that collapsed his line and forced him from the field while much of his army still resisted. Relieved of command in October, he was given the Department of Missouri in 1864 but did not distinguish himself during a Confederate raid.

Postwar, Rosecrans served variously as minister to Mexico, register of the Treasury, congressman, and California rancher. Brilliant but erratic, touted before Chickamauga as a potential general in chief or presidential candidate, Rosecrans saw his military career essentially ended by a single error in judgment on 20 September 1863.

ROSIE THE RIVETER. See Gender and War.

ROSTOW, WALT W. (1916-), U.S. national security adviser, 1966-69. Walt Rostow was one of the leading American strategists during the *Vietnam War. Throughout the conflict, he maintained a pro-war position. A prominent and well-respected professor of economic history at the Massachusetts Institute of Technology, Rostow was brought to the White House by President John F. *Kennedy in January 1961 as deputy national security adviser. He later developed the "Rostow thesis," which held that an externally supported insurgency could be defeated only by military action against the external source of support. The thesis called for a series of escalating military measures designed to raise the cost of supporting the insurgency. As the number of American ground troops in Vietnam increased by early 1966, Rostow emerged as the leading proponent of President Lyndon B. *Johnson's Vietnam policy. In March 1966, Johnson named him national security adviser; he became one of the president's closest foreign policy advisers and a major advocate of bombing North Vietnam.

Rostow left government service at the end of the Johnson administration in 1969. His strong association with Vietnam policy left him estranged from some in the American academic community. He accepted a teaching position at the University of Texas, where he continued to teach and to write books on history, economics, and international affairs.

ROTC—the Reserve Officers Training Corps—is the program for training students in American universities, colleges, high schools, and academies to serve as officers in the U.S. armed forces. Since World War II it has provided the majority of active duty and reserve officers, particularly junior officers, for the armed forces.

Although the ROTC program was established in 1916, the idea of obtaining military officers from civilian institutions dates back to the "citizen-soldiers of the colonial militia units. In the new republic, while the federal government founded its own military and naval academies for officering the regular forces, and a few states had private military academies, most officers in the state militias (later National Guard) and the ad hoc wartime units of volunteers were civilians temporarily in uniform. Their preparation came from prior military experience, militia membership, or simply by reading military manuals.

The "Civil War expansion of the army showed the need for a more widespread training of such citizen-officers. The idea of including military training in public colleges was incorporated into the Morrill Act of 1862, which granted public lands for the establishment of colleges and provided that military tactics should be offered as part of the curriculum in these land-grant institutions. The federal government provided some funding and the War Department assigned some active duty or retired officers as professors of military science and tactics. By 1893, some seventy-nine colleges and universities provided such military instruction, varying by state or institution as to whether it was voluntary or compulsory for male students. Between 1865 and 1919, West Point continued to be the main source of commissioned officers for the regular army. The graduates who had taken military courses at the land-grant colleges were neither commissioned nor registered with the War Department.

The growing size of armies and the emergence of the United States as an active world power in the early twentieth century led some military planners, businesspeople, and college presidents to advocate a regularized system of commissioning reserve officers from the citizenry. In 1913, Gen. Leonard "Wood, the army chief of staff, with several college presidents established summer military training camps for college students. After the outbreak of World War I, these formed the model for summer military training camps, held at Plattsburg, New York, and elsewhere in 1915 and 1916, for some 13,000 business and professional men. General Wood, former President Theodore "Roosevelt, and former Secretary of War Elihu "Root obtained federal funding for the camps and the commissioning of their graduates in the army's new Officers Reserve Corps.

The National Defense Act of 1916 also authorized the creation of a campus-based Reserve Officers Training Corps in its modern form. Students would take a two-year basic course plus a two-year advanced course; in addition to their regular academic courses, they would also participate in summer field training, and some would be eligible for scholarships and living allowances. Those who com-

pleted the four-year program would become commissioned officers with the regulars or the reserves. U.S. entry into the war in 1917 came as ROTC was just being established. Although ROTC provided some wartime officers, the majority came from the enlisted ranks of the regular army and National Guard, from Plattsburg camp graduates, and from civilians who went through ninety-day officer training camps established by the army during the war. Reserve officers provided 43 percent of the World War I officers, yet the army still obtained only half the 200,000 officers it desired to lead 3.5 million men.

Because the war had demonstrated the shortage of pre-trained citizen-officers, the National Defense Act of 1920 expanded the two main programs for preparing reserve officers: the summer camp-oriented Civilian Military Training Corps and the larger, campus-based ROTC. By 1928, there were ROTC units in 225 colleges and universities, 100 high schools and academies, with a total enrollment of 85,000 students. ROTC commissioned about 6,000 graduates each year. In addition, the U.S. Navy created Naval ROTC (NROTC) in 1926 with the units initially at six colleges and universities.

In the antiwar and antimilitary mood of the 1920s and early 1930s, peace activists, educators, and clergy, including John Dewey and Oswald Garrison Villard, formed the Committee on Militarism in Education, to challenge ROTC and military drill programs in high schools. The committee was more successful at the secondary schools than in higher education, for the Supreme Court upheld the right of states to make military training compulsory in state colleges.

With the adoption of the draft and the buildup of the army in 1940-41, ROTC graduates provided many of the required junior officers. During American participation in World War II, as the army expanded to 8.3 million men and women, the largest number of officers came from the enlisted ranks and received three to four months' training at Officer Candidate Schools run by the army. About 120,000 also came through ROTC, but the wartime army fell far short of its desired quota of officers. The navy and Marines obtained wartime officers through NROTC units at two dozen colleges and universities plus special officer training programs at dozens of schools.

Since World War II, ROTC has been the primary source of officers for all the armed forces. (A separate air force ROTC program, AFROTC, was established in 1947.) During the "Korean War, 70 percent of the 26,800 lieutenants called to active duty by the army between 1951 and 1953 were ROTC graduates. The program also supplied a high percentage of the junior officers for the "Vietnam War in the 1960s and early 1970s. Even though the compulsory basis of ROTC had been ended at all public institutions after 1961, the unpopularity of the Vietnam War led to protests and demonstrations on many campuses against the program. Still, in 1968 there were 150,000 students in the initial two-year course. Antiwar and antimilitary sentiment led several colleges and universities to drop their ROTC units.

In the 1980s, however, the number of units grew again, and by the end of the decade, there were army ROTC units at 300 colleges and 800 high schools, AFROTC at 150 colleges and 300 high schools, and NROTC at 65 colleges and 230 high schools. A smaller military in the post-Vietnam and post-Cold War eras required fewer officers. The ROTC

programs of the army, navy, and air force had a total enrollment of about 100,000 students in the 1990s.

RULES OF ENGAGEMENT (ROE) are directives issued by commanders that control the use of military force. Basic standards for the use of force have been with the U.S. military since the *Revolutionary War. The classic example was: "Don't shoot until you see the whites of their eyes." Although basic standards for the use of force have long been used, the term *Rules of Engagement* is of recent origin. Detailed ROE standards were developed during the *Cold War era, partly in response to the changing technology and increasing lethality of weapons.

The *Laws of War (LOW) include international treaties and customary practices that guide civilized nations. The basic LOW principles of necessity, proportionality, and avoiding collateral damage are the fundamentals that guide the drafting of ROE for all U.S. military operations.

In the 1980s, a series of incidents caused a reexamination of ROE for U.S. forces. The multinational force ROE in Beirut in 1983 restricted sentries from loading their weapons without instructions from a commissioned officer. This rule was in effect when a suicide truck-bomber ran the gate of the U.S. compound at the Beirut airport, destroying the Marine barracks and killing 241 Marines. In another incident, ambiguous ROE for the warship USS *Vincennes* contributed to the destruction of a civilian Iranian airliner and the death of all aboard on 3 July 1988. After an extensive review, the * Joint Chiefs of Staff in 1994 approved new Standing Rules of Engagement (SROE) to replace the Peacetime Rules of Engagement (PROE) in use since 1988. The SROE provide for self-defense whenever U.S. forces are subjected to a hostile act or when there is clear evidence of hostile intent.

Military lawyers are usually involved in the preparation and dissemination of ROE, but guidance on the use of force is ultimately the commander's responsibility. When U.S. forces engage in multinational or *United Nations-sponsored operations, U.S. policy now requires effective ROE that provide adequately for both mission accomplishment and self-defense.

RUSH-BAGOT AGREEMENT (1817). After the *War of 1812, an Anglo-American arms race threatened the peace. Fearing U.S. encroachments, Canada stationed warships on the Great Lakes and demanded that Great Britain follow suit. America responded with its own vessels. Britain

preferred, however, to focus its naval energies on the high seas, while America—confident that it could construct ships quickly if crisis loomed—wished to avoid an expensive naval race. A mutual disarmament treaty therefore appealed to both nations. In notes exchanged between British minister Charles Bagot and Acting Secretary of State Richard Rush, America and Britain pledged to maintain no more than one ship each on Lakes Champlain and Ontario, and only two on the remaining Great Lakes. This accord neither completely nor immediately disarmed the lakes, nor did it address land forces; but it did constitute the first qualitative disarmament treaty in history. No more warships were introduced, the Anglo-American "era of good feelings" continued, and tensions eased along the border. Responding to war threats in 1940, both Canada and the United States modified Rush-Bagot to permit naval construction and training.

RUSSELL, RICHARD <1897-1971>, governor of Georgia and U.S. senator. A widely respected political figure, Russell, a Democrat, served in the U.S. Senate from 1933 to 1971. As chairman of the Armed Services Committee from 1951 to 1968, he greatly influenced American military and foreign policy in the post-World War II era.

A leader of southern senators against civil rights, Russell unsuccessfully opposed President Harry S. *Truman's 1948 integration of the military. In 1951, his deft leadership helped assuage the outcry over Truman's dismissal of Gen. Douglas *MacArthur, commander of *United Nations forces in the *Korean War. As chairman of a Senate inquiry into MacArthur's dismissal, Russell provided Truman's congressional opponents an outlet for their anger and prevented expansion of the war and cancellation of armistice negotiations.

Although a strong supporter of Truman's Korean policy, Russell opposed America's initial involvement in Southeast Asia in 1954. By the mid-1960s, he became a reluctant supporter of Presidents Johnson and Nixon's escalation of the *Vietnam War, although he expressed strong concerns that neither man was willing to pursue a decisive victory over North Vietnam. In 1968, Russell relinquished his Armed Services chairmanship in order to head the Appropriations Committee, where he secured continued funding for the war.

RUSSIA, U.S. MILITARY INTERVENTION IN, 1917-20. American intervention in Russia developed in response to the political turmoil and great power competition triggered by the Russian Revolution and civil war. President Woodrow *Wilson and his advisers enthusiastically welcomed the revolution of March 1917, seeing the overthrow of the incompetent and allegedly pro-German Czarist regime as a triumph of American political principles, an opening to displace German and British rivals for Russian

markets, and an opportunity to revitalize Russia's military effort against the Central Powers at the moment when the United States was entering the Great War on the side of the Allies. However, in the following months, Bolsheviks and other antiwar radicals challenged the Russian provisional government's continuation of the war and stimulated socialist and pacifist agitation in foreign countries. In response, in the summer and fall of 1917, American officials offered financial and political support to the liberal and moderate socialist leaders of the provisional government and approved publicity campaigns to counter Bolshevik and German propaganda.

The American loans and pro-war propaganda did not prevent the Bolsheviks from seizing power in Petrograd (now St. Petersburg) in November 1917. Five weeks later, on 12 December 1917, President Wilson and Secretary of State Robert Lansing authorized covert financial support for anti-Bolshevik forces then gathering in southern Russia. American leaders hoped the Cossacks and Russian officers would be able to block German access to Russian resources and would serve as a nucleus from which a democratic Russia could be regenerated.

While Wilson was willing to provide money and moral encouragement to anti-Bolshevik groups, in the first half of 1918 he repeatedly declined British and French proposals for direct military intervention in Russia. Wilson and his top advisers feared that Allied intervention, particularly by Japanese soldiers, would cause Russians to rally around the Soviet government and seek protection from Germany. American leaders also believed that the war was going to be won on the western front, that diverting forces from France would be unwise, that Allied proposals to recreate an eastern front were impractical, and that condoning or participating in expeditions to Russia would undermine American popular support for the war.

After the Bolsheviks ratified the Treaty of Brest-Litovsk with the Central Powers and Germany launched a new western offensive in March 1918, Allied leaders intensified their pressure for military intervention in Russia. In the United States, Congress and the American people grew more favorable to action that might keep German forces in the east. At the same time, anti-Bolshevik leaders outside Russia issued numerous appeals for the liberation of their country from Bolshevik and German domination.

By the end of May, Wilson agreed to contribute American soldiers to an Allied expedition to northern Russia, and in early July he consented to Allied requests for an American expedition to Siberia. On 17 July 1918, Wilson issued an *aide-memoire* that explained to Allied leaders that he remained opposed to military intervention directed at the unrealistic objective of restoring an eastern front. American forces, he declared, could only be used to guard military stockpiles at Archangel and Vladivostok, to assist pro-Allied Czechoslovakian soldiers who had come into conflict with Red forces along the Trans-Siberian Railway, and to aid patriotic Russians who were attempting to organize armies and regain control of their affairs.

Despite Wilson's strictures, American forces became involved in fighting Bolsheviks. In early August, shortly after anti-Bolshevik forces overthrew the local Soviet government at Archangel, the USS *Olympia* sailed into the port and deployed fifty bluejackets, twenty-five of whom immediately joined Allied soldiers in chasing Bolsheviks retreating to the south. On 4 September, the 4,500 men of

the 339th Infantry Regiment arrived at Archangel. While Lt. Col. George E. Stewart lacked clear instructions about the deployment of his command, the U.S. ambassador to Russia, David R. Francis, authorized the assignment of American soldiers to the front lines along the Dvina River and the Archangel-Moscow railway. In the following months, the American North Russian Expeditionary Force suffered, more than 500 total "casualties, including 100 killed in combat with numerically superior Red Army units. The Wilson administration's failure to provide a convincing explanation for why American troops remained in northern Russia after fighting against Germany ceased in November 1918 exacerbated declining troop "morale among the Americans and provoked demands by their relatives for the return of the expedition. In February 1919, facing persistent criticism from Republican senator Hiram Johnson of California and many other members of Congress, President Wilson ordered the withdrawal of the expeditionary force, which was carried out in June 1919.

Though the Archangel expedition involved "dough-boys" from the Great Lakes region, most of the American soldiers dispatched to Siberia were from the West Coast. In August 1918, the 27th and 31st Infantry Regiments sailed from the Philippines to Vladivostok. On 1 September, they were joined by 5,000 men from the Eighth Division. Although some American diplomats and officers hoped to provide active military assistance to anti-Bolshevik armies, Gen. William S. Graves, commander of the Siberian expedition, followed a strict interpretation of President Wilson's *aide-memoire* and tried to keep American forces largely neutral in the civil war. In patrolling the railway between Vladivostok and Lake Baikal, however, American soldiers safeguarded the route over which American and Allied supplies were shipped to anti-Bolshevik armies under Adm. Alexander Kolchak in western Siberia. Consequently, American forces clashed both with Red partisans who attacked the railroad and with Cossacks who contested Kolchak's authority in eastern Siberia.

As in the case of the Archangel expedition, the Wilson administration faced demands to bring American soldiers home. Yet Wilson and his advisers had committed themselves to supporting Kolchak, and they worried that withdrawing the American expedition while 70,000 Japanese soldiers remained in eastern Siberia would lead to the establishment of an exclusive Japanese sphere of influence. American officials decided to evacuate the U.S. forces only after the Red Army drove Kolchak's troops eastward across Siberia in the fall of 1919. American soldiers completed their departure from Vladivostok in April 1920.

The limited American interventions in Russia failed to sustain democracy, protect American loans and investments, revive Russian military resistance to Germany, or prevent the Red victory in the Russian civil war of 1917 to 1920. While aid to anti-Bolshevik armies and an economic blockade of Soviet Russia did not eliminate the menace of Bolshevism, they aggravated Bolshevik suspicions of the West and provided Soviet leaders with major themes for anti-American propaganda over seven decades. Wilsonian policy toward Russia also had lasting repercussions in the United States, where senators like Hiram Johnson and many other progressives and socialists viewed the "secret" interventions as dangerous precedents of presidential usurpation of war powers and ominous signs that membership in the "League of Nations would entail fur-

ther interventions around the world to suppress revolutionary change.

Intervention in Russia has been a subject of enduring controversy among American historians. "Orthodox" or traditional scholars have tended to portray the military expeditions to northern Russian and Siberia as reluctant aberrations in Wilsonian foreign policy caused by the exigencies of waging war against Germany. "Revisionist" or "New Left" historians, on the other hand, have tended to view the expeditions as parts of a wider effort to contain the ideological threat of Bolshevism and overthrow the Soviet government.

RUSSIA, U.S. MILITARY INVOLVEMENT IN, 1921-95. By 1921, the United States had withdrawn its military forces from Russia and entered a long period of official noninvolvement. After opening diplomatic relations with the Soviet Union in 1933, the only military involvement was the usual stationing of military attachés and Marine guards at the U.S. Embassy in Moscow.

In World War II, as a cobelligerent with the Soviet Union against Germany and Italy, the United States provided extensive material military assistance to the Soviet Union under the "Lend-Lease Act and Agreements. And in 1944, some U.S. aircraft flying bombing missions against targets in German-occupied or German-allied Central and Eastern Europe landed on airfields in the Soviet Union. U.S. military personnel were thus involved in the military supply effort (by sea in Murmansk, by air through Alaska, and by land through Iran) and to a limited extent in direct support of U.S. air combat operations.

After this cooperative engagement in World War II, as U.S.-Soviet relations plummeted into the "Cold War" during the years after 1945, there was again no direct U.S. military involvement in Russia. There was, however, an active U.S. military role in air and sea reconnaissance along the borders of the Soviet Union. Sometimes inadvertently, and sometimes deliberately, such forays transgressed into illegal incursions into Soviet coastal water and air space. There were also some military, as well as "Central Intelligence Agency, deep air penetrations. This led to dozens of incidents and the shooting down of thirty-one U.S. military aircraft along Soviet borders between 1950 and 1970. Some minor accidental collisions of U.S. "submarines and Soviet ships took place in or near Soviet waters, and there was one deliberate minor collision between surface warships in Soviet territorial waters in 1983.

In only one instance during the Cold War did the United States engage in direct military combat action against a target in the Soviet Union, and then not deliberately. During the "Korean War, in 1950, an American

fighter-bomber by error bombed and strafed a military airfield in the Soviet Union near North Korea.

As the Cold War drew to a close, such incidents declined sharply. Moreover, new forms of cooperative and even collaborative contacts emerged. The Intermediate Nuclear Forces ("INF) Treaty in 1987 provided for inspection of intermediate-range missile facilities in the two countries, and U.S. military inspectors thereafter visited many locations in the Soviet Union. This pattern expanded under the START Treaty of 1990, both treaties going beyond the SALT agreements of 1972 in providing exchanges of military information as well as on-site inspection.

Following a meeting of Soviet minister of defense Dmitry Yazov and U.S. secretary of defense Frank Carlucci in 1987, a series of bilateral high-level military contacts took place. The respective military chiefs of staff, Marshal Sergei Akhromeyev and Adm. William "Crowe, reciprocated visits in 1988-89. Many military exchanges at lower levels, including from respective War Colleges, ensued. Ships of the two navies also carried out courtesy calls.

Such cooperative relations continued between Russia and the United States after the Soviet Union dissolved at the end of 1991. By 1995, perspective collaboration in "peacekeeping operations during the "Bosnian Crisis was planned with Russian troops under a senior American commander. A new era had arrived.

RUSTIN, BAYARD (1910-1987), pacifist and civil rights activist. Born in Westchester, Pennsylvania, Rustin was raised by his grandparents as a Quaker. As an African American of developing political consciousness, Rustin joined the Young Communist League in New York City in the early 1930s, but quit in 1941. He then joined the "Fellowship of Reconciliation, and in 1942, helped form the Congress of Racial Equality (CORE). Rustin spent two years in prison as a conscientious objector during World War II. Afterwards, he joined various anticolonial organizations, including the Free India movement and the Committee to Support South African Resistance. In 1947, he participated in CORE's Journey of Reconciliation, precursor to the 1960s Freedom Rides. Rustin also served as executive director of the "War Resisters League (1953-55).

Best known for his work in the civil rights movement, Rustin joined the Montgomery Bus Boycott, helped conceive the Southern Christian Leadership Conference, and was a key organizer of the 1963 March on Washington. Although one of Martin Luther "King, Jr.'s, closest advisers on "nonviolence and political strategy, Rustin remained on the periphery because of his homosexuality and his ties to the Left. In the mid-1960s, he was among few who urged King to take a political stand against the "Vietnam War. Subsequently, he sought to minimize King's stance to preserve the fragile civil rights coalition.

In six decades of political activism, Rustin shifted from a racially conscious leftist to a more humanist-oriented pacifist and advocate of coalition politics.

SAIGON, BATTLE FOR (1968). On 31 January 1968, during the Vietnam War, the North Vietnamese and their Viet Cong (VC) allies in South Vietnam launched the massive *Tet Offensive. Timed to exploit reduced South Vietnamese vigilance during lunar New Year celebrations ("Tet"), the offensive was intended to spark an insurrection by disaffected southern civilians and military units against the American-backed regime with its capital in Saigon. Given the offensive's overtly political purpose, attacking prominent targets in Saigon was key to Hanoi's plans to spark a southern revolt.

At about 3:00 a.m., just as the last volley of Tet celebratory fireworks was set off, a variety of targets were attacked in and around Saigon: air bases, southern military and police headquarters, U.S. military command and billeting facilities, and television and radio studios. Although Communist forces had tipped their hand by mistakenly attacking Huế and others cities to the north of Saigon on 30 January, Americans were shocked by the realization that about 4,000 VC could infiltrate the capital and launch vicious attacks.

The most spectacular engagement in Saigon occurred when the VC C-10 Sapper Battalion penetrated the U.S. Embassy compound, prompting a desperate shootout with security guards and embassy staff. The VC were cleared from the embassy grounds by 9:00 a.m., but American reporters, who had witnessed the fight, were shocked by Gen. William Westmoreland's assertion that this was a VC publicity stunt and militarily meaningless. The American public was also shocked by television, film, and still photographs of the summary street execution of a suspected VC commando by Nguyen Ngoc Loan, the South Vietnamese chief of Saigon's security forces.

Westmoreland's prediction was accurate militarily; within forty-eight hours, allied forces in Saigon were hunting down the VC, and by 16 February, the battle for Saigon was over. But politically the Tet attacks, especially the VC success in turning Saigon into a battlefield and the false news reports that the VC had actually penetrated the embassy building itself, produced a political uproar in the United States, particularly because they seemed to clash with previous government and military assurance that the VC had been crushed. The summary street execution also revolted many Americans. The credibility gap resulting in part from the Tet Offensive and the Battle for Saigon ultimately prompted President Lyndon B. Johnson not to run for reelection and American officials to reduce U.S. military involvement in Southeast Asia.

SAILING WARSHIPS. The infant U.S. republic was blessed in that the premier naval weapons system of the day was one it could produce well and use effectively. Modern designers might well pine for a vessel with the nearly unlimited range, comparatively low construction cost, and ease of repair and resupply offered by the sailing man-of-war. Sailing vessels needed only the wind to move them and the food and water to support their crews. Range and endurance depended on how much food and water a given ship needed to get to the next source of supply. Effective repairs of even the most severe damage to a wooden vessel could be and often were carried out on the beach, with tools of the crudest sort.

Building Sailing Warships. The technology of the sailing warship itself was relatively stable from 1775 to 1862, requiring no expensive research and redevelopment each decade or so. Sails, ropes, timber, and guns were the components of the vessels themselves. Hemp for cordage and sails was an early crop in the colonies, and one useful for more than warship construction. Timber, the most basic and vital component of the wooden sailing warship, was present in profusion. Cannon were the most difficult component to produce in the colonies, but the United States produced simple iron smoothbore tubes and round shot as early as 1777. Stable gunpowder would prove most difficult to manufacture, but at least that was a commodity widely available on the international market.

British naval architects quickly realized that the naval stores to be found in the New World were of superior quality to the gleanings centuries of deforestation had left in the British Isles themselves. New England pines and cedars offered masts and spars of such great strength and height as often to negate the need to construct the composite masts that His Majesty's larger ships otherwise required. Moreover, North America produced over seventy-five species of oak, which offered the greatest strength and damage resistance to wooden vessels. The squat and hardy southern live oak (*Quercus virginiana*) offered more advantages for wooden ship construction than many British shipwrights were equipped to employ. The wood grew in useful shapes and was fantastically strong—so much so that it discouraged the builders whose tools it dulled and who found it difficult to work. American shipwrights would come to understand that it could be soaked in brine and made workable, and it soon became apparent that salt water had a tremendous preservative effect on the wood. Thus, after two centuries of naval service, the USS *Constitution*, "Old Ironsides," retains 20 percent of her original

timber: a remarkable fact given that the life span of a man-of-war might be considered long at forty years.

The timber itself prompted strains that would contribute to the independence of the United States and play a role in the nature of its earliest navy. British law dictated that prime trees would be marked with the "broad arrow" of the crown and could not be used except for naval construction. It made considerably more economic sense to construct completed vessels in the colonies, as soon became the case for merchant vessels. Colonial shipwrights came to resent the preemption of the finest local timber for the Royal Navy and the British policy of constructing vessels no larger than the welterweight frigates of the era in American yards. In at least subordinate ways, these forces would contribute to American resentment of the crown in the 1760s and 1770s.

The nurturing environment that had led to the construction of the very large colonial merchant marine allowed the *Continental navy, and its successor, the U.S. *Navy, to build or convert functional vessels effectively and quickly. Even the earliest vessels of the fleet could be tremendously effective. The tiny sloop *Providence*, built as *Katy* and armed with cannon stolen from a British fort in 1774, would bedevil the British until 1779, raiding British commerce until finally trapped and burned in the face of overwhelming force. American shipwrights during the

* Revolutionary War and the *War of 1812 constructed tire fleets of warships on Lake Champlain and the Great Lakes from imported fittings and standing timber, in as little as nine weeks. The relationship of civilian to military ship technology was sufficiently close to allow privateers—armed vessels outfitted by merchants—to wage a devastating campaign against the British merchant marine in two wars. The Americans built well. The frigates authorized by the Continental Congress in 1775 would perform as creditably as conditions and the varying skills of the commanders allowed, and their designers would be available when the U.S. Navy placed its first orders for purpose-built men-of-war in 1794.

The skills of the wooden shipwright were largely a matter of genius and intuition. Once again, the infant country was fortunate. Joshua Humphreys of Philadelphia designed frigates in the Revolution and had observed their fates when overhauled by powerful British squadrons or larger vessels. The designs he submitted to Congress embodied Secretary of War Henry Knox's brilliant concept that a ship should be able to outrun any opponent it could not outfight, and influenced American naval architecture until well past the advent of steam. Among Humphrey's other creations was the *Constitution*. Humphrey's son, Samuel, and rivals such as Henry Eckford and Adam and Noah Brown were profitable civilian designers and successful military naval architects. Costs stayed low enough for the cities of Boston, New York, and Philadelphia to build ships with local contributions and present them gratis to the infant navy.

Types and Performance of Sailing Vessels. The ratings system most widely used in all navies of the period depended on the number of cannon a given vessel could carry into battle, whether she carried them or not. The system was inexact. The *Constitutions* official rating was 44, the number that followed her name in contemporary records and histories. In fact, the vessel carried a mixed battery of up to fifty guns, including a main battery of long

24-pounders and short carronades, which could fire a heavier 32-pound ball for a much shorter distance. The Royal Navy's somewhat more accurate system never became established in the U.S. Navy since that arm's ships did not conform to its standards, but it provides perspective on the range of vessels in use of the time.

Ships "of the line," expected to participate in the battle line at fleet actions, ranged as low as "5th Rate," such as HMS *Serapis*, which fell victim to John Paul *Jones, rated at forty-four guns but classed as a small ship of the line because she carried them on two gun decks, unlike the heavy frigate *Constitution*, which would have made short work of her. The larger, workhorse "seventy-fours" celebrated during the Napoleonic era were "3rd Rates" under this system; among these, the U.S. Navy boasted Henry Eckford's beautiful USS *Ohio* of 1820. Nelson's *Victory*, 103 guns, was officially a 1st Rate, although a monster larger than she would appear in the U.S. Navy, Humphrey's *Pennsylvania*, of 1840, designed to carry 132 long "32-pounders."

Lighter vessels ranged upward from the *cutter*, a single-masted schooner with as little as one cannon on the open deck, or nothing but swivel guns mounted on her railings. Thomas *Jefferson's navy experimented with gunboats, colloquially named *Jeffs*, of one or two heavy guns—tiny ships that had little to offer in terms of seakeeping ability and endurance. The term *sloop* was used to denote almost any sort of vessel, from the single-masted *Providence* with her battery of twelve 4-pounders to the formidable *Cumberland* of 1862, with a three-masted "ship" rig, armed with a battery of twenty-four tremendous cannon. A *corvette* was a sloop with her guns mounted on an open spar deck. One tremendously successful ship design was the two-masted *brig of war*, with two masts and varying battery, easy to work and fight with a smaller crew. *Niagara*, a restored veteran of the Battle of Lake Erie (1814), remains today a superb vessel of this type, with a single battery of carronades on her spar deck and a shallow, fresh-water hull.

Larger still were the famous frigates, the commerce-raiding cruisers and scouts of the era. These vessels had a full set of square-rigged sailing, three masts, weapons as heavy as "long" 32-pounders or the massive Dahlgren guns of the *Civil War era on a heavy gun deck.

The range of even the smallest sailing vessel was practically unlimited, given basic seaworthiness and intact stores. A fast sailer such as *Constitution* could make as much as 14 knots (16 miles per hour) under sail, but heavier vessels tended to be much slower, a fact to which the *Constitution* owed her life on more than one occasion.

The Sailing Ship in U.S. Service. Privateers, commissioned as warships by the government, made both the Revolution and the War of 1812 tremendously costly to British commerce and so performed a great service to the new nation before massive British *blockades reduced their ability to operate. The early challenges faced by the U.S. Navy included chastising raiders sent from France in the Quasi-War of 1798-1800, and the suppression of Muslim corsairs operating out of North Africa in the decade following. The celebrated U.S. frigate victories of the War of 1812 did much for the navy and the country's prestige, while the twin fleet victories by Americans on Lake Erie and Lake Champlain effectively forestalled British advances from Canada and led to the stabilization of the northern frontier.

The great endurance and qualities of sailing vessels proved useful in the U.S. Navy's sporadic efforts to suppress the African slave trade at its source, starting in 1820. In 1820-33, U.S. vessels worked to suppress piracy in the Caribbean, while ships of the fleet also operated off the coast of revolutionary South America and off the Chinese coast.

The age of the sailing ship as a warship began to end with Robert "Fulton's" development of steam-powered ships beginning in the "War of 1812. Yet sailing ships as well as combination steam and sail frigates remained part of the U.S. Navy for several decades. During the Civil War, the destruction of the becalmed *Cumberland* and *Congress* by a steam-only ironclad in 1862 did not prevent other sailing vessels from effective service in Abraham "Lincoln's" blockade, but unmistakably signaled the end of the sailing warship in American service. In the decades of decline after the Civil War, the navy would emphasize sail (combined with steam propulsion) for reasons of economy and range; but the last sail-only vessel for the U.S. Navy was constructed in 1855.

ST. LÔ, BREAKOUT AT (1944). After the successful "D-Day" landing, by early July 1944 the World War II fighting in Normandy had become a costly slugging match. The British Second Army was still stalled in front of Caen and the American First Army was mired in the swamps and *bocage* (hedgerows) of the lower Cotentin Peninsula.

The First Army commander, Gen. Omar "Bradley, in consultation with Gen. Dwight D. "Eisenhower, Gen. Bernard Law "Montgomery, and the U.S. VII Army Corps (under Maj. Gen. J. Lawton Collins) devised a plan to attack on a narrow front following massive air bombardment of the enemy lines.

Scheduled for 24 July, the bombers were launched, but bad weather in the target area—a rectangle 5,000 yards by 2,500—forced a postponement to the next day. A few planes did not receive the message and bombed anyway. Some "bombs fell short, killing 25 and wounding 130 in the 30th Division.

On July 25—a bright, clear day—the attack of 2,000 heavy and medium "bomber aircraft and 700 fighter bombers started about noon. Many bombs fell short and over 600 American "casualties resulted. Lt. Gen. Leslie J. McNair, commander of army ground forces in the United States, on an observation visit to the front, was killed.

Despite the disorganization, only one regiment and one battalion were unable to attack on time.

The German *Panzer Lehr* Division and remnants of the German Fifth Parachute Division put up spirited resistance. By the end of the first day, the American infantry was only halfway through the bombed area, but the defense seemed uncoordinated and General Collins ordered the exploitation force to attack the next day. The breakthrough at St. Lô (25 July) and then at Coutances (28 July) opened the way for Lt. Gen. George S. "Patton's Third Army to slash into Brittany and toward the Seine. Thus, the invasion of "Normandy led to the liberation of "France.

ST. MIHIEL, BATTLE OF (1918). This battle was the first independent operation of the newly organized U.S. First Army during World War I. The objective for the American offensive was a German salient into the Allied positions at St. Mihiel, south of Verdun, in northern France. The commander, Gen. John J. "Pershing (who also retained command of the entire American Expeditionary Forces), demanded that the Allied leadership allow the U.S. Army to conduct an independent operation. French general Ferdinand Foch, Supreme Allied Commander, reluctantly agreed. Pershing also requested and received 3,000 Allied "artillery pieces and 430 "tanks (about half of these weapons manned by Americans). In addition, 640 Allied and American aircraft, commanded by U.S. Col. Billy "Mitchell, supported the operation. First Army planned a converging attack by fourteen U.S. and colonial French divisions, striking both sides of the salient.

The offensive began early on 12 September, after a four-hour artillery bombardment. It was a mixed success. The salient was cut off within twenty-four hours, but had already begun a tactical withdrawal to stronger positions; as a result, the number of Germans captured—about 15,000—was less than Pershing had sought. American "casualties were about 7,000 out of 550,000 troops engaged. The operation showed the Americans the difficulty of sustaining a massive infantry attack much beyond four days or ten miles because of difficulties of resupply. However, the First Army's success brought much praise from Allied leaders, who had been skeptical about the state of planning and élan of the U.S. forces.

SALT TREATIES (1972; 1979). Over the decade from November 1969 to June 1979, the United States and the Soviet Union conducted strategic arms limitation talks (known as SALT). The first set of accords, called SALT I, were reached in less than three years and signed at the first summit meeting of President Richard M. "Nixon with Soviet leader Leonid I. Brezhnev in Moscow on 26 May 1972. It took seven years before a follow-on treaty was reached, SALT II, signed at the only summit meeting between President Jimmy "Carter and Brezhnev, in Vienna on 18 June 1979.

These were the first substantial arms control agreements between the two countries. Originally proposed by the United States in December 1966, the Soviet Union equivocated until May 1968, when the Soviets had numerical strategic parity in sight. A planned opening of SALT at a summit meeting in September 1968 was derailed by the Soviet-led "Warsaw Pact occupation of Czechoslovakia in August. With the defeat of the Democrats in the 1968 presidential election, SALT had to await a new administration and its review of defense and foreign policies. The delay of the opening of SALT from fall 1968 to late fall 1969 had one significant adverse effect: during that year, the United States successfully tested and developed deployable MIRV (multiple, independently targeted reentry vehicle) warheads for its strategic "missiles—five years ahead of the Soviet Union. As a result, the negotiations placed no restrictions on these missiles and a significant continuing growth in numbers of warheads, seriously undercutting the value of the SALT I and SALT II agreements limiting strategic offensive delivery vehicles.

The two SALT I accords reached in May 1972 were the Anti-Ballistic Missile (ABM) Treaty, which severely limited defenses against ballistic missiles (ABM defenses), and an Interim Agreement on the Limitation of Strategic Offensive Arms, which froze the total number of strategic offensive missile launchers pending further negotiation of a more comprehensive treaty limiting strategic missiles and bombers. (A separate agreement on measures to avert accidental use of nuclear weapons had been concluded in September 1971.) The ABM Treaty, of indefinite duration, restricted each party to two antiballistic missile sites, with 100 ABM launchers at each. In the only later amendment to the treaty, a 1974 protocol, the two parties agreed to forgo one of those sites, so that each was thereafter limited to a single deployment location. Further constraints included a ban on the testing and deployment of land-mobile, sea-based, air-based, and space-based systems. Only fixed, land-based ABM systems could be deployed at the one allowed site. The Soviet Union kept its existing ABM deployment around Moscow. The United States completed its deployment at a site for defense of intercontinental ballistic missile (ICBM) launchers near Grand Forks, South Dakota, but in 1975 "mothballed" the complex as too expensive.

The ABM Treaty was a significant achievement in arms limitation, although agreement had been facilitated by doubts on both sides as to the cost-effectiveness of available ABM systems. Although the treaty headed off a costly and useless ABM deployment race, it did not have the desired effect of also damping down deployment of strategic offensive missiles, especially because MIRVs were not constrained.

The Interim Agreement froze the level of land- and sea-based strategic missiles (permitting completion of launchers already under construction). The Soviet Union had a quantitative advantage with 2,348 missile launchers to 1,710 for the United States. This was, however, offset in two important ways. First, neither strategic bombers nor forward-based nuclear delivery systems were included, and the United States had a significant advantage in both categories. Second, although the Soviet Union had more missile launchers and deployed missiles, the United States had a larger number of strategic missile warheads and by 1972 had already begun deploying MIRV warheads. Overall, the Interim Agreement placed only modest limits on strategic missiles. In contrast to the ABM Treaty, it was not significant as an arms control measure.

President Gerald R. *Ford and Soviet leader Leonid Brezhnev reached an agreement at Vladivostok in November 1974 to place a cap of 1,320 on the number of MIRV warheads and equal overall levels of strategic nuclear delivery vehicles at 2,400, including strategic bombers. This was not, however, a formal agreement and efforts to reach a SALT II Treaty to replace the SALT I Interim Agreement remained stalemated for another five years.

Another abortive attempt to conclude an early SALT II Treaty was made by President Jimmy *Carter in March 1977, soon after assuming office. He attempted to set aside the Vladivostok accord and plunge into deeper cuts, but the attempt failed because it abandoned the earlier basis for agreement by seeking reductions of Soviet intercontinental systems not covered in the proposed treaty. The negotiations got back on track, but by that time other geopolitical differences between the two sides made agreement more difficult and the negotiations more protracted.

The SALT II Treaty was finally signed at the summit meeting of President Carter and President Brezhnev at Vienna in June 1979. It provided equal levels of strategic arms (2,400, to be reduced over time to 2,200, strategic delivery vehicles) and included strategic bombers as well as strategic missiles. Intended to be in effect for ten years, during which a third SALT negotiation for further reductions was envisaged, the SALT II Treaty fell afoul of the collapse of the Soviet-American detente of the 1970s after the Soviet occupation of Afghanistan in 1979, and was never ratified. Its major constraints, however, were formally observed by both sides until 1986, and for all practical purposes even thereafter.

Pursuant to the SALT I agreements a Standing Consultative Commission (SCC) was established to resolve questions regarding the meaning of and compliance with the SALT agreements. It was also stipulated that there would be no interference with the use of national technical means of verification, such as observation satellites. SALT thus helped at least to stabilize, if not greatly reduce, the military balance. The SALT process and the agreements reached, while causing some friction and disagreements, did contribute to the overall political detente of the 1970s. Although not sufficient to sustain that detente, the SALT process helped ensure that even under renewed tension the risk of nuclear war remained low.

The SALT process was a success in demonstrating that adversaries could reach arms limitation agreements. Nonetheless, owing to the very cautious and conservative approaches of both sides, the limitations on strategic offensive arms were unable to keep up with the military technological advances given precedence by the two countries. The SALT I Interim Agreement and the unratified SALT II Treaty did, however, bridge the period until later strategic arms reduction treaties (START) were reached in the early 1990s.

The ABM Treaty proved surprisingly durable over at least a quarter of a century. To be sure, it was challenged in the 1980s by advocates of President Ronald *Reagan's *Strategic Defense Initiative, and especially by an ill-conceived attempt by the Reagan administration at unilateral reinterpretation to allow greater testing of space-based ABM systems through a "broad interpretation" of the treaty, later repudiated. In the 1990s, a renewed interest in limited defense of the United States against possible missile proliferation or accidental missile launchings, and difficulty in defining the dividing line between strategic ABM systems limited by the treaty and tactical or theater ABM systems not limited by it, again posed a serious challenge. The ABM Treaty continues to be in effect and constitutes an important consideration in making possible the deep reductions in strategic offensive arms under the existing and contemplated START Treaties.

Overall, the SALT Treaties made a significant contribution to containing the dangers of the Cold War and provided a foundation for continuing arms control measures to reduce the risk of nuclear war.

SAMOAN INCIDENT (1888-89). The Samoan Islands, which lay on an important sealane, were the site of a war scare in the 1880s between Germany and the United States as both nations expanded into the Pacific. Some historians see the crisis as a critical turning point in U.S. foreign policy, a harbinger of American overseas "expansionism."

In 1878, Washington secured a coaling station at the harbor of Pago Pago on Tutuila in exchange for protection against other foreign powers. However, Berlin also sought territory, particularly Apia Harbor on Upolu, and in December 1888, when German ships shelled Apia, British and American warships confronted them. Expansionist secretary of state James Blaine threatened Germany, and Congress voted \$500,000 to protect U.S. interests. But early in March 1889, the three nations agreed to a conference in Berlin.

On 16 March, a hurricane hit Apia, destroying all three U.S. ships and the three German vessels, with heavy loss of life. Consequently, the Berlin conference agreed on 14 June 1889 to a three-power protectorate over the Samoan Islands, with nominal Samoan rule.

After the "Spanish-American War and U.S. acquisition of the Philippines, Guam, Hawaii, and Puerto Rico, the Samoan archipelago was formally divided in 1889. The United States obtained Tutuila, administered by the U.S. Navy, and all except two of the western islands, which went to Germany. New Zealand seized the German islands in 1914 and held them until their independence in 1962. The other islands remained under American control.

SAMPSON, WILLIAM (1840-1902), naval officer. Born in Palmyra, New York, Sampson graduated first in his class at Annapolis (1861). After service in the "Civil War, he alternated between commands at sea and staff positions. Becoming superintendent of the Naval Academy (1886), he sponsored educational reforms. As an ordnance specialist, he championed technological modernization. In 1898, he headed the inquiry that erroneously attributed the sinking of the USS *Maine* to external causes.

Sampson became commander of the North Atlantic Squadron in March 1898. Promoted to admiral when the "Spanish-American War began (21 April), he immediately blockaded Havana. Transferring to Santiago de Cuba after a Spanish squadron under Adm. Pascual Cervera arrived there, his blockade and plans to foil a sortie by Cervera led to the complete destruction of the Spanish squadron (3 July 1898), forcing Spain to negotiate peace.

Unfortunately, Sampson had left the blockade when Cervera attempted to escape, leaving Commodore William Schley in command. This circumstance engendered a post-war controversy about credit for the victory at Santiago, which divided the navy for many years. Debilitating illness, probably Alzheimer's disease, increasingly compromised Sampson's efficiency between 1897 and his death.

The SAND CREEK MASSACRE (1864) was a tragedy inflicted on the Cheyenne village of Chief Black Kettle by local Colorado troops. Antagonized by Colorado officials, Cheyenne and other Plains tribes had raided settlements and travel routes throughout the summer of 1864. With the approach of winter, the peace chiefs, of whom Black Kettle was the foremost, sought terms. The commander of the military district was Col. John M. Chivington, a former Methodist clergyman with political ambitions who had entered the volunteer service at the outbreak of the "Civil War. He directed the chiefs to camp on Sand Creek until further arrangements could be made. Here Black Kettle believed himself at peace and under military protection.

Chivington, however, had raised a regiment of 100-day militia to fight Indians, and citizens expected it to do so. With great secrecy, he concentrated a force of 700 men, consisting of the territorial militia and units of federalized volunteers, and at daybreak on 29 November, he launched a surprise attack on Black Kettle's village. On Chivington's orders, the troops took no prisoners and indiscriminately shot down men, women, and children. Of some 500 people in the village, 200 were killed and their bodies scalped and mutilated. About two-thirds of the dead were women and children. A few, including Black Kettle, survived.

Sand Creek set off Indian warfare that engulfed the Great Plains through 1865 and 1866. It also prompted official investigations that exposed the perfidy of Chivington's actions and led to new Indian policies emphasizing diplomacy rather than war. Chivington, however, escaped court-martial by leaving the service.

SANE. See National Committee for a Sane Nuclear Policy.

SANITARY COMMISSION, U.S. (1861-65). Shortly after the outbreak of the "Civil War, New York minister Dr. Henry W. Bellows led a delegation of physicians to Washington, where they lobbied for improved sanitation and medical care in the Union camps. In June 1861, this voluntary group received official status as the United States Sanitary Commission (USSC), charged with inspecting the camps, collecting medical supplies, and advising a somewhat reluctant Medical Bureau. President Abraham "Lincoln accepted the plan with skepticism, fearing that the USSC would become the "fifth wheel on the coach." Before long, the Sanitary Commission's agents were a familiar and welcome sight to Union soldiers. The commission played a crucial role in promoting the appointment in 1862 of a progressive surgeon general, William Hammond, and in breaking army resistance to the use of female nurses.

Under the direction of executive secretary Frederick Law Olmsted, the commission proclaimed a deep passion for order and efficiency and insisted that those goals could only be achieved through careful centralized control. Seven thousand local auxiliaries throughout the North raised funds and shipped food, medicine and clothing to ten regional depots. As the financial demands continued, the USSC turned to nearly thirty local sanitary fairs (1863-65), which netted \$4.4 million.

The Sanitary Commission can be interpreted as evidence of the emergence of a more centralized, modernizing society. But although many local bodies eventually af-

filiated with the commission, others sent their own agents into the field. And even those local branches of the "Sanitary" retained some traditional practices.

The USSC also raises interesting questions about wartime gender roles. Although men dominated the national leadership, women made up the vast majority of local volunteers, and Chicagoans Mary Livermore and Jane C.

Hoge became central figures in the commission's mid-western branch. Even if the activities of the Sanitary Commission rarely challenged traditional gender roles, the local bodies provided new opportunities for women to hone public skills.

SAN JACINTO, BATTLE OF (1836). The Battle of San Jacinto, fought near present-day Galveston, Texas, on 21 April 1836, was shaped to a large degree by the mistakes of Mexican president and general Antonio Lopez de "Santa Anna, who after his costly victory at the Battle of the "Alamo divided his remaining forces into four units. Driven by an incautious determination to capture the Texas government's leaders, his command pursued ahead of his army's other branches. He missed his political adversaries by a few hours on 19 April.

Emboldened by his numerical advantage, Texas Gen. Sam Houston and his 900 men at last turned toward the enemy's advance units and began skirmishing on 20 April. The encamped Mexican forces, trapped by a swamp to their rear, had been reinforced to twice their previous numbers and were lulled into unpreparedness by that and the lateness of the hour. Houston's "order of battle in the late afternoon the next day was a thin line, supported by "artillery in the middle and cavalry on its right. The assault turned into a mad rush of hand-to-hand combat; the engagement lasted for fewer than twenty minutes, followed by several hours of individualized killing dominated by revenge-seeking Texans. Santa Anna was captured, along with about half of his force of over 1,300. Houston and thirty others in the army were wounded; only nine of the Texans died in battle.

San Jacinto became a turning point when the Mexican president's retreat orders were obeyed by his next in command. It proved to be the decisive battle of the Texas revolution (San Jacinto Day is a Texas holiday) as the captured Santa Anna signed a treaty pledging recognition of an independent Texas.

SAN JUAN HILL, BATTLE OF (1898). Probably the best known U.S. battle in Cuba during the "Spanish-American War because of the media coverage of Theodore "Roosevelt, the Battle of "San Juan Hill" is more accurately the Battle of San Juan Heights, and Roosevelt's famous charge occurred on nearby Kettle Hill.

On 1 July 1898, the U.S. Expeditionary Forces under Maj. Gen. William R. Shafter assaulted the Spanish defenses of Santiago, where the Spanish squadron lay protected in the harbor. After sending one division to attack Spanish fortifications at El Caney on his right flank,

Shafter ordered the Fifth Corps to attack San Juan Heights, where Gen. Arsenio Linares had established a forward defensive line 4,000 yards long anchored on San Juan Hill, the largest elevation in the area.

In the difficult terrain below the heights, U.S. troop concentrations, located by their "artillery's smoke and their observation balloon, came under Spanish fire. The main attack finally began at 1:00 p.m. The key to the assault on San Juan Hill by a U.S. infantry division was the effective fire of a battery of three Gatling (machine) guns that swept the summit and forced most of the Spanish defenders to flee as the infantry in some disarray secured the heights.

To the right, meanwhile, elements of a dismounted cavalry division moved against Kettle Hill. Without benefit of artillery or the "Gatling gun, and in the face of heavy enemy fire, the dismounted troopers of two regular army cavalry regiments, the First and the Ninth (the latter one of the army's black regiments), and the First U.S. Volunteer Cavalry Regiment, moved up the slopes and drove the Spanish soldiers from the entrenchments at the top.

Although U.S. Army regulars provided the bulk of the force, the press and the American public focused primarily on the exploits of Lt. Col. Theodore Roosevelt, a New York politician, and his First Volunteer Cavalry Regiment, a group of western cowboys and eastern elites known as the "Rough Riders."

In the fighting of 1 July, the U.S. attacking forces sustained 205 killed and 1,180 wounded, the Spanish defenders 215 killed and 376 wounded. Because of the "casualties, Shafter did not assault the next and primary Spanish defensive line, but the Spanish governor general ordered the squadron out of the harbor, where it was destroyed on 3 July by waiting U.S. naval forces. Santiago surrendered on 17 July 1898.

SANTA ANNA, ANTONIO LOPEZ DE (1794-1876), Mexican general and politician. An opportunist, Santa Anna shifted allegiance from party to party in Mexico. As dictator, his consolidation of power in 1835 prompted resistance in several Mexican regions, including Texas. Santa Anna took personal command of an army of 6,000 in early 1836. He made significant strategic and tactical errors in the campaign against the "Texas War of Independence, which ultimately resulted in his defeat and capture at the Battle of "San Jacinto.

Despite his slaughter of the defenders of the Battle of the "Alamo, and the execution of those captured around Goliad, Santa Anna survived death threats and imprisonment. He returned to Mexico in time to lead resistance against the French in 1838, made a triumphal return from exile in 1846, and recruited an army of 25,000 to face the United States in the "Mexican War.

Again, Santa Anna displayed more talent for rallying support and planning a campaign than for executing strategy. His only offensive of the war failed at the Battle of "Buena Vista (1847), due mainly to superior U.S. "artillery under Gen. Zachary "Taylor.

He then implemented a plan to defend easternmost

mountain passes, confining the enemy to unhealthy coastal areas. However, at Cerro Gordo (1847), Santa Anna failed to reinforce positions that were turned, resulting in a rout. He managed to collect a considerable force in retreat to Mexico City but was unable to inspire the confidence necessary for a strong resistance. Mexico City fell to Gen. Winfield *Scott's army, and Santa Anna was exiled once more. He returned to rule as "perpetual dictator" from 1853 to 1855, when revolutionaries finally drove him from power.

Santa Anna's failure as a military commander resulted from a character susceptible to delusions of grandeur but lacking in trust sufficient to delegate details to subordinates.

SANTIAGO, BATTLE OF (1898). Early in the *Spanish-American War, President William *McKinley on 26 May 1898 dispatched an army force to help the U.S. Fleet under Rear Adm. William *Sampson destroy Spain's Atlantic Battle Squadron, which had taken refuge in the harbor of Santiago de Cuba, and which was thought capable of raiding the North American coast or endangering American invasion forces bound for Cuba. The 15,000-man army expedition, commanded by Maj. Gen. William R. Shafter, disembarked near Santiago between 22 and 24 June. Following a preliminary action at Las Guasimas on the 24th and a week's delay to bring supplies and equipment ashore, Shafter's army on 1 July assaulted and captured Santiago's outer defenses at El Caney and then fought the Battle of *San Juan Hill, at the cost of more than 1,000 U.S. troops killed and wounded.

Adm. Pascual Cervera, his ships in range of U.S. "artillery fire, now considered Santiago untenable and on 3 July attempted to escape the harbor. His four poorly maintained armored "cruisers and two torpedo boat destroyers were no match for Sampson's five "battleships and two armored *cruisers. In less than three hours, Sampson's squadron, at a cost of one man killed, destroyed all of Cervera's vessels. More than 300 Spanish sailors died. On 17 July, the Spanish land force commander surrendered Santiago, 28,000 troops, and the entire eastern end of Cuba to General Shafter.

The destruction of its Atlantic Fleet and the capture of Cuba's second largest city induced Spain to sue for peace. The campaign was hailed as a triumph for the modern, steel-built U.S. "Navy, as well as for the U.S. Army and Theodore "Roosevelt's famous volunteer cavalry regiment, the "Rough Riders," although the army suffered supply problems and subsequent outbreaks of malaria and yellow fever.

SARATOGA, BATTLES OF (1777). The plan to isolate rebellious New England, adopted by British secretary of state for the colonies George Germain midway into the Revolutionary War, stipulated a Lake Champlain-Hudson River

campaign under Gen. John "Burgoyne and a sweep through Lake Ontario under Lt. Col. Barry St. Leger, both to join, at Albany, with Gen. William "Howe's army, advancing north from New York City. Burgoyne's army included 4,135 British regulars, Friedrich von Riedesel's 3,116 Germans, and large numbers of authorized "camp followers." Approximately 500 Indians and 500 French Canadian militia also accompanied the expedition, but most soon departed. Fort Ticonderoga fell to Burgoyne when its commander, Arthur St. Clair, left it unprotected against "artillery fire from southwest Sugar Loaf Hill and northwest Mount Hope. The Americans escaped across the lake.

Burgoyne, running short of food, sent a detachment of Germans under Lt. Col. Friedrich Baum to Bennington, Vermont, for supplies; there they were routed by John Stark's militia on 16 August 1777. Howe, meanwhile, sailed for Philadelphia instead of Albany, and St. Leger's army of loyalists and Indians, although victorious at Oriskany, 6 August, withdrew to Canada. Burgoyne, instead of turning back, declared his orders mandatory and crossed the Hudson; this effectively severed his Canadian supply line.

Horatio "Gates, as commander of the 10,277 American troops, replaced Philip Schuyler, who was blamed for the loss of Ticonderoga. At Freeman's Farm, 19 September, Burgoyne's three-pronged attack was stalled by Col. Daniel "Morgan's riflemen and thrown back by a charge under Gen. Benedict "Arnold. British losses were 566, American 313. At Bemis Heights, 7 October, Burgoyne's 1,723-man spearhead was repulsed by an unauthorized but successful attack led by Arnold, who was wounded in the leg. British losses were 631, American 130.

Gen. Henry "Clinton, Howe's successor in command at New York, declined to send reinforcements, and Burgoyne had waited too long to turn back. He retreated to Saratoga, and on 17 October surrendered his force of 5,895 men. The defeat of a major army led the British government to restrict operations to the southern coast. More important, the American success at Saratoga led France to sign the "France-American Alliance and provide the forces that ultimately helped win the Revolutionary War.

SATELLITES, RECONNAISSANCE. American reconnaissance satellites provide images of the Earth and monitor electronic emissions of terrestrial and airborne communications and "radar systems. These automated spacecraft normally are positioned about the Earth in circular, low-altitude polar orbits; in highly eccentric orbits (with a low perigee and extremely high apogee); or in geosynchronous equatorial orbits, in which a satellite remains fixed over a given spot above the equator.

In the years after World War II, America's political leaders sought to prevent the recurrence of an intelligence failure like the attack on "Pearl Harbor and to obtain advance knowledge of any attempt at an atomic surprise attack on the United States. The U.S. "Navy and "Air Force first examined Earth satellites between 1946 and 1949. In 1950, the Research and Development Board of the Department

of "Defense (DoD) assigned jurisdiction for military satellites to the air force. Study participants agreed that the most valuable use of satellites was as a platform from which to observe and record activity on Earth.

By late 1954, President Dwight D. "Eisenhower embraced "strategic reconnaissance" as a national policy: the United States would acquire reliable intelligence about the economic and military activities and resources of a potential foreign adversary through periodic, high-altitude overflight in peacetime. Eisenhower and his advisers crafted the legal rationale for this policy in the spring of 1955. Because international law denied airplanes of one state the right to enter the airspace of another without authorization, Eisenhower first sought agreement to permit aerial reconnaissance at a four-power summit conference in July. After Soviet leaders rejected this approach to reducing "Cold War tensions, the president, on his return to the United States, announced that America would launch scientific Earth satellites as part of the nation's contribution to the International Geophysical Year (IGY) planned by the international scientific community in 1957-58. Because international law did not yet apply in outer space, the administration determined to keep that region open to all, where the spacecraft of any state might overfly all states. It intended to use scientific satellites to establish the precedent of "freedom of space," with all that implied for the eventual overflight of reconnaissance satellites.

Meanwhile, the RAND Corporation had completed studies of a potential reconnaissance satellite for the air force in 1954. In 1956, the air force contracted with the Lockheed Aircraft Corporation to build these satellites. Lockheed already held a secret contract for Project AQUATONE that produced an aerial precursor, "U-2 spy planes. The air force satellite project, eventually termed SAMOS, was an open secret. As reported in the press, this satellite's camera would view the Earth from a circular polar orbit and produce images of surface features of about 20 feet resolution. The exposed film would be scanned electronically and the pictures transmitted to ground stations as the satellite passed overhead. The DoD, however, restricted funding of this "follow-on" satellite system, and little more than design studies had been completed by the time the Soviet Union launched Sputnik 1, the world's first artificial satellite, into Earth orbit on 4 October 1957.

In response, early in February 1958, President Eisenhower approved a secret, high-priority reconnaissance satellite effort known as Project CORONA. Similar in many respects to its SAMOS cousin, CORONA employed the same spacecraft, but was designed to return exposed film to Earth in a special atmospheric reentry capsule that could be recovered in midair or on the ocean's surface. Organized like Project AQUATONE in a partnership between the "Central Intelligence Agency (CIA) and the U.S. Air Force, the first Project CORONA satellite was launched in 1959. President Eisenhower received the first CORONA pictures of the Soviet Union in August 1960, four months after the "U-2 incident in which an American spy plane was shot down. Late in August, Eisenhower approved formation of a new civilian-led organization in the DoD to control and direct the air force SAMOS Project. This organization reported to the secretary of defense and soon became a partnership between the CIA and the military services, acquiring responsibility for all of America's strategic reconnaissance assets; in 1961, it was formally named

the National Reconnaissance Office (NRO). Finally, just before leaving office in 1961, Eisenhower established the civilian-led National Photographic Interpretation Center (NPIC) to receive, process, and distribute reconnaissance film. NPIC reported to the director of Central Intelligence (DCI).

More than 100 CORONA missions were flown over the next 12 years until the project terminated in 1972. Equipped with Itek cameras that produced an image with a resolution at the Earth's surface of about 25 feet on average and, pointed at nadir, eventually about 6 feet at best, CORONA was employed for wide area searches. These satellites proved so successful that the struggling SAMOS project was canceled in the early 1960s after several SAMOS satellites failed to transmit to Earth even one usable picture of the Soviet Union. Other reconnaissance satellites augmented CORONA in the early 1960s, all of them featuring film capsule recovery systems. Project ARGON launched seven successful camera-equipped satellites to support U.S. Army mapping and charting. Collectively, in the years that followed, reconnaissance satellites provided the United States with an overhead "inspection system" that warned of imminent hostilities and permitted international agreement on arms reduction treaties with verification. They continue today to provide America's leaders with information vital to national security.

SCHENCK AND ABRAMS CASES (1919). Under the 1917 Espionage Act, Charles T. Schenck, a high official in the Socialist Party of America, was arrested for urging resistance to the draft. His pamphlet, sent to draftees, condemned "conscription as despotic and unconstitutional. In sustaining Schenck's conviction, Justice Oliver Wendell Holmes, Jr., based his standard for expression on the common law rule of proximate causation. His "clear and present danger" test became the starting point for subsequent free speech cases until the 1960s. Critics, however, deplored the subjectivity of the rule and Holmes's insensitivity to its larger implications for free speech.

The subsequent *Abrams* case, brought under the 1918 Sedition Act, involved the trial of an anarchist Russian immigrant, Jacob Abrams, and his supporters for distributing pamphlets, mainly in Yiddish, calling for a general strike to protest the presence of U.S. troops in Siberia during the Russian Revolution. The Supreme Court sustained conviction following a "bad tendency" test, but Holmes,

responding to his critics, dissented. He saw no clear and present danger, but he also took the occasion to argue that free speech served broad social purposes and that the national interest would suffer more from restricting speech, however controversial, than from allowing it to be injected into the marketplace of ideas.

SCHLESINGER, JAMES R. (1929-), economist, strategic analyst, secretary of defense, and first secretary of energy. Schlesinger served as secretary of defense during 1973-75, a turbulent period marked by the final stages of the "Vietnam War, severe cuts in the defense budget, the end of conscription, and the beginning of the "All-Volunteer Force. A Phi Beta Kappa and 1950 summa cum laude graduate of Harvard College, he subsequently earned a Ph.D. at Harvard, then taught economics at the University of Virginia (1955-63). Next came service at the RAND Corporation as a senior staff member (1963-67) and director of strategic studies (1967-69). He entered government in 1969 as assistant director of the Bureau of the Budget, in 1971 became chairman of the Atomic Energy Commission, and in 1973 was appointed Director of Central Intelligence.

Moving later that same year to the Department of "Defense, Schlesinger forthrightly portrayed the impact of declining budgets, inflation, and spiraling personnel costs on force structure, modernization, and readiness. He laid before Congress a series of hard choices and the likely consequences of each. The United States, Schlesinger maintained, could not escape great responsibilities in a world where "military power remains relevant." He offered a vision of continued American involvement in world affairs based on strength, prudence, and reliability. Because of his background at RAND, Schlesinger was perhaps the secretary of defense most accomplished as a nuclear strategist. He claimed that it was "a dangerous illusion" to think that in the 1990s, when the United States no longer dominated in "nuclear weapons, that "deterrence of the Soviet Union could be based on the ability to inflict "unacceptable" retaliatory damage. "Deterrence is not a substitute for defense," he stressed. Instead, he maintained, deterrence, defense, and also detente "are inextricably bound up with one another in the maintenance of an equilibrium of power."

In 1976, Schlesinger was named assistant to the president to develop a national energy policy; when the Department of Energy was established the following year, he became its first secretary.

SCHOOLS, POSTGRADUATE SERVICE. Each of the armed services has its own system of postgraduate service schools for the indoctrination, training, and education of officers. Although each system is different, particularly at

the lower levels, all military postgraduate schools fall into one of five main categories: service schools, staff colleges, senior service colleges, joint colleges, and specialist training schools. Service schools prepare newly commissioned officers for duties in operational units and aboard ship and senior company-grade officers for small unit command and staffwork. Staff colleges prepare selected midcareer officers for command and staff postings at intermediate echelons. Senior service colleges prepare selected senior field-grade officers for the highest command and staff positions. Joint service colleges teach joint operations and seek to improve interservice cooperation. Specialist training schools impart technical knowledge and manual skills.

U.S. Army. The army was the first of the services to recognize a need for postgraduate officer education. In April 1824, Secretary of War John C. "Calhoun established the Artillery School of Practice at Fortress Monroe, Virginia, to disseminate knowledge of elementary tactics and administration. By 1880, the Artillery School, under the influence of Emory "Upton, had become the model for the service schools later established for each of the army's branches (Infantry, Transportation Corps, etc.). Since 1973, the army service schools have been controlled by the U.S. Army Training and Doctrine Command (TRADOC).

In 1881, Gen. William Tecumseh "Sherman established the School of Application for Infantry and Cavalry. In its early years the service school at Fort Leavenworth, Kansas, prepared lieutenants for company-level duties and was often derided as "the army's kindergarten." The Leavenworth school was transformed between 1890 and 1910 by Arthur L. Wagner, Eben Swift, John F. Morrison, and other officers convinced of the need for an officer corps educated in both theory and practice and imbued with a sense of responsibility, reliability, intellectual acuity, and teamwork. These military educators introduced the systematic study of "strategy, "tactics, and military use of "history, as well as a broad range of other professional subjects using the so-called applicatory method, which called for active student involvement in the learning process by way of participation in the individual or group solution of strategic, tactical, and logistical problems using maps, indoor war games, or outdoor exercises known as *tactical rides*.

Beginning in 1887, a second year of study was provided for the best graduates of the School of Application. The second-year program evolved into the Army Staff College. Renamed the Army Command and General Staff College in 1928, the Leavenworth school thrived in the period between the two world wars and is often credited with being the principal educational influence on the men who led U.S. forces to victory in World War II. In the early 1980s, two new levels of instruction were added to the traditional staff college curriculum. The new Combined Arms and Services Staff School was established to prepare senior company-grade officers for service in battalion- and brigade-level staff positions, and a new School of Advanced Military Studies was created to provide a second year of advanced study for selected Command and General Staff College graduates.

The poor coordination of army forces in the 1898 "Spanish-American War prompted Secretary of War Elihu "Root to act on the ideas expressed by Emory Upton some twenty years before and to establish the Army War College in Washington, D.C., in November 1901. Until 1917, the Army War College was a not entirely successful adjunct of

the newly created General Staff. Closed during World War I, the college reopened in 1919 with a regular curriculum stressing strategy, the command and management of large units, and military history. From 1919 to 1940, the Army War College formed the professional officers who held the most senior army commands in World War II. Classes were again suspended in 1940, but the army's senior service college was reestablished at Fort Leavenworth in 1950 and moved to Carlisle Barracks, Pennsylvania, the following year. Since 1950, the Army War College curriculum has focused on the study of national military policy and has become a center for strategic studies, the development of ground warfare doctrine, and international *peacekeeping.

U.S. Navy. For many years, the navy relied on experience at sea as the principal means of officer development. However, the immense changes in naval technology and naval doctrine in the post-*Civil War era prompted the establishment of the Naval War College at Newport, Rhode Island, in October 1884 to provide "an advanced course of professional study for naval officers." The creation and early development of the Naval War College—the first of the senior service colleges—was due primarily to the efforts of Rear Adm. Stephen B. *Luce. As president of the college from 1884 to 1886, Luce was responsible for bringing Alfred T. *Mahan, the great theorist of seapower, to the faculty in 1885. In 1890, William H. Little introduced the applicatory method, and the Naval War College subsequently became a center for the development of war games and naval tactics and strategy. Today, the navy has its own fully developed system of service schools and specialist training institutions, and the navy's own staff college—the College of Naval Command and Staff—is co-located with the Naval War College at Newport. The navy also has a unique high-level technical school, the Naval Postgraduate School, established in California, February 1913, to provide advanced instruction in naval ordnance and engineering subjects.

U.S. Marine Corps. A School of Application for newly commissioned Marine Corps lieutenants was opened in Washington, D.C., in May 1891, and in 1910 an Advance Base School was established at New London, Connecticut. However, before World War I, formal postgraduate education at these service schools took second place to expeditionary service abroad for most Marine Corps officers. In 1920, the Marine Corps School was established at Quantico, Virginia. Recently redesignated the Marine Corps University, it consists of an array of service and specialty schools and the Marine Command and Staff College. There is no Marine Corps senior service college; instead, Marine Corps officers attend the war colleges of the other services or one of the senior joint service colleges such as the National War College.

U.S. Air Force. Since 1947, the air force also has developed its own system of postgraduate professional education. Today, the Air University at Maxwell Air Force Base, Alabama, oversees the service school-level Squadron Officers School, the Air Command and Staff College, and the Air War College, as well as a number of specialist schools and the Air Force Institute of Technology at Wright-Patterson Air Force Base, Ohio, which conducts specialized educational programs, mostly of a technical nature.

Interservice Education. There are also a number of joint service colleges that bring together officers of all services to study joint operations and improve interservice

cooperation. Since January 1976, these joint institutions have been part of the National Defense University. The two joint senior service colleges, the National War College and the Industrial College of the Armed Forces, are both located at Fort McNair in Washington, D.C. The National War College was created in 1946 to perpetuate the effective interservice cooperation developed during World War

II. Its curriculum is similar to that of the other senior service colleges, but with greater emphasis on joint matters. The Army Industrial College, created in 1924, became a joint activity after World War II and was renamed the Industrial College of the Armed Forces. It focuses on mobilization and military-industrial preparedness. Since 1981, the Armed Forces Staff College in Norfolk, Virginia, established in 1946, has also been part of the National Defense University. Its six-month course concentrates on the functions and capabilities of the various services and on joint operations.

There is a wide variety of specialist training schools, many of which train students from more than one service. Some are designed to teach specific individual skills, such as flying or parachuting; others prepare officers for specific types of warfare, such as amphibious or nuclear operations, or teach technical subjects, such as *communications and computer technology. In addition, a number of joint postgraduate schools provide instruction in such fields as languages, medicine, intelligence, and resource management.

Recent Trends. Each year a limited number of officers from each of the services is selected to attend the military schools of other nations. A few American students also attend the six-month course at the *NATO Defense College in Rome, considered the equivalent of a U.S. senior service college. Officers can be selected to attend graduate degree programs or short courses at civilian universities. Training with industry is yet another alternative, especially for those in technical fields.

In recent years, postgraduate service schools have been greatly influenced by two trends. The first, and most influential, has been the growing demand for greater interservice cooperation, or "jointness," which has resulted in a greater emphasis on attendance at the joint colleges and on the study of joint operations at the various postgraduate institutions. The second important trend has been the growing interest in computer-assisted simulations. War games have a long history in American military education, and recent advances in computer technology have permitted the construction of complex, multifaceted games. Today, computer-assisted simulations are used for officer training at every level of the integrated, progressive system of postgraduate military education in the United States.

SCHOOLS, PRIVATE MILITARY. The disciplined environment of West Point has provided one model for civilian schools established to educate intellectually and morally responsible citizens.

The earliest military-style academies in the United States offered practical and technical curricula quite unlike the classical education of contemporary universities. At Norwich University, opened as the private American Literary, Scientific, and Military Academy in New England in 1819, cadets studied engineering, navigation, and agriculture, along with composition and Latin. The Virginia Military Institute (VMI), which opened at Lexington in November 1839, took West Point's engineering curriculum as its model. In 1843, The Citadel Academy at Charleston began a similar course of practical studies for indigent South Carolina boys.

Graduation from these military-style schools did not lead automatically to army commissions, but during the "Civil War," citizen-soldiers educated at these and other antebellum military academies served under arms, many as commissioned officers. A number of Northern academies, including Norwich, survived the war, but many Southern military schools—VMI excepted—did not. The Citadel remained closed through "Reconstruction; the Georgia Military Institute never reopened; and the University of Alabama's antebellum corps of cadets languished and finally disbanded. The military department of the Howard English and Classical School in Alabama bucked the trend, reemerging postwar as the Marion Military Institute, a two-year school still operating today.

The Morrill Land Grant Act of 1863 extended military-style education to land-grant colleges. By law, these schools had to provide male students with basic military instruction, but they remained essentially civilian institutions. A few land-grant schools initially organized their entire student bodies into military-style formations. Some, such as Clemson University, disbanded their corps of cadets years ago. Others—most notably Texas A&M and the Virginia Polytechnic and State University—still support a corps of cadets, but the military school environment they provide exists only as part of larger state universities. Today, only one school with a land-grant heritage—North Georgia College, opened in 1873 as a mining and technical school in the University of Georgia system—still adopts a military-style organization for the bulk of its student body.

At modern accredited four-year military colleges, cadets no longer find themselves limited to technical or practical majors, and they must meet the same standards for graduation required at comparable civilian institutions. But they still adhere to a tightly structured lifestyle. Although hazing is banned, freshmen endure an emotionally, physically, and intellectually rigorous first year. An Honor Code remains at the heart of the cadet experience. Time has brought change: regulations on "uniforms have relaxed at some schools; certain institutions now allow cadets to marry; others no longer require cadets to live in barracks; cadets may still be required to take "ROTC courses, but they do not necessarily accept a commission to graduate. Most recently, female cadets have begun to appear in the ranks. North Georgia College admitted women to cadet companies in the early 1970s when ROTC programs accepted female cadets, and Norwich did the same when it merged in 1972 with the all-female Vermont College. The Citadel and VMI were forced to open their ranks to women in the 1990s.

Two other types of private military schools exist. The Department of the Army supports an early commissioning program at six military-style academies, which include junior colleges such as Valley Forge Military Academy

in Wayne, Pennsylvania. Since the 1880s, military-style schools, some now modeled on the navy, Marine Corps, and air force, also have filled a small niche in secondary education.

The "Vietnam War destroyed much of the attraction of military-style schools. Of 169 secondary and college-level schools open in 1945, only 50 remained in 1975. In the 1990s, however, a slight resurgence of interest in military-style schools has been observed around the country. Today, many of the surviving institutions belong to the Association of Military Colleges and Schools in the United States.

SCHROEDER, PATRICIA (1940-), member of Congress (1972-97). Patricia Schroeder, a graduate of Harvard Law School, campaigned as an antiwar, liberal Democrat and won the congressional seat representing the racially diverse Denver, Colorado, district in 1972. When she entered the House of Representatives in the 92nd Congress, there were just thirteen women members. By 1996, when Schroeder announced she would not seek reelection, there were forty-seven women, though still barely 11 percent of the House. Schroeder's period of greatest influence on military issues came in the 1992-94 103rd Congress when the Democrats controlled the House; she chaired a House Armed Services subcommittee; there was a large, politically cohesive Congressional Caucus for Women's Issues and a network of sophisticated women's lobbying groups. Several of these groups focused on military issues (e.g., Women's Action for New Directions and the Defense Advisory Committee on Women in the Services).

Among the issues that Schroeder influenced were: ensuring that military wives and female personnel had access to abortion services at U.S. overseas military hospitals; reversing a Department of "Defense policy that had allowed divorced military men to exclude military retirement benefits from alimony calculations; opening up more "near-combat" and "combat" jobs to women; and insisting that "sexual harassment be taken seriously by senior Defense Department officials. On general questions, Schroeder joined all the other Democratic women in the House in voting against the "Don't ask, don't tell" formula for maintaining the "gay men and lesbians in the military ban. She also voted against funding the B-2 bomber for U.S. participation in "United Nations "peacekeeping.

SCHWARZKOPF, H. NORMAN (1934-). U.S. Army general. Born in Trenton, New Jersey, the son of a professional army officer, Schwarzkopf graduated from West Point in 1956. After serving with an airborne unit, he returned to the academy as an instructor. But he interrupted that assignment to serve during the "Vietnam War as an adviser (1965-66) to a South Vietnamese Airborne brigade, winning two Silver Stars and a Purple Heart. After completing

his faculty assignment and a year at the Army Command and General Staff College, he returned to Vietnam in 1969, soon taking command of the First Battalion, Sixth Infantry Regiment in the American Division along the northern coast near Chu Lai. In 1970, he earned another Silver Star and Purple Heart.

Back in the United States, Schwarzkopf graduated from the Army War College, then commanded an infantry brigade. As a brigadier general in 1978, he served as an assistant division commander in Germany, later as director of military personnel management at the * Pentagon, and in 1983-85 as commander of the 24th Infantry Division (Mechanized). In October 1983, he became deputy commander of the U.S. intervention in *Grenada, but was highly critical of the operations shortcomings.

Between 1985 and 1988, Schwarzkopf served two tours in the Pentagon in operations and plans and also commanded a corps for a year. In 1988, as a full general, he took charge of the U.S. Central Command, with responsibility for possible deployment to the Middle East from its headquarters in Tampa, Florida.

In August 1990, after Saddam * Hussein's invasion of Kuwait, Schwarzkopf was given overall command of all U.S. and non-Arab Coalition forces, responsible for the massive *mobilization and deployment to the Persian Gulf, and for the planning and execution of the containment and then defeat of the Iraqi forces in Kuwait. The burly general hailed by the press as "Stormin' Norman" developed the so-called fast envelopment—the flanking ground offensive that led to the liberation of Kuwait in February 1991. Subsequently, he retired and wrote his memoirs, explaining his strategy and defending the controversial decision to halt at the Iraqi border.

SCIENCE, TECHNOLOGY, WAR, AND THE MILITARY. World War II transformed the relationship between war and the military on the one hand and science and technology on the other. What had been a fitful and uncomfortable relationship before the war became continuous and consistent thereafter. Important ties existed before 1941, but they were nothing like the intimate conjunction of these two fields in the last half of the twentieth century.

Engineers initiated that conjunction early in the nineteenth century. President Thomas *Jefferson modeled West Point, the first school of engineering in the United States, on the French state technical schools. The goal of the military academy was not only to train officers for technical service in the army but also to cultivate a pool of engineering talent for the young republic. West Point graduates, both in and out of the service, worked on roads, canals, bridges, and other elements of infrastructure. While the country quadrupled its territory in the nineteenth century, these engineers designed, built, and operated the railroad network that tied the new nation together. In the process, the army divided its personnel into combat and civil engineers, the latter taking up a dominant role in the development of America's water resources.

The military, science, and technology also found them-

selves jointly engaged in other enterprises in the nineteenth and early twentieth centuries. Both army and navy led exploring expeditions, such as the *Lewis and Clark expedition for the Louisiana Purchase (1804-06) and the Charles Wilkes expedition of 1838-42 to the Antarctic and Pacific Oceans. The army developed a meteorology branch that would become the nucleus of the National Weather Bureau. The American System of Manufacture, which caused a stir in Europe after a strong showing at the Great Exhibition of 1851 in London, was based on techniques of large-scale factory production first developed in government arsenals and private factories producing small arms. Beginning in the nineteenth century, manufacturing standards and contracting protocols were established by army and navy agencies buying goods and services in the private sector. The National Academy of Sciences was created during the *Civil War to help the federal government deal with the avalanche of inventions and proposals that poured into Washington, many having to do with military matters.

As the nineteenth century gave way to the twentieth, the relationship deepened between war and science and between the military and technology. War and the military contributed significantly to the development of such technologies as steel, radio, and aviation. Though none of these fields had their roots in the military, all were shaped by military developments and in turn became indispensable components of military capability.

In spite of this historically close relationship, the military services kept technology at arm's length in World War I. Some science and technology was institutionalized during the war. For example, the National Research Council (NRC) was formed as the working arm of the National Academy of Sciences to assist the services in the war effort. And the National Advisory Committee for Aeronautics (NACA) was created in 1915 to keep aviation developments apace with the hothouse activity in Europe precipitated by the war. But generally, when the services wanted scientific and technical talent, they simply inducted into uniform the individuals deemed necessary. Nobel laureate Robert Millikan, for example, left his academic post at the California Institute of Technology first to serve the navy as a civilian member of the NRC and then to accept a major's commission in the U.S. Army Reserves to head the Signal Corps Science and Research Division. He and others like him helped the services make significant advances in "submarines, radio, aviation, sound-and-ranging techniques for "artillery firing, and other areas. Nonetheless, the services emerged from World War I feeling that science and technology had served them poorly. The famed Naval Consulting Board, for example, chaired by Thomas Alva *Edison, fell into hopeless wrangling over the creation of a naval research laboratory and contributed little to the war effort. Better institutional arrangements were clearly necessary if the military in the future was to realize the full potential of science and technology.

Just such arrangements appeared in World War II. This conflict was the first in history in which the weapons deployed at the end of the war were significantly different from those that opened it. Many of the new developments—*radar, jet propulsion, ballistic "missiles, the atomic bomb—were developed largely or entirely in the course of the war. For all the major combatants, this required the mobilization of the full resources of the state, including, of course, its scientific and technical talent.

In the United States, an entirely new institution sprang up to meet the need. Clearly, much technical work continued to be done in the traditional way through contracts with industry and through research and testing in government laboratories and arsenals. But a significant portion of the most innovative and important research and development in World War II was done through the Office of Scientific Research and Development (OSRD). This small, independent branch of government was the responsibility of Vannevar *Bush—an inventor, teacher, and former dean of engineering at MIT. Originally constituted as the National Defense Research Committee (NDRC) and modeled on the NACA, which Bush had chaired, OSRD soon took shape as a clearinghouse of scientific and technical talent that could be applied to military problems.

The principles behind OSRD, which were to continue into the postwar world, were three. First, instead of trying to do all its own research, the government contracted with scientists and engineers to perform some of it. Second, instead of inducting them into service, as had been done during World War I, the government left its contractors in place, usually in university research laboratories. Third, developments sprang from two different sources: scientists and engineers might respond to military requests for new techniques or devices, or they might propose new developments themselves.

The entire range of research, from basic research through development of working prototypes, was open to exploration. The OSRD examined proposals from scientists and funded those with merit, and the office also took on problems from the military services and sought out researchers and laboratories to work on them. Radar, for example, the largest area of wartime research outside the atomic bomb project, was divided into more than 100 separate research undertakings and distributed to laboratories and test centers around the United States. OSRD scientists actually flew combat missions with prototype equipment to test it out and bring field results back to the laboratory for further refinement.

Just before war's end, Bush and his colleagues submitted to President Franklin D. *Roosevelt a manifesto entitled *Science, the Endless Frontier*, calling on the government to perpetuate the wartime experience of OSRD in a national research establishment. The purpose was to guarantee the economic and military security of the country by keeping its scientific and technical talent funded and focused on projects of national interest. The proposal ran afoul of political concerns over the autonomy that Bush wanted the scientists to have in setting their own agenda. Only in 1950 did the proposal finally become law, creating the National Science Foundation (NSF). Not the peacetime OSRD that Bush had recommended, NSF left military and medical research and development to other agencies and concentrated on basic, civilian research.

Meanwhile, the military services—the army, navy, and after 1947 the air force as well—took independent steps to institutionalize the scientific and technical assistance that had proved so critical in World War II. While uniformed officers in the United States and other countries had historically been skeptical of technological innovation, they now embraced research and development as the key to national security. The world wars may have been wars of industrial production, but the dramatic weapons innovations of the last conflict, culminating in the atomic bombs

dropped on Hiroshima and Nagasaki, led many officers to believe that quality would displace quantity as the determinant of victory in the future.

The services empaneled their own technical consultants, such as the Scientific Advisory Board of the air force; created or continued their own research laboratories, such as the Naval Research Laboratory; and supported research arms at universities around the country, such as the army's Applied Physics Laboratory at the Johns Hopkins University. The developments flowing from these sources resulted in new weapons that succeeded each other in the nation's arsenal at a rate never before seen in peacetime. As the United States slid into a cold war with its former ally, the Soviet Union, a standing military establishment emerged for the first time in the nation's history. Within that establishment, the services competed with each other for the right to develop and deploy ever newer and more sophisticated weapons and thus secure a place on the nation's front line of defense.

Soon this formula produced what President Dwight D. *Eisenhower called the "military-industrial complex." In his farewell address in 1961, Eisenhower warned of "the unwarranted influence, whether sought or unsought," of contractors grown dependent on military funding. In private, he spoke of a "delta of power" linking the Department of *Defense, Congress, and industry in a mutually reinforcing conflict of interest that shaped U.S. foreign and defense policy and threatened the future of the country. Along with this danger, Eisenhower cautioned that "public policy could itself become the captive of a scientific-technological elite."

Eisenhower's warning did not significantly divert the military-industrial complex. In 1960, more than half the research and development done in the United States—government, corporate, and university-based—was military. The military services, or defense-related agencies such as the Atomic Energy Commission, became the principal supporters of research in nuclear physics, computers, microelectronics, space, and other scientific and technical fields. Furthermore, military considerations had second order consequences in seemingly nonmilitary areas of scientific and technical development. The National Defense Education Act, for example, funded graduate study in science and technology for thousands of American students. More broadly, military funding supported a significant percentage of university research in the *Cold War and helped to shape these institutions. The national interstate highway system was instituted in the Eisenhower administration in part to facilitate the *mobilization and movement of military forces in the event of national emergency. The national space program was launched on military missiles and took its rationale from the Cold War competition with the Soviet Union for the hearts and minds of the world's people. Even social sciences such as psychology and international relations were mobilized in the name of national security.

Preparation for strategic war with the Soviet Union engaged most of the scientific and technical research bent to the Cold War. *Nuclear weapons competition dominated the entire conflict, moving from the U.S. monopoly after World War II through the Soviet explosion of its first nuclear device in 1949 followed by the race to thermonuclear weapons in the early 1950s and other innovations such as tactical nuclear weapons and the neutron bomb in the

years to follow. At first, airplanes were the delivery vehicles for these weapons, spawning enormous research and development efforts in aircraft development, antiaircraft defense, early warning systems, and electronic countermeasures. By the end of the 1950s, however, ballistic missiles had become the delivery system of choice, and research and development turned to more powerful launch vehicles, improved guidance systems, multiple independently targetable reentry vehicles (MIRVs), ballistic missile defense, and other esoteric technologies of strategic warfare. Throughout the Cold War, U.S. science and technology proved generally superior to that of the Soviet Union, and yet the Soviets displayed a remarkable capability to mimic U.S. achievements and keep the "arms race close.

The contest finally climaxed in the midst of the most far-reaching and expensive gambit of all, a program by the United States to develop a nationwide ballistic missile defense system. President Ronald "Reagan's "Strategic Defense Initiative (1983-93) invested some \$40 billion in ballistic missile defense that critics said could not work; its supporters claimed that the Soviet Union finally had to admit defeat when faced with the prospect of trying to match the effort. In any case, the collapse of the Soviet Union in the late 1980s ended the Cold War and initiated a scaling back of the military-industrial complex, the end of which is not yet in sight.

Beginning with the "Vietnam War, a large amount of attention became focused on conventional and unconventional war. Precision-guided munitions and "smart" bombs employed advanced microelectronics to achieve unprecedented levels of accuracy and discrimination, seeking not only to hit the desired target but to avoid collateral damage. Sensing devices such as night-vision scopes and "heat-seeking technology helped combatants find and target the enemy. New types of "antipersonnel weapons such as cluster bombs and claymore mines entered the deadly arena of unconventional "jungle warfare and other nontraditional fighting environments. Even psychology and social sciences were enlisted in the struggle against enemies who chose not to fight in the traditional Western style.

Weapons and equipment developed for strategic war with the Soviet Union came to be enlisted in nonnuclear war against enemies around the world. Thus the F-117 stealth fighter, an attack airplane virtually invisible to traditional radar, played a role in both the U.S. invasion of Panama in 1989 and in the "Persian Gulf War of 1991. The latter conflict witnessed a rout of the Iraqi Army by "United Nations Coalition forces because the sophisticated arsenal of the United States was able to virtually eliminate the command, control, and "communications of the Iraqis before the ground engagement began. In the minds of some advocates, the Gulf War witnessed the apotheosis of airpower that had been predicted in some quarters since the 1920s.

The tremendous impact of science and technology on war during the second half of the twentieth century mirrored the equally momentous impact that war had on science and technology. In addition to the phenomena already mentioned, military demand created the discipline of operations research, pioneered the techniques employed in the commercialization of nuclear power, introduced many important medical practices and products, and developed technologies such as high-resolution photography

and the global positioning navigation system that subsequently entered the civilian economy.

SCOTT, WINFIELD (1786-1866), U.S. "Army officer and commanding general. Born in Virginia, Scott entered the army in 1807. In the "War of 1812, promoted to brigadier general, he trained his troops superbly and led his brigade ably in battle, defeating British regulars in 1814 at the battles of Chippewa and Lundy's Lane where Scott was severely wounded and became a national hero. To this day, West Point cadets wear gray 1814 uniforms in honor of the American victory over British regulars. After the war, he prepared a three-volume manual on infantry tactics that endured throughout the smoothbore era. He served in the "Black Hawk War and in the campaigns against the Seminoles and Creeks, and in 1838, he supervised the removal of the Cherokees to the West. Scott had a talent for peace-making, demonstrated first in 1832 when President Andrew "Jackson sent him to Charleston and he helped negotiate the Nullification crisis. Later, he helped restore peace on the Canadian border during the *Caroline* crisis in 1838 and during the so-called Aroostook war over the Maine border in 1839. In 1841, as a major general, Scott was appointed commanding general of the U.S. Army, a position he held until 1861.

During the "Mexican War of 1846-48, Scott achieved the most spectacular success of any U.S. commander, but his pompous attitude and his squabbles with subordinates and superiors marred his effort and contributed to his sobriquet, "Old Fuss and Feathers." While Zachary "Taylor led the invasion of northern Mexico, Scott in 1847 personally led the southern expedition.

Scott's campaign began with the first major amphibious landing in U.S. history: more than 12,000 U.S. troops were put ashore by the U.S. "Navy without loss of life near the Mexican port of Veracruz in surfboats specifically requested by Scott. The city surrendered after an 88-hour bombardment by Scott's siege guns, which killed between 1,000 and 1,500 Mexicans. At the beginning of the campaign, Scott had issued General Order No. 20, responding to atrocities committed by some of the volunteer troops; in it he required U.S. troops to respect the rights and property of Mexicans, local government, and the Roman Catholic Church.

To avoid yellow fever on the coast and to capture the

Mexican capital, Scott then led the expedition on a long, overland campaign across mountainous terrain to Mexico City. He broke through Gen. Antonio Lopez de Santa Anna's defense at the strategic pass of Cerro Gordo and then paused at Puebla to await replacements for the twelve-month volunteers whose enlistments expired. When Scott departed from his line of supply and decided to live off the countryside, the Duke of Wellington in Britain declared he would be lost. But Scott successfully led the U.S. troops to Mexico City, first winning victories at Contreras and Churubusco, where Scott's "casualties were one-tenth that of the Mexicans, largely because of his use of superior "artillery and flanking maneuvers. U.S. troops at Churubusco captured members of the San Patricio Battalion, Irish American soldiers who had changed sides when Mexico offered them land and protection of their rights as Roman Catholics. Scott ordered the survivors executed as traitors.

Arriving in front of Mexico City, Scott agreed to Santa Anna's request for an armistice, hoping for a negotiated peace. But when the Mexicans sought to rebuild their army, Scott resumed the offensive, defeating the Mexicans at Molino del Rey in an uncharacteristic frontal attack that cost nearly 800 U.S. "casualties and 2,000 Mexicans killed and wounded. Attacking Mexico City, Scott's forces bombarded, then stormed the Castillo de Chapultepec, overcoming the defenders—including the young cadets, "los Niños," of the military academy there, who died defending the Mexican capital.

President James K. "Polk recalled Scott from Mexico in early 1848 after the disagreements and suspicion between the Democratic president and the Whig general were compounded by the myriad disputes that erupted between Scott and his fellow officers, some of whom filed charges against him. A court of inquiry dismissed these, however, and Scott became a national hero. In 1852, Congress brevetted Scott a lieutenant general and he ran poorly as the Whig Party candidate for president against Democrat Franklin Pierce. In the mid- 1850s, Scott's squabbles with Secretary of War Jefferson "Davis were legendary.

Despite his Virginia birth, Scott remained loyal to the Union when the South seceded. In declining health, he still formulated the much derided but thoughtful "Anaconda Plan" for a long, strangling blockade and siege of the Confederacy to preserve the Union while keeping casualties low. After the First Battle of "Bull Run, which he opposed, he retired in November 1861; he died at West Point in 1866.

SEA POWER. See Mahan, Alfred T.; Strategy: Naval Warfare Strategy.

SEATO (est. 1954). On 8 September 1954, the United States, Britain, France, Australia, New Zealand, the Philippines, Thailand, and Pakistan signed the Southeast Asia Collective Defense Treaty in Manila. Sometimes referred to as the Manila Pact, this agreement created the Southeast Asia Treaty Organization (SEATO). The Eisenhower administration and especially Secretary of State John Foster "Dulles -had worked to establish this loose alliance after the "Geneva Agreement on Indochina ended the French war in Southeast Asia in 1954. Under the prevailing strategy of containment, Dulles envisioned SEATO as a "no trespassing" sign warning Beijing and Moscow not to threaten Southeast Asia. Also, congressional leaders had opposed unilateral U.S. military assistance to France during the siege of Dienbienphu in Vietnam in the spring of 1954. With SEATO, Dulles believed, Congress would support the use of U.S. military forces in any future crisis in Southeast Asia.

Unlike "NATO in Europe, SEATO did not create its own military structure, nor did it obligate its members to respond if one was attacked. In the event of aggression or subversion in the treaty area, the signatories were to consult and to meet the common danger in accordance with their own constitutional processes. South Vietnam, Laos, and Cambodia could not be members because of prohibitions in the Geneva Agreements, but those Indochinese states could request SEATO protection under a separate protocol to the treaty. India, Burma, and Indonesia preferred to maintain a neutral stance toward China and the USSR and declined to join SEATO.

Despite the purposefully vague wording of the SEATO charter, the administration of President Lyndon B. "Johnson claimed in 1965 that SEATO allowed and even required the build-up of U.S. forces in South Vietnam. However, only Australia, New Zealand, and Thailand among the SEATO nations joined the United States in sending combat troops to the "Vietnam War. Pakistan withdrew from the alliance in 1972. After the Democratic Republic of Vietnam prevailed in the Vietnam War, SEATO dissolved completely in 1977.

SEA WARFARE, in the history of the American Republic has consisted of two missions—control of sea lanes and projection of power ashore. During the "Revolutionary War, a great many American merchant ships were outfitted as privateers and preyed on the commerce of Great Britain. According to the records of Lloyds, between 1775 and 1781 American privateers captured 2,600 British merchantmen. The financial impact of these captures on the most influential Britons was an important factor in bringing about American independence. With higher priorities in Europe and India, the British navy attempted to blockade American ports with little success. American projection of power ashore was limited to small raids, but the brief blockade of the Yorktown peninsula by the French fleet under the Comte de Grasse in 1781 was crucial to Gen. George "Washington's victory over Gen. Charles "Cornwallis.

In the "War of 1812, the principal operations of the U.S. "Navy and privateers were in preying on British commerce, which they did with great success. They were much

less successful in preventing the Royal Navy from capturing more than 100 American merchantmen, or in preventing the repeated projection ashore by the Royal Navy of successful invasion forces, including those which captured Washington, D.C., in August 1814.

During the American *Civil War, the *Union navy's principal mission was to prevent the use of the seas for resupply and commerce by the Confederacy. A secondary mission was to split the Confederacy in two by taking control of the Mississippi River and using its tributaries and other major systems to interdict communications and commerce with the Confederacy itself. The *Confederate navy devoted its efforts to attempting to break the very effective strangulation of the Union blockade and to raiding Yankee commerce around the world. The nineteen Confederate raiders, most notably the *Alabama*, which took sixty union prizes under Capt. Raphael Semmes, were sail- or steam-powered, heavily armed packets, some, like the *Alabama*, purpose-built in England.

Following the Civil War, the U.S. Navy entered a period of considerable intellectual ferment and technological innovation. Alfred T. *Mahan revolutionized thinking about naval strategy and marine warfare throughout the world; Mahan's *The Influence of Seapower Upon History* changed the course of world history and helped fuel the German-British naval rivalry leading to *World War I. It was a maxim of Mahan's theories that in addition to the classic naval tasks of raiding enemy commerce and protecting one's own and projecting power ashore, the U.S. Navy must have "a navy powerful enough not just to fend off the enemy, but to smite him down" and thereby achieve "command of the seas." This doctrine of maritime superiority became the reigning orthodoxy in the navy from the late nineteenth century to the present.

Before American entry into World War I, the strategic attention of the navy had come to focus on the growing naval power of Japan. Beginning in 1911, "Plan Orange" was a strategy to fight a naval war against Japan and became the central planning focus of the U.S. Navy until 1945. There was virtually no plan for the war with Germany that came in 1917. The official "Plan Black" was an unrealistic scenario of Germany attacking the Caribbean. In the event, the navy focused almost entirely on fighting the German U-boat threat in the North Atlantic and on conducting the transport of munitions and men to Europe. Despite another period of post-war budget slashing, the 1920s and 1930s saw a great deal of technological innovation in the navy. Advanced versions of naval guns and *torpedoes were developed, and American *submarine design was brought forward. The most far-reaching innovation was the introduction of *aircraft carriers to the fleet, beginning with the commissioning of the USS *Langley* in 1922.

*World War II was the largest naval war ever fought. While *battleships fought important engagements and were indispensable in providing the naval gunfire for amphibious assaults in Europe and the Pacific, they were rapidly replaced as the central weapons system by seaborne air power. The sinking of the *Bismarck* by British carrier aircraft and the *Repulse* and the *Prince of Wales* by Japanese aircraft demonstrated that surface combatants, including the largest battleships, could not survive without the protection of air superiority. The Battles of the *Coral Sea and *Midway in 1942 made clear that aircraft would dominate

the war at sea. Thereafter the war unfolded predictably with the U.S. submarine and then surface Pacific fleets interdicting Japanese logistics and blockading the home islands, while multiplying carrier and battleship task forces hunted down and destroyed the remaining elements of the Japanese battle fleet. Simultaneously, Gen. Douglas *MacArthur in the Southwestern Pacific and Adm. Chester W. *Nimitz in the Central Pacific retook the Japanese conquests closing in for the final invasion of Japan planned for late 1945.

The submarine emerged also as a devastating weapons system. For the first two years of the war, despite the fact that the United States was turning out two merchant ships a day, the Germans were able to sink shipping faster than it could be replaced. Once again, however, Allied air cover, and the lack of German air cover, turned the tide. Germany lost 827 submarines and did not pose a serious threat by the end of 1942.

In the Pacific, the American submarine force was enormously effective throughout the war in destroying Japanese commerce and military transport. Japanese submarines, by contrast, equipped with better torpedoes and some better designs, were never used effectively and had no impact on the outcome of the war. When final victory came in 1945, the U.S. Navy had 105 aircraft carriers, 5,000 ships and submarines, and 82,000 vessels and landing craft deployed around the world, manned by experienced citizen-sailors on a ration of seventy reservists to each regular navy individual.

The emergence of nuclear weapons at the end of the war set the stage for a bitter struggle between the navy and the Air Force over roles and missions in the era of nuclear deterrence. The Air Force sought primacy with its long-range bombers and the navy with its carrier-based aircraft. Ultimately, both were relied upon, but they were eclipsed as delivery systems by the emergence of both land-based and sea-based *missiles. In 1960, the first Polaris submarine was deployed on missile patrol with sixteen nuclear-tipped missiles capable of launching while submerged and flying to targets in the Soviet Union. This strategic deterrent mission remains a fundamental part of the navy. Throughout the *Cold War, naval aircraft carriers carried nuclear weapons and, beginning in the mid-1980s, the Tomahawk cruise missile contributed to nuclear deterrence.

Sea warfare in the *Korean War and the *Vietnam War was limited to projection of power ashore. Korea saw the first use of jet-powered aircraft flying combat missions from aircraft carriers. The strategic use of American carrier aircraft in bombing and mining North Vietnam is well chronicled and was the overwhelming bulk of U.S. Navy effort in the war.

After the end of the Vietnam War, the focus of the U.S. Navy swiftly returned to the growing Soviet naval threat to the sealines of communication and the threat of Soviet fleet ballistic missile submarines. This focus was called sea control and had the highest priority in naval planning through the 1970s. Because of the numerical superiority of the Soviet fleet of some 1,700 ships (compared to some 500 ships in the U.S. fleet plus an additional 500 in *NATO and Allied navies), naval strategy took on a fundamentally defensive posture. *Anti-submarine warfare became the highest priority mission with research and development on surveillance, detection, and offensive and defensive weapons systems. Naval strategy was driven by the central

importance of resupplying NATO in the event of an attack by the *Warsaw Pact, and preventing Soviet submarines from interdicting the North Atlantic sea-bridge below the "GIUK" gap (Greenland, Iceland, United Kingdom).

In the 1980s, with the adoption of a more assertive foreign policy toward the Soviet Union by the administration of President Ronald *Reagan, the navy, led by Secretary John Lehman, fundamentally shifted its strategy to a more forward posture emphasizing immediate offensive operations in the event of a war initiated by the Warsaw Pact. To a continuing emphasis on sea control and anti-submarine warfare was added a reassertion of projection by naval forces of strike power ashore in support of the land battle and deep into the Warsaw Pact. Naval task forces were trained and redeployed to enable the launch of Tomahawk cruise missiles from submarines and surface ships and air strikes from carrier-based air wings. The integrated Reagan military strategy enabled the threat of significant offensive operations from the sea against Warsaw pact vulnerabilities.

After the collapse of the Soviet Union and the end of the Cold War, the Soviet naval threat rapidly disappeared. Sea control and anti-submarine warfare has remained a top priority of sea warfare because relatively low-cost, effective diesel electric submarines have proliferated around the world, and all naval operations in the future are likely to encounter that threat. Nevertheless, the emphasis has again shifted to the projection of power ashore for crisis management and in support of land forces and peacekeeping efforts.

Whether the naval mission requirement is controlling or interdicting sealanes or the projection of power ashore, the same platforms, electronic systems, and weapons are employed. The foundation of sea warfare today is the aircraft carrier. These large, robust mobile air bases provide the protective bubble of air supremacy without which commercial and military surface ships cannot survive in conflict. The aircraft embarked on these ships include ten difference types of specialized platforms engaged in anti-submarine, anti-surface warfare, electronics, surveillance, intelligence, air combat, and surface strike.

Cruisers, destroyers, frigates, and corvettes are designed to engage simultaneously in anti-submarine, anti-aircraft, anti-ship, and projection of power ashore through naval gunfire and Tomahawk cruise missiles. To this capability is now being added theater area missile defense using the *Aegis radar system and the vertical missile launch tubes on cruisers and destroyers. All submarines in the American navy are nuclear powered and are either fleet ballistic missile submarines or attack submarines designed to detect and destroy enemy submarines and surface ships.

Navy and marine amphibious forces are designed and trained to transport and put ashore substantial marine land and air combat forces against enemy opposition. This involves the use of specialized ships that can simultaneously launch helicopter forces and seaborne landing craft and LCAC air cushion landing craft. The landed forces are provided direct fire support from guns and missiles aboard naval surface combatants, and from navy and marine aircraft flying from aircraft carriers, including the marine VS-TOL Harriers flying from the amphibious ships. In the 1990s the Atlantic Fleet pioneered joint operations using aircraft carriers and amphibious ships to land entire army divisions, integrating army and air force aircraft with navy

and marine. With the earth covered two-thirds by water, space-based systems for communications and intelligence are essential to sea warfare. Their product is integrated in all naval tactical planning and satellite navigation, and communications are primary resources for the fleet.

SELECTIVE DRAFT CASES (1918). In World War I, the Supreme Court upheld the constitutionality of the Selective Draft Act of 1917 and national *conscription in general in the Selective Draft Law Cases (officially, *Arver et al. v. United States*, 245 U.S. 366).

In a unanimous decision written by Chief Justice Edward White, the Court rejected arguments that the draft was not authorized by the Constitution and violated the Thirteenth Amendment's prohibition against involuntary servitude. Citing Southern court rulings upholding conscription in the *Civil War (the Northern judiciary had divided), White—a Confederate veteran and former Louisiana judge and senator—declared that the power to compel military service was inherent in any state for its defense. The Constitution permitted national conscription as "necessary and proper" to implement the specific congressional authority "to raise and maintain armies." Although the judiciary modified some Selective Service procedures, particularly during the *Vietnam War, the Supreme Court has never reexamined the constitutionality of national conscription.

SELECTIVE SERVICE. See Conscription.

SEMINOLE WARS (1818; 1835-42; 1855-58). The southeastern border of the United States was continuously turbulent during the early nineteenth century. Runaway slaves escaped into Spanish Florida, while Indian bands and white bands marauded unrestrained. Open war finally broke out on 27 November 1817, when Maj. Gen. Edmund P. Gaines sent a detachment to Fowltown, a Seminole village, to arrest its chief, Neamathla, for defying the authority of the United States.

Maj. Gen. Andrew * Jackson took over command on 26 December 1817. With an army of about 4,000 men, half of them Creek Indians, he invaded Spanish Florida and destroyed Seminole power west of the Suwannee River. He went on to take St. Marks and Pensacola, offending Spain; then offended Great Britain by executing two British citizens for aiding the Seminoles. The war seemed over to him, and on 30 May 1818, he left Florida. The next year, because of Jackson's conquests, the Spanish government transferred Florida to the United States by the *Adams-Oms Treaty.

For the Seminoles, American acquisition ended an era of

prosperity and began one of deprivation. The first U.S. policy, initiated in 1823, confined them to a reservation of 4 million acres of poor land. There were numerous violent confrontations, many of them disputes over the ownership of blacks. U.S. slaveholders, Creek Indians, Seminoles, and the blacks themselves harried each other over slave property.

As Americans shoved into Florida in the years after the war, the Seminoles, a loose association of diverse bands, prepared to fight once more. In 1834, however, their leadership came not from hereditary chiefs but from "Osceola, a part-white warrior without ancestral or tribal standing, whose courage and determination inspired the bands to act together. Miccosukees ravaged the plantations east of the St. Johns River, while Alachuas and others killed the Indian agent, Wiley Thompson, and annihilated Maj. Francis L. Dade's detachment of 108 men on 28 December 1835. Dade's defeat began the undeclared Second Seminole War, 1835-42.

By September 1836, the Seminoles controlled all of North Florida east of the Suwannee River except Newnansville, Micanopy, and Gary's Ferry. But when Osceola sickened in the late summer, cooperation among the bands slackened. Leadership passed from Osceola to Wildcat (Coacoochee), Alligator (Halpatter Tustenuggee), Jumper (Ote Emathla), Halleck Tustenuggee, Billy Bowlegs (Holata Mico), and Sam Jones (Arpeika). These men led not a nation but disparate bands that sometimes cooperated.

For the United States, Brig. Gen. Duncan L. Clinch commanded first, followed by Maj. Gen. Winfield "Scott. After Scott, the civilian governor of Florida, Richard K. Call, took charge for six months. Then the sequence of ranking general officers recommended: Maj. Gen. Thomas S. Jesup, Brig. Gen. Zachary "Taylor, Brig. Gen. Walker K. Armistead, and Brig. Gen. William J. Worth.

Scott's Napoleon-like strategy failed. Jesup, frustrated, began to seize key leaders when they came in to negotiate; his most notorious capture was of Osceola on 27 October 1837. Zachary Taylor directed the notable battle near Lake Okeechobee on Christmas Day, 1837. He threw his 800 men head-on against a position meticulously prepared by the three bands of Seminoles waiting there. He finally dislodged them but sustained 138 "casualties.

About 400 blacks, effective fighters, stood with the Seminoles until the spring of 1838. In March of that year, General Jesup reversed previous policies and promulgated his order that all blacks who joined the U.S. force would become free. Thereafter, the blacks shifted allegiance, ceasing to serve alongside the warriors.

The last two U.S. commanders relied on small detachments led by junior officers. Blacks or captured Indians guided them to the ultimate hideaways of the Indians, where they destroyed the remaining Seminole means of subsistence. Ragged, hungry, and short of ammunition, hostile bands began to surrender; in August 1842, General Worth was able to declare the Second Seminole War ended. About 350 Indians remained south of Lake Okeechobee and Peace Creek.

For a few years, Billy Bowlegs and Sam Jones strove to keep the peace; but the United States, pressed by settlers, began to build roads and survey within the Indian preserve. Escalating white encroachments brought an attack on an army camp on 20 December 1855. It was the catalyst for the Third Seminole War. U.S. volunteers rather than

regulars provided the main military force this time. The last fight took place on 5 March 1857. Billy Bowlegs, convinced that the cause was lost, accepted several thousand dollars to emigrate, taking with him 165 followers. About 120 Seminoles remained behind. One of them was Sam Jones, who never left, but died in Florida in 1867, one hundred eleven years old. The United States declared the Third Seminole War officially ended on 8 May 1858.

SERMONS AND ORATIONS, WAR AND THE MILITARY IN. The role of religious ideology in military history is often overlooked. Military matters are frequently touched on in connection with religious history, but only to reinforce the prevalence of religious trends, not to demonstrate religion's impact on military operations. Yet throughout American history, religion has served distinctive militaristic purposes as preachers have conjoined military action with piety to foster a sense of duty, mission, and historic connection to God's will.

In seeking to justify war, ministers in colonial America emphasized conflict as a natural consequence of sin. The Puritan minister Urian Oakes examined the internal struggle with sin and its external manifestation in war. In his 1672 military sermon ("The Unconquerable, All-Conquering, and More-Than-Conquering Souldier"), Oakes superimposed the metaphysical struggle between good and evil onto the military necessities of colonial New England. In the aftermath of "King Philip's War, Samuel Nowell emphasized a more practical theme, self-preservation, in "Abraham in Arms" (1678). He argued that God was a man of war and concluded that the colonists should resist both Indians and European nations. Such messages promoted a sense of military obligation to God and the "state, linking civil religion to "patriotism and military training.

Religious ideology emphasized the orderly, manly, and godly aspects of European-style war. The colonial militia trained in linear European tactics, despite the fact that the Indian forest warfare made them useless. In this instance, religious ideology hindered effective operations. The Puritan minister John Richardson ("The Necessity of a Well Experienced Souldiery") noted in 1675 that learning the art of war gave much glory to God, "the author of every commendable art or science." The pursuit of reason and order through the militia training may have encouraged God's favor, but it did little to prepare colonists for irregular warfare.

A second, functional level of military activity responded to shifts in the conduct of operations. The reality of non-European opponents fighting in unorthodox and "unmanly" ways caused colonists to learn, at great cost, new ways of fighting in dense forests: that maneuver was as important as volley and fire. Without open fields, small units composed of light, mobile troops became the most effective means of combatting the Indians. Such warfare was at odds with both Puritan theology and accepted military practices. In a sermon entitled "Military Duties Laid

Before a Trained Band" (1686), the eminent Puritan minister Cotton Mather addressed Indian tactics and God's will, emphasizing the Christian aspects of military duty and likening the Puritan-Indian struggles to those of the Israelites and the Philistines. New England's success in King Philip's War, he concluded, proved the justness of war and the efficacy of prayer.

In defining accepted behavior, most ministers emphasized the just causes of war. In an election sermon preached to the Honorable Artillery Company of Boston during King William's War ("Good Souldiers a Great Blessing," 1700), Benjamin Wadsworth argued that war was not only lawful, but necessary. Obedience to God and resistance to Indian treachery were the reasons to learn war; like Mather, he reinforced historic connections to Israel and urged participation in militia training. Both Mather and Wadsworth fostered a kind of religious "nationalism by praising military action.

Preachers in the evangelistic era of the Great Awakening (1740–45) suffused this religious ideology with a growing awareness of political rights and liberties. As their sermons reveal, motives for war were no longer strictly religious and defensive; rather, war could be seen as a guarantor of civil liberties.

At the outset of the *French and Indian War, the Presbyterian minister Samuel Davies insisted that warfare was both a civic responsibility and a Christian duty. In August 1755, Davies preached to a company of independent volunteers from Hanover County, Virginia, on the theme "Religion and Patriotism the Constituents of a Good Soldier." Davies rebuked the congregation for unmanliness in failing to support the frontier army, which as members of the body politic they had a responsibility to do. Three years later, Davies preached "The Curse of Cowardice" to a general militia muster, taking his text from Jeremiah 48:10: "Cursed be he that doeth the work of the Lord deceitfully, and cursed be he that keepeth back his sword from blood." Davies used associations with Israel to define the condition of service as something owed both to God and to country. Thus, between the 1740s and the 1780s, many preachers fused political patriotism with religious nationalism. The result was a religious ideology that defined godliness and manliness through the performance of military obligation.

The rise of the political oration in the *Revolutionary War era marked the first shift away from the military sermon. The *Boston Massacre Day orations serve as partially secularized functional equivalents to New England artillery sermons. In 1774, John Hancock ("An Oration Delivered ... to Commemorate the Bloody Tragedy of the Fifth of March 1770") employed traditional religious imagery to convey an essentially political message: that colonists "fight *pro aris & focis*, for their liberty, and for themselves, and for their God." Key to his message was his order of delineation: liberty, self, and God. By contrast, John Lathrop, pastor of the Second Church in Boston ("A Discourse Preached on March the Fifth, 1778"), based his commemoration on the biblical text of Genesis 6:13: "... The earth is filled with violence." Lathrop argued that North America had been "reserved in divine providence as the last retreat" for those who placed God above "the will of any temporal monarch." These examples bridge the gap between artillery sermons and quasi-religious commemorative speeches, and they mark the beginning of a shift in the control of popular ideology from the pulpit to the political platform.

In the post-Revolutionary era and beyond, these trends became >more pronounced. On the one hand, sermons serving to articulate military and political values and to mobilize public sentiment declined generally; yet in times of crisis or impending war, clergy often integrated familiar themes that reinforced cultural attitudes about God's will and just war.

The *Civil War was perhaps the last example of overwhelming ministerial unity on the propriety of war, with sectional interests serving as the justification. Although denominations split along sectional lines, both Northern and Southern ministers used the pulpit to promote their region's cause, and each employed similar themes to reinforce the intended message. When, in 1862, the Northern Congregationalist minister James D. Liggett ("Our National Reserve") preached to a crowd in Leavenworth, Kansas, he relied on historic connections to Israel and the justness of the antislavery cause. Meanwhile, Joel W. Tucker ("God's Providence in War"), a Southern Presbyterian preacher from Fayetteville, North Carolina, made similar connections to Israel and declared that God had ordained the war for Southern independence despite human efforts to prevent it.

At the same time, new and varied ways to express political values contributed to decline of the traditional military sermon. Public orations increasingly expressed familiar themes in this secularized form, linked to religious themes but not denominational affiliation. During the Civil War, President Abraham *Lincoln employed this style in his speech dedicating the cemetery at Gettysburg (1863). In his address, Lincoln made clear that those who had perished in the fight to preserve the Union did not die in vain, for through their sacrifice the nation would have "a new birth of freedom." Here, Lincoln relied on ingrained Christian beliefs to make his point without a formal exegesis of their religious underpinnings. Lincoln had at his disposal an entire history of engendered religious attitudes to carry his meaning home to his audience.

In the late nineteenth century, increased secularism and the waning of providentialist reasoning hastened the decline of clerical consensus on the question of just war, particularly among Protestant clergy. Though both the establishment of religious freedom and the disestablishment of state churches had emerged as consequences of the Revolution and American independence, ministers maintained the power to help influence public opinion. By the turn of the twentieth century, however, the public oration clearly predominated. In 1898, the New York reformer Theodore *Roosevelt appealed to "muscular Christianity" and its values of manly self-sacrifice to encourage participation in the *Spanish-American War; in 1917, President Woodrow *Wilson acted as a moralizing evangelist to stir public sentiment in support of American involvement in World War I.

The linking of religious ideology to military action and public support for war necessitates a reassessment of American civil-military relations. Religion encouraged, if not demanded as a Christian duty, military participation. This, in turn, helped prepare Americans for war. Religion established a just war model and often equated a just war with a holy war. Many ministers joined a sense of religious nationalism to notions of civic republicanism, and transformed both into a political nationalism tinged with highly charged religious metaphors. Thus, emerged a civil religion that defined both religious identity and citizen-

ship through war. Public orators adapted the sermon style to play on traditional themes with the added emphasis of state support. Although the clergy split over several American wars, such as the Revolutionary War, the *War of 1812, and the *Mexican War, this trend has persisted into the modern period.

SERVICE ASSOCIATIONS. The establishment of service associations or societies for military personnel is a key milestone in the development of professionalism in the U.S. armed forces. America's first military society, the U.S. Naval Lyceum (1833-39), addressed a small audience with an underdeveloped sense of professional identity, dispersed around the globe. The next effort was more enduring and set the pattern for later groups. In 1873, the U.S. Naval Institute was formed by officers who were interested in advancing naval thought and doctrine, even though their service was moribund after the post-*Civil War drawdown. The institute consciously patterned itself after the British Royal United Services Institute, which in turn had imitated the activities of medical and engineering societies. It published a journal, sponsored lectures, symposia, and prize competitions for essays, and lobbied uniformed and civilian authorities.

The army quickly followed the lead of its maritime counterpart with the establishment of the Military Service Institution of the United States (MSIUS) in 1878. However, the various army branches eventually established their own societies, such as cavalry (1885), infantry (1904), and field artillery (1910). This fragmentation eventually proved fatal to MSIUS, which in 1917 succumbed to the frantic World War I buildup. Attempts to gain a "one-Army" voice floundered in the interwar period and were successful only in the early 1950s with the merger of the infantry, field artillery, and coast artillery bodies into the Association of the United States Army.

The U.S. Navy avoided this fragmentation, though the naval engineering corps formed the American Society of Naval Engineers, which addressed technical concerns. Marine Corps officers formed a Marine Corps Association in 1913, and the Air Force Association was established in 1946. Over the years, other associations for various military branches and activities were organized, such as the Reserve Officers Association and the Non-Commissioned Officers Association. These societies generally sponsor journals, book ordering services, meetings, writing competitions, and financial services (insurance, charge cards, job placement, etc.). Moreover, they cultivate government and industry contacts to advance the members' agendas, which often (but not always) parallel the concerns of the relevant armed service. Some academic critics contend

that the officers' societies are not true professional bodies that define expert knowledge but are merely lobbying or "backstop" groups that promote the military's interests in the federal government.

Another type of association is the military-industrial trade group, which often consists of uniformed and civilian members. One of the earliest was the Navy League (1902), which initially tried to become a major grassroots pressure group like its British and German counterparts. After several decades of searching for a workable identity, it adopted a more realistic mission of championing the maritime industry in the federal government. The periods after both world wars saw the emergence of groups that initially focused on army activities but quickly expanded to address similar concerns of the other services. Most prominent of these are the American Defense Preparedness Association, the Armed Forces Communication and Electronics Association, and the American Logistics Association.

Normally, the activities of the societies are fairly low-keyed, but there is an inherent tension in having government officials as members of private bodies that try to influence government activities. From time to time, the congressional and executive branches have tried to distance official military activities from the societies. In 1973, Congress passed a ban on active duty personnel working on associations' staffs, and Navy Department assistance to the Tailhook Association declined rapidly in the 1990s following the notorious Tailhook Convention (1991). Despite such actions, the existence of military societies is well established; they will continue to examine defense issues, provide services for their members, and champion their interests.

SEVEN DAYS' BATTLE (1862). In response to Union Gen. George B. *McClellan's Peninsular Campaign in spring 1862, after brief engagements at Yorktown and Williamsburg, Confederate Gen. Joseph E. *Johnston withdrew to Richmond. They leisurely pursued McClellan along the north bank of the Chickahominy River, arriving at the city's outskirts on 17 May 1862. Although McClellan believed Richmond could best be taken from the south, he held his army north of the Chickahominy in order to receive reinforcements from Gen. Irvin McDowell, advancing from the north via Fredericksburg. A bridgehead across the river was maintained by a single-Union corps under Erasmus Keyes at Seven Pines. As McDowell approached, Johnston realized he could not defend Richmond against two armies, and decided to attack McClellan in hopes of forcing him to withdraw. The obvious point of attack was Keyes's exposed position at Seven Pines.

Johnston's assault was bungled, but it discouraged McClellan from further offensive action. Erroneously convinced that he was outnumbered by an enemy of 200,000 troops (the actual number was 85,000), McClellan opted to prepare for a siege of Richmond. He also reversed the disposition of his army relative to the Chickahominy, moving all but Fitz John Porter's corps of 30,000 men south of the river. Porter's task was to protect communications across the river and receive McDowell, if and when he

should arrive. In the meantime, Confederate Gen. Robert E. Lee replaced Johnston, who had been wounded in battle. Lee faced a situation identical to Johnston's, with McClellan in front and McDowell behind. His solution was likewise similar. Rather than defend against a significantly reinforced enemy, Lee prepared to strike McClellan, hoping to defeat him, and then turn on McDowell. Lee summoned "Stonewall" Jackson, who had been operating in the Shenandoah Valley, to join him. Intelligence informed McClellan that Jackson was en route and headed straight for Porter's corps, yet McClellan did nothing to strengthen his exposed flank.

Lee concentrated 55,000 soldiers against Porter, leaving only 30,000 troops to guard against McClellan's 70,000 men south of the Chickahominy. On 26 May he attacked, driving Porter from his position at Mechanicsville east along the river. Fortunately for McClellan, the Confederate attack was poorly handled and Porter ably defended himself, despite the absence of any help from McClellan. However, Lee's assault threatened McClellan's line of communications, prompting him to shift his base of operations south to the James River.

Again, Lee attempted to destroy Porter on the 27th at Gaines' Mill, with similar disappointing results. Porter was nonetheless obliged to withdraw across the river, which reunited the Army of the Potomac. With the change of base, and with the Chickahominy between him and Lee, McClellan might well have held his ground. But he was convinced that Lee now had 250,000 men (nearly three times Lee's actual strength) and could see only imminent disaster if he stayed put. On the 28th, McClellan began a full-scale retreat. Bridges over the Chickahominy were burned, as were tons of supplies that could not be carried away, delaying Lee's pursuit one day. The withdrawal was hastily executed and without the benefit of McClellan's personal guidance. He had ridden ahead to Harrison's Landing and failed to appoint a second in command. Only Lee's momentary confusion about McClellan's intentions saved the "Union army from immediate attack.

Once apprised that McClellan was moving south, Lee sent two divisions on a circuitous route to strike the Union right, while the rest of Lee's army came down on its rear. Confederate forces caught up with the Union rearguard at Savage's Station on the 29th. Lee's flanking elements failed to appear, and the Federal army escaped.

As the Union retreat continued, a mammoth bottleneck developed at Frayser's Farm, halting the withdrawal. There Lee attempted to concentrate his forces and envelop the Federal line, but again his subordinates were slow, and the Union army escaped. On 1 July, McClellan's force held an impressive defensive position atop Malvern Hill. Frustrated by his previous inability to engage McClellan successfully, Lee ordered an imprudent and costly frontal attack against the closed lines and massed artillery of the *Fédérés*.

When the Army of the Potomac reached Harrison's Landing, Lee ended his counteroffensive. During seven days of fighting, the Confederates suffered about 20,500 "casualties to the Union's 16,500. Despite the higher casualties, Lee was proclaimed a hero in the South, for he had taken the offensive and driven a larger army away from Richmond. McClellan, believing he had saved his army from a larger force, criticized Washington for not giving him more support.

SEVERSKY, ALEXANDER DE (1894-1974), airpower activist. Born in Tiflis, in Georgian Russia, de Seversky served in the Imperial Russian Naval Air Service during World War I. A combat accident in 1915 claimed his right leg, but he continued flying. The Russian Revolution made de Seversky's temporary assignment to the United States permanent in 1917. Four years later, he sold an new bombsight to the U.S. government. He also met Billy Mitchell, and for the rest of his life would champion Mitchell's doctrine that strategic air power could win wars, rendering armies and navies superfluous.

In 1939, de Seversky began writing full time. *Victory Through Air Power*, his most influential work, was published in April 1942, following a string of Allied defeats. Readers eager for an antidote to Axis domination bought at least 350,000 hardcover and paperback copies. *Reader's Digest* released a condensed version and many newspapers carried installments. Walt Disney was inspired to make a film using animation to transfer de Seversky's theories to the screen. In his book, Seversky extended Mitchell's vision of airpower to argue that even if bombing could not achieve quick victory, it could obtain total victory through unconditional surrender. He also openly criticized military leaders for slowing development of very long-range "bomber aircraft in order to promote more conventional weapons such as "aircraft carriers and fighter airplanes. Army air force and navy leaders and public relations officers campaigned to discredit de Seversky, his book, and the film. They were largely unsuccessful. By war's end, de Seversky had stimulated popular awareness and driven the national debate on strategic airpower further than any previous writer.

SEWARD, WILLIAM H. (1801-1872), secretary of state during the Civil War. An 1820 graduate of Union College, Seward became a lawyer in Auburn, New York, and was active in the Anti-Masonic Party. He subsequently led the Whig Party in the state. Elected governor in 1838, he entered the U.S. Senate in 1849 and established himself as a promoter of America's mission in the world and a leading opponent of slavery. In 1850, he appealed to a "higher law than the Constitution" in condemning slavery, and in 1858, by then a Republican, spoke of an "irrepressible conflict" between freedom and slavery.

After losing the party's 1860 presidential nomination to Abraham Lincoln, Seward was offered the State Department as a consolation prize. He accepted only in the false hope of thereby becoming president in all but name. Initially, he proposed going to war with France and Spain in order to reunite the country and avert the Civil War. But his subsequent achievements were considerable.

He worked successfully to keep the European powers out of the Civil War, smoothed relations with Great Britain

after the Trent Affair, ended French intervention in Mexico through persuasion and the moving of American troops to the Rio Grande in 1866, and laid the groundwork for the so-called *Alabama* claims for damages done by Confederate commerce raiders. He purchased Alaska from Russia in 1867 and annexed Midway in the same year, concluded a treaty with Great Britain for the suppression of the African slave trade, and opened diplomatic relations with the black republics of Haiti and Liberia. In his eight years in office, he negotiated more treaties with foreign nations than had all his predecessors combined.

With his vision of an American commercial hegemony that would spread democracy throughout the world, Seward was clearly ahead of his time. Such proposals as acquiring Hawaii, the Dominican Republic, and the Danish West Indies came to nothing at the time, as did plans for an isthmian canal and a worldwide telegraphic communications network. But they clearly foreshadowed the shape of things to come.

SEX AND THE MILITARY. The sexual behavior of those in the military, and attitudes and policies related to that behavior, provide important vantage points from which to examine the interactions between civil society and the military society. In the United States, sexual stereotypes are powerful and have helped guide the creation of military policies and regulations. "Natural" and generally different sexual behaviors and attitudes are often associated with being male or female. These understandings, to some degree, have changed over time and certainly are influenced by such factors as culture, race, and age. In times of crisis, particularly wartime, established norms may be contradicted by expediency or military needs and thus force the adoption of quite different practices, regardless of stated ideals.

During the *Revolutionary War, it was common for armies to rely on accompanying wives of soldiers, military *families, or "camp followers" to provide a range of support services, including sexual ones. During the *Civil War, prostitutes were allowed into army camps and probably performed other than sexual "chores" as well. As Estelle Freedman and John D'Emilio have argued in *Intimate Matters* (1988), the Civil War "facilitated the expansion of prostitution," increasing the number of women set adrift socially by the war who had few other options for survival, and providing a mass market of men in training and camp. Officials of the *Union army became concerned about exposure of soldiers to sexually transmitted *diseases, and therefore experimented with regulating prostitution through medical examinations.

By the last decades of the nineteenth century, prostitution had become a focus of social reformers and public health officials. There was, however, disagreement as to whether prostitution posed primarily a moral or a health threat to American society. As U.S. entry into World War I drew closer, the War Department sought to make military camps safe from both immorality and venereal diseases. As Allan Brandt notes in *No Magic Bullet* (1987), Secretary of War Newton Baker believed that it was the government's

responsibility to maintain order and heighten "soldier's moral rectitude." In April 1917, Baker created the Commission on Training Camp Activities, which used education and organized recreational activities to keep soldiers morally and physically fit. Additionally, a moral reform section of the Conscription Act of 1917 prohibited prostitution or the sale of liquor near training camps; this resulted in new attempts to control prostitutes, who were described as "disease spreaders and friends of the enemy," and led to government closing of bordellos in New Orleans, Memphis, and a host of other cities.

In this case, military needs and policies carried into the civilian sphere. By March 1918, thirty-two states had passed laws requiring compulsory medical exams for prostitutes. However, once American troops reached France, the issue of health and efficiency overcame moral goals, and eventually preventive medical programs against sexual diseases were instituted and prophylaxis mandated. As Brandt concludes, these policies "unhinged the alliance with moral reformers at home."

During World War II, educational programs much like those of the previous war were utilized, and vice activities near medical installations were made a federal offense under the May Act of 1941. Training films showed the ravages of advanced syphilis and gonorrhea. However, officials also recognized that they could not fully control sexual behavior and thus provided condoms, as well as subsequent treatment for infections (especially effective after the introduction of penicillin in 1944). At first the army rejected anyone with venereal disease, but by 1942 it changed the policy to allow induction if the cases were not complicated. The military also abandoned the regulation that imposed penalties on those with venereal disease.

Reflecting postwar prudery, the military in the 1950s returned to an emphasis on education and moral exhortations, but these did not create substantive changes. The target in subsequent decades would be the health and efficiency of the armed forces. This would be complicated when *AIDS became a nationally recognized health issue; in 1985, the Department of *Defense mandated screening of new recruits for the HIV antibody and rejection of those infected.

Just as military responses to prostitution and sexually transmitted diseases resembled a balancing act between social values and institutional needs, so military attitudes toward and treatment of homosexuality also illustrated the contradictions between theory and practice. Most social historians agree that it was not until the late nineteenth or early twentieth century that homosexuals were "scientifically" defined as personality "types" and individuals self-identified as homosexuals. In the World War I era, both the army and the navy punished "sodomists" for their criminal acts. In 1916, assault with intent to commit sodomy was made a felony, and, in 1919, sodomy, the act itself, usually defined as anal and sometimes oral sex between men, became a crime, meriting appropriate court-martial and five or more years of imprisonment. Publicity and protest surrounding several such cases brought congressional investigations in 1920 and a report in 1921 that mandated an end to such punishments because "perversion" was not a crime but a disease.

Between the end of World War I and the beginning of World War II, the medical world, and society more generally, adopted the view of homosexuality as "abnormal" and

therefore an illness. During World War II, questioning and psychiatric tests were used to prevent homosexuals from entering the services, with limited success. By 1942, the first restrictions on inducting homosexuals were enacted, and a year later a complete ban on homosexuals in the services became the rule. Those already in uniform "found" to be homosexual were deemed unsuitable for military service and received undesirable discharges. Alan Berube argues that, regardless of policy, because of manpower shortages during World War II, most homosexuals were tolerated. Scholars of gay and lesbian history point to an unintended result of this wartime focus on homosexuality—the creation of homosexual identity and subcultures among these military personnel that lasted long after the war ended.

During the 1970s and 1980s, legal challenges to the ban on homosexuals increased, and in 1993, President Bill Clinton sought to use his executive authority to allow homosexuals in the armed forces. However, strong public and military opposition to that stand left the ban in place, modified somewhat by Senator Sam Nunn's "Don't Ask, Don't Tell" compromise policy.

Separate spheres for men and for women generally kept women out of the more permanent and institutionalized military structures of the nineteenth century, but by World War I, with the establishment of a permanent Army and Navy "Nurse Corps, and particularly with the establishment of the Women's Army Corps ("WAC) in World War II, certain matters of sexual behavior had to be addressed. Primary among these would be women's sexual activity, marriage, and reproductive roles. Before World War II, the Army Nurse Corps would not accept married women, and discharge was automatic if a nurse married. Illegitimate pregnancy and morals offenses were causes for dishonorable dismissal.

World War II brought large numbers of women into all the services and prompted a reexamination of some of the existing sexual regulations. Married women could enter the women's uniformed services (the WAC, "WAVES, and "SPARS), and single women who married in the service could leave voluntarily, a decision not available to men. Women, unlike men, had to provide proof that their spouses and children were dependents in order for them to receive support benefits. Women could still be discharged from the service for pregnancy (or for adopting or for acquiring stepchildren), but the decisions were left up to each service and waivers were possible. At one point during World War II, the surgeon general proposed full sexual instruction and distribution of condoms to all women in the newly formed Women's Army Corps. WAC director Col. Oveta Culp "Hobby rejected the plan as undermining her efforts to keep the women sexless and "respectable." During the war, WACs did receive training lectures condemning sexual relationships between women. However, officers were instructed not to engage in witch-hunts of lesbians. This was consistent with Culp Hobby's effort to protect the reputations of service women and to counter misogynous sexual stereotyping of military women as lesbians or prostitutes.

In the 1960s and 1970s, many of the traditional military policies toward women came under attack, and reforms were instituted. The changes were the result first of civil rights legislation, feminist politics, and sexual revolution. Second, by 1973, the adoption of an "All-Volunteer Force

created new and sometimes different "manpower" needs (women soon comprised more than 10% of the armed forces). Certain technological and strategic changes also altered many traditional gender exclusions in military occupation specialties in most of the services. (The navy generally remained the most resistant to change, the air force generally the most amenable.) A series of court cases and DoD investigations and policy changes in the 1970s resulted in women obtaining the same dependent rights as men and made discharge for pregnancy voluntary. It is now common for lectures on pregnancy and sexual awareness to be a part of command indoctrination programs. As the controversies surrounding the navy's 1991 "Tailhook" Convention demonstrate, the military's continuing discharges of gays and lesbians, issues of sexual harassment and sexual stereotyping, differential treatment for men and women, and debate over segregated training and combat exclusion all remain problems within military institutions, as they do within society at large.

SEXUAL HARASSMENT. In the early 1990s, sexual harassment in the military made headlines as decades of mistreatment of military women became known. The initial spotlight followed the public revelation of the events of the U.S. Navy's annual Tailhook Convention at the Las Vegas Hilton in September 1991. Hundreds of navy and Marine aviators attended the convention, where male aviators assaulted their female colleagues and both men and women took part in inappropriate activities. Naval leadership did not respond to a formal complaint about the event, which only worsened its reputation when the abuses were exposed in the national media. The ripple effects of Tailhook were felt for years within the navy, until another event overtook the public's attention.

In November 1996, allegations of rape, sexual assault, sexual harassment, and fraternization on the part of drill sergeants at the army's Aberdeen Proving Ground training facility in Maryland rekindled public outrage. Tailhook, Aberdeen, and numerous other incidents brought considerable media attention to gender relations in the military. This, in turn, led to commissioned studies, panels, and congressional hearings on the topics of sexual harassment and, more generally, the role of "women in the military.

As revised in 1995, the Department of "Defense defines sexual harassment as a form of sex discrimination that involves unwelcome sexual advances, requests for sexual nature when (a) submission to such conduct is made either explicitly or implicitly a term or condition of a person's job, pay, or career; (b) submission to or rejection of such

conduct by a person is used as a basis for career or employment decisions affecting that person; or (c) such conduct has the purpose or effect of unreasonably interfering with an individual's work performance or creates an intimidating, hostile, or offensive working environment.

People commonly use the term *sexual harassment* to refer to an even wider range of behaviors, including sexual discrimination, sexual assault, and gender harassment. The concept of sexual harassment is particularly problematic because what offends one individual may not faze another. Research has shown that people are more likely to define a behavior as sexual harassment if it comes from someone in a position of power over them, or if it comes from someone of a different race or class background.

In an article entitled "How Women Handle Sexual Harassment: A Literature Review," published in *Sociology and Social Research* (1989), James E. Gruber classified victims' individual responses to harassment into four categories: *avoidance* of the harasser or the place of harassment; *defusion* of the incident, such as making a joke of the issue or discussing it only with friends; *negotiation*, which includes telling the harasser that his behavior is offensive and asking him to stop; and *confrontation*, in which women use more forceful language and may issue an ultimatum or threat.

At the organizational level, military personnel have been reluctant to file formal complaints of sexual harassment for a number of reasons: they do not believe the organization will respond; they believe there will be a "backlash" against them for filing a complaint; they believe the incident was minor and dealt with satisfactorily on the individual level; they are afraid that a minor complaint will be blown up into a major public issue; or there were no witnesses and they do not believe they will win a "he-said, she-said" case. In the 1990s, as harassment received more publicity and women's complaints were taken more seriously, many military men became afraid that they might be falsely accused. The degree to which this actually occurs, however, has not yet been measured.

The targets of sexual harassment can suffer a number of negative effects: poor physical and mental health, drug or alcohol abuse, work dissatisfaction, alienation from coworkers, tardiness and absenteeism, decreased work performance and poor evaluations, job loss or career disruption, and the costs of legal fees, health care, and counseling.

In some ways, the military environment fosters sexual harassment. Military culture has traditionally emphasized aggression and the masculine role, and many of the men who join hold traditional beliefs about gender. Moreover, women have always been and are still a small and very visible minority, historically excluded from some of the most powerful and prestigious military roles. At the same time, the military is a large-scale formal organization with explicit methods for communicating and enforcing its rules and regulations. Its members are trained to be highly disciplined and to uphold a high moral code. Therefore, the military might also be the workplace most able to stamp out sexual harassment, much as it was more successful than the civilian world in integrating racial minorities.

Studies of sexual harassment rates in the civilian workforce typically find that about 50 percent of women have been harassed at work, although some organizations' rates are considerably higher. Rates in the military have been measured at similar levels—noteworthy because soldiers

live and work together twenty-four hours a day, seven days a week, and see each other not only "on the job" but in dining facilities, in the gym, in the barracks, and in the base shops and clubs. Harassment rates tend to be higher in the ground combat services—the Marines and the army—and lowest in the air force, which is more technically oriented, has the highest percentage of women overall, the highest percentage of women officers, and the greatest percentage of positions open to military women.

Sexual Harassment in the Workplace (1996), a synthesis of the literature, reports the estimated cost of sexual harassment to the U.S. Army in 1988 to be \$533 million (in 1993 dollars). These lost funds derive from reduced productivity; absenteeism; separation, transfer, and replacement of harassers and/or victims; and other miscellaneous costs. The estimate does not account for the expenses of litigation or medical and counseling services.

Because women are not likely to be banned from serving in the armed forces ever again, and because their numbers are increasing under the public's watchful eye, sexual harassment will have to be dealt with effectively by the military. Eliminating the abusive treatment of any soldier will reduce military costs and assist soldiers in maximizing their ability to fight and win wars.

SHARPSBURG, BATTLE OF. See Antietam, Battle of (1862).

SHAYS'S REBELLION (1786-87). After the Revolutionary War, soldiers of the *Continental army were demobilized with little or no pay; whatever "Continental notes" they received could be exchanged only at an enormous discount, and the very states that had approved their issue did not accept them as payment of taxes. Officers eventually received compensation, including land in the Ohio Territory, but by 1786 the plight of the former soldiery was dire, especially in rural Massachusetts, where veterans and farmers suffered most from both the postwar depression and the radical deficit reduction plan of the conservative new governor, James Bowdoin. That year, in western Massachusetts, where many believed they had lost significant political representation under the state constitution of 1780, scores of rural towns petitioned for relief but received none.

In September 1786, a movement called "the Regulation" began across western Massachusetts: whenever the circuit courts were scheduled to meet, between 500 and 2,000 men gathered and marched in a military manner on each court, with the stated aim of postponing the seizure of

properties until after the next gubernatorial election. Over the next five months, under an indeterminate, changing leadership, the "Regulators," armed with clubs and muskets, converged upon Northampton, Springfield, Worcester, and other towns where the courts were scheduled to sit, surrounding the courthouses to keep them closed. Until the last of these protests, there were no casualties.

This widespread movement resembled traditional protests, but those who wanted to establish a national constitution depicted it as anarchy. Gen. Henry *Knox, Massachusetts-born secretary of war for the Continental Congress, traveled to Springfield after the first Regulation to consider the safety of the weapons stored there in the undefended Continental Arsenal. It was Knox, writing to Congress, who first declared that this "rebellion" was led by former Capt. Daniel Shays. Knox, like other nationalists, welcomed an opportunity to demonstrate the necessity of a federal government and a permanent standing army; he proclaimed to Congress and to his mentor, Gen. George *Washington, that the "rebels'" goal was to share all private property as "the common property of all," "to annihilate all debts, public and private," and to foment a "civil war." Since the treasuries of both Massachusetts and Congress were empty, Knox helped Bowdoin solicit wealthy Boston merchants to finance an expeditionary force of 4,400 volunteers led by Gen. Benjamin Lincoln to quell the "rebellion." At the Springfield Arsenal on 24-25 January 1787, Lincoln's forces overwhelmed some 1,500 Regulators, led by Captains Daniel Shays, Luke Day, and Eli Parsons. With the first cannon fired, three Regulators were killed and the rest fled. In pursuit, Lincoln captured a number of Regulators for trial; later, two were hanged.

These mostly peaceable protests provoked alarm that the movement could spread across the thirteen states. This concern helped persuade the states to send delegates to the Constitutional Convention in Philadelphia in May 1787, and to create a central U.S. government better equipped to deal with similar economic and social problems.

SHERIDAN, PHILIP H. (1831-1888), Civil War general and frontier army commander. Sheridan was born in Albany, New York; his Irish Catholic family soon moved to Somerset, Ohio, where his father worked as a laborer. Receiving only modest schooling, Sheridan still obtained an appointment to the U.S. Military Academy, graduating in 1853. Typical frontier assignments found him posted as lieutenant of infantry in Oregon in 1861.

After the outbreak of the Civil War, Sheridan served first in the western theater, demonstrating skills as an operational combat commander in several positions. After starting as a cavalry commander, Sheridan led an infantry division in the Battle of *Perryville, Kentucky (8 October 1862) and the Battle of *Stones River, Tennessee (31 December 1862-3 January 1863), and was promoted to major general in the volunteers. In the Battle of *Chickamauga, Georgia (19-20 September 1863), a Confederate attack battered Sheridan's division, and it suffered heavy *casualties. Under the eye of Gen. Ulysses S. *Grant, Sheridan performed well in the fighting around Chattanooga, Tennessee, including an outstanding role in the victorious

Union assault in the Battle of *Missionary Ridge (25 November 1863).

In 1864, Grant as general in chief selected Sheridan to lead the cavalry corps of the Army of the Potomac in the eastern theater. During May and June 1864, Sheridan's cavalry participated in raids supporting the Union offensive toward Richmond, Virginia. Grant next assigned Sheridan to command the Federal Army of the Shenandoah, with about 40,000 soldiers. As part of the new economic warfare, Sheridan devastated crops in the Shenandoah Valley (the Confederacy's "breadbasket"); he also defeated the *Confederate army operating under Gen. Jubal A. Early. The campaign culminated at the Battle of Cedar Creek (19 October 1864), a victory that helped reelect President Abraham Lincoln and made Sheridan one of the top three Northern heroes of the war, ranking behind Grant and William Tecumseh *Sherman. At the end of the war, Sheridan's victory at Five Forks (1 April 1865) prevented Robert E. *Lee's army from escaping from Virginia and led to Lee's surrender at Appomattox.

After the war, Sheridan supervised *Reconstruction in Louisiana and Texas, insisting on basic rights for black soldiers and freedmen. Sheridan's military government and enforcement of congressional Reconstruction policies put him at odds with President Andrew *Johnson, who reassigned him to the Great Plains in 1867.

During the next decade, from the field and headquarters in Chicago, Sheridan directed major campaigns against Indian tribes in the vast area of the Military Division of the Missouri, from Montana to Texas. During the *Plains Indians Wars, those campaigns included devastating clashes with the Sioux, Cheyennes, and Comanches. Sheridan employed railroads in his military operations and winter campaigns that caught the tribes off guard. He adamantly supported Grant as president, even returning for another controversial assignment in Louisiana to enforce federal laws there after the presidential election of 1876. He served as commanding general of the army from 1884 until his death in 1888.

To some, Sheridan appeared radical for his day, especially in Reconstruction politics. In many ways traditional, he also appeared innovative by using railroads in military *logistics, endorsing development of western lands, supporting specialized officer training schools, and testing new firearms for the army. A great combat commander, Sheridan was determined in defense and relentless in attack. As a measure of respect, Congress voted to promote him to the four-star rank of general of the army shortly before he died.

SHERMAN, FORREST (1896-1951), naval officer. One of the most intellectually gifted and effective military leaders of his generation, Sherman spent most of his career in naval aviation. After participating in the Atlantic Charter Conference of August 1941, he was captain of the aircraft carrier *Wasp* during World War II until she was sunk in the Guadalcanal campaign in September 1942. He played such

a major role in forging Pacific Fleet aviation doctrine as chief of staff to its air commander, Adm. John H. Towers, that he was transferred to the staff of Adm. Chester "Nimitz, Pacific Fleet commander, late in 1943. Promoted to rear admiral and deputy chief of staff for planning, Sherman functioned as Nimitz's alter ego in helping direct the Central Pacific offensive that defeated Japan.

After Nimitz's appointment as chief of naval operations (CNO), Sherman, now a vice admiral, served as deputy CNO for operations during 1945–47. He helped devise early U.S. "Cold War strategy and was the navy's representative in hammering out the compromise that unified the armed forces in 1947. He commanded U.S. naval forces in the Mediterranean until called upon in the wake of "the Revolt of the Admirals" to be CNO in the rank of admiral in November 1949. Sherman restored navy morale and mobilized the navy for the "Korean War and Cold War rearmament. He died on active duty while engaged in a diplomatic mission to strengthen the new North Atlantic Treaty Organization, "NATO.

SHERMAN, WILLIAM TECUMSEH (1820-1891), Civil War general and commanding general of the U.S. Army. Born in Lancaster, Ohio, the sixth child of Charles R. and Mary Hoyt Sherman, Sherman was named for the Shawnee Indian leader "Tecumseh. William was not added until 1830: after his father's sudden death and his mother's inability to provide for the family, he was baptized into the Catholic Church upon his entry into the home of a famous Whig politician, Thomas Ewing.

Sherman studied at the U.S. Military Academy, graduating sixth in the class of 1840. He would have ranked fourth except for demerits received because of his unwillingness to follow regulations. Instead of gaining a slot in the prestigious "Army Corps of Engineers, therefore, he settled for the artillery, serving in Florida during the Second Seminole War (1840-42), in Alabama at Fort Morgan (1842), and in South Carolina at Fort Moultrie (1842-46).

With the outbreak of the "Mexican War in 1846, Sherman sailed to California. He saw no combat, doing administrative work and policing the gold-mining areas. Returning to the East (1850), he married his foster sister, Ellen Ewing, and served in the Commissary Corps in St. Louis and New Orleans. In 1853, he left the army to become a banker in San Francisco (1853-57) and New York (1857), a lawyer and real estate entrepreneur in Kansas (1858-59), and superintendent of the Louisiana Military Seminary (1859-61). When Louisiana seceded from the Union in 1861, Sherman reluctantly left the state, taking a position as president of a St. Louis street railway company.

After the Confederate capture of "Fort Sumter, which began the Civil War, he rejoined the army as colonel of the 13th U.S. Infantry Regiment. At age forty-one, Sherman brought with him not only wide experience but also anxious concerns. The death of his father, his entry into the

Ewing family as a young ward, and later his marriage had been crucial factors in his life. He carried a lifelong fear about family-destroying financial failure and an equally important determination to impress his successful foster father. He had spent most of his adult life in the South and developed a genuine affection for its people; his successful tenure as a popular Louisiana educator made his departure wrenching. His lack of combat experience also played on his mind, as did his conviction that Northern political leaders and people did not understand the importance of the Southern threat of secession. To Sherman, the Union represented the order that both he and the nation needed to avoid the catastrophe of public anarchy and personal failure.

Though his leadership abilities stood out at the July 1861 First Battle of "Bull Run (Manassas), the Union failure there convinced him that his fears about Northern unpreparedness were accurate. Later, commanding in Kentucky, he was so overwhelmed by the dangers he saw around him that he fell into a deep depression that came close to incapacitating him. His subordinates believed he had lost his mind and supported his demand to be relieved of command. In early 1862, he was training recruits in a backwater of the war.

The beginning of Sherman's successful association with Gen. Ulysses S. "Grant and his well-praised performance at the Battle of "Shiloh in April 1862 propelled him back into the mainstream of the conflict. From June to December 1862, he successfully governed Memphis, Tennessee, where the idea for another kind of warfare began to form in his mind. Confederate guerrillas and uncooperative civilians led him to realize that the war involved not just organized armies but supporting civilians as well. In retaliation for guerrilla sniping at Mississippi riverboats, he ordered the destruction of Randolph, Tennessee; he then issued Special Order Number 254 calling for the expulsion of ten families from Memphis for every boat fired on.

In December 1862, Sherman led a failed Union attack at Chickasaw Bayou, near Vicksburg, but he later helped Grant capture Vicksburg in July 1863. That November, Sherman became commander of the Army of the Tennessee and participated in Grant's victory at Chattanooga.

In early 1864, Sherman led 25,000 troops from Vicksburg, through Jackson, to Meridian, Mississippi, destroying property along the way in order to diminish civilian support for the war. When Grant moved east, Sherman became commander of the western theater. Using conventional warfare, he repeatedly outflanked Confederate Gen. Joseph E. "Johnston. Defeating Gen. John Bell "Hood, Sherman captured Atlanta in September, his victory helping to ensure Abraham "Lincoln's reelection in November. He inflicted severe damage on the city, but he did not burn it to the ground.

Hoping to end the war quickly and with the least number of "casualties, Sherman, with Grant's authority, decided he had to make another direct assault on civilian and material support for the war. He marched from Atlanta to the sea and then north through the Carolinas, inflicting severe property destruction but few casualties. He brought terror into the heart of the Confederacy while positioning his army to join Grant against Lee in Virginia. The Confederate will to continue the fight diminished and the inevitability of Union "victory became clear. Demonstrating that he had been truthful in promising a soft peace once

his hard war had overwhelmed his Southern friends, Sherman gave General Johnston such mild peace terms that his own government accused him of treason.

In the postwar years, Sherman used his office as commanding general to try to protect the army's place in American life by insisting on its professionalization. He had limited success, but he did establish the concept of service schools for what he hoped would be a more intelligently prepared officer corps. He supervised the hard war against the Indians, determined to make them productive members of society according to white standards. He was a leading Northern opponent of Republican Reconstruction. When Republicans regularly asked him to run for president, he always declined.

Sherman's impact on American military history was substantial. He pushed warfare away from the increasingly old-fashioned approach of masses of soldiers attacking in gigantic frontal assaults and toward the concept of war between entire societies: total war.

SHERMAN'S MARCH TO THE SEA (1864-65). After capturing Atlanta in September 1864, a victory that guaranteed the reelection of Abraham Lincoln and the continuation of the Civil War, Gen. William Tecumseh Sherman, Union commander in the west, turned his thoughts to the most direct assault he could imagine on the heart of the Confederacy, one that targeted Southern morale. Despite some misgivings on the part of Lincoln and Ulysses S. Grant, the overall Union commander and Sherman's closest friend, Sherman decided to send a blocking force under George H. Thomas to stop Confederate moves northward. Breaking his lines of communication, he would fan out his army and set off for Savannah, Georgia, on a giant raid that became known as the march to the sea, carving a wide swath through the Georgia countryside on his way.

Uniquely among Union generals, Sherman had the intellectual and emotional capacity to understand "psychological warfare, a war of mass civilian terror. He was quite explicit about the deeper meanings of his march even before he started. "I propose to demonstrate the vulnerability of the South, and make its inhabitants feel that war and individual ruin are synonymous terms," he wrote to one associate, while adding to another, "I am going into the very bowels of the Confederacy, and will leave a trail that will be recognized fifty years hence." In a cooler and more analytic vein, Sherman also recognized that as the South lacked a military force to oppose his destruction of its infrastructure and agricultural supplies, his Victory would be "proof positive" to all Southerners and to the world that the North had an overwhelming power that the South could not resist. "This may not be war, but rather statesmanship," Sherman concluded, thus making his own political analysis of

war. If civilian morale crumbled, so would the Southern army and state.

In their march of 285 miles, which lasted 5 weeks, Sherman's army of 60,000 men cut a swath of between 20 and 60 miles through Georgia, destroying fences and crops, killing livestock, burning barns and factories as well as some houses, particularly those deserted by the planter class. It must be emphasized that Sherman's forces refrained from raping white women and from killing civilians. Although many historians have rather carelessly called Sherman's campaign total war, it never became genocidal, nor had Sherman intended it to become so. Such limits were, of course, of scant comfort to the impoverished and malnourished civilians Sherman's army left in its wake.

On 22 December 1864, the day after the Confederate garrison of 10,000 had escaped the city, Sherman's army marched into Savannah on the sea, which Sherman announced to Lincoln and to the Union with his usual rhetorical vivacity: "I beg to present you as a Christmas gift, the city of Savannah, with 150 heavy guns and plenty of ammunition, and also about 25,000 bales of cotton." A week earlier, George H. Thomas's force had destroyed John Bell Hood's Confederate army at Nashville, triumphantly completing the other half of Sherman's post-Atlanta strategy. As Grant's Army of the Potomac was bogged down in trench warfare before Petersburg, Virginia, it was the Christmas victories of Thomas and Sherman that lifted Union spirits.

On 1 February 1865, Sherman's army set off on its even longer sequel to the march to the sea, a campaign of over 400 miles up through the Carolinas, to come up behind Lee's army for one last, climactic battle if it was needed. As much of South Carolina was a swamp during winter, this part of Sherman's march was more an engineering than a fighting marvel: his troops cut down trees to make roads, bridges, and causeways at a pace of ten miles per day. Incapable of opposing Sherman militarily, Confederates could only watch in horror as Sherman's troops laid waste to the countryside at an even greater level of intensity than they had evinced in Georgia. Now almost all civilian homes were destroyed, and several cities were burned, including Columbia, the capital of South Carolina, although Confederates began the blaze by burning cotton bales in the street before departing. Many of Sherman's men broke ranks and joined in a night of burning and looting before they were disciplined; other Union troops extinguished the flames the next day. At Columbia, Sherman's men reached an apotheosis of destructiveness.

Sherman had realized the potential for terror his army would bring to bear on the state that was the cradle of the Confederacy. "The truth is the whole army is burning with an insatiable desire to wreak vengeance on South Carolina," he had written on Christmas Eve, 1864. "I almost tremble at her fate but feel she deserves all that seems in store for her." Sherman's men—his "bummers," as they styled themselves—shared in this contempt for Confederates, especially those of the South Carolina gentry. "Nearly every man in Sherman's army say they are ready for destroying everything in South Carolina," one private wrote home from Savannah before the campaign resumed, while another confirmed after they had finished that "in South Carolina, there was no restraint whatever in pillaging and

foraging. Men were allowed to do as they liked, *burn and destroy*" (Fellman, *Citizen Sherman*, 222-24). Sherman and his men were attuned to one another and acted accordingly. They wanted to create a legend of invincible destructiveness, and they succeeded, landing a devastating blow on Southern morale as they marched and destroyed.

When his army reached North Carolina in March 1865, Sherman reined in the behavior of his troops to a certain extent, because he would soon link up with the Union and feared potential condemnation of his extremism in the press; because he conceived of North Carolinians as poor whites more attuned to Unionism than South Carolina planters; and because he was aware that as the war was nearing an end, violence could decrease. When Lee's lines collapsed at the end of March 1865, Sherman's men were not needed for a final push into Virginia.

But their march would live on in history and in legend. Seven years after the war, Sherman testified that he had not ordered the burning of Columbia, but that "If I [had] made my mind to burn Columbia I would have burnt it with no more feeling than I would a common prairie dog village." Southerners were not mistaken in their hatred of Sherman, who really had intended them as much destruction as he felt might be needed to end the war. Defeated Confederates also testified, despite themselves, to Sherman's effectiveness, for they realized he was the general who had broken their hearts. His march probably shortened the war and made the Southern defeat more comprehensive; therefore the moral meanings of Sherman's march are complex and moot. The march was terrible, but it worked, and it might even have saved lives.

Sherman himself never doubted the efficacy of the destructiveness he had brought to bear. In his 1875 *Memoirs*, he wrote, "My aim then was to whip the rebels, to humble their pride, to follow them to their inmost recesses, and make them fear and dread us." For cold calculation, rage, and ruthlessness, no Union general had a better understanding of the kind of war against civilians that could defeat a democracy such as the Confederacy.

SHILOH, BATTLE OF [Pittsburg Landing, Tennessee] (1862). The prelude to the Shiloh campaign occurred months earlier in the Civil War, in February 1862, when Union Maj. Gen. Ulysses S. "Grant captured Forts Henry and Donelson. The successful Union offensive along the Cumberland and Tennessee Rivers resulted in the evacuation of Nashville and forced Confederates under Gen. Albert S. Johnston to cede much of middle and western Tennessee.

Grant massed his 40,000 troops at Pittsburg Landing, on the Tennessee River twenty-two miles north of Corinth,

Mississippi, a vital rail junction and Grant's next operational target. Union theater commander Maj. Gen. Henry W. Halleck ordered Maj. Gen. Don Carlos Buell, who had occupied Nashville, to leave the capital with 35,000 troops and rendezvous with Grant's force of 40,000 near Pittsburg Landing, Tennessee.

The potential concentration of Grant and Buell alarmed Confederate Gen. P. G. T. "Beauregard, Johnston's second in command, who boldly took charge in the wake of the loss of two forts in February. Beauregard proceeded to issue appeals, collect and organize troops at Corinth, and wield influence over Johnston when the latter arrived. Problems abounded for the "Confederate army. Most of the soldiers were inexperienced, some were poorly trained, and there was a general lack of familiarity between the various components. In spite of the difficulties, Beauregard recommended an offensive strike against Grant near Pittsburg Landing before Buell arrived. Johnston assented.

The movement commenced 3 April, but Beauregard's timetable was too ambitious for the green troops. The plan called for an attack the next day, but rain, rough terrain, and logistical difficulties prevented an attack on either the 4th or the 5th. Convinced that the element of surprise was gone, Beauregard urged Johnston to return to Corinth; but Johnston demurred. Battered by critics for the past several months, Johnston was psychologically unwilling to abandon the offensive. As a result, a massive two-day battle opened early on 6 April near a Methodist meetinghouse called Shiloh Church.

Beauregard's overly intricate "order of battle arranged the 44,000-man army into four lines, commanded successively by William J. Hardee, Braxton "Bragg, Leonidas Polk, and John C. Breckinridge. Hardee's men collided with Federal skirmishers before daylight, and the Confederates soon struck three Union divisions without fieldworks under Brig. Gen. Benjamin M. Prentiss, Brig. Gen. William Tecumseh "Sherman, and Maj. Gen. John A. McClelland. The Confederates achieved tactical surprise and steamrolled one Union position after another. Some Northern units fought tenaciously, while others fell back and reorganized; many of the raw recruits fled, panic-stricken. After three hours of hard fighting, the Confederates had forced the Union right back nearly a mile. Yet success came at an awful price, as "casualties and confusion blunted the Southern momentum.

Prentiss rallied his Union troops along a sunken wagon road, and this spot in the Union center became a magnet for uncoordinated Confederate assaults. At least eleven separate efforts were made against what bloodied Confederates dubbed the "Hornets' Nest." Preoccupation with the Hornets' Nest stalled the Confederate attack for hours. It also prevented the Southerners from massing an effort against Grant's left, closer to Pittsburg Landing. Although the Confederate battle plan called for the primary blow to be made here, the fighting had swirled predominately along Grant's right and center. Johnston rode near the front lines throughout the day, exhorting his men and sending units into the fray. By early afternoon he began probing for the Union left, in order to turn that flank. However, struck by a stray ball that severed an artery in his leg, Johnston died around 2:30 P.M., and Beauregard assumed command. The Hornets' Nest finally gave way after the Southerners assembled sixty-two guns and blasted the

position. Surrounded, Prentiss and the last survivors surrendered around 5:30 p.m.

Despite the carnage on his right and center, Grant's hold on Pittsburg Landing was never seriously threatened. The Confederates never marshaled enough men for a knockout punch to drive the Fédéraux away from the river. By the time dusk arrived, it was too late. Johnston's son later accused Beauregard of squandering a brilliant victory by calling off the action at sunset, but evidence suggests that this is untrue. The disorganized blows delivered against the Union left were easily repulsed, and by late afternoon a line of over fifty Federal cannon crowned the heights above Pittsburg Landing. By the end of the day, the assaulting Southerners faced insuperable problems. Hunger, fatigue, command disorder, and high losses helped check the Confederates.

Beauregard had received a telegram asserting that Buell was near Decatur, in northern Alabama. As a result, he evidently expected Grant to retreat across the river that night or remain in place for a renewed Confederate assault the next morning. Yet the vanguard of Buell's army began crossing the river in late afternoon on 6 April. The reinforcements from Buell and the belated arrival of one of his own divisions more than made up for Grant's losses. At dawn on 7 April, Grant assumed the offensive. Beauregard's troops resisted the onslaught but without reinforcements could do little more than launch isolated counterattacks. By midafternoon Beauregard realized the precariousness of his situation and began withdrawing to Corinth, Mississippi.

Both sides claimed Shiloh as a victory, but the Fédéraux had a far stronger case. They retained possession of the battlefield, and in addition, the strategic situation in the west remained unaltered despite the bloodletting. The Confederates had not dealt a mortal blow to either Grant or Buell. Nor had they driven the invaders from Tennessee or reversed the Union's victories in the winter campaign. Instead, Memphis and the remainder of western Tennessee fell into Union hands after the Confederates evacuated Corinth in late May.

The lengthy casualty lists from Shiloh stunned both North and South. Union losses included 1,754 dead, 8,408 wounded, and 2,885 missing, for a total of 13,047 casualties; the corresponding Confederate figures were 1,723, 8,012, and 959, for a total of 10,694. Shiloh disabused both sides of the notion that the war would be short-lived. Grant's failure to fortify, and his heavy losses, injured his reputation until the capture of Vicksburg in July 1863 redeemed him.

SHOUP, DAVID (1904-1983), general and Marine Corps commandant. The son of an Indiana farmer, Shoup graduated from DePauw University in 1926 with an "ROTC commission. After a month as a lieutenant in the U.S. Army Reserve, he was transferred to the Marines. He served on expeditionary duty in Tientsin, China, in 1927-28, and returned to China on various duties, 1934-36. In 1941, he accompanied a Marine brigade to Iceland.

In the Pacific during World War II, Colonel Shoup was twice wounded in action and won the Congressional Medal of Honor for rallying his troops and leading a charge at Betio atoll, Tarawa, in the Gilbert Islands in 1943. He was chief of staff of the 2nd Marine Division in the battles of Saipan and Tinian.

After the war, Shoup served in logistical, fiscal, and training positions. In 1956, he led an investigation of the drowning of six Marine recruits on a disciplinary night march at Parris Island, South Carolina. President Dwight D. "Eisenhower appointed him Marine Corps commandant in 1960. Always outspoken, Shoup criticized attempts to indoctrinate troops with anticommunism, chastised the services for overemphasizing their own interests, argued against introducing U.S. ground forces in the crises with Cuba in 1961 and 1962, and advised against a massive buildup of U.S. forces in Vietnam. In retirement after 1963, he became an outspoken critic of the "Vietnam War.

SICILY, INVASION OF (1943). The invasion of Sicily on 10 July 1943, a combined American and British operation, was the first major Allied attempt to seize a foothold on homeland territory of an Axis power. Code named "Operation Husky," it followed total "victory over Axis forces in the "North Africa Campaign two months earlier. It was undertaken because success in North Africa had made pressing on with the British-backed Mediterranean strategy strategically logical for the Allies. But the U.S. War Department regretted that it delayed for another year the war-winning invasion of occupied France across the English Channel from Britain.

Operation Husky's invasion armada, consisting of 2,500 ships sailing to Sicily from North Africa, Britain, and the United States, was the largest assembled to that time. Two armies—the U.S. Seventh Army on the left, commanded by Gen. George S. "Patton, and the British Eighth Army on the right, under Gen. Bernard Law "Montgomery—effected the landings on an 85-mile front between Licata and Syracuse on the southeast corner of Sicily. "Landing craft for "tanks and infantry that were to feature prominently in subsequent Allied "amphibious warfare were employed for the first time.

The invasion, under the overall command of Gen. Dwight D. "Eisenhower, was to be spearheaded by airborne operations, but U.S. paratroopers and British gliderborne forces were dispersed by gale-force winds. The amphibious landings, preceded by powerful naval and air bombardments, proved successful. The 180,000 troops put ashore on the first day met little initial resistance from war-weary Italian defenders. But mounting a fierce counterat-

tack the following morning, German armored forces almost drove the Americans back into the sea at Gela. Nevertheless, within forty-eight hours of the first landings, all the beachheads were secured. Subsequent operations in Sicily proved the fighting abilities of American troops as well as General Patton's aggressive combat leadership, demonstrated by Patton's success in achieving final victory on the island by capturing Messina, across from the Italian mainland, while Montgomery remained bogged down short of the city.

Enemy resistance in Sicily was totally crushed by 17 August—though not before faulty tactical planning by the Allied command permitted most of the German forces on the island to escape. The conquest of Sicily, and control of its air bases, led to the invasion and conquest of "Italy a month later.

Allied "casualties in the Sicily operation were: U.S. Army, 8,781 killed and wounded; U.S. Navy, 1,030. British, 11,843 army, 729 navy. Estimated German casualties totaled 29,000; the Italian estimated total was 145,000, including those captured.

SIDE ARMS, STANDARD INFANTRY. In the national imagination, an armed infantryman stands for all America's warriors, past and present. From the musket-wielding Minuteman in the Revolution to the M-16-toting "grunt" in the "Vietnam War, the image is apt: Until the twentieth century, infantry was the primary combat arm, and even now, infantry continues to play a vital role in modern warfare. The evolution of "weaponry reflects fundamental historical changes in America's military, both as an institution and as a war-fighting entity.

A nation's weapons reveal much about its industry and technology, its commitment to preparedness, and how its military fights. After all, peacetime weapons development determines wartime fighting capabilities. When hostilities begin, a military draws from existing arsenals; new weapons, especially small arms, must often await the next war. Taking a weapon from blueprint to servicewide usage cannot be done overnight. Production lines need retooling; new weapons necessitate fresh tactics (for weapons generally dictate tactics, not vice versa); and end users (infantrymen) must fully accept the new arms. All this requires time, a precious commodity in war.

Arms procurement was much simpler in April 1775. Roused by William Dawes and Paul Revere, Massachusetts Minutemen at the onset of the "Revolutionary War took personal weapons (mostly muskets and fowling pieces) from the mantle and assembled at Lexington Green and Concord Bridge. Such diverse weaponry created ammunition resupply problems, so when the "Continental army was formed, the muzzle-loading, smoothbore flintlock musket was its basic infantry weapon.

Smoothbore muskets remained standard American (and British, Prussian, and French) infantry side arms well into the nineteenth century. During the Revolutionary War, Continentals were armed with French and Dutch imports, British muskets gleaned from battlefields and left over from the Seven Years' War, and a few American manufactures modeled upon Britain's short land service musket, or "Brown Bess." Typical of most contemporary muskets,

the Revolutionary-era "Bess" weighed about 13 pounds, featured a 42-inch smoothbore (unrifled) barrel set on a wooden stock, used black powder, fired a .75-caliber (3/4-inch-diameter) soft lead 1-ounce ball (or round), and mounted a 17-inch socket bayonet. Contemporary drill manuals dictated twenty separate steps to load and fire the Bess, including five just to replace the ramrod.

Mastering these exercises so that a soldier could continue reloading and firing as the enemy closed demanded endless drill and harsh discipline. European doctrine required that troops fire four unaimed rounds per minute—unaimed, because volume of fire, not accuracy, won eighteenth-century battles, and because smoothbore muskets were notoriously inaccurate beyond 50 yards. (A 1779 English test pitted a Bess sharpshooter against a longbowman. At 100 yards, a musketeer with a Bess hit a 4-foot-square target 57 percent of the time; his opponent hit the same target with 74 percent of his arrows.) During the Revolution, however, chronic shortages of gunpowder forced Americans to change doctrine. Officers and noncommissioned officers called for aimed fire to conserve powder (hence Gen. Israel Putnam's Battle of "Bunker Hill injunction "not to fire until you see the whites of their eyes").

For skirmishing and sniping, American light infantry employed "Pennsylvania" or "Kentucky" long rifles. Rifles had spiraled grooves cut inside the barrel—rifling—which imparted spin to the musket ball for greater distance and accuracy. One of Daniel "Morgan's frontier marksmen could pick off a British officer at 300 yards or more. Rifles, however, needed a full minute to load and could not accept bayonets, which made them unsuitable infantry weapons. Nevertheless, the image of a sharpshooting American rifleman exerted powerful influence on subsequent weapons development.

After the Revolutionary War, Congress established national armories in Springfield, Massachusetts, and Harpers Ferry, Virginia. Beginning in 1795 and 1801, respectively, these armories manufactured muskets based upon a .69-caliber French 1777 design. Production and inventiveness initially suffered from a lack of precision machinery and ineffective management by political appointees; but by the 1840s, interchangeable parts production of the American-designed Model 1841 musket began. Percussion caps (invented in 1805 but heretofore little used) now replaced flints, but the basic weapon remained a smoothbore musket. This soon changed.

Marrying a rifle's accuracy and range with a smoothbore's speed in loading was achieved when French Capt. Claude Minié perfected the minié ball in the 1840s. The minié ball—in fact, a cylindro-conoidal bullet—was muzzle-loaded like a round ball, but its hollow base expanded when fired to fit the rifling of even a powder-fouled barrel. Springfield and Harpers Ferry arsenals began producing .58-caliber rifled weapons capable of firing this new ammunition in the mid-1850s. Revised after Britain's Enfield rifle, Springfield Models 1861 and 1863 rifled "muskets became standard Federal (and Confederate, from post-battle harvests) infantry side arms during the "Civil War. Unfortunately, tactics lagged behind technology.

Rifled muskets increased the average infantryman's effective killing range to 250-300 yards. But Confederate and Union generals raised in the smoothbore era and influenced by "Napoleonic warfare persistently sent massed troops in frontal assaults across open fields. Battlefields

became slaughterhouses. The battles of *Fredericksburg, *Gettysburg, *Franklin, and the * Wilderness were just a few examples where nineteenth-century weaponry shattered eighteenth-century tactics. That frontal assaults sometimes succeeded despite enormous * casualties speaks more of soldierly courage and fortitude than any general's brilliance.

The bloodletting would have been infinitely worse if repeating rifles had become standard issue. In the 1850s, American gunsmiths Samuel *Colt, Benjamin Tyler Henry, and Christopher Spencer began developing breech-loading, repeating rifles. Colt's, Henry's (later Winchester), and Spencer's rifles used rim-fire, copper-clad cartridges (from .44 to .56), and in the Civil War were primarily carried by Union cavalrymen. Thus armed, 100 men replicated the firepower of a regiment. Why, then, were not all Federal troops in the *Union army armed with repeaters, at least toward war's end?

Military institutionalization had paralleled industrialization, creating a weapons procurement bureaucracy that valued inertia and infighting over fresh ideas and inventiveness. Though field commanders clamored for added firepower, army ordnance bureaucrats believed in long-range, deliberately aimed, ammunition-conserving fire. Only President Abraham *Lincoln's direct intervention forced the army to adopt the seven-shot Spencer repeaters near war's end. Modified and improved, repeating rifles were sometimes employed as U.S. Cavalry weapons in post-Civil War campaigns in the *Plains Indians wars. (But not always; at the Battle of the *Little Bighorn in 1876, George Armstrong *Custer's men fought with single-shot rifles.) The war between aimed fire and firepower advocates, however, had only begun.

After the Civil War, small-arms technology evolved rapidly, but a penurious Congress and an intractable ordnance board balked at rearming an entire army. For instance, in 1866, rather than producing a new weapon utilizing the repeater's efficient breech-loading mechanism, muzzle-loading Springfield rifles were converted to breechloaders with a "trap door" action so imperfect that it was capable of ripping the heads off fired cartridges, leaving the weapon hopelessly jammed. (Many of the rifles from Custer's command were recovered from the Little Bighorn in this condition.) When a new weapon was adopted in 1893, it satisfied no one, least of all soldiers in the field. This was the Krag-Jorgensen, a poor Scandinavian version of the German Paul Mauser's advanced bolt action rifle. Its modern features included a five-shot box magazine and a powerful, .30-caliber smokeless powder round; but the Krag was a Mauser copy, not the red thing. Standard issue during the *Spanish-American War (1898), the Krag was unpopular among the troops. In 1903, the famous *Springfield Model 1903 rifle replaced it.

The Springfield '03 resulted from servicewide modernizing reforms initiated by Secretary of War Elihu *Root. Its adoption was a victory for aimed fire advocates since the bolt action rifle (.30/06) was accurate to well over 600 yards. But it so closely duplicated Mauser's latest rifle that patent infringement charges almost prevented its introduction. Although millions were eventually produced, arsenal production was slow. Many World War I "doughboys" trained with broomsticks, not rifles. The Springfield '03 remained America's basic field weapon until the late 1930s.

World War I *trench warfare demonstrated the need for lightweight, semiautomatic/automatic (self-loading)

infantry weapons. Competitions were held featuring two notable weapons designers, J. D. Pederson and John M. Browning. Browning's designs dominated early twentieth-century American automatic arms. His 1911 .45 automatic pistol (M1911A1) remained standard issue until replaced in the 1980s by a 9-millimeter, fifteen-shot Beretta (*NATO designation M-9). The *Browning Automatic Rifle, or BAR, a lightweight .30/06-caliber machine gun, earned kudos from soldiers from World War I to Korea. But after extensive testing, the winner was the little known Springfield Arsenal designer John C. Garand.

Garand's superb rifle was adopted in 1936 and carried into battle by millions of G.I.'s during World War II. Designated the *M-1 rifle, the Garand was a gas-operated, magazine-fed weapon. Propellant gases forced back the bolt, ejected the empty cartridge, and recocked the hammer. The M-1 weighed 9.5 pounds and fired .30/06 rounds in eight-shot clips. The Garand was the only battleworthy semiautomatic produced by any major combatant during World War II, but other nations began eschewing long-range, aimed fire for the increased, if less accurate, firepower of shoulder-fired machine pistols, or submachine guns. These weapons included German Schmeisser "burp" guns capable of firing 450 to 550 rounds per minute, the American Thompson submachine gun, and Britain's Sten gun. All had a major influence on the next generation of infantry arms, the assault rifles.

The first and most influential post-World War II assault rifle was the Soviet Union's Avtomat Kalashnikova 47 or AK-47. Invented in 1947 by Mikhail Kalashnikov, the gas-operated AK-47 (7.62mm, later 5.45mm) weighed 10.6 pounds (later 8.3 pounds), and was capable of semi-automatic or automatic fire at a rate of 600 rounds per minute. Cheap and durable, millions of Kalashnikovs were manufactured and distributed to revolutionary movements worldwide.

America's response was, as usual, a compromise. The semiautomatic M-1 was converted into an automatic, the M-14. The M-14 was a good weapon, but in automatic fire, its 7.62mm round made the recoil too powerful and unstable. Following the *Korean War (1950-53), experiments began with a .22 (or 5.56mm) cartridge with high muzzle velocity (over 3,000 feet per second). To fire this small but powerful round, the army chose a weapon developed by Eugene M. Stoner of Fairchild Aircraft's ArmaLite Division, the AR-15. This 7.6-pound weapon with its plastic stock was capable of semi- and fully automatic fire (700-900 rounds per minute). The U.S. Air Force purchased the AR-15 in 1961, but the army, after extensive testing and controversial modifications, delayed adopting it until 1967 as the *M-16 rifle (technically, the M-16-A1).

The AR-15 was an excellent weapon, the American equivalent (or better) of the Soviet AK-47 and perfect for the mixed terrain of Vietnam; the M-16 was not its equal. Like the AK-47, the AR-15 could take incredible punishment (dirt, rain, poor care) and still keep firing; moreover, Stoner's innovative rifling made it lethal at long range. Infighting between army bureaucrats and a progressive Department of *Defense, however, delayed adoption and forced uncalled-for changes. Perfectly clean and with an M-79 grenade launcher attached, the M-16 was a fine combat weapon; in the mud and dust, jungles and mountains, and rivers and rice paddies of Vietnam, it proved unreliable.

After the "Vietnam War, a new, heavier round was developed, and a remodeled M-16 (the M-16-A2) became standard issue in 1980. This would be the weapon American infantrymen carried in the "Persian Gulf War in 1991 and as "peacekeeping troops during the "Bosnian crisis. Development of laser-type infantry weapons may eventually revolutionize U.S. military arms, but one certainty exists: as long as the current costly, time-consuming procurement process continues, the choice is sure to be controversial.

SIMS, WILLIAM S. (1858-1936), admiral, supporter of reforms to modernize the navy, especially technological innovation and organizational change. Sims graduated from Annapolis in 1880. During the "Spanish-American War, he served as naval attaché in Paris, organizing espionage to report Spanish ship movements. Later he advocated improved gunnery, popularizing the techniques of the Englishman Sir Percy Scott. He commanded two "battleships, *Minnesota* (1909-11) and *Nevada* (1915-16), but his most important command was the Atlantic Torpedo Flotilla (1913-15). He was president of the Naval War College when in March 1917 he was sent to London to coordinate the navy's role in World War I. He later became commander in chief of U.S. naval forces in European waters.

Admiral Sims immediately sensed the necessity for anti-submarine operations to counter Germany's adoption of unrestricted undersea warfare, a maritime strategy intended to force "victory before the United States could make its presence felt. He recommended construction and deployment of antisubmarine craft to European waters to serve under British admirals such as Sir Lewis Bayley at Queenstown, Ireland. This course meant suspension of American naval construction intended to create a unified battle fleet. His views prevailed despite initial opposition from Secretary of the Navy Josephus Daniels and the chief of naval operations, Adm. William Benson, who concluded that Sims was unduly influenced by the British Admiralty. Sims emphasized protection of supply shipments to the Allies; the Navy Department stressed protection of troopships transporting the "American Expeditionary Force to France. Sims generally supported Admiralty views, which made him popular in Britain but suspect at home.

After the war, an angry Sims sparked a congressional inquiry into naval affairs in 1917-18, arguing that the Navy Department's effort had been slow and misdirected. This investigation led to long-term divisions within the officer corps. In 1920, he published *The Victory at Sea*, an account of his wartime service, which won the Pulitzer Prize.

SITTING BULL (1831?-1890), Hunkpapa Lakota Sioux chief. One of the most significant of all Indian leaders, Sitting Bull achieved distinction not only as a war leader but as a political chief and spiritual leader as well. His record in war with enemy tribes was exemplary even before he came to the notice of whites in the 1860s. Sitting Bull played a leading role in the fighting with the forces of U.S. Army generals Henry H. Sibley, Alfred Sully, and Patrick E. Connor, who led strong columns into Sioux ranges of Dakota and Montana in 1863-65. After the Treaty of 1868, Sitting Bull was principal leader of the bands that scorned the reservation and came to be known as *hostiles*. He was present at the Battle of the "Little Bighorn, 25-26 June 1876 but as an "old man" chief did not take a conspicuous part in the fighting. As Sitting Bull's coalition fell apart under military pressure, in 1877 he and a small following sought refuge in Canada. Dwindling buffalo resources forced his surrender and return to the United States in July 1881. At the Standing Rock Reservation he feuded with the reservations agent and assumed a prominent role in the Ghost Dance troubles of 1889-90. On 15 December 1890, while attempting his arrest, Indian policemen shot and killed him.

SMART BOMBS. See Bombs.

SOCIETY AND WAR. Research on the intersection of social history and the history of warfare has concentrated on four specific areas: social stratification, family forms, veterans' benefits, and taxation.

War and Social Stratification. The effect of war on social inequality is a matter of considerable debate. From the "Revolutionary War onward, the issue of profiteering—of making a fortune out of war provisioning—has come to the fore time and again. The effects on economic organization are evident: war benefits industries able to tie into the munitions trade. These industries emerge stronger after the conclusion of hostilities, and can use the experience and capital generated in wartime to perform more efficiently in peacetime. Thus, war creates wealth and benefits one fraction of the wealthy.

Other property owners may not do so well. The reason is inflation. Those living on fixed incomes, investments, or rent can be devastated by war, since their return on capital loses its real value during periods of spiraling prices. Land as property may produce good profits in wartime, but if rented out over the long term, its capacity to generate annual incomes is compromised by price inflation.

The same mixed fortunes affect wage earners. Those able to transfer their skills to munitions production can do much better in wartime than in peacetime. Hostilities usually eliminate unemployment. They also promote corporate solutions to industrial relations, leading to the

temporary recognition of workers as partners in management. This is in everybody's interest because it achieves maximum productivity with a minimum of strikes.

Other workers are not so lucky. Those who work at producing nonessential goods or those unable to move to areas of munitions production are either thrown out of work or earn an inadequate wage at a time of price inflation. Those not central to the tasks of waging war can go to the wall during it. This is a form of economic triage, separating workers whose activities are essential from those the economy (and the nation) can spare. Many of the latter are elderly.

On balance, though, there is a tendency for war to reduce the distance between classes and between strata within classes. This leveling effect may not be long-lasting, and it does create expectations hard to realize in the aftermath of war. Social gains during a war can create a deep sense of anger about their disappearance when the shooting stops.

War and Family Forms. The effects of war are profoundly evident in terms of family forms and behavior. "Mobilization separates families; "casualties destroy them. In the aftermath of war, millions of families are reconstituted. These processes have had significant long-term effects. For example, the cult of domesticity underlying the post-1945 "Baby Boom" is related to the vast upheaval of war and its effects on family life. An inner migration to domesticity happened in most major combatants after World War II; the United States was no exception.

War also changes ideas about divorce. At the outbreak of hostilities, many unfortunate people marry hastily. Over time they see the error of their choice, or grow apart, or find other partners during a spouse's absence. Sexual loyalty is the exception, not only in wartime but perhaps especially during such anxious and emotionally charged periods.

During wartime, civilian migration increases—not only to get out of the way of the fighting, as in the "Civil War, but also to take up new jobs in new places. At the same time, international immigration is suspended. After World War I, that change was made permanent. Reactions to the war, and the supposed radical ideas of European immigrants, helped close the door to immigration in the 1920s. Before the war, such action was contemplated; after the war, it was realized.

The growing importance of families in the shadow of war had profound effects, too, on the discussion of women's rights. In America as in other countries, women's contribution to postwar recovery was always configured in terms of their domestic work: childbearing; organizing and maintaining the home; and caring for the husband, defined as the key breadwinner and figure of authority. In this network of social tasks, women's outside lives or aspirations had little place. Thus, the irony of war is that it encourages women to leave home to help produce the goods and services needed for victory, and then encourages them to go home again because their primary obligation is not to produce but to reproduce. When wars destroy families, it is their reconstruction that takes precedence over women's rights. This has been as true in the United States as it was for other combatant countries of the major wars of this century. If there is increased recognition of women's talents and services in wartime, that recognition is with-

drawn as soon as the shooting stops. One step forward, two steps back is one way to characterize the impact of war on this aspect of family life.

War and Veterans' Benefits. A third area of fundamental interest for social historians is veterans' history. The first question is pensions: How much and for how long? No country in the world matches the generosity of the "Veterans Administration in the United States, but free access to its medical facilities is not always the pathway to the best medical care. There is less doubt about the positive effects of the "G.I. Bill of Rights, for example, in expanding opportunities for higher education among many men and women who would not have had it in the absence of war.

Veterans form associations, and the history of these groups—by no means restricted to the "American Legion or the "Veterans of Foreign Wars—has drawn much attention in recent years. Their activities in promoting such projects as the Vietnam Veterans' Memorial or the Korean War Memorial in Washington reflect the self-consciousness of veterans that their experience has given them a voice—and a conscience.

The reintegration of veterans into peacetime society is also important. What to do about the handicapped—crippled in mind or in body—has been a preoccupation of many Americans throughout their history. The worry has existed that men trained to kill will turn to crime in peacetime. The "taint" of military or naval service was therefore something soldiers and sailors had to contend with in many different periods. One solution was to move from soldiering to policing or similar service activities.

War and Taxation. The question of pensions for veterans is central to another critical part of the literature on war and social organization. As Theda Skocpol has shown, after the Civil War, pensions' provision constituted the single largest item of the federal budget. The inflection of federal expenditure and taxation in the twentieth century therefore is an extension of nineteenth-century precedent. The expansion of state activity in wartime creates both a concentration effect—bringing to the center activities done at the periphery—and a threshold effect—making the government's share of gross national product rise. Just as in Europe, state expenditure as a proportion of national income doubled after World War I. The same upward inflection happened after 1945 and after the "Vietnam War. The need for states to expand in wartime is self-evident; not so clear is their tendency to stay expanded in peacetime.

When they do, they tend to be in the business of servicing deficits produced in wartime. As current expenditure has to go into paying back past wartime expenditure, the sums available for peacetime projects dwindle. The shadow of war therefore restricts or truncates the capacity of the peacetime federal government to meet wartime expectations for improvements following hostilities.

SOCIETY, MILITARY ORGANIZATION AND. "War has been one of the great learning mechanisms in human history. In the nineteenth century, as war took on its large-scale form, involving enormous numbers of individuals in both combat and support roles, organization became a decisive factor in national survival. Nations able to administer large bodies of men had a tremendous military advantage. Lessons of organization and administration learned in the military field were transferred to civilian society, especially to large-scale business enterprise; they played important roles in the industrialization of the United States and Europe. In the twentieth century, military organization has continued to influence business and economic organization, but now in a mutually reinforcing way, with developments and innovations from the civilian economy increasingly adapted by the military.

The "Civil War was the first large-scale national administrative effort undertaken by the U.S. government. The horrendous logistical experiences in the "Mexican War had been endured by junior officers who later took command of Union and Confederate armies; more than any other factor, this alerted military leadership to the new organizational demands of administering large bodies of men. The demand for millions of "uniforms by the "Union army placed entirely new requirements for speedy mass production of clothing. Uniforms had to be made to fit certain standard sizes, and for the first time serious attention was given to collecting statistics on basic clothing measurements for the American male population. The firms granted these contracts—companies such as the suit manufacturer Hart, Schaffner, and Marx—later used this knowledge to mass-produce men's business suits, the uniform of the rising class of office workers and middle managers in America's industrial age.

The Civil War also produced major administrative advances in railroad management, arms production, food rations, and recordkeeping—for payrolls, for example. Operation at larger scale, over an enlarged geographic space, and with more stringent quality requirements revolutionized American management in ways that were later copied by business. Railroads are a particularly interesting example of how military needs shaped commercial organization. Railroad construction was long dominated by West Point-trained engineers. But railroad operation was different from construction. Making the trains run on time, and making sure they did not collide on the single-track lines of nineteenth-century America, became far more demanding with the increased traffic of the Civil War. Gen. Ulysses S. Grant's famous War Order Number 1 of 1864, requiring that offensives in the eastern and western fronts be coordinated, was really an order about railroad scheduling: that it had to be centrally controlled. The central control of signals and schedules later contributed to concentrated ownership of railroad companies. Giant organizations in oil, coal, and meatpacking, which precipitated the antitrust movement, had their origins in the efficiency gains learned in centralized railroading during the Civil War.

At the turn of the century, the military lagged behind corporate organizational development. The "Spanish-American War was a logistical disaster for the United States. Even in World War I, the U.S. military remained logistically deficient because factories in America were not properly coordinated for war production. In 1917-18, not

a single artillery piece manufactured in the United States made it to Europe in time to be used in action. The army and the government learned that lesson.

World War II, with its requirement for war on an entirely new scale and its mobilization of the national economy, transformed organizational life. The war saw the introduction of such innovations as federal support of institutionalized research in universities, statistical quality control, the scientific study of military actions known as *operations research*, coordination of complex multi-plant factories, and the industrialization of what were once considered activities not suitable to this form of management, such as airplane manufacture. While each of these existed in the 1930s, all were applied on such a large scale and with such success during the war that they were almost immediately adapted after the war ended, becoming the accepted form of organization and management for America's rise in world business in the 1950s. For example, Robert S. McNamara, assistant to the secretary of war, took his entire unit of statistical control analysts to the Ford Motor Company immediately after the war, where new methods were used to control costs and quality for a major expansion of output to meet the driving needs of a mobile public in the 1950s.

The principal organizational innovations of the "Cold War were *systems engineering* and large-scale coordination of geographically separated units. Systems engineering was used to coordinate the complex technological projects that dominated the Cold War, involving "radar warning systems, "missiles, and airplanes. Large-scale principles were used to gain the maximum performance from the regional commands of the armed forces, for example, to coordinate "antisubmarine warfare operations in the Atlantic and Pacific Oceans. Operations research methods such as linear programming were used to achieve this, and these were quickly copied by airlines and automobile producers, who also faced complicated scheduling problems. Most notable was the speed with which this military-to-business transfer took place.

Skills in coordinating multi-plant factory outputs were used in America's business foray into the new European Common Market of the 1950s and 1960s. European business before the war focused on relatively small national markets, rather than on continental-scale markets as American competitors had done. This was one major reason behind the tremendous resentment displayed toward American multinational firms so prominent in Europe during the 1960s. U.S. companies were constructing continental-scaled markets from local ones in Europe, something they had earlier pioneered and perfected in their own country.

Since the period of the Civil War through the 1970s, the principal impact of military organization on American society was to contribute to the trend of grouping people into increasingly large hierarchies. Whether in the military or in business, large organizations dominated. But in the late 1970s a partial reversal of this trend began, with a move toward small, decentralized structuring of human activity. The disadvantages of centralization and big organization were increasingly recognized. The tendency toward bureaucratic inertia, indifference to costs, loss of flexibility, and lack of innovation were met by a major move toward downsizing, not only as a way to reduce costs

but also as a way to increase flexibility and organizational agility. A technological revolution greatly reinforced this trend: management of information moved from centralized mainframe computers to small, decentralized personal computers. With the Internet, originally created by the "Pentagons Advanced Research Projects Agency, an even greater capacity to decentralize became available.

The results have revolutionized American business enterprise, and these changes have in turn been quickly copied by the military. The U.S. military is copying business organization by emphasizing smaller size and decentralized decision making as keys to flexibility, and by removing strong departmental boundaries in favor of building organizations around processes—known as *reengineering*. The army emphasizes dispersed small units coordinated by shared information. The navy has developed more flexible groupings of ships that are no longer centered on the aircraft carrier. In both instances, the decentralized format of the Internet is being used as an organizational model for the armed forces.

SOMALIA, U.S. MILITARY INVOLVEMENT IN. In 1988, civil war broke out in Somalia in East Africa. The dictator, Siad Barre, was expelled, but power remained divided among local leaders. In the capital of Mogadishu, Mohamed Farah Aideed and Ali Mahdi Mohamed struggled for control; regional groups fought among themselves. In April 1992, the "United Nations established the United Nations Operations in Somalia (UNOSOM I), with a few unarmed troops and Mohamed Sahnoun, an Algerian diplomat, as political coordinator. Sahnoun established good relations with both sides but alienated UN headquarters and soon resigned. In July 1992, the secretary general estimated that 1 million Somali children were malnourished and another 4.5 million people urgently needed food aid. Under pressure from the media, members of Congress, and the international community, President George "Bush decided to airlift food to Somalia in August. However, it was impossible to deliver sufficient quantities of food by air.

Troops of the United Nations Task Force (UNITAF) landed in December 1992. UNITAF was a U.S. military operation, although troops from 30 countries were included; at its peak it numbered about 38,000 troops, of which 25,000 were American. Its mission was confined to relief; the United Nations would conduct political negotiations and prepare a force to replace it. UNITAF succeeded in stopping famine throughout the country within five months.

UNOSOM II had about the same troop strength but a more ambitious task: to establish a Somali government. Somali factions attacked UNOSOM troops, and the conflict escalated. U.S. Delta Force commandos and rangers were sent to Somalia to capture Aideed. Instead, on 3 October 1993, they were ambushed and lost eighteen men. Television cameras showed one of the dead Americans being dragged through the streets. The Clinton administration decided to negotiate with Aideed. U.S. troops were

withdrawn, and the rest of the UN forces left Somalia in March 1995. The famine had been ended, but UN "peace-keeping had been discredited in the United States.

SONAR (underwater sound navigation ranging) can be either of the *passive* or *active* type. Passive sonars were developed first and rely upon listening for noise generated by the target vessel, usually "submarines (however, submarines also use sonar to detect other ships). The most difficult aspect of passive sonar use is distinguishing *target noise* from that of the surrounding sea (referred to as *ambient noise*) and particularly that of the searching platform. Active sonars are popularly characterized by the famous *ping* known to anybody who has ever watched a Hollywood submarine movie. The *ping* is a sound wave generated by the searcher that is bounced back off the objects, thus giving the sonar operator a picture of the object in the path of the sound wave.

U.S. sonar development began before World War I when the Submarine Signal Company, formed in 1901, developed steam-operated underwater warning bells that could be heard for up to 10 nautical miles. By 1912, warning bells were used to supplement the work of lighthouses in marking hazards to navigation off the coasts of North America, South America, Europe, and Asia.

In February 1917, the U.S. Navy Consulting Board created a Subcommittee on Submarine Detection. Two passive sonar detectors developed by a staff member of the Submarine Signal Company, Professor R. A. Fessenden, were installed on navy destroyers, but their performance proved disappointing.

World War II saw active sonar systems predominate in U.S. ships and submarines, in contrast to the Germans, who concentrated on large fixed passive array systems. The American approach helped mitigate the effect of ocean noise that proved such a problem with passive sonars. Navy General Board guidelines of 1938 called for two sonars per destroyer and one unit for lesser craft. However, wartime demands for escort vessels and the low rate of sonar production prevented these guidelines from being followed. Instead, the scarce equipment was put out among destroyer escorts. U.S. submarines typically carried a passive device along with a combined ranging and sounding set.

During the "Cold War, passive developments included large arrays of hydrophones mounted conformally along submarine hulls to achieve very well defined and very long range receiving beams; systems for passive range finding; PUFFS (Passive Underwater Fire Control Feasibility Study, a short range triangulation device using three passive sonars mounted along the length of a submarine); and submarine-towed arrays. The towed array came into use to mitigate the effect of a vessel's own noise upon passive sonar systems; it consists of a string of passive hydrophones towed at some distance behind the ship. A further advantage of the towed array is that it can be made as long as necessary to detect sounds with long (very low frequency) wavelengths.

Today's most advanced U.S. submarines, the SSN-688I and the SSN-21, use the AN/BSY-1 integrated sonar and fire control system that includes both active and passive

sonar types. In addition to MAD (magnetic anomaly detector) sensors (a means of locating submarines by detecting changes in the earth's magnetic fields caused by large metal objects), aircraft use small sonobuoys as a means of detecting submarines. *Helicopters hover above the ocean surface and dip scanning sonars that emit a *ping* in all directions at once.

SOUTHEAST ASIA TREATY ORGANIZATION. See SEATO.

SPAATZ, CARL A. (1891-1974), World War II general. A 1914 graduate of the U.S. Military Academy, one of the earliest U.S. military aviators, commanded a pilot training center in France during World War I. He also managed one tour at the front and shot down three aircraft. After the war he showed his moral and physical courage by testifying at the Mitchell courts-martial and in pioneering in-flight refueling. As a special observer in England, in 1940, his optimistic reports helped ensure continued U.S. aid. After participating in "World War II planning, he took the Eighth Air Force to England in 1942 and established a cordial working relationship with the Royal Air Force (RAF). Gen. Dwight D. *Eisenhower called him to North Africa in late 1942 as Allied Air Forces commander. Again Spaatz established a sound relationship with the RAF and also helped correct U.S. air-ground cooperation difficulties. Upon returning to England in 1944 he became the senior U.S. air officer in Europe. At his insistence the United States began the highly successful bombing of the German synthetic oil industry. After the victory in Europe, he transferred to the Pacific and was the senior operational officer in the atomic bomb drops on *Hiroshima and Nagasaki. In 1946, as Gen. "Hap" *Arnold's successor, he played a leading role in the creation of the U.S. "Air Force (USAF) as a separate military service and in the division of roles and missions between the services. He became USAF Chief of Staff in 1947 and retired the next year.

SPACE PROGRAM, MILITARY INVOLVEMENT IN THE. The U.S. space program began with military studies of instrumented Earth satellites in 1945. Ten years later, American political leaders approved and subsequently organized a space program expressly for purposes of national security. Because the "space age" began amid the superpower tensions of the 1950s, the tone, tempo, and direction of America's astronautical enterprise in the years afterward would be impressed with the near-indelible seal of the "Cold War.

The U.S. *Navy, *Army, and *Air Force first examined the military applications of Earth satellites between 1945 and 1950. The air force continued these studies in the early 1950s, primarily through contracts with the RAND Corporation, an independent consultant organization established and funded by the service.

On 4 October 1957 the Soviet Union launched the

world's first satellite, Sputnik I, and in November, its heavier companion, Sputnik II, followed. The public outcry in the United States after the launches prompted various measures from the administration. In February 1958, President Dwight D. *Eisenhower established the Advance Research Projects Agency (ARPA) in the Department of "Defense (DoD), assigning to it temporary responsibility for directing all U.S. space projects—civil and military. Early in that same month, he authorized Project CORONA, a secret reconnaissance satellite effort that might more quickly return images of the Soviet Union. Because of its national security applications, Eisenhower was inclined to assign all of America's burgeoning civil and military space programs to ARPA, but Vice President Richard M. "Nixon and Eisenhower's science adviser, James R. Killian, Jr., persuaded him otherwise. On 2 April 1958, they submitted to Congress draft legislation that would establish the National Aeronautics and Space Administration (NASA). Except for military space flight, for which the DoD remained responsible, the statute declared that all nonmilitary aeronautical and space endeavors would be directed by this civilian agency. The 1958 legislation divided American space activities between civilian space science and applications missions and military defense support missions, for which the air force eventually became the lead service. In 1960, after one of the *U-2 spy planes was shot down over the Soviet Union, Eisenhower completed the framing of American astronautics in a house of three wings: civil space science and applications (NASA); DoD military support missions (such as communication, navigation, and missile early warning); and reconnaissance satellites, now directed by a civilian National Reconnaissance Office in the DoD.

A few months later, on 6 March 1961, Secretary of Defense Robert S. "McNamara confirmed this division of labor when he issued Directive 5160 on the "Development of Space Systems." If loss of the strategic reconnaissance mission had been a bitter pill for air force leaders to swallow, the directive at least offered a sugar coating: the air force was given responsibility for running all DoD space development programs. Among the most prestigious of space endeavors at that time, military or civil, was manned space flight.

The air force first sought a role in the nation's manned space flight program with a rocket bomber entrant known as "Dyna-Soar" (for Dynamic Soaring). The winged space vehicle, carrying one man, would be mounted atop an ICBM and launched into Earth orbit. Later, after completing its mission, Dyna-Soar would reenter the Earth's atmosphere and glide to a landing. But just what its manned mission would be remained a serious stumbling block because, in 1958-59, administration officials refused to consider weapons in orbit. The Kennedy administration in December 1963 canceled Dyna-Soar in favor of a military space station, termed the Manned Orbital Laboratory (MOL).

With Project Apollo (the manned lunar landing) well underway at NASA, the DoD sought with MOL to determine and test the military usefulness of human beings in Earth orbit. Exactly what military duties astronauts might perform, however, continued to dog the enterprise. The most likely mission appeared to be one of reconnaissance. In the years that followed, MOL's technical problems multiplied and its costs soared. A few weeks before NASA's Project Apollo landed men on the Moon, in July 1969,

President Richard M. "Nixon canceled MOL. His defense secretary, Melvin "Laird, cited funding constraints and recent advances in the performance of instrumented military satellites that performed the same missions planned for MOL. The president's decision ended air force attempts to create a separate military manned space program.

Having lost the strategic reconnaissance mission to a civilian DoD agency in 1960, the armed services still held responsibility for the remaining defense support missions identified in the 1950s. In fact, the DoD had assigned responsibility for instrumented navigation satellites to the navy and communication satellites to the army before Secretary of Defense McNamara's 1961 dictum named the air force the lead service in space affairs. But in May 1962, McNamara canceled the army communications satellite project, known as Advent, which featured a set of satellites to be placed in geosynchronous orbit 22,300 miles above the equator.

In place of Advent, McNamara authorized a larger number of small communications satellites in medium-altitude orbits of about 6,000 miles. He designated the air force responsible for procuring the launch vehicles and satellites, and the army for developing the ground terminals. Known at first as the Interim (or Initial) Defense Communications Satellite Program (IDCSP), after worldwide operations began between fixed bases, it was renamed the Defense Satellite Communications System I (DSCS I). Beginning in June 1966, clusters of seven or eight satellites were launched simultaneously; a final launch in June 1968 brought the operational system to twenty-six DSCS I satellites.

In 1968, the DoD approved a follow-on military strategic communications satellite program, similar in many respects to Advent and called DSCS II. These larger communication satellites began to be launched into geosynchronous orbits in 1972, and, after some early spacecraft problems, a set of four was declared operational in late 1978. More advanced DSCS III satellites followed in the 1980s, and the DoD declared this military space communications system operational in 1993. The first of four even more advanced and complex satellites, called Milstar and designed to use extremely high frequencies, was launched into geosynchronous orbit in 1994.

Meanwhile, a navy program known as Transit began to launch instrumented satellites in 1960 to improve terrestrial military navigation. When declared operational in 1964, Transit consisted of five satellites in offset polar orbits circling the Earth at an altitude of about 670 miles. By combining the calculated satellite positions, the range difference measurements between these positions as the satellite moved overhead, and information on vessels' speed, ships or submarines receiving Transit radio signals could obtain a two-dimensional position fix accurate to about 650 feet in latitude and longitude. Although widely employed at sea, Transit proved useless for aircraft, which moved at too high a speed; nor could it determine altitude. However, the navy and the air force began investigations of an improved three-dimensional system—one that would provide a terrestrial vehicle's position in tens of feet, its velocity at all speeds, and its altitude above the Earth's surface.

In 1974, the DoD combined the best features of the navy and air force navigation satellite proposals, assigned the air force responsibility for the project, and identified it as the Navstar Global Positioning System (GPS). When declared operational in 1994, the GPS consisted of 24 satel-

lites that circle the Earth every 12 hours at a height of 12,524 miles. Four satellites are located in each of six planes inclined 55 degrees to the equator, creating a satellite "bird cage" around the world. Each GPS satellite, equipped with atomic clocks, continuously transmits pseudorandom codes at two frequencies that provide synchronized time signals and data about its own position. Integrating the signals from four satellites, a vehicle equipped with a GPS receiver can determine its location, velocity, and altitude with extreme precision. Although American military leaders were slow to procure GPS receivers, the 1991 "Persian Gulf War demonstrated the extraordinary advantages of this space system for military forces in navigating, mapping, and directing artillery fire.

Two other important defense support missions—early warning of missile launches and the detection of nuclear detonations—have roots in the 1950s, when these issues consumed the U.S. leadership. The first of them, called MIDAS (for Missile Detection and Alarm System), began as a part of Lockheed's reconnaissance satellite contract in 1956. The concept called for mounting infrared sensors and a telescope on an instrumented satellite that pointed them at the Earth. The instrument, turned at about 6 rpm, swept a given field of view and detected the hot exhaust flames of rockets as they ascended under power through the atmosphere. The time of a missile's launch, its location, and direction of flight would be radioed to an Earth station within moments, allowing the air force time to scramble its alert bombers before the warhead struck.

Not until the mid-1960s did Lockheed demonstrate beyond question the performance and reliability of the MIDAS concept in space operations. At that time, the DoD *put the operational system out to bid with industry*. Known as the Defense Support Program (DSP), it would employ three or four satellites in geosynchronous orbits instead of the twelve or fourteen satellites in 6,000-mile-high polar orbits planned for MIDAS. TRW prevailed in this competition, and the air force launched the first DSP satellites in the early 1970s. The performance of these instrumented satellites exceeded expectations and the system was declared operational in the mid-1970s. Employed in 1991 during Operation Desert Storm, DSP satellites gave Allied Coalition forces in the Persian Gulf and citizens of Israel crucial advance warning of Iraqi Scud ballistic missile launches. This allowed people to seek cover and Patriot missiles to be pointed and fired at an incoming Scud.

Back in the late 1950s, the DoD had also approved development of a second, related space system that could detect nuclear detonations on Earth and in space. A variety of national concerns promoted this project, known as Vela Hotel. In the mid-1950s, President Eisenhower initiated negotiations with leaders of the Soviet Union and Great Britain to secure agreement on a nuclear test ban treaty. Administration leaders then demanded a space system that would police compliance with its terms.

Representatives of the United States, Great Britain, and the Soviet Union signed a "Limited Nuclear Test Ban Treaty in August 1963 that prohibited testing of nuclear devices in the atmosphere, underwater, and in outer space. The air force began to launch Vela Hotel satellites before month's end. Placed in 70,000-mile-high elliptical orbits that rose far above the Van Allen radiation belts, and located on opposite sides of the Earth, the initial satellites provided complete coverage of outer space. Later satellites

with improved optics also looked earthward to detect the flash of a nuclear explosion. Eventually, Vela instruments were carried on board other military satellites, such as DSP and GPS vehicles, and the effort was renamed the Integrated Operational Nuclear Detection System (IONDS). But however named, for over thirty years this space system detected numerous atmospheric atomic tests and verified, contrary to the fears of some, that all states party to the Nuclear Test Ban Treaty had abided by its terms.

The last of the major military application satellite systems, the Defense Meteorological Satellite Program, or DMSP, also began in the late 1950s. Originally, NASA was to develop a single civil-military satellite system, one that would serve both the DoD and the Commerce Department's Weather Bureau. Because NASA's design was so complex, the DoD authorized the air force to develop a simplified, low-altitude military weather satellite. The resulting spacecraft, first launched in 1962, proved so effective that the Weather Bureau soon advised NASA it would buy copies of the military satellite system.

Shortly after these classified military weather satellites became operational, U.S. forces began military operations in the "Vietnam War. DMSP satellites in 450-nautical-mile polar orbits, equipped to provide day- and nighttime images of cloud cover, were employed to assist both air and surface military activity. The cloud cover photos, widely distributed in Southeast Asia, made DMSP an open secret by the early 1970s. In 1973, Secretary of the Air Force John McLucas publicly announced the program's existence, and DMSP images were released for civilian use.

Operation Desert Storm, the military campaign in the Persian Gulf War to liberate Kuwait from Iraqi occupation in January-February 1991, became the first major contest of arms in which all military space systems were integrated into both planning and operations. It has been called "the first space war" because communication, navigation, weather, early warning, and reconnaissance satellites provided information indispensable to combat operations. These military space assets, pre-positioned in Earth orbit, permitted the Allied Coalition leaders to wield terrestrial forces in concert and multiplied their effects on the battlefield so enormously that without them, an enemy in the twenty-first century has little hope of prevailing in combat.

SPANISH-AMERICAN WAR (1898). In 1895, the Cuban patriot José Martí renewed his homeland's attempt to achieve independence from Spain, triggering a guerrilla war that eventually brought about U.S. intervention. The Spanish government tried to suppress the insurgency, but the Cubans, led by Maximo Gomez and Antonio Maceo, managed to remain in the field. One Spanish general, Valeriano Weyler, adopted a policy of reconcentration of the

civilian population in detention camps, but this measure backfired when it aroused international concern, notably in the United States. Presidents Grover Cleveland and William McKinley both extended good offices to Spain, eventually urging a policy of home rule. This campaign proved successful. The Spanish premier Práxedes Sagasta granted a form of autonomy to Cuba and Puerto Rico beginning 1 January 1898, but the insurgents, sensing weakness, rejected it.

U.S. opinion gradually coalesced in favor of the insurgent cause, but only the mysterious sinking of the USS "*Maine*" in Havana Harbor on 15 February 1898 led to vast popular support for armed intervention on behalf of the Cubans. McKinley proved reluctant to go to war. He attempted to obtain Cuban independence by diplomatic measures. The Spanish government balked. It recognized that the United States would most likely prevail in battle, but Sagasta and his colleagues, after unsuccessfully seeking assistance from other European powers, decided that failure to defend the Pearl of the Antilles might lead to revolution at home. An unsuccessful war appeared preferable to overthrow of the established order. On 25 April, the United States declared war, retroactive to 21 April.

Spain had a large army in Cuba and a strong garrison in its other insular possession, the Philippine Islands, but its navy was largely based in home ports. A weak squadron defended Manila. There were no significant naval forces in Cuban waters. In an attempt to retain its principal overseas colonies, Spain adopted a defensive strategy, depending on troops already in the field to fend off American attacks. The navy would reinforce and resupply threatened locations.

The United States fielded a small regular army of only 28,000 men, although it would eventually mobilize an impressive volunteer army to support the efforts of its modest but well-prepared navy. Prewar preparations envisioned a naval blockade of Cuba and command of the Caribbean Sea—an achievement that would permit land operations when the U.S. Army was sufficiently mobilized to take such action. A secondary naval campaign would take place in the western Pacific. The Asiatic Squadron would attack the Spanish Squadron at Manila to preclude commerce raiding and to exert maximum pressure on Spain.

On 21 April, Adm. William Sampson took the North Atlantic Squadron to Havana and established a blockade, and on 1 May, Commodore George Dewey smashed Adm. Patricio Montojo's squadron in Manila Bay. Sampson extended his blockade to other Cuban ports while awaiting the arrival of a Spanish squadron under Adm. Pascual Cervera. Dewey remained in Manila Bay, unable to take further action until land forces came to his assistance. Early in May, the McKinley administration decided to send troops under Gen. Wesley Merritt to seize Manila and to prepare for eventual land operations at Havana. The Eighth Army Corps assembled at San Francisco finally reached Manila.

Plans for operations in Cuba changed when Cervera's squadron, reduced to six vessels, arrived at Santiago de Cuba, only to be blockaded in port by 28 May. This event led McKinley to organize a force at Tampa composed mainly of regular army regiments. It was ordered to Santiago de Cuba to help destroy Cervera's squadron.

Gen. William Shafter hastily transferred the Fifth Army Corps, 17,000 men strong, to Santiago de Cuba, arriving

there on 20 June. Admiral Sampson urged him to attack the batteries defending the entrance to the harbor. When these were reduced, he could sweep naval mines from the channel and steam in to engage Cervera. Shafter had different ideas. He decided upon an interior line of operation, proceeding westward from a beachhead in the Daiquiri-Siboney area to Santiago de Cuba, depriving himself of much needed naval gunnery support. After landing virtually unopposed, the Fifth Corps moved toward the San Juan Heights, the principal bulwark in the first of three defensive lines around the city. Spanish artillery supported this position from a second line of defenses. The only opposition to the advance occurred at Las Guásimas, where a small skirmish gave the Fifth Corps its baptism of fire (24 June).

Shafter chose to form three divisions in line for the attack on the San Juan Heights, which would roll over the hills and move on to capture Santiago de Cuba. To protect his right flank, he asked Gen. Henry Lawton, commanding one of his divisions, to seize the Spanish fortifications at El Caney before moving into the line of battle at the heights. The Spanish commander, Gen. Arsenio Linares, played into Shafter's hands: he distributed his force of 10,000 at various points around the perimeter of Santiago de Cuba instead of concentrating at probable points of attack. Only 500 men defended the heights.

Shafter attacked on 1 July, but the engagement did not develop as expected. Lawton encountered difficulty from a garrison of a mere 500 Spaniards at El Caney. After considerable delay, Shafter decided to attack the heights without Lawton. After a difficult deployment under Spanish artillery fire, the dismounted cavalry division under Gen. Joseph Wheeler attacked up the northeastern extension of the heights, a rise known as Kettle Hill, and the infantry division to its left commanded by Gen. Jacob Kent assaulted the principal elevation to the southwest. Fortunately, a battery of Gatling guns positioned at El Pozo about 600 yards to the rear was able to drive the Spanish defenders off the heights. Fifth Corps struggled into the Spanish positions and hastily entrenched. All thought of continuing on to Santiago de Cuba was forgotten. American casualties for the day were 1,385, with 205 killed, about 10 percent of the troops engaged. The Spanish suffered less—593 casualties, with 215 killed, about 35 percent of some 1,700 troops in good defensive positions. Theodore Roosevelt's ability to publicize his exploits as a commander of The First U.S. Volunteer Cavalry Regiment—the Rough Riders—during the Battle of San Juan Hill helped propel him into the governorship of New York and later the vice presidency.

After the action of 1 July, Cervera received orders to leave Santiago de Cuba. On 3 July, the reluctant admiral complied. His six ships—four cruisers and two destroyers—began their exit from the channel at 9:00 A.M. Sampson had left the blockade to meet Shafter, leaving Commodore William Schley as the senior officer present. The American vessels were able to concentrate their fire on each Spanish ship as it emerged from the channel. Only one, the *Cristóbal Colón*, managed to avoid immediate destruction or beaching. It fled for about seventy miles westward toward Cienfuegos, but the pursuing Americans finally obtained its range, and the Spanish commander drove his vessel onto the shore. After the war, a controversy erupted over credit for the victory between Schley and Sampson, dividing the officer corps for many years.

Shafter decided to besiege the city, a measure that forced its capitulation on 17 July. The Fifth Corps meanwhile fell victim to tropical diseases. Early in August, it was evacuated to Long Island for recuperation and other troops arrived to continue the occupation.

The victory at Santiago de Cuba forced the Spanish government to inaugurate peace negotiations, but during this process, the army undertook two more campaigns. One was an expedition to Puerto Rico, led by the Commanding General of the Army, Gen. Nelson Miles, which landed on the south shore of the island and advanced against token opposition toward San Juan. The other was an attack on the city of Manila. The land operations of the Eighth Corps amounted to a sham battle because Admiral Dewey managed to arrange a Spanish capitulation that took place after a brief engagement satisfied Spanish honor. A third operation, a naval sortie into Spanish waters by a detachment of Sampson's fleet designated the Eastern Squadron, did not occur because Spain finally agreed to a protocol signed on 12 August that ended hostilities.

The protocol settled all major issues except the disposition of the Philippine Islands. Early in June, the United States signaled its war aims to Madrid through a third party. They included independence for Cuba, the cession of Puerto Rico in lieu of a monetary indemnity, the cession of a port in the Ladrões (Marianas), and a port in the Philippines. In the protocol, Spain agreed to the first three demands. A peace conference was arranged to confirm this agreement and to decide the disposition of the Philippines. McKinley eventually instructed the American peace commission to obtain the entire archipelago, responding both to a burst of annexationist sentiment and to the lack of a viable alternative. Spain reluctantly accepted a payment of \$20,000,000. On 6 March 1899, the Senate gave its consent to the treaty, and on 19 March, the queen regent of Spain overrode opposition in the Cortes and agreed to ratification. Ratifications were exchanged on 11 April 1899.

The acquisition of the Philippines led to a long insurgency that was finally quelled by July 1902. McKinley and his successor, Theodore Roosevelt, were able to exert sufficient force to bring down the Filipino insurgents while overcoming an active but ultimately ineffective protest from anti-imperialists who offered constitutional, political, economic, and even racial arguments against annexation. The imperialist impulse proved short-lived. As early as 1916, Congress began preparations for Philippine independence, a process that was completed in 1946.

Although the United States triumphed during the Spanish-American War, inefficiency, waste, and even scandal characterized the army's mobilization efforts, especially the supplying of troops. Widely investigated by the newspapers and the Dodge Commission, appointed by the McKinley administration, these problems prompted calls for a restructuring of the War Department and reconsideration of the relationship between the regular army and the National Guard. During the tenure of Secretary of War Elihu Root, a series of reforms were implemented.

SPARS. The Women's Reserve of the Coast Guard was created by an act of Congress signed into law on 23 November 1942. It was modeled on the one the U.S. Navy had created a few months earlier, with similar restrictions: women could not (a) serve in combat; (b) be stationed outside the continental United States; or (c) be given command authority over men.

Capt. Dorothy C. Stratton, former dean of women at Purdue University, served throughout the war as director of the Coast Guard Women's Reserve. She suggested that its official nickname—SPARS—be based on the Coast Guard motto: "*Semper paratus*—Always Ready."

During World War II, the SPARS recruited about 12,000 women, including 955 officers. SPARS and female civilian employees did most of the clerical work in the Coast Guard's Washington headquarters. Other specialties gradually were opened to enlisted SPARS, who eventually held forty-three ratings from boatswain's mate to yeoman. Twelve SPARS staffed the Chatham, Massachusetts, LORAN station, part of a highly secret electronic navigation system. In September 1944, Congress lifted the ban on stationing women outside the contiguous states; about 200 SPARS were sent to Alaska and 200 more to Hawaii.

SPARS enlisted for "duration plus six"—the length of the war plus six months. After the surrender of Japan in August 1945, the women's reserve branches of all the services were disbanded, though the label SPARS continued to be applied informally to female Coast Guardsmen. In 1956, twenty-one women were serving in the "Coast Guard Reserve. Though it continued to accept a few female recruits, the service made no further systematic effort to recruit women until the 1970s when women were admitted into all of the U.S. armed forces.

SPECIAL FORCES. See Special Operations Forces.

SPECIAL OPERATIONS FORCES

SPECIAL OPERATIONS FORCES: OVERVIEW

Functionally, American special operations forces have existed since the seventeenth century, but they were only formally institutionalized in the late twentieth century. Habitually comprising a very small portion of the military services, these diverse units perform unusual tasks requiring extensive training and particular skills. The U.S. "Army has six types of special operations forces: Special Forces, Psychological Operations, Civil Affairs, Delta Force, Special Operations Aviation, and U.S. Army "Rangers. The Navy has the SEALs (Sea, Air, Land) and the air force has the Special Operations Wing. The Marine Corps has no such permanent forces but contained special operations units during World War II, and it periodically conducts training.

Special operations forces share some common characteristics. Unlike conventional combat units, these forces are not organized, equipped, or trained to conduct sustained combat. They depend on stealth, surprise, and speed to achieve their aims and usually operate deep within enemy held territory. In contrast, army psychological operations forces and civil affairs units are not combat units: they perform their missions from rear areas or in conjunction with combat units. Psychological operations units attempt to influence enemy attitudes and those of indigenous populations. Civil affairs units work with civilian governments and nonmilitary organizations to further the aims of American commanders.

Rangers were the first American special operations organization. Skilled woodsmen capable of Indian-style fighting, Rangers, as early as 1676, were employed in small groups to scout ahead of colonial militia and later British infantry forces. Robert Rogers's Rangers were particularly useful in the "French and Indian War and Daniel "Morgan's Rangers during the "Revolutionary War conducted long-range raids and reconnaissance tasks. Similarly, John S. Mosby's Confederate partisans plagued Union forces from 1863 until the end of the "Civil War.

Despite proven utility, these kinds of American units were disbanded after each conflict, only to be recreated during the next one. American Rangers prized independence and individual initiative, bridled at parade ground obedience, and were thus often suspect to professional soldiers. Additionally, these units required a special style of commander and often held loyalties untransferable to other leaders.

The cycle of wartime creation and peacetime disbandment was tempered after the "Korean War. Although Rangers were once again formed, employed, and disestablished, the army retained military government (now civil affairs) and psychological operations units after war's end. In 1952, the "guerrilla warfare support function was embodied in a new organization called Special Forces. The latter are mature soldiers, averaging thirty-two years of age and possessing ten years' military experience, who advise, train, assist, and sometimes lead indigenous irregulars against enemy forces. Special operations forces were rapidly expanded during the "Vietnam War, but were just as quickly reduced when American forces were withdrawn from Southeast Asia. President John F. "Kennedy had become an enthusiastic supporter of the army's Special Forces (called the "Green Berets" because of their distinctive headgear) and encouraged the other services to create

companion elements. In the early 1960s, the navy established the SEALs and the air force organized the Air Commandos, later redesignated the Special Operations Wing. However, in the wake of America's disillusionment with that war, special operations forces were cut back far below pre-Vietnam levels. In 1978, Special Forces and the Special Operations Wing were at only 60 percent of their 1964 strengths.

Congressional legislation in the aftermath of the failed special operations attempt to rescue U.S. hostages in Iran in 1980 resulted in the reform and expansion of special operations forces. It also led to a wholly new four-star command, a Department of "Defense office to represent these forces, and a separate, enhanced budget. After more than three centuries, America's special operations forces achieved permanence.

SPECIAL OPERATIONS FORCES: ARMY SPECIAL FORCES

Organized in 1952, the U.S. "Army's Special Forces, identified by their distinctive, world-famous green berets, perform guerrilla support, reconnaissance, raids, and other kinds of behind-the-lines missions that require experience, maturity, and special skills. Additionally, these forces are capable of training, advising, and assisting foreign military and paramilitary organizations in "counterinsurgency. The employment of a few Special Forces troopers has often provided U.S. decision makers a middle course between the use of American combat units or doing nothing militarily.

Conducting small-unit, clandestine operations deep in an opponent's territory has been a part of the American military tradition since the colonial era. During the "French and Indian War, Robert Rogers's "Rangers" staged effective frontier actions against Indians allied with the French. There were also Rangers in the "Revolutionary War and "Civil War. But it was not until World War II that an organized, behind-the-lines American military system was created and employed. This was mostly achieved by the uniformed arm of the Office of Strategic Services (OSS), operating under the direction of the "Joint Chiefs of Staff. In the Southwest Pacific area, Gen. Douglas MacArthur encouraged highly effective Filipino guerrilla support operations without OSS aid. Elsewhere, from 1942 until 1945, OSS led, advised, or supported partisan operations in Burma, China, France, Italy, and Yugoslavia. OSS was dissolved after the war, although some of its activities and personnel were carried over to the "Central Intelligence Agency.

During the "Korean War, an ad hoc Eighth U.S. Army organization recruited, organized, and employed the more than 22,000 Korean partisans who fought the Communists in North Korea. But in 1952, the first contingent from the newly formed Special Forces began arriving in Korea. Not long after the conflict had begun, the 10th Special Forces

Group, an organization created to support guerrilla warfare in Soviet bloc countries in the event of another European war, had been formed. In 1953, the 77th (later redesignated the 7th Group) had been activated at Fort Bragg, North Carolina. Soon thereafter, the 1st Special Forces Group was deployed to a Pacific Ocean base, the island of Okinawa.

Under President John F. "Kennedy, Army Special Forces attained its greatest notoriety. Seeking an unobtrusive, less costly means of battling Communist-inspired "guerrilla warfare in the Third World, Kennedy settled on Special Forces. By 1963, the newly formed 8th Special Forces Group was assisting Latin American governments in five separate counterinsurgency campaigns; the 5th Special Forces Group was performing the same task in Vietnam; and the 3rd and 6th Special Forces Groups were being organized for Middle East and African contingencies. Kennedy had overruled the army's hierarchy, which was suspicious of this special elite force, and granted the wearing of the green beret at the request of the Special Forces commander, Brig. Gen. William P. Yarborough. Although Special Forces organization was reduced after the "Vietnam War, it recovered much of its former strength during the 1980s and performed liaison, rescue, and reconnaissance tasks during the 1991 "Persian Gulf War.

The popularity of Special Forces among recent U.S. decision makers is due to their maturity, secretiveness, and ability to achieve substantial aims with small numbers. Special Forces recruits chiefly noncommissioned officers. The average age of troopers is 32—ten years older than the average army infantryman or Marine. Troopers therefore have already had considerable experience, extensive training, the ability to teach, and are likely to command more respect than would a younger, less experienced soldier. Additionally, Special Forces troopers are parachutists; they are also required to speak at least one foreign language.

Special Forces units traditionally shun publicity in their missions. They have often worked abroad in civilian clothes. Using a low-visibility approach, they allow indigenous forces to take credit for achievements. Typically, the unit that Special Forces employs on an independent mission is the twelve-man "A" Detachment, composed of a captain, a warrant officer, and ten noncommissioned officers. The members of this small contingent possess highly developed communications, medical, engineering, weapons, and intelligence skills. A full-strength Special Forces Group contains fifty-four "A" detachments.

The most important advantage offered by Special Forces is the ability of the "A" detachment to extend its influence far beyond its small numbers. Each of these units can train, assist, or if need be lead an indigenous unit of 300-500 members. It is this "force multiplier" effect that has attracted U.S. policy makers. By employing Special Forces units, an American ally may solve its own military problems with minimal use of U.S. manpower and resources.

SPECIAL OPERATIONS FORCES: NAVY SEALS

Youngest of the American special operations forces, U.S. *Navy Sea-Air-Land (SEAL) teams, SEAL Vehicle Delivery teams, Special Boat Squadrons, and Light Attack Helicopter Squadrons perform a wide variety of maritime, shoreline, and riverine special operations. The nautical arm of U.S. Special Operations Forces has experienced growth, often over the objections of traditionalist senior naval leadership. In a short time, naval special operations units have developed a distinct culture.

In December 1962, at the insistence of President John F. Kennedy's secretary of defense, Robert S. McNamara, the navy initiated its special operations forces with the primary aim of accomplishing "limited counterinsurgency civic action tasks incidental to counterterrorist operations." Additional goals were to conduct shallow-water and riverine boat operations and to "organize, train, assist and advise friendly military or paramilitary forces." The central focus of this development was the growing American involvement in Southeast Asia. The first naval special operations force was a SEAL team: an organization of ten 16-man platoons, each composed of two officers and ten enlisted men. As parachute-qualified underwater swimmers, the SEALs quickly found themselves employed along the littoral and riverine sections of the Republic of Vietnam.

Navy special operations forces have always pushed the outer limits of technology. SEAL teams have been equipped with steadily improving bubbleless, closed-circuit breathing equipment and underwater communications devices and weapons. During the late 1960s and early 1970s, SEALs were joined by SEAL Delivery Vehicle teams and Special Boat Squadrons. The delivery teams are equipped with free-flooding mini-*submarines that can carry six SEALs and are themselves launched from a submerged submarine. They are capable of transporting their passengers into an enemy harbor for sabotage missions. The Special Boat Squadrons possess a mix of fast surface craft, inflatable boats, and pump jet propulsion craft capable of rapid movement in shallow water. In the 1980s, small helicopter gunships and transport units were added.

Naval special warfare units experienced some reduction in strength in the post-Vietnam era, but during the 1980s these forces were substantially enhanced, and they gained their own senior command. In April 1987, the Naval Special Warfare Command, headed by an admiral, was established with the mission to "organize, equip, train, and provide naval Special Operations Forces that specialize in maritime and riverine operations." SEAL strength grew from twenty platoons in 1981 to sixty in 1993.

U.S. naval special operations forces experienced hard luck during the 1980s in combat operations. At the outset of the 1983 U.S. intervention in *Grenada, four SEALs lost their lives in an attempted air-sea rendezvous with a U.S. naval combatant in heavy seas. However, in a successful operation six years later during Operation Just Cause in Panama, five SEAL platoons under Cmdr. Tom McGrath denied the Panamanian defense forces use of their own patrol craft, isolated some of these forces on an island, and prevented the Panamanian leader, Manuel *Noriega, from using his personal jet at Paitilla Airport.

SPECIAL OPERATIONS FORCES: MARINE SPECIAL UNITS

In World War II, the Marine Corps formed a number of special units, only two of which remained in combat until the end of the war. These were the "war dogs" and "rocket platoons," both of which saw action on Okinawa, the final major campaign of the Pacific War. The other disparate organizations were the defense, Raider, and parachute battalions, and the glider and barrage balloon squadrons. Of these, two obtained lasting fame—the parachute and Raider units.

Marine parachutists, or Paramarines, began training in the fall of 1940. The 1st Parachute Battalion came into being on 15 August 1941; the 2nd Parachute Battalion became active 2 September. They were used as infantry in the Solomon Islands campaign because the Corps did not have an adequate lift capability to use them as parachutists. The parachute program was formally disbanded on 29 February 1944, and its Marines were reassigned primarily to the newly organized Fifth Marine Division.

Several Marine Raider battalions formed in the war from volunteers met the apparent need for specially trained commando units that would conduct hit-and-run raids on Japanese-controlled islands of the Pacific and keep the Japanese off balance. Raider training began 6 January 1942, when the 1st Battalion, Fifth Marines, an infantry unit commanded by Lt. Col. Merritt A. Edson, was redesignated the 1st Separate Infantry Battalion, and then the 1st Raider Battalion on 16 February. Before the war, Edson's reputation had been established by his anti-banditry exploits in the early 1930s. On the West Coast, on 4 February 1942, the 2nd Separate Battalion was activated under command of Lt. Col. Evans F. Carlson. It became the 2nd Raider Battalion on 19 February. Carlson had been an observer in China with Mao Zedong's Eighth Route Army during the Sino-Japanese War. Carlson's executive officer was Capt. James Roosevelt, son of President Franklin D. *Roosevelt.

The 1st Raiders joined the 1st Marine Division in the Battle of *Guadalcanal on 31 August 1942. The Raiders suffered heavy losses in the Battle of Bloody (or Edson's) Ridge and were no longer an effective unit when they were withdrawn from the island on 17 October. Carlson's 2nd Raider Battalion went to Hawaii for training in landing from *submarines and rubber boat handling. Two companies reinforced the garrison at Midway in the successful repulse of the Japanese attack in early June 1942.

On 8 August 1942, the 2nd Battalion boarded submarines and set out for the Gilberts for a raid on Makin Island on the 17th. The greatest asset of the raid was its effect on home front morale. Carlson's battalion then moved to Guadalcanal, landing there in early November to begin a 20-day combat patrol, fighting more than a dozen actions and killing nearly 500 Japanese soldiers. In September, a 3rd Raider Battalion was formed in Samoa; and a 4th Battalion was formed on the West Coast that October. Eventually, two Raider regiments were formed. The 1st took part in the capture of the Russell Islands and later participated in the New Georgia operation. The 2nd Raider Regiment (Provisional) reinforced the Third Marine Division in its assault of Bougainville in November. As with the parachute

units, Raider regiments siphoned off manpower needed elsewhere; they proved to be a luxury the Marine Corps could not afford. The Raiders also were too small in organization, too lightly armed, and too specialized in their tables of organization and equipment. Unlike the paratroopers, they did conduct at least one operation of a type for which they had been trained—the raid on Makin. In early 1944, the Raider organizations were disbanded and redesignated as components of the new Fourth Marines.

The Marine Corps established no lasting special units in the post-World War II period, during the "Korean War, or during the "Vietnam War, except for reconnaissance companies and battalions that were organic to larger organizations. In 1985, the Marine Amphibious/Expeditionary Units (MAU/MEU) assigned to the navy's afloat amphibious ready groups were trained for "special operations capabilities." The tasks assigned to these units centered on the security requirements following a decade of low intensity conflicts instead of war, and they trained for such assignments as raids, hostage recovery, evacuation of civilians from areas of conflict, and humanitarian efforts. The Marine Corps also established surveillance-reconnaissance-intelligence groups (SRIG) that combined various units with like missions. The SRIG also operated the surveillance and reconnaissance centers that coordinated the similar assignments during the "Persian Gulf War, "in Somalia, Haiti, and in "Panama during Operation Just Cause.

SPECIAL OPERATIONS FORCES: AIR FORCE SPECIAL FORCES

The U.S. "Air Force's involvement in unconventional warfare has been episodic, and special operations aviators have operated on the fringes of air force organization and culture.

During World War II, the Army Air Forces organized the 1st Air Commando Group in early 1944 to support Allied irregular operations in North Burma against the Imperial Japanese Army. The "air commandos"—named after Lord Mountbatten's British Commandos—used C-47s and gliders to transport the troops and P-51s to fly close air support. They also pioneered in rescuing downed pilots and waging psychological warfare. Flamboyant and unconventional, air commandos adopted the motto, "Any Place, Any Time, Any Where." Other U.S. airmen in Europe supported Allied unconventional warfare operations by the Office of Strategic Services (OSS) and the British Special Operations Executive, such as the 60th Troop Carrier Group that operated in the Balkans in 1943-44.

After 1945, the air force eliminated the air commandos, but they lived on in the public's imagination through Milton Caniff's popular comic strip, "Terry and the Pirates." In 1951, the U.S. Air Force organized three "air resupply and communications" wings that supported U.S.-South Korean partisan operations in Korea, Chinese Nationalist

forces against the Chinese Communists, and the French against the Viet Minh in Indochina. But these units fell victim to air force reorganization in 1953.

The air force entered the "counterinsurgency field in 1961, when it organized the 4400th Combat Crew Training Squadron ("Jungle Jim," renamed 1st Air Commando Squadron in 1963), and deployed a detachment ("Farm Gate") to South Vietnam. In 1962, the Special Air Warfare School (later Special Operations School) opened at Hurlburt Field, Florida.

Air force special operations forces grew rapidly in Southeast Asia, while the "Central Intelligence Agency created "Air America," a similar civilian organization that specialized in aerial resupply of irregular forces and rescue of downed American airmen. In 1965, air commandos began using unusual aerial gunships: AC-47s, AC-119s, and later AC-130s (nicknamed "Spooky," "Spectre," or "Puff the Magic Dragon"), armed with rapid-firing mini-guns and even side-firing 105mm cannon. Air commandos supported other special operations forces and conducted search and rescue, reconnaissance, direct action, and psychological operations. At the height of the "Vietnam War, the air force had in the region 4 special operations wings (as they were renamed in 1968) with 500 aircraft. By then, more modern A-37s and AC-130s had replaced the venerable A-1s, B-26s, T-28s, and AC-47s. Five air crew received the Medal of Honor as air commandos.

After the Vietnam War, the air force dismantled most of its special operations formations and reduced the 1st Special Operations Wing to twenty aircraft. But the air force once again rebuilt its capabilities after 1980 under the 23rd Air Force, procuring the MH-53J Pave Low helicopter and other sophisticated equipment. A new generation of air commandos played important roles in Grenada, Panama, the "War on Drugs," and undeclared wars in Central America. In 1990, the 23rd Air Force became Air Force Special Operations Command, a component of U.S. Special Operations Command. In 1991, during the "Persian Gulf War, 1st Special Operations Wing pilots of "helicopters led the first strike against Iraqi "radar sites and hunted mobile missile launchers. Since then, air force special operations forces have seen extensive service in various post-"Cold War military operations.

SPOTSYLVANIA, BATTLE OF. See Wilderness to Petersburg Campaign (1864).

THE SPRINGFIELD MODEL 1903 rifle was developed at the Springfield National Armory in Massachusetts between 1900 and 1903 in order to provide a magazine-loaded, bolt action rifle more robust than the U.S. "Army's previous standard infantry rifle, the Danish-made Krag-Jorgenson, adopted in 1892. Based on the German Mannlicher system, the Springfield used a five-round clip instead of the single-round clip used by the Krag. The weapon weighed 9 lbs., 8 oz., and fired 220-grain round propelled by 43.3 grains of smokeless powder. An 18-inch knife bayonet was added to the weaponry in 1905. The "Springfield '03," as it was called, saw favorable service

through World War I. However, the American Expeditionary Forces (AEF) made only limited use of the 1903 rifle because the British 1917 Enfield was already in wartime mass production and was adopted as the M-1917 for the American army. In 1936, the Model 1903 rifle was replaced by the M-1 gas-operated, semi-automatic Garand rifle as the standard infantry weapon. The Model 1903 continued to be used, however, as a limited standard weapon, particularly as a sniper rifle and a grenade launcher. The "Springfield '03" ultimately was made by a variety of manufacturers and had a reputation as one of the most accurate military rifles ever produced.

SPRUANCE, RAYMOND A. (1886-1969), World War II U.S. "Navy admiral. Born in Baltimore, Maryland, the son of a reclusive father, Raymond was reared by his mother and three spinster aunts; he showed an early talent for writing poetry. The shy young man graduated from the U.S. Naval Academy in 1907, and first sailed around the world with the "Great White Fleet," returning to study electrical engineering at the General Electric Company in 1909. His first command at sea was the Philippines-based destroyer *Bainbridge* in 1913. Promoted to lieutenant commander in August 1917, Spruance never saw action during World War I.

Regarded as a superb ship handler, Spruance advanced between the wars, rising to the rank of rear admiral in 1940 after commanding a battleship. Taking command of Cruiser Division Five at Pearl Harbor in September 1941, he served as the surface screen commander for Adm. William F. "Halsey" during the early months of the war. When his friend Halsey was temporarily ill, Spruance took command of the American carrier force that fought and won the most crucial and decisive naval engagement of World War II: the June 1942 Battle of "Midway."

Afterward, Spruance served as chief of staff to Adm. Chester "Nimitz" in Pearl Harbor, but he returned to battle in 1943 commanding the Fifth Fleet. His command of this force during the Battle of the "Philippine Sea" in 1944 attracted some criticism because the Japanese fleet escaped. However, it was during this battle that Japan lost the bulk of its remaining naval airpower, and Spruance's primary mission was to protect the transports carrying the troops to invade Saipan. After the war, he served as the president of the Naval War College until his retirement. Called out of retirement, Spruance served as the U.S. ambassador to the Philippines (1952-55) before retiring once again. Spruance's near-flawless performance of command during two critical battles in World War II marked him as one of the U.S. Navy's great commanders.

STALIN, JOSEF (1879-1953), Communist leader of the Soviet Union for a quarter of a century, including World War II and the formative years of the Cold War. *Stalin*, the pseudonym adopted by a young underground revolutionary and former Orthodox seminary student in Czarist

Russia, means "man of steel." This quality indeed marked the career of Josef Vissarionovich Djugashvili, who was born in obscurity in Russian Georgia in December 1879 and died a feared autocrat and world leader in March 1953.

Stalin rose within Lenin's Bolshevik faction of the Russian Communist Party from 1898 through the Russian Revolution in 1917 and beyond. Following Lenin's death, he outmaneuvered Trotsky and other rivals and by 1929 became the sole leader of the ruling Communist Party of the Soviet Union. A shrewd and ruthless political infighter, he built a tyrannical but powerful totalitarian state. Millions were "liquidated" in massive "purges." In international affairs, although Stalin's outlook was shaped by belief in a historically destined global victory for communism, he was also a realist and pragmatist.

When World War II came to the USSR in 1941, despite Stalin's political machinations to avoid German invasion (including the Nazi-Soviet Pact of August 1939), the Soviet Union was ill-prepared. Stalin, who had become prime minister as well as chief of the ruling party, also became commander in chief of the armed forces. For many Russians, he symbolized successful determination to win the war. The Soviet Union entered a grand alliance with Great Britain and the United States against the Axis powers (although against Japan only in the final weeks of the war). Stalin concentrated on winning the war, but not at the expense of constant calculation of how to enhance the international role and power of the Soviet Union in the postwar world. He dealt shrewdly with Western leaders, including Winston S. "Churchill" of Great Britain and Presidents Franklin D. "Roosevelt" at the "Yalta Conference" and Harry S. "Truman" at Potsdam. Despite "victory and the founding of the "United Nations, the very success of the wartime coalition ended the common interest that had brought the USSR and the Western democracies together. The end of World War II thus quickly led to the emergence of a new so-called Cold War, dividing the former Allies.

Stalin's ideological predispositions, reinforced by personal suspiciousness, if not paranoia, led him to pursue an aggressive postwar course in foreign relations that constituted a central element in the unleashing of the Cold War. His reliance on a personal dictatorship within his own Communist Party, and a totalitarian state structure within the Soviet Union, required severe limitations on contact with the outside world. It also contributed to a conduct of relations with other states that soon resulted in the sharp drawing of lines between the bloc he controlled and the outside world.

Stalin sought to expand Communist rule, Soviet influence, and his own control in those places and under circumstances where it was possible. Unlike Adolf "Hitler," however, he was not driven to advance where it was inexpedient, much less to court or initiate war. This was true of even the most apparent exception—the "Korean War." Archival documents released in the 1990s showed that the principal impetus for a North Korean military attack on South Korea came from Kim Il Sung, although Stalin (and Chinese leader Mao Zedong) were led to approve and provide support for the attack and thus bear responsibility. Initially, however, Stalin refused to approve Kim's plans, and did so only when he mistakenly concluded that the United States would not intervene. The Korean attack was neither Stalin's test of Western resolve nor precursor to a

possible Soviet attack in Western Europe, as was widely feared at the time.

In his last years, Stalin's paranoia grew, and he was about to launch a new purge of his henchmen when he suffered a stroke and died. Ironically, he had imagined or invented a plot by Kremlin doctors against Soviet leaders and removed long-trusted doctors, aides, and guards; some of his threatened surviving entourage may then have hastened his death by denying medical assistance. In any event, succeeding leaders soon stopped virtually any mention of his name, a striking contrast to the ubiquitous glorification of Stalin that had emerged after the war. By 1956, his successor, Nikita Khrushchev, not only condemned "the cult of the individual" that had been built up by Stalin, but in a secret speech denounced his crimes against the people and the party. The lot of the people, while still subordinated to the interests of the state, improved. Stalin's successors also moved to reduce frictions with the rest of the world.

Thus, after Stalin's death, a general lessening of tension ensued. The Cold War, however, continued with varying intensity for another thirty-six years, until a Soviet leader—Mikhail Gorbachev—came to power prepared to discard the "Stalinist" world view and so end the division of Europe and the world.

STANTON, EDWIN M. (1814-69), secretary of war under President Abraham *Lincoln, was born in Steubenville, Ohio, 19 December 1814. Admitted to the bar in 1836, Stanton made a quick reputation for brilliance. Moving to Pittsburgh in 1847, he won national attention by representing Pennsylvania before the Supreme Court in an interstate commerce suit. A growing Supreme Court practice took him to Washington, D. C. in 1857.

In 1858, Stanton exposed a conspiracy to defraud the government of some \$150 million worth of land in California. This catapulted him into the office of U.S. Attorney General when President James Buchanan reorganized his cabinet in December 1860. Democrat Stanton opposed slavery and supported the Wilmot Proviso, but accepted the Dred Scott decision. He tried to strengthen Buchanan's policy against secession and to reinforce Fort Sumter.

Stanton returned to private life when Buchanan's term ended. He distrusted Lincoln and befriended Gen. George B. *McClellan when he took charge of army operations and openly derided Lincoln and his administration. Nevertheless, Lincoln invited him to replace Simon Cameron as Secretary of War in January 1862. Inheriting an administrative shambles, Stanton soon restored honesty and order.

Brusque and intemperate with people, rigid and vigorous in pursuit of victory, Stanton made few friends in his department or the cabinet, but he and the president gradually forged mutual admiration. Lincoln trusted Stanton's judgment and came to rely heavily on his advice. An active war secretary, Stanton lost faith in McClellan. In September 1863, Stanton's dispatch of 23,000 men from east to west in less than seven days to reinforce Gen. William S.

*Rosecrans ranks as a logistical marvel. An early admirer of Gen. Ulysses S. *Grant, he pushed his advancement, and enthusiastically approved his appointment as general-in-chief of the Union armies in 1864.

Meddling in civil affairs, Stanton censored newspapers and had citizens arrested for suspicion of disloyalty. Although Stanton and Grant got along well, the general disliked the secretary's abrupt and severe rebuke of Gen. William Tecumseh *Sherman for his proposed surrender terms to Gen. Joseph E. *Johnston.

Lincoln's assassination released a fanatical streak in Stanton, who pushed the execution of Mrs. Mary Surratt and tried to implicate Jefferson *Davis in the assassination plot. President Andrew *Johnson kept Stanton at his post—an error he soon regretted. Although Stanton did a masterful job in demobilizing the Union armies, he joined the Republican Radicals against presidential reconstruction policies. He did, however, oppose the *Tenure of Office Act (aimed at keeping him in office).

When Johnson asked for his resignation in August 1867, the secretary refused to leave office until Congress reconvened in December (he argued that since the Tenure of Office Act had been passed over Johnson's veto, it was law). Johnson suspended him but was overridden by the Senate in January 1868. The president dismissed Stanton in February 1868, but Stanton held on and even ordered the arrest of Adjutant-General Lorenzo Thomas, whom Johnson had named as secretary ad interim. Stanton resigned when Johnson's impeachment failed. Appointed by President Grant to the Supreme Court, Stanton died on December 24, 1869, four days after his confirmation.

START. In 1982, under the administration of President Ronald *Reagan, a new series of negotiations, the Strategic Arms Reduction Talks (START), succeeded the negotiations that had led to the *SALT Treaties of the 1970s. In July 1991, the START I Treaty was signed in Moscow by President George *Bush and Soviet president Mikhail Gorbachev. In January 1993, the START II Treaty was also signed in Moscow, by Bush and Russian president Boris Yeltsin. Both treaties involved substantial reductions; even so, START I brought the level of strategic warheads down only to about the level prevailing when SALT II was signed, and START II would bring it down to the level when SALT I was signed.

The START I Treaty, signed just months before the dissolution of the Soviet Union, could only be ratified by Russia and the United States after agreements were reached with Ukraine and Belarus, also successors to the Soviet Union, that those states would relinquish Soviet strategic nuclear arms on their territory and commit themselves to join the Treaty on the *Nonproliferation of Nuclear Weapons as nonnuclear weapons states. The START I Treaty then went into effect in December 1994. Under this treaty, the United States reduced its ballistic missile warheads by about one-third, and Russia by about one-half, to totals (not specified) of about 8,000-10,000 for each side.

The START II Treaty is more ambitious, not only providing for considerably deeper reductions but also for the

elimination of all MIRV warheads on land-based intercontinental ballistic *missiles (ICBMs). Overall, each side would be limited to no more than 3,500 strategic warheads. Bomber *nuclear weapons are also counted on a more realistic basis, and hence its warhead levels were real rather than nominal.

At present, the START II Treaty has yet to be ratified by Russia, not so much owing to its terms (although some Russians object to the need to scrap all existing land-based MIRV missile systems due to uncertainties with respect to continued U.S. observance of the ABM Treaty and a general deterioration of U.S.-Russian relations). In addition, the START I reductions, and still more the prospective additional large START II reductions in Russian ICBM systems, pose a heavy burden in dismantling and destroying such systems under START procedures intended to assure verification.

Further reductions in Russian strategic forces, and to a much lesser extent U.S. systems, will proceed even without ratification of START II, given the inevitable obsolescence and the lack of ready replacements. But the elimination of land-based MIRV systems, especially in Russia, and the large reduction in submarine-launched ballistic missiles (SLBMs), especially in the United States, will not take place for some years unless START II is ratified or until there is at least tacit agreement to proceed as though it had been ratified (as occurred with the SALT II Treaty).

STAR WARS. See Strategic Defense Initiative.

STATE, THE. The American concepts of state and state power have since colonial times been shaped by national security interests and by experience in the management and use of the American military. Insofar as a sovereign state holds a monopoly on the legitimate use of violence, state power must be defined with reference to the raising and employment of armed forces. The logic is Hobbesian. The state provides order; the alternative is anarchy and a life both "brutish and short." Given this choice, the citizen opts for order and accepts the rule of Hobbes's Leviathan—the state.

Historical development has distanced the American state from this view but never quite overcome it. The nation's founding myth—that a dispute with the crown over contractual rights and responsibilities caused the Revolution—follows John Locke's contrary postulate that the social contract grants limited power to the state. The Constitution itself confirmed the relevance of Locke's version of the contract metaphor to the U.S. government and its constitution.

The Internal Security Dilemma and the Nineteenth-Century American State. This conception of limited state power poses special problems with respect to national security. National security becomes a vital issue when survival of the state is threatened; then the Hobbesian (or realpolitik) understanding of the state and state power clashes with the Lockean (or liberal) conception. This clash creates what can be called the "internal security dilemma." In the realpolitik view, the state cannot provide

the blessings of liberty unless it can assure its own survival. In the liberal view, the powers of the state must be so disposed as to protect citizens. Hence the dilemma: The state must somehow cope with threats to itself while maintaining the liberties and rights of citizens.

From the end of the *War of 1812 to the close of the nineteenth century, state survival was not a question of external threat. Survival emerged as a serious sectional issue, which the *Civil War settled; otherwise, policies and disputes associated with the security of the American state centered on providing the United States with strategic space. By denying the western hemisphere to rival powers, the *Monroe Doctrine (declared in 1823 but an unfinished project until the twentieth century) laid claim to an enormous strategic space for the United States. The quarrel with Britain over the Oregon Country, settled diplomatically in 1846, and the disputes with Mexico that led to the *Mexican War in that same year, actualized American state claims to territory on the basis of strategic considerations no less than by invoking "manifest destiny." The Civil War, however, definitively established the nineteenth-century American understanding of the state's power to ensure its survival, as the federal government held a continent-wide country-qua-empire together by force of arms. The scale and violence of the Civil War tested the limits of war itself, while its political stresses took a heavy toll on civil liberties—the federal courts proving particularly ineffective guardians against martial law's encroachments on freedom of speech and assembly.

The exercise of political opposition and the employment of military force furnish two major reference points for defining the state. Democracy requires the possibility of legitimate opposition to government, while nation-states under threat to their survival or security, and states that vastly expand their military activity, usually give priority to security considerations and seek to limit political partisanship. Such tensions were particularly evident in the early- and mid-nineteenth-century United States, where army officers, and to a lesser extent navy officers, often cultivated political connections and acted as partisan figures. In 1846, for example, the Senate rejected President James K. *Polk's attempt to appoint Senator Thomas Hart Benton, a civilian with no military experience and a fellow Democrat, as the top general commanding the campaigns against Mexico. Polk had to content himself with two Whig generals, Zachary *Taylor and Winfield *Scott, both aspirants to their party's presidential nomination in 1848, as leading officers in the campaigns. In 1864, Gen. George B. *McClellan, once Abraham *Lincoln's general in chief, ran against Lincoln as Democratic nominee for the presidency. For his own part, Lincoln did not hesitate to appoint brigadier generals and allot military contracts as a means of cultivating local interests and winning their political support.

Partisanship and "pork" persisted after the Civil War, but preferment gradually diminished. The army, deployed in the West during the *Plains Indians Wars, became more isolated from American society and thus susceptible to reforms, adopted after the *Spanish-American War, that made it more professional and less political. Up to that point, however, political considerations generally tended to place American state power—and the services of the U.S. Army—at the disposal of local interests. This was largely true in the Mexican War and in westward expansion. In the

Spanish-American War, the Cuban campaign was essentially a projection of land power partly in response to the demands of Cuban exiles in New York and Florida.

The army reforms of 1899-1904, largely under Secretary of War Elihu "Root, reinforced civilian authority over the army, with a chief of staff, the army's leader-manager, answering to the president as "commander in chief, and depending upon the civilian secretary of war to be effective in his own job. This structure reduced the autonomy of the army bureaus and weakened their links to congressional interests, while centralizing authority in such a way as to strengthen professionalism. Despite a certain amount of resistance at the top, officers tended to embrace the new managerial ideals, which facilitated the planning and coordination fundamental to modern warfare, and thus rejected older, populist views of military leadership, which stressed romantic, intuitive qualities and fostered partisan political activity. The navy followed suit, achieving its reforms by more informal means.

Professionalism has usually advanced at the expense of local politics in the American military establishment and has strengthened civilian leadership based on the power and authority of the president as commander in chief. Significant advances occurred during the first two decades of the twentieth century, although localism remained evident at the end of the century when post-"Cold War budget cutbacks led to military base closings that were opposed by local interests.

During the twentieth century, American armed forces took part in four major wars—World War I, World War II, the "Korean War, and the "Vietnam War—and several minor conflicts, the largest of which was the "Persian Gulf War. None of these five occurred in the western hemisphere: two took place in Europe, two in Asia, and one in the Middle East. Local interests played either a negligible role or no role at all in any of them. Military power was associated with "high politics," a phrase commonly used during the Cold War to refer to the way Congress and the executive branch handled "national security in the nuclear age—in particular, the way Congress deferred to the president—and the way the public rallied to support state power in times of crisis.

When the United States entered World War I, President Woodrow "Wilson chose a professional officer to command the American Expeditionary Forces. Though Gen. John J. "Pershing was son-in-law to a senior Republican senator, he avoided partisan politics, and after the war, he scotched a movement to run him for president on the Republican ticket.

During World War II, President Franklin D. "Roosevelt minimized political controversy about the conduct and purpose of the war effort by two means. One was to promote bipartisanship; the other, to delay the resolution of contentious issues about war aims until the return of peace. The first he accomplished by bringing two prominent Republicans into his wartime cabinet (Henry L. "Stimson as secretary of war and Frank Knox as secretary of the navy) and appointing other Republicans to administer war agencies. The second he accomplished by declaring, as he did at the Casablanca Conference in 1942, that unconditional surrender was the Allied military objective of the war.

But important issues about the employment of the armed forces as the principal instruments of state power in

war remained. One had to do with strategic priorities. Roosevelt adopted the army's favored strategy of defeating Germany first (before Japan). Command links to the European theater from Roosevelt through Army Chief of Staff George C. "Marshall to Gen. Dwight D. "Eisenhower in Europe worked nearly perfectly. No field commander in American history caused his commander in chief less trouble or delivered more results than did Eisenhower. Although Japan surrendered sooner than expected, the Pacific War was a different matter, for Asia's lower priority left two military scores to be settled after 1945—one with the navy and one with Gen. Douglas "MacArthur. Both had important consequences for the state and its control over the armed forces.

The navy's priority lay in the Pacific theater, where it could demonstrate its seaborne striking power. Only after the defeat of Germany did it gain first priority, and then the Pacific War ended quickly. In the immediate aftermath of the war, as the administration of Harry S. "Truman sought to restructure the U.S. military, the navy bitterly opposed the force integration that modern warfare required. This dispute was settled by the "Key West Agreement of 1948 and other compromises, delaying the development of combined arms warfare and perpetuating interservice "rivalry that handicapped military operations and distorted military advice during the Vietnam War.

MacArthur proved in some ways a more difficult problem. Charismatic and personable, he was a virtual throwback to the nineteenth century; as army commander in chief of the Pacific theater, he proved an uneasy partner to the admiral commanding the Pacific Fleet, Chester "Nimitz. With the defeat of Japan, MacArthur became the virtual American proconsul in Tokyo, often ignoring instructions from Washington on occupation policy. The problem worsened when it fell to him to lead the "United Nations (predominantly American) forces in the Korean War. His relations with Washington deteriorated into mutual mistrust until President Truman dismissed him in 1951, when MacArthur sought the support of congressional Republicans in a ploy reminiscent of the Partisan Politics of the Mexican War or the Civil War.

This, the second score to be settled from World War II, showed that Eisenhower's example was now the rule. A general might have presidential aspirations, but not a hint of them may show until he takes off his uniform. American military activities in the last half of the twentieth century would scarcely be isolated from business interests or shielded from political controversy, but whatever personal political ambitions arose within the officer corps were strictly channeled.

The Truman administration's political fortunes suffered because of the Korean War, which put any candidacy by Truman for a second elected term as president beyond consideration. In broader terms, Truman had invoked crises too often in his efforts to build a permanent and stable Cold War posture. Eisenhower profited by his predecessor's hard lesson that presidents could overplay their hand in the "high politics" of state power. Elected in part to end the Korean War, Eisenhower resisted the temptation to use crises to win political support for military programs and military actions. Yet his calmer leadership style with respect to "high politics" had its own problems. When the Soviets launched Sputnik, the first of the space "satellites, in 1957, his administration came under attack for its seem-

ing unconcern about competing with Soviet military technology. John F. "Kennedy employed charges of a "missile gap" in his successful presidential campaign in 1960 (only to learn later, and admit, that it never existed).

No twentieth-century war drew the American state into more domestic dissent than the Vietnam War. President Lyndon B. *Johnson's decisions about the war added up to an unsuccessful military policy, with disastrous domestic effects. As with Truman and Korea, they led to a turnover of the White House to a Republican president. Richard M. *Nixon, who succeeded Johnson, expanded the war in the course of ending it, leaving the Democrats in bitter opposition and the American state burdened with failures in both security policies and the handling of its military leaders and forces. Yet if Vietnam raised the political costs of engaging American military forces abroad, it did not end the practice. It had little effect on *NATO; if anything, the ending of the American engagement in Vietnam enabled the United States to strengthen its forces in Europe. Meanwhile, the nation's postwar "isolationism proved only temporary. Jimmy *Carter was elected president in 1976 at the head of a Democratic Party that espoused moderately anti-internationalist and antimilitary policies. But Carter reversed himself and started a rearmament program that became the Ronald *Reagan rearmament policy of the 1980s. The Vietnam War's more permanent legacy, a reduced confidence in America's leaders in their employment of force, led Reagan to try to restore popular confidence in U.S. military power. In this he proved only partially successful.

"Vietnam" remained shorthand for a warning against committing American military forces without an exit strategy. But strategy alone was not the issue: the way the American state handled "high politics" was.

As the management of the armed forces in relation to Congress, the executive branch, and society, "high politics" defined the degree of consensus on national security issues and hence the dimensions of American state power. Defined in this inclusive way, the Cold War's high politics shifted dynamically over time to reflect changes in threat perceptions, in the perceived need for the armed forces, and in their successes and failures. State power expanded and contracted accordingly, growing during the first half century, declining briefly in the early fifties as a result of the Korean War and the Communist scare, then recovering and reaching its high point of consensus on security issues in the early sixties. It was never the same again. The manifest errors of the Vietnam War reduced public and elite confidence in the employment of force to achieve political goals and sharply curbed the expression of state power. Eventually, the early seventies watchword, "No more Vietnams," faded from use; but the skepticism it reflected remained. By the late eighties and nineties, policymakers concerned with security and the state were looking increasingly to economic leverage as a substitute for military power.

Nuclear Danger and the Definition of the Powers of the Commander in Chief. Before the United States acquired *nuclear weapons, U.S. political leaders regarded the state's military function as synonymous with its capacity to mobilize for and conduct large-scale warfare. Nuclear weapons did not displace this role because conventional war-fighting capabilities continued to be regarded as necessary in maintaining stable "deterrence and in minimizing the danger of a catastrophic nuclear war. Yet nu-

clear weapons irrevocably altered the way the American state employed force to achieve security. Three interrelated factors shaped the change.

The first was World War II's impact on the balance of power. The war severely damaged the military capacity of all participants except the United States, which emerged as the world's first superpower. This eliminated the prospect that America could confine itself to the role of power balancer of last resort, for other states could no longer reliably stabilize the international political order. Specifically, Western Europe could not balance the Soviet bloc without an explicit and tangible U.S. commitment from the beginning. For the first time in its history, the American state had to maintain massive military forces in the absence of active hostilities.

The second factor that shaped the American state's military power after World War II was the American view of the Soviet Union during the Cold War. U.S. leaders saw it as a threat to the military and political security of Western Europe and to American interests there. They took the Soviet bloc as a given; in the interest of stability, they did not challenge it—which in turn meant containing it, not defeating it. For a European statesman, the point was self-evident, but those who wielded American state power found it an unfamiliar idea. Only for the leaders of the American state was it necessary to decouple the identification of a rival from the course of the action the United States had taken in two world wars: to mobilize and defeat it.

The third factor was the American development of nuclear weapons systems—the warheads themselves and the technologies for warning and target acquisition, for aiming and delivering and guiding weapons, for safeguarding them and for commanding and controlling their employment—that could deter enemies from attacking at locations remote from U.S. territory; and finally, the doctrines that explained how these vast, complicated systems should be positioned and employed. All of this placed an enormous burden on the military "command and control process, beginning at the top, with the commander in chief. President Kennedy, appalled at the "spasm war" scenarios for which the nuclear air force had planned, took steps in 1961 to provide himself, as commander in chief, with options in a *Flexible Response doctrine, expanding the range of choices available to presidents for employing nuclear weapons. But the Vietnam War produced a quite different approach to options, based on a critique that placed much of the blame for the U.S. defeat on civilian leaders—in particular, on the president—for overextending American power and micromanaging the war with catastrophic consequences.

This criticism has persisted. President Reagan's secretary of defense, Caspar "Weinberger, issued guidelines for military interventions that assured maximum autonomy to the generals in determining how they might fight. In substance, President George "Bush followed these guidelines in the "Persian Gulf War.

Criticisms of the Vietnam War also led to the Congressional "War Powers Resolution of 1973. Intended by its authors to increase congressional participation in decisions that might lead to war under circumstances that did not directly threaten the survival of the United States, this act has been opposed by every president since its passage. Presidential concern for preserving the prerogatives of the commander in chief, however, have been no more

significant in rendering the act inconsequential than has congressional reluctance to follow through on the claim to a decisive role in determining whether or not forces should be introduced in dangerous situations. The law claims for Congress a resolve it has in actual practice lacked: to share in presidential decisions regarding the employment of conventional forces.

At the end of the twentieth century, divergent views about security threats, the military forces needed to meet them, and the employment of those forces have left the American concept of the state, in relationship to security and the military, unfocused and in flux. Congress avoids showdowns over military issues with the president; legislators avoid partisan showdowns among themselves over military policies. Meanwhile, the military itself enjoys a voice in security policy—and is called upon to participate in quasi-police activities like the “war on drugs”—to a degree unanticipated by military professionals at midcentury.

Looking back from an era of total war and nuclear standoff, one is struck by the prominence the U.S. Constitution gave (and still gives) to executive power by combining in the presidency the offices of chief of state and commander in chief. This solution reflected British experience as it was understood at the Constitutional Convention in Philadelphia in 1787, and addressed the internal security dilemma in two enduring respects. One was to avoid the potential tyranny of an Oliver Cromwell (the English military dictator in the mid-seventeenth century) by conferring the highest military authority on a civilian, whose authority did not derive solely from the Congress. The other was to combine the offices of chief of state and commander in chief as a means of avoiding “Caesarism,” the despotism of a military commander insulated by popularity from control by civil authorities. The men who drafted the Constitution were aware of an internal security dilemma when international threats to the survival of the American state were taken seriously. This dilemma remains. After more than 200 years, it continues to impose stress on a government of limited powers that, when dealing with the issues of its citizens, ultimately depends upon the survival of the state.

STEALTH AIRCRAFT. The term “stealth” is commonly applied to aircraft or missile systems that have been de-

signed to produce as small a radar signature as is practicable. In fact, stealth technology goes beyond this to include reducing as many “observables” of an aircraft or missile system as possible—for example, its visual, noise, and heat signatures, as well as its electromagnetic ones. Stealth technology is applicable to other systems as well, particularly to ship design. Overall, while the term “stealth” is convenient shorthand, a more precise and all-encompassing term used in the military community is “low observables.”

Interest in reducing the observable characteristics of aircraft dates to *World War I, when various of the warring powers experimented with both camouflage paint schemes and even see-through fabric coatings applied to airplanes. Theoretical studies in *World War II indicated that it might be possible to reduce the radar signature of an airplane; in related work, the Germans developed radar-absorbent materials to shield * radar return from submarines’ Schnorkels when these retractable air pipes were raised above the surface of the water. Flight tests of flying wing designs in the late 1940’s indicated that they had minimal radar return characteristics, but this was serendipitous, and not the result of a deliberate attempt to develop low observable technology. In the late 1950’s, with the growing sophistication of radar and missiles, the United States developed a comprehensive series of radar test ranges, where models could be suspended from cables or mounted on poles, and then radiated by radar emitters to assess their “signature” characteristics. Such “pole testing” played an important part in developing both a knowledge base on reducing radar signature and in assessing what portions of an aircraft typically offer the greatest strength of radar return. The strength of return determines the radar cross section (RCS) of the aircraft; it is the apparent size of an aircraft as it appears to search and fire control radars, and has no relationship to the actual physical cross section of an airplane.

The first aircraft designed to have a greatly reduced radar signature was the Lockheed A-12, the predecessor of the SR-71 Blackbird strategic reconnaissance airplane. It made use of the three major means of radar cross-section reduction: shaping, structural absorption via special materials, and specialized coatings. During the *Vietnam War, such technology was also exploited on small jet-propelled drones launched over North Vietnam on photo reconnaissance and electronic intelligence missions during the late 1960’s and early 1970’s. This experience, coupled with the lessons from the 1973 Arab-Israeli war (which demonstrated the vulnerability of conventional aircraft to radar-guided *missiles and gunfire, as well as heat-seeking missiles) greatly encouraged development of larger special-purpose radar-defeating “stealth” aircraft.

Ironically, given the Soviet Union’s failure to exploit stealth technology, the key breakthrough in developing a stealth airplane came from theoretical studies by Pyotr Ufimtsev, the chief scientist at the Moscow Institute of Radio Engineering. Ufimtsev’s conclusions, published in the West, were studied by Lockheed engineer Denys Overholser, who recognized that they enabled the systematic analysis of an aircraft’s shape to assess its radar reflectivity. Overholser discussed his findings with Ben R. Rich, the chief of Lockheed’s famed “Skunk Works” advanced development team. Rich ordered developmental tests and, in September 1975, pole tests on a slender delta configuration having a faceted surface configuration (like a diamond)

confirmed that such a shape could have a remarkably reduced radar return. The next step was development of a true airplane.

The first true "stealth" airplane—an aircraft designed primarily to defeat radar—was the Lockheed Have Blue technology demonstrator. Two of these aircraft, first flown in 1977, demonstrated that an aircraft company could design and build a potentially militarily useful airplane incorporating low observable principles. In 1978, the Air Force contracted with Lockheed for a special purpose stealth attack airplane. This airplane, the Lockheed F-117, first flew on June 18, 1981, entering service with the Air Force in 1983; 59 were subsequently built. During the "Persian Gulf War, F-117's shattered Iraq's air defense control centers, opening up the country to attack by conventional non-stealthy strike airplanes. Because of their survivability and ability to undertake precision attacks using laser-guided bombs, they were the only strike aircraft operated over Baghdad throughout the war.

Development of the first stealth aircraft encouraged the development of the Northrop B-2 stealth bomber (which entered Air Force service in December 1993), and an advanced stealthy cruise missile, the General Dynamics AGM-129. Stealth is an important development in military aerospace, for it renders an aircraft or missile difficult to detect, and virtually impossible to track, engage, and destroy. The success of these early stealth efforts has spawned interest both in counter-stealth studies and in a variety of other stealth designs. But as of this writing, only the United States possesses stealth aircraft and missiles in operational service.

STEAMSHIPS. In his classic study, *Sea Power in the Machine Age*, Bernard Brodie observed that navies were relatively late in utilization of the technological advances of the machine age. Progress in steampower development was followed closely by the various admiralities—Great Britain, France, and the United States being most active. During the nineteenth century, the steam warship was by far the most important of the great naval revolutions, the most significant such innovation in warships since the fifteenth century. Steampower completely revised naval tactics and strategy; now ships could go anywhere, any time. During a transition period at midcentury, the largest warships retained masts and sails while adding steampower and either paddle wheels or screw propellers. Actually, the transition from the warfare of "sailing ships to modern naval warfare involved multiple technological developments: steam propulsion, iron (later, steel) construction, armor plate, replacement of paddle wheels with screw propellers, advances in naval ordnance such as the shell gun and rifling, the development of "torpedoes and "mines, and even some experimentation with the ram. Former reliance on wind and weather for the sailing ships was superseded by dependence on fuel sources—first the burning of wood, then coal, and finally oil. Logistical supplies of these sources became decisive factors. Naval steampower used on a global basis made overseas bases essential.

The earliest steam-powered engines, initially developed in Great Britain through the collaboration of James Watt and Matthew Bolton in the late eighteenth century, were crude, inefficient, and bulky. They were initially used to

pump water to facilitate mining at deeper levels. Installation of increasingly efficient engines in vehicles for water transport took place in Great Britain, France, and the United States in the early nineteenth century. Key contributions were made by James Rumsey, John Fitch, Robert "Fulton—all Americans—and a Swedish immigrant to America, John "Ericsson. For the steam engine, reciprocation into rotary motion, compound pressurization, and separation of the condenser as a detached unit contributed to efficiency, portability, and use at sea.

Fulton's "North River Steamboat," erroneously dubbed *Clermont*, was the first unqualified commercial success, operating on the Hudson River from New York to Albany beginning in 1807. Fulton also designed the first steam-powered warship, "Fulton Steam Frigate," to be used for harbor defense and as a blockade runner during the "War of 1812. Fulton died in early 1815, and the steam warship was completed too late for use during the war. Its paddle wheel arrangement was centered amidships, a less vulnerable location. *Fulton I*, as it was later named, was diverted for use as a receiving ship in New York Harbor, where it accidentally blew up in 1829.

In the continuous naval competition between the British and French, invasion panics arose in Great Britain in the early 1840s when the French announced advances in steam warship design. In 1845, the British Admiralty sponsored a demonstration to determine which was superior, the paddle wheel or screw propeller; the latter clearly won. Steam warships proved their effectiveness and capability irrespective of wind and weather when used by the British and French during the Russian (Crimean) War, 1854-56. The French *Gloire* of 1859 was the first seagoing armored warship, built of wood with a covering of iron plate. The following year, the British response, HMS *Warrior*, contained an iron hull. Metal hulls facilitated larger size. In the next decade, the British entry, HMS *Devastation*, contained turrets and no sails. (HMS *Warrior* has been restored. Along with the ultimate sailing ship-of-the-line, HMS *Victory*, Lord Nelson's flagship of 1805, it is on display at Portsmouth, England.)

For the U.S. "Navy, the transition from the first steam warship to the modern battle fleet occurred between the 1840s and 1880s, led by Benjamin Franklin Isherwood, engineer-in-chief. The USS *Princeton*, designed and built by Ericsson, qualified as the first steam-powered, screw propeller warship, but a fatal gun accident in 1844 caused delays in its development. The expedition of Adm. Matthew "Perry to Japan in 1854 included steam warships. Meantime, the American gun developed by John "Dahlgren in 1856 proved temporarily superior. More important, Ericsson designed and built the USS *Monitor* just in time to participate in the famous Battle of "Hampton Roads, Virginia, in March 1862, against the "Confederate navy's *Virginia* (formerly USS *Merrimac*), a converted ironclad steam vessel. *Monitor* contained the first turret gun arrangement. The battle was a draw but nevertheless revolutionized naval warfare. *Monitor* was unstable and later sank off North Carolina. The USS *Michigan* was the first iron-hulled, paddle wheel steamship of the U.S. Navy, in service for eighty years. Another advance was Isherwood's USS *Wampanoag*, completed in the late 1860s, a steam and sail cruiser capable of 18 knots speed.

Further advances in steampower, metal boilers, expansion systems utilizing high pressures, reduction gears,

and more efficient propeller designs followed. By the 1880s, the navy had converted entirely to steampower and the age of sail was over. Steam remains the basis of propulsion for sea transportation, generated today by petroleum or nuclear fuel.

STEUBEN, FRIEDRICH WILHELM VON [BARON] (1730-1794), Revolutionary War general. Born at Magdeburg, Friedrich Steuben followed his father's path into the Prussian Army, eventually serving as an infantry officer, staff officer, and aide under Frederick the Great. Court life lured the young captain from the army in 1764, but the American *Revolutionary War drew him back to military service. In 1777, the self-proclaimed Lt. Gen. ("Baron von" Steuben—who was neither a general nor a nobleman—arrived in Philadelphia and requested a commission in the *Continental army. Americans soon found that if the Prussian had misrepresented his credentials, he did not exaggerate his talents.

After Congress accepted Steuben's offer to serve without rank in January 1778, he found the beleaguered Continentals at Valley Forge lacking the skill and knowledge of European regulars. Steuben consequently developed a system of drill that customized European methods to American needs, demonstrated its effectiveness on his personally trained "model company," and eventually published its principal elements in *Regulations for the Order and Discipline of the Troops of the United States* (1779). By May 1778, he became inspector general, with the rank of major general. Though he also served in the field, Steuben's most significant military contribution remained the greater degree of professionalism he gave to Continental forces.

STEVENS, THADDEUS (1792-1868), radical Republican and leader of the House of Representatives. Stevens was born in Danville, Vermont, graduated from Dartmouth, and established himself as a lawyer in Gettysburg and later in Lancaster, Pennsylvania. He was an excellent parliamentarian who served (with few interruptions) in 1833-42 as an Anti-Mason in the Pennsylvania legislature, where he was instrumental in saving the bill for compulsory free education. Elected to Congress in 1848 as a Whig, he took a determined antislavery stand and retired in 1853, only to be reelected in 1858 as a Republican.

As a strong opponent of the secessionists, in 1861, Stevens became chairman of the Ways and Means Committee, a position that enabled him to frame and implement important legislation during the Civil War. Stevens constantly pressured President Abraham *Lincoln to institute an antislavery policy. He believed that only the laws of war, not the Constitution, applied to the seceded states, which he considered conquered provinces and in which he advocated confiscation of rebel property. His adept congressional leadership enabled him to raise the necessary funds for the Union forces, particularly by the introduc-

tion of paper currency "greenbacks," which he favored throughout his career.

After the war, Stevens was the main proponent in the House of Radical Reconstruction. Largely responsible for denying seats to Southern members and for the establishment of the Joint Committee of Fifteen on Reconstruction, he became the principal author of the Fourteenth Amendment; the Reconstruction Acts, which initially remanded the Southern states to military rule; and the impeachment of Andrew *Johnson. Often called vindictive and a dictator of Congress, Stevens was in fact opposed to the death sentence and did not succeed with many of his measures that fell short of his desires. Nevertheless, his advocacy for equal rights for the freedmen was an important inducement for Republican Reconstruction measures. He died in 1868, disappointed at his failure to procure the conviction and removal of President Johnson.

STILWELL, JOSEPH (1883-1946), U.S. general in World War II. Graduating from West Point in 1904, Stilwell's first assignment, to the Philippines, began a military career that would be closely associated with Asia, especially China. After service as an intelligence officer during World War I, Stilwell was sent to China—the first of several assignments that eventually included a stint as military attaché (1935-39), when he observed the Sino-Japanese War.

Highly regarded by Gen. George C. *Marshall, Stilwell, who was fluent in Chinese, was appointed U.S. commander of the *China-Burma-India theater of operations in 1942. Although allotted minimal resources, Stilwell strived to encourage the Nationalist leader, Chiang Kai-shek, to build an effective military force to counter Japanese advances in China and Burma. Stilwell's relationship with Chiang was strained, given the latter's unwillingness to reform the corrupt and poorly led Chinese armies. Nicknamed "Vinegar Joe" for his blunt manner, Stilwell proved unable to use Chinese troops to halt the 1942 conquest of northern Burma, which cut the only viable land link between China and India. Relying largely on Chinese forces trained by his American staff, he succeeded two years later in recapturing a large part of northern Burma and was promoted to lieutenant general. This campaign eventually paved the way for the reopening of the Burma Road in 1945.

Recalled by President Franklin D. *Roosevelt in October 1944 at the behest of Chiang, Stilwell returned to the United States to resume his career in Washington, D.C., as commander of army ground forces. He was slated to command the Tenth Army for the planned invasion of Japan before the surrender of Tokyo in August 1945.

STIMSON, HENRY L. (1867-1950), lawyer, secretary of state, secretary of war. The grandson of a New York stockbroker and son of a doctor, Stimson was educated at Phillips Andover Academy, Yale College, and the Harvard

Law School. He practiced law in New York as a partner of Elihu *Root, later, like him, secretary of both war and state.

Stimson's long career spanned the entire history of modern American warfare, from Indian fighting to the atomic bomb. As an undergraduate, he saw Indian warfare in Colorado. As secretary of war in the Taft administration, he visited the army posts of the Old West in the last years of their existence. He saw active service in France during World War I as an artillery officer with the American Expeditionary Forces.

In early 1902, while riding in Washington, Stimson was spotted by President Theodore *Roosevelt, who jokingly ordered him to swim Rock Creek. Stimson took the order literally and nearly drowned as he forded the creek. Within a year, Teddy Roosevelt, who liked that kind of man, tapped Stimson as U.S. Attorney in New York, where he made a great record as a prosecutor.

Appointed secretary of war by President Taft, Stimson helped to modernize the army's structure, ending the isolation of the privileged staff corps. His reforms infuriated conservatives, led by the adjutant general, Maj. Gen. Fred C. Ainsworth, who called Stimson and his supporters, in writing, "incompetent amateurs." After consulting Root, who said when a man pulls your nose you must hit him, Stimson fired Ainsworth for gross insubordination.

Stimson ran unsuccessfully for governor of New York in 1910; then, after the war, practiced law in New York until he was asked by Coolidge to impose a settlement in Nicaragua and in 1927 to serve as governor general of the Philippines. As Herbert C. *Hoover's secretary of state, he was involved in the London Naval Conference of 1930 and in the 1931-32 Manchuria crisis, in which he formulated the "Stimson Doctrine" of nonrecognition of conquered countries.

He was prominent among the internationalist Republicans who argued for American "preparedness" in the late 1930s. In 1940, President Franklin D. *Roosevelt appointed him secretary of war. Stimson worked closely with Gen. George C. *Marshall and assembled an able team of civilian advisers, including Robert C. Lovett and John J. McCloy. He helped to steer through the decision to give first priority to the war in Europe; he also presided over the 'Manhattan Project, which built the atomic bomb.

Although he chaired the meetings at which the decision to use the bomb was taken, after the bombings of *Hiroshima and Nagasaki, Stimson had second thoughts. At his last cabinet meeting in September 1945 he argued that the United States should enter into an agreement with the Soviet Union to control the use of 'nuclear weapons.

running southeastward from Nashville into the heart of the Confederacy. Union Maj. Gen. William S. 'Rosecrans's Army of the Cumberland (44,000 strong) advanced from Nashville 30 miles to meet Bragg's army at Murfreesboro in late December. Rosecrans and Bragg both planned to attack with their left wings, but Bragg moved first at dawn, 31 December, catching the *Fédérés* by surprise. Rosecrans's extreme right wing quickly retreated, offering scattered resistance. The Federal center fought more steadily, particularly Brig. Gen. Philip H. 'Sheridan's division, which slowed the Confederate advance several hours.

The flat terrain, rocky outcroppings, and intermittent cedar forests also confused and delayed the Confederates. In the center, Col. William B. Hazen's brigade held a wooded area called the Round Forest against repeated and fierce attacks. The Forest spanned the Nashville Pike and the Nashville 8c Chattanooga Railroad, Rosecrans's lines of communication. Hazen's stand saved the Federal army, allowing the right wing to retreat by pivoting on his position.

By nightfall, Rosecrans had managed to patch together a final stand along the pike. When the fighting died down, the Confederates hastily constructed breastworks to protect their gains. The bitter cold caused great suffering for the thousands of wounded men of both armies who littered the field that night. The next day, the two exhausted armies maintained their positions without moving.

The stalemate was temporarily broken on 2 January 1863, when Rosecrans moved a division under Col. Samuel Beatty across Stones River at McFadden's Ford to threaten Bragg's extreme right wing. Confederate Maj. Gen. John C. Breckinridge's division counterattacked, driving Beatty's men back across the river, but was halted by the concentrated fire of nearly sixty Federal field guns. This engagement demonstrated the effectiveness of Union 'artillery as a decisive factor on the battlefield. After five days of maneuvering and bitter fighting, neither army had gained an advantage. On 3 January, Bragg was given evidence that Rosecrans was receiving substantial reinforcements, and he decided to give up the field. The Confederates began to retreat that night, but Rosecrans chose not to pursue. He consolidated his position at Murfreesboro, digging extensive 'fortifications, while Bragg fortified towns a few miles further south along the rail line. The two armies had so exhausted themselves that neither resumed active campaigning for nearly six months.

Stones River was both a tactical and a strategic Victory for the North. Occurring after costly Federal defeats at Fredericksburg, Virginia, and Chickasaw Bayou, Mississippi, the morale of the Northern public needed a victory, even one bought at such a dear cost in lives. Confederate and Federal 'casualties amounted to approximately 13,000 men apiece, roughly one-third of those engaged.

STONES RIVER, BATTLE OF (1862-63). Stones River—also known as the Battle of Murfreesboro—was one of the costliest engagements of the Civil War in Tennessee. Following the failure of his Kentucky campaign the previous fall, Confederate Gen. Braxton *Bragg positioned his Army of Tennessee (34,000 strong) to protect the railroad line

The STRATEGIC DEFENSE INITIATIVE (SDI) was a major program for defense against Soviet 'missiles championed by President Ronald 'Reagan beginning in 1983.

The U.S. missile defense program began in March 1946 in response to Germany's World War II missile program that included plans for an intercontinental ballistic missile

(ICBM). By the mid- 1950s, when intelligence indicated the Soviets were developing their own ICBM, both the army and air force were pursuing missile defense programs. In 1958, to end squabbling that had developed between the two services, the secretary of defense assigned responsibility for missile defenses to the army.

After its Nike Zeus missile achieved the first successful intercept of a dummy ICBM warhead in July 1962, the army pushed for the deployment of national missile defenses. Secretary of Defense Robert S. "McNamara successfully resisted such a deployment until September 1967. By then, the Soviets were deploying their own system around Moscow; in response, President Lyndon B. "Johnson ordered the fielding of Sentinel to provide limited protection for U.S. cities.

Following his election in 1968, President Richard M. "Nixon switched the focus of Sentinel to defense of deterrent forces and renamed it Safeguard. In August 1969, about two months after Nixon had invited the Soviets to discuss reductions in strategic arms, Congress approved the Safeguard deployment.

The first phase of the Strategic Arms Limitation Talks (SALT) produced the Anti-Ballistic Missile Treaty in May 1972. It restricted the signatories to two missile defense sites, each having up to one hundred interceptors. A 1974 protocol reduced to one the number of sites each nation could deploy.

About a year after the protocol, the United States completed its Safeguard site at Grand Forks, North Dakota. A few months later, Congress ordered the Department of "Defense (DoD) to close the facility. The Soviet missile defense system near Moscow remains operational.

After the closure of Safeguard, the army concentrated its missile defense efforts on developing hit-to-kill (HTK) missiles to replace the nuclear-tipped interceptors required by Safeguard. In June 1984, this new interceptor concept was successfully demonstrated.

In the meantime, the Soviets were improving their nuclear forces. By the early 1980s, some strategic analyses showed the Soviets could cripple U.S. retaliatory forces and still have enough missiles to devastate American cities. As a result, in a February 1983 meeting with President Reagan, the "Joint Chiefs of Staff (JCS) recommended greater emphasis on strategic defenses.

Already supportive of missile defenses, Reagan was receptive to this message. In a nationally televised speech on 23 March 1983, he announced his decision to initiate an expanded research and development program to assess the feasibility of strategic defenses. In April 1984, following a year of technical and strategic studies, DoD chartered the Strategic Defense Initiative Organization under the leadership of Air Force Lt. Gen. James A. Abrahamson. This organization was to conduct the research to resolve the feasibility issue.

After two and a half years of work, the president and Secretary of Defense Caspar "Weinberger decided at the end of 1986 to enter the Strategic Defense System (SDS) Phase I Architecture into the defense acquisition process. This architecture had two major deficiencies: it was expensive, and its space-based elements were vulnerable to Soviet antisatellite weapons (ASATs). These difficulties were epitomized in the space-based interceptor (SBI), one of the architecture's six subsystems.

SBI was a large, garagelike satellite housing ten hit-to-

kill interceptors. About 300 SBIs were to orbit the Earth. In case of a Soviet attack, the SBIs would launch their interceptors at Soviet missiles, destroying many of them before they could release their multiple warheads and decoys. Because of its complexity, SBI was costly; because of its size, it was an easy target for ASATs.

The solution to these problems was to use miniaturized sensors and computers to give individual interceptors the ability to operate without support from a garage. Instead of several hundred large targets, Soviet ASATs would now confront several thousand small, hard-to-find interceptors. Because these Brilliant Pebble interceptors (BP) were to be mass-produced, they would be relatively inexpensive, thereby lowering the cost of SDS Phase I.

The decision to integrate BP into the architecture came in 1989, as the Soviet empire began to crumble. This dramatically changed the strategic situation, prompting President George "Bush to initiate a review of U.S. strategic requirements. The SDI portion of this review was completed in March 1990 by Ambassador Henry Cooper, who had served as America's chief negotiator during the defense and space talks. Cooper's report argued that the most dangerous threat to the United States was now unauthorized or terrorist attacks by limited numbers of missiles. Moreover, deployed U.S. forces would increasingly face threats from shorter-range theater missiles as the technology of ballistic missiles and weapons of mass destruction proliferated. Cooper recommended refocusing SDI to concentrate on defenses against these new threats.

Shortly after Cooper took over the SDI organization, his report proved prophetic. In August 1990, Iraq invaded Kuwait, touching off a crisis that led to the "Persian Gulf War of 1991. This war produced the first operational engagement between a ballistic missile (an Iraqi Scud) and a missile defense system (the American Patriot). Furthermore, the danger of theater missiles was graphically illustrated on 25 February when a single Scud killed twenty-eight Americans and injured one hundred.

Responding to the new world situation, on 29 January 1991, President Bush had announced a reorientation of the SDI program away from developing strategic defenses to a new system known as GPALS for Global Protection Against Limited Strikes. GPALS consisted of three main components: a ground-based national missile defense (NMD), a ground-based theater missile defense (TMD), and a space-based global defense. In this scheme, the space-based element complemented TMD and NMD.

The emphasis on TMD reflected in GPALS was reinforced under President Bill "Clinton, whose secretary of defense, Les "Aspin, Jr., changed the name of the Strategic Defense Initiative Organization to the Ballistic Missile Defense Organization. In announcing this change on 13 May 1993, Aspin hailed the end of the "Cold War and credited SDI with helping to end it.

In September 1993, a new shape for America's missile defense program emerged from the Bottom-Up Review (BUR), the Clinton administration's study of America's post-Cold War defense needs. The BUR laid out a three-part, \$18 billion missile defense program covering the six years of the future years defense plan. The top priority was to be a \$12 billion TMD component focused on three programs: improvements to the Patriot missile system; upgrading the navy's "Aegis air defense system so it could intercept theater ballistic missiles; and a new army system

known as Theater High Altitude Area Defense to complement Patriot. The second element of the plan was a \$3 billion "technology readiness" program to shorten NMD's deployment time. Finally, a \$3 billion technology program was to support both national and theater defenses.

Over the next few years, the Clinton administration would find it necessary to expand the TMD program and increase its funding. Additional funding was also required for NMD, which had to be transformed into a deployment readiness program to permit rapid fielding of defenses as the missile threats to the U.S. homeland suddenly emerge. Nevertheless, the BUR had provided the broad framework that guided the U.S. missile defense program into the new millennium.

STRATEGY: FUNDAMENTALS

To ancient Greeks, *strategos*, from which we derive strategy, meant simply the general's art; a modern definition, however, would generalize the meaning to a reasoned relationship among military means and the ways they might be used to reach the ends of national policy. For the senior commander of a theater of war, the battle tactics of lower echelons blend into operational strategy in which he uses their combat in the conduct of campaigns designed to achieve war's politically defined purposes. The national military headquarters also uses the means-ways-ends calculation while devising a national military strategy, establishing campaign objectives, and building armed forces as one of several instruments contributing to *grand strategy*, often called national security policy.

Dimensions. In *On War*, Carl von Clausewitz helped push the domain of strategy beyond the battlefield when he acknowledged that the tactical and operational successes sought by military commanders are but means to political ends. At the highest level, therefore, military strategy and national policy overlap, with the latter shaping and directing military operations and force development. As Clausewitz warned, however, political leaders should not ask their generals to pursue goals unattainable through organized violence, beyond their forces' capacity to attain, and either imposing disproportionate costs or requiring methods so destructive as to preclude a satisfactory *peace—summarized as the tests of suitability, feasibility, and acceptability. From the French Revolution, Clausewitz concluded that the strategic calculations of the government and armed forces depend not simply on the * State

and the army, but also on a sound estimate of popular attitudes—the existence of a national will to carry war to a successful conclusion.

The twentieth century's expanded governmental bureaucracies and financial systems—and revolutions in production and *transportation—have added new dimensions to strategy. A government able to mobilize overwhelming human and material resources and convey them to the theater of war can, for example, enable its generals to defeat even opponents more skilled in the operational aspects of strategy. As World War I demonstrated, the capacity to mobilize massive military resources includes the danger that modern industrial powers with sound logistical strategies might fall into a mutually destructive war of attrition that continues until even the victors have paid too great a price for * victory.

Though technological superiority may enable a beligerent to escape attrition's blind alley, the *Cold War demonstrated that two technologically superior powers possessing the means and the will to destroy one another may create a long-term strategic impasse that precludes fighting—except through proxies—until one of the powers suffers internal collapse. Because the development and production of increasingly sophisticated modern weapons (and training armed forces in their use) takes years, major powers must also devise peacetime force development strategies that economically build forces for wars they can only anticipate.

Strategy also has a psychological dimension, which may enable a power skilled in propaganda or with a reputation for great resolve and military skill to undermine its opponent's will to resist and gain its political ends with a minimum of combat. As Sun Tzu observed more than two millennia ago, the "acme of skill" is overcoming your enemy's resistance "without fighting," or, failing that, accepting battle only when strategic success makes victory certain. Although that psychological dimension of warfare may lead to great strategic efficiency, a strategist who overrates his nation's military reputation or underrates his opponent's resolve may so miscalculate the means-ways-ends relation as to increase the risk of defeat if threats and reputation do not suffice.

Strategic Concepts. Because strategic concepts represent ways that military and other means might be employed in pursuit of political ends, their principal forms deserve brief description.

In the broadest terms, strategies may be either *direct* or *indirect* and *sequential* or *cumulative*. Military force supplies the paramount element of a direct strategy whose focus is violent, perhaps sequential assaults on the enemy's main strength with the aim of overcoming his forces in decisive battle and thus rendering him vulnerable to coercion. In the extreme, the destruction becomes so complete as to lead to his political overthrow and might be characterized as a strategy of *annihilation*. Should a decisive victory prove impossible, the direct approach may end in exhausting the enemy's forces or will through attrition.

Indirect strategies, championed by Basil Liddell Hart, often involve less violence and typically include a series of military, economic, diplomatic, or psychological actions completed in no fixed order but aimed at enemy weaknesses, often locations on his periphery. If successful, the cumulative effect of the attacks will so unbalance the enemy as to cause him to yield or, at least, render him

vulnerable to direct assault. Though more passive in nature, the *containment* strategy of the Cold War era represents another form of indirect approach, one leading to an opponent's internal collapse as prelude to victory.

Maritime and airpower strategies also have an indirect character in that they aimed to undermine the enemy's will to resist or deny his armed forces the means to make war. Seapower strategy, whose best known advocate is Alfred T. *Mahan, seeks those ends by gaining control of the seas—perhaps in a decisive fleet engagement—and imposing an economy-strangling blockade. To the same end, weaker naval powers raid an enemy's commerce. To avoid costly ground campaigns, airpower strategists, beginning with Giulio *Douhet and Billy *Mitchell, advocated bombardment of an enemy's military and industrial base, or, by attacking cities, terrorizing citizens into surrender.

Although **deterrence*, seeking to prevent war by making even victory unacceptably costly, has long been a factor in strategy, nuclear-tipped intercontinental * missiles made it the distinguishing strategic concept of the Cold War. The nuclear powers typically sought deterrence by threatening an enemy's cities (*countervalue strategy*), but a desire to limit war's costs should deterrence fail led to consideration of *counterforce strategies* (attacks on military facilities).

Revolutionary strategy, developed in its modern form by Mao Zedong, aims to overthrow an existing government through a long struggle during which the revolutionaries develop a covert political base amongst the population and strengthen it with propaganda, terrorism, and guerrilla attacks (hence the use of * guerrilla warfare for this strategy) designed to discredit and demoralize the government before launching assaults by the rebels' conventional troops on its weakened armed forces. In response, the leading Western powers developed equally multifaceted **counterinsurgency* strategies.

With the collapse of the former Soviet Union, the United States entered a new strategic environment in which it needed to assess the contribution of armed forces to maintaining regional balances and Third World *peace-keeping at a time of public reluctance to pay for forces sufficient to either purpose.

STRATEGY: HISTORICAL DEVELOPMENT

Shielded by broad oceans and neighbors presumptively friendly but certainly weak, the United States has scarcely needed the ingenuities of strategy since it survived a most bloody civil war to acquire the world's richest economy. It is those who fight against the odds, outweighed defenders or overambitious attackers, who must try to circumvent enemy strengths and exploit enemy weaknesses by obeying the paradoxical (seemingly contradictory) logic of strategy, as opposed to commonsense "linear" logic.

At each level, the paradoxical logic of strategy usually precludes the most efficient action, for the latter is inherently predictable and can therefore be anticipated, blocked, or circumvented. At each level, the paradoxical

logic entails risks, possibly catastrophic (e.g., long, thin, deep penetration offensives can be cut off and encircled). But at each level, the high-risk/high-payoff methods inspired by the paradoxical logic can allow the weak to prevail over the strong, though never reliably.

At the *tactical* level, paradoxical action, i.e., the deliberately "bad" move, can be the good move if it yields surprise, thus reducing the enemy to a nonreacting object—if only temporarily, if only partially. Surprise is thus the supreme advantage, for it suspends the entire predicament of warfare, characterized precisely by the presence of a reacting enemy.

At the *operational* level, the logic favors the disruption of the enemy's physical or mental preparations by maneuver over the systematic destruction of his forces by head-on combat, for in the latter ("attrition"), sheer strength must prevail.

At the level of *theater strategy*, narrow-deep penetrations and outflanking thrusts on the offensive, or elastic maneuvers on the defensive, are likewise favored over broad-front advances or firm defenses, both of which require a superiority of means to yield victory. In nonterritorial *force strategies*, there are the aerial, maritime, or space equivalents, where again ingenuity can prevail over sheer strength.

Finally, at the level of *grand strategy*, the logic favors artful combinations of intelligence, diplomacy (the leveraging of force by threatening or reassuring), material inducements, deception and subversion (undermining the enemy by terror, propaganda, and substitution), as well as concrete military strength, as opposed to strength alone or accompanied by material inducements, whereby the results obtained depend on the military and economic resources expended.

The United States and its armed forces have by contrast generally been able to prevail in modern times by straightforwardly efficient and correspondingly reliable methods, which obey only the "linear" logic of common sense. At every level—tactical, operational, theater strategic, or grand strategic—the sheer strength of U.S. military forces and an abundance of economic means have usually sufficed to yield success at low risk, though not at low cost.

There have been exceptions, of course, as in the case of Gen. Douglas *MacArthur's very bold theater-level outflanking maneuver of September 1950: North Korea's victorious invasion forces were cut off and destroyed by the U.S. forces inserted into their deep rear by the high-risk/high-payoff *Inchon landing.

In the 1991 * Persian Gulf War, by contrast, an overwhelming technical superiority was applied to an enemy virtually incapable of reacting, except by flight. With the paradoxical logic of strategy mostly irrelevant, there was no need to deviate from reliable, efficient, predictable managerial methods. After thirty-nine days of systematic air bombardment that hollowed out Iraq's entire military structure, there followed a simple, broad-front 100-hour ground offensive, neither bold nor quick, yet quite sufficient to induce Iraq's withdrawal from Kuwait (no deep outflanking maneuver to cut off Iraq's army was attempted). As for the one ingenuity later claimed—the non-landing of U.S. Marine amphibious forces that supposedly pinned down Iraqi troops on the Kuwaiti shore—it was not a planned deception but rather the result of prudence: the Iraqis had scattered sea *mines, and losses of

ships and "landing craft were feared. (In any case, Iraq's forces in Kuwait were already immobilized by the impact of the air campaign.)

Earlier, during the "Vietnam War, on the other hand, a vast superiority of means was outmaneuvered by an enemy that stubbornly refused to concentrate into efficiently targetable mass formations—and no strategical remedy was found when sheer firepower was thus frustrated.

The origin of Western strategical thought is unambiguously found in the words attributed to Heraclitus of Ephesus (c. 500 B.C.): "Men do not understand ... [the coincidence of opposites]: there is a 'back-stretched connection' like that of the bow...." and "the equilibrium of all things existent is due to the clash of opposing forces." Deemed obscure by the ancients, Heraclitus has been made transparent by our experience of nuclear "deterrence, whereby the peaceful had to be constantly ready to attack, and "nuclear weapons could only be useful if unused. That fully uncovered for all the paradoxical logic of strategy, the "back-stretched" connection that unites opposites. Long before Heraclitus, many a cunning fighter had won by surprising his enemy—something only possible when better ways of attacking, hence expected ways, are deliberately eschewed. In war's coincidence of opposites, the bad move is good because it is bad, and vice versa.

Carl von Clausewitz, *the* modern strategist, extended the logic beyond the coincidence of opposites, revealing the dynamics of reversal: "victory turns into "defeat after its culminating point by exhausting the will to fight and/or overstretching the until-then victorious forces and/or frightening neutrals into enmity and allies into neutrality. "War itself is transformed into "peace beyond its culminating point, by consuming the means and the will to fight, and/or because the costs of warmaking (human, material) devalue the perceived losses of war termination (thus, the abandonment of South Vietnam was accepted when too many American lives were lost). Again, because the destructive capacity of nuclear weapons exceeded the culminating point of advantageous destruction, they were too effective (militarily) to be effective (politically). Their season of maximum importance was therefore short (1945-69), and their significance in world politics has not ceased to decline since then—only hollow great power pretenders such as India and Pakistan and second-rate countries of the Iran/Iraq type still strive to acquire them.

Enemies react, therefore straightforward "engineering" methods routinely fail in war. But they are persistently seductive, because war is so much simpler when the enemy is ignored. In World War II, both the British Bomber Command and the U.S. "strategic" air forces (then under the U.S. Army) kept asking for the means (additional thousands of bombers) in order to destroy physically the industrial sources of German and Japanese military power and thus win the war by airpower alone. But, as Prime Minister Winston Churchill kept pointing out, if the bombing *did* begin to succeed, Germans and Japanese would not passively await defeat, but would instead strengthen their air defenses and disperse their industries, for in war, "all things are always on the move simultaneously."

Eventually, bombing proved very effective (in part by forcing the diversion of German and Japanese resources to air defense) but quite insufficient on its own. This did not stop Robert S. McNamara from repeating exactly the same error in the 1960s with his Mutual Assured Destruc-

tion policy, which was meant to stabilize "deterrence and stop the nuclear "arms race. McNamara began with the very sound claim that a reliable ability to destroy half the Soviet Union's population and three-quarters of its industrial capacity was ample to deter, but he ignored the possibility that Soviet leaders might not want what he wanted, the paralysis of mutual deterrence. In fact, they kept aiming for a nuclear superiority that was entirely meaningless according to McNamara—but not according to them. In the end, it was the open-ended technological challenge of President Ronald "Reagan's "Strategic Defense Initiative (SDI) that forced the Soviet leadership to give up military accumulation to try domestic reforms instead—with fatal results for their system.

Conflict unfolds at the several distinct levels, which interpenetrate much more easily downward than upward. In World War II, all German tactical-, operational-, or even theater-level victories (notably over France in 1940) were nullified by Adolf "Hitler's choice of the wrong allies (Italy, Romania, Hungary, Slovakia) and the wrong enemies (the Anglo-American-Soviet coalition) at the level of grand strategy. Even if the "D-Day landing had been repulsed and the Soviet army had ceased to fight, Germany would still have been ultimately defeated—by the fission bomb. As for Japan, given its utter inability to march on Washington to impose a favorable peace, the brilliant success of the surprise "attack on Pearl Harbor was worse than useless: had the pilots of the Japanese navy failed miserably, evoking ridicule instead of hatred, American public opinion might not have been so aroused and the United States might have dealt less harshly with Japan.

Different grand strategies can be evaluated by the degree of their reliance on force. It was the high strategic achievement of the United States that it successfully protected numerous allies throughout the Cold War by relying primarily on the "armed suasion" of nuclear deterrence, while having to fight seriously only in Korea and Indochina. That was only possible because an American diplomatic elite that had been very small, and military elites that had been very provincial, were able to develop rapidly an entire culture of multilateral diplomacy and alliance management, notably to create "NATO and preserve its unity in the face of constant difficulties and frequent crises. The precondition of that historic success was, however, the extraordinary evolution of American public opinion, from the isolationist presumption that lasted until 7 December 1941 to a remarkably sophisticated understanding of the value of allies—even inconstant, demanding, and deliberately irritating allies.

It was only when the diplomatic and military elites persisted in pursuing diplomatic and military priorities *after* the Cold War had ended (c. 1990) that American public opinion started to withdraw its consent from their aims and methods. Symptomatic of this divergence, while much of elite opinion still saw Japan as a valuable ally, popular opinion recognized it as a direct economic competitor. But the more obvious change was the collapse of public support for military intervention. Having correctly understood that, in Cold War conditions, any locality could be important once it became the scene of Soviet-American contention, no matter how worthless economically or lacking in any sort of American presence or connections, public opinion reacted to the end of the Cold War by generally refusing to sanction large "discretionary" military

interventions in the absence of immediate and compelling justifications for the same.

STRATEGY: LAND WARFARE STRATEGY

For almost four centuries, American land warfare has tested nearly the full range of strategies: direct strategies pursuing decisive battles of *annihilation* to overthrow the enemy army; somewhat less direct efforts to overcome an enemy's forces through *attrition* and *exhaustion*; strategies of *maneuver* seeking, with a minimum of bloodshed, to control important territories; more explicitly *indirect approaches* and multifaceted strategies such as *containment*; as well as **guerrilla warfare* and **counterinsurgency*. In addition to strategies focused on combat, American strategists have given careful thought in peacetime to defense of the coasts, sizing the army, and fixing its relation to the militia. Until the *Cold War, moreover, the United States followed a **mobilization* strategy, relying on distance and sometimes allies for security while it prepared for war.

Strategies of Annihilation. Beginning with the seventeenth-century Indian Wars, American strategists have usually preferred to act directly against an enemy's armed forces, somehow bringing them to battle and seeking in a single decisive action or campaign to destroy them so thoroughly as to force terms on a disarmed opponent.

Despite the possibility of an armed European descent on their ports, the first colonists principally feared the normally hospitable Indians. Aware of the defensive inadequacies of militia and blockhouses in an age when both messages and men moved slowly, colonials favored short offensives that quickly returned them to farms and families. Indians, however, refused to fight in the European manner, and militiamen generally lacked the skill and patience for tribal warfare. The colonists therefore overcame their foes by attacking, usually in winter, their food supplies and villages in order to force a decisive battle that would annihilate the hostile tribe as an independent polity, as in the Tidewater Wars, the Pequot War, and *King Philip's War—a strategy also used in the *Plains Indians Wars.

Facing European opponents, colonists applied strategies of annihilation in a regional context. During the imperial conflicts culminating in the *French and Indian War, Americans displayed little strategic variation as they held to a single goal: permanent security by driving France off the continent. With the aid of the British army and navy, they finally achieved this in 1763.

Early in the *Revolutionary War, George *Washington made similar efforts to drive Great Britain from the continent. He threatened its forces with destruction if they did not evacuate Boston, and later dispatched forces under Richard Montgomery and Benedict *Arnold in an unsuccessful attempt to seize Québec. Washington even attempted to turn back the British invasion of New York, un-

til a series of lost battles around Manhattan convinced him to abandon so direct a strategy in favor of exhausting the British and exploiting the revolutionary role of the militia.

In the *War of 1812, similarly unable, except through commerce raiding, to strike at the sources of British power, the United States chose to invade Canada, which if successful might add new territory and eradicate British power in North America. Due to antiwar sentiment in New England, the army unwisely failed to concentrate in northern New York for an overwhelming descent on Montréal and Québec. Until forced on the defensive by Napoleon's 1814 defeat, the army instead launched a series of indecisive offensives in the West.

During the *Civil War, Robert E. *Lee, commander of the Army of Northern Virginia, and Union commanders George B. *McClellan and George Gordon *Meade pursued decisive battlefield victories in the Napoleonic manner—victories so complete as to break an opponent's will to continue. With the introduction of rifled weapons to armies that still moved on foot and by horse, battles became more bloody even as decisive *victory became less likely.

Considering the Confederacy's vast land and maritime frontier, lack of a navy, small population, and industrial inferiority, Lee wisely rejected the strategy of perimeter defense initially employed in the western theater. But the Confederacy proved unable to replace the losses resulting from an aggressive strategy in which his army sought to break the Union's will through the defeat of its armies or victories on its soil, which eluded Lee at Antietam and Gettysburg.

In the end, Lee could not withstand Ulysses S. *Grant's use (in 1864-65) of unremitting pressure, campaigns of constant battles rather than a few decisive engagements. Driven back on Petersburg, Virginia, Lee accepted a siege he knew to be fatal before being overwhelmed by Union forces as he attempted escape. In the western theater, Grant sent William Tecumseh *Sherman in similar grim pursuit of the Army of the Tennessee, which Sherman destroyed. Those Union victories, historian Russell Weigley has asserted, established annihilation as the army's preferred strategy.

In World War II, though initially forced by the British and lack of resources to follow a peripheral strategy, American forces in Europe finally launched their preferred cross-Channel attack in June 1944, and in conjunction with British forces and (on the eastern front) the Red Army, commenced a concentrated mass assault on German forces, aimed at their annihilation and imposition of unconditional surrender.

In the *Korean War, annihilation of the enemy's forces, following an envelopment, also influenced Douglas *MacArthur's *Inchon landing—though attrition became the strategy following Chinese intervention and increasing American fear of a Soviet attack in Europe.

During the *Persian Gulf War, the army planned a campaign of annihilation calling on airpower to isolate the battlefield and weaken Iraqi forces in Kuwait, which only an early armistice saved from being enveloped and destroyed by ground and air attack. That campaign also benefited from recent American preparations for the defense of Western Europe without relying on the early use of "nuclear weapons. Aiming to win, though fighting outnumbered, the U.S. Army intended to annihilate the Red Army not through the unremitting direct pressure of superior

force (in the manner of Grant) but by increasing the pace of combat beyond what the Soviets could match, using violent maneuver that would send American forces into rear areas, disrupting Soviet * command and control, service support, and reserves.

Strategies of Attrition and Exhaustion. When unwilling or unable to win through annihilation, U.S. strategists have sometimes resorted to gradual and often indirect efforts to wear down their opponents military forces or exhaust his will to resist.

The superiority of British regulars led Washington to alter his initial strategy in 1777, keeping his * Continental army largely concentrated and employing it principally to shadow and harass the British. His forces sought battle only when they could safely retreat from failure or overwhelm detachments from their opponents main body—as at Trenton and Princeton, Saratoga, Monmouth, and, during 1781, in the Carolinas and at Yorktown. That strategy wore down British forces, and when combined with French forces, also Britain's will to continue the war. With American militia units retaining control of most of the countryside and the population—as in a revolutionary strategy—Britain had little to show for its expensive military efforts.

Confederate president Jefferson *Davis favored a similar defensive strategy in the *Civil War, concentrating Confederate forces in a few large armies that would avoid decisive battles, maintain Southern independence, and exhaust Union will. That meant, however, leaving more areas of the Confederacy vulnerable to occupation than Davis could tolerate politically—opening the door for Lee's offensives in the East. Only Joseph E. * Johnston—too late in the war and with too little room for maneuver—skillfully employed that strategy against Sherman's advance on Atlanta.

Early on, Abraham * Lincoln, preferring the more rapid results seemingly promised by direct methods, rejected Winfield *Scott's "Anaconda" Plan for undermining Confederate will through naval *blockades and army-navy riverine assaults to isolate major sections of its territory. In the last twelve months of the war, however, Grant encouraged *Sherman to exhaust Confederate will by marching his army across Georgia and through the Carolinas, destroying the supplies and lines of communication upon which Lee depended and making Confederates feel war's "hard hand." Drained by combat losses, suffering naval blockade, and terrorized by Sherman's capacity to ravage rear areas, Confederate will collapsed, and both Lee and Johnston refused Davis's order to commence guerrilla operations.

Strategies of Maneuver and Indirect Approaches. If American ground forces have most often employed strategies of annihilation and various types of attrition, they have also used traditional maneuver strategies aimed either at forcing an enemy's withdrawal with a minimum of fighting or gaining control of points whose possession might lead to *peace. Acting even less directly, they have fought limited battles at weak points along an enemy's periphery and employed economic, political, and psychological methods designed to undermine his strength or will to resist.

In the * Mexican War, for example, President James K. *Polk directed his generals to seize Mexican territory—the northern tier of provinces bordering Texas, and ultimately the capital itself—in order to pressure Mexico to cede New Mexico and Upper California to the United States. Win-

field Scott's seizure of Veracruz and movement on Mexico City, with a minimum of costly combat, represent classic American use of maneuver warfare.

In 1846, Henry W. Halleck and his mentor, Dennis Hart Mahan, published the first American works on strategy. Both rejected Napoleonic offensives in favor of fortification, tactical defense, and maneuver-oriented strategies characteristic of the eighteenth century and Scott's campaign. Although most (strategically unschooled) Civil War commanders knew only that the great Napoleon had won military fame in decisive but bloody battles, the Union produced one advocate of maneuver who was sympathetic to the need for both speedy * victory and minimal "casualties": George B. McClellan, unsuccessful commander of the Army of the Potomac.

The *Spanish-American War better illustrates that American land war strategy has taken limited forms. The army initially planned to assist Cuban independence only by providing military assistance to the insurrection, perhaps through some remote port seized by a few regulars. Meanwhile, it would defend coastal cities and carefully raise, arm, and train volunteer units, if necessary, to occupy the island. With the president impatient for victory and the navy leading the way, the army captured Guam en route to occupation of Manila, seized Puerto Rico, and stormed El Caney and the San Juan Heights in order to take Santiago and drive the Spanish fleet into the navy's guns. This tactic forced Spain to recognize the futility of further resistance and eliminated any need directly to overcome its main army in Cuba.

In World War I, initially convinced that neither maneuver nor a single battle could decisively overcome a major power, John J. *Pershing expected his American Expeditionary Forces in 1918 to employ frontal assaults, modified by open field tactics, only to penetrate German positions before descending on its objective, the rail center at Metz. That strategic maneuver, Pershing hoped, would force a general German withdrawal from France. Fighting on a front without flanks and as part of a multinational force, however, Pershing had to accept his Allies' reliance on bloody frontal assaults to push German forces back all along the line, a strategy more in keeping with the Grantian tradition.

During the first years of World War II, the United States, possessing few mobilized, trained military forces, had no alternative but to adopt Winston S. *Churchill's peripheral strategy, a classically indirect approach. The British opposed a prompt cross-Channel invasion and favored weakening Germany with indirect attacks: strategic bombardment, supplying the Soviets, assistance to resistance movements, and seizure of territory on the periphery of the German conquests. But President Franklin D. *Roosevelt was eager to involve American forces in the fighting. His planners reluctantly agreed, first, to the invasion of French North Africa, then Sicily, and finally Italy, before insisting, with Soviet support, that Churchill abandon his Balkan schemes and agree to invade northern France in mid-1944.

The Pacific War was an American war of strategic maneuver, even if for unlimited ends and involving many bloody tactical assaults. In the face of Japan's rapid advance in the winter of 1941-42, the United States and Great Britain sought to secure their lines of communication to Australia and India. Although unconditional surrender

seemingly required the annihilation of Japan's armed forces, the United States thereafter bypassed and isolated many Japanese strongholds en route to gaining control of a vast oceanic territory. Using land, sea, and air forces, the U.S. Army pushed north from Australia, while the navy led the drive through the central Pacific, a two-front advance culminating in the conquest of the Philippines, Okinawa, and Iwo Jima. With its navy sunk, its economy prostrate, and half its army isolated overseas, after the bombings of "Hiroshima and Nagasaki, Japan surrendered before American plans for combined assaults on its home islands could be implemented.

Cold War Strategies. The Cold War and nuclear weapons changed the strategic position of the United States and the emphasis of its land warfare tradition. The country lost the protection offered by European rivalries, and technology undermined the security of vast oceans. Facing an enemy threatening America's very survival, U.S. planners dared not rely on weakened allies to buy time for "mobilization.

Although containment emerged in 1947 as America's grand strategy, the next four decades demonstrated great variation in its means (economic, political, and military) and intermediate ends (protecting vital areas or securing all the nations along the Sino-Soviet perimeter). To overcome the Red Army's numerical superiority in Europe, the United States relied on nuclear "deterrence while also employing military assistance, German rearmament, tactical nuclear weapons, and new maneuver strategies later tested, as noted above, in the Persian Gulf.

During periods when containment emphasized perimeter defense, the army engaged in limited conflict in Korea and in revolutionary war in Vietnam. Although not unaware of the nature of the "Vietnam War and the elements of successful counterinsurgencies, the army—aided by the marines and the other services' air forces—too often fought in traditional ways. Commanders hoped to bring the enemy's main forces to decisive combat, used firepower lavishly to limit U.S. casualties, and relied on airpower to isolate the battlefield, destroy the enemy's economy, and break his will. Fearful of prompting Chinese intervention, the United States applied its power incrementally—discounting the psychological impact of sustained powerful blows and rejecting direct assault on North Vietnam—and made a negotiated settlement its war aim. All of this meant that its opponent could set the pace and intensity of the war at levels it found endurable. "Vietnamization"—turning the war over to the South Vietnamese—showed initial promise, but without lavish American aid, the strategy could not resist North Vietnam's 1975 cross-border invasion.

STRATEGY: NAVAL WARFARE STRATEGY

On the surface, Alfred T. Mahan embodies American thinking about the uses of a navy and the exploitation of the nation's maritime geography. Captain (later Admiral) Mahan, ship commander, historian, and teacher, explored earlier wars for their lessons about sea power. He wrote and lectured for his fellow naval officers, found an international hearing among navalists, and gathered a large public audience. His ideas guided the generations who built the navies before and after "World War I, and his emphasis on the battle fleet still dominates the American naval culture. Mahan, like Carl von Clausewitz, typifies the strategist we expect to instruct us: a military professional whose rigorous thinking illuminates basic truths about war.

In Mahan's formulation, "strategy decides where to act." Yes, but the American strategic tale transcends the historian's record of admirals and sea fights. With the exception of the pre- and post-World War I decades and part of the Pacific War in World War II, the history of American naval strategy is not Mahanian and only intermittently about full-scale war. The makers of strategy have often been civilian officials; their regular problem has been how to use the navy day to day in peacetime and in small, distant skirmishes. When planning for war they have worked closely with the army. Invariably, domestic priorities and partisan politics entangle military and naval logic. Why? Because navies are expensive. They take time to build and train. And once built, they last a long time. The fleet cruising on a distant station has been wrestled into place by a struggle among many participants, each favoring a different strategic calculus, few of them ship captains, fewer likely to have foreseen the contingency at hand.

An inattentive strategic culture was visible in our earliest days: "A disposition seems rather to prevail among our citizens to give up all ideas of navigation and naval power and lay themselves consequently on the mercy of foreigners, even for the price of their produce," wrote John Adams from London to Thomas Jefferson in Paris. Exchanging letters between their ambassadorial posts in 1786, a year before the Constitutional Convention in Philadelphia, the two future presidents were discussing ways to resolve the threat to American commerce from the pirates of Algiers. Jefferson—later to lead a political party fiercely opposed to a standing navy—proposed an armed naval force. Adams—later as president to shepherd the bill establishing a small peacetime navy—judged that an attack on the Barbary ports was not likely to eradicate the threat. He held that, however unsavory, discussions and tribute payments were the better *modus vivendi*. "I agree in opinion of the wisdom and necessity of a navy for other uses," wrote Adams, "... [but] I perceive that neither force nor money will be applied."

His skepticism was sound. It was to be fourteen years before Adams, as president, sailed the USS *George Washington* with a "peace offering" to the Dey of Algiers. A year later, with Adams defeated for reelection and the situation worsening, newly installed President Jefferson shifted policies. In a show of force, he dispatched America's first "squadron of observation"—half the decaying naval establishment he had been left by Adams—with instructions to "superintend the safety of our commerce there, and to exercise our seamen in their nautical duties." Jefferson advised the Dey that it was "the first object of our solicitude

to cherish peace and friendship with all nations with whom it can be held of terms of equality and reciprocity”

Thus are evident from our earliest days some durable traits: in the political arena, subtle, foresighted thinking by individual leaders, a shallow reservoir of public support, and party politics that confuse positions and delay action. Also foreshadowed are a perennial preference for influence by peaceful indirection, for sailing fairly large, well-armed task forces in troubled waters with politically ambiguous instructions to cruise for “observation” and “training,” and a preference for operations mounted far from U.S. coasts. Other inclinations rise from the inevitable gap between the politics which create the fleet and the circumstances demanding its use. The construction of flexible, multi-purpose forces is preferred over investment in smaller, single-use systems; the ability to invent winning tactical combinations with the forces at hand is valued above the rote execution of preplanned doctrine.

As Adams cautioned, we should not find too much rigor in these instincts for the use of a navy and the exploitation of the nation’s maritime geography. Inattention more than ingenuity, politics more than policy have husbanded America’s naval resources. Frustrating as this intermittent attention may be to navalists, it accords with the national psyche. Save for the anomalous half-century of the *Cold War, American security strategy has been marked by a preference for other, more domestic concerns and by a parallel bias against the apparatus of standing forces, be they military and naval or latterly aerial and space-based. That bias has extended to thinking about the use of force. In over two centuries, the United States has seen only a few theoreticians gain a public audience, and they often appeared as propagandists aiming to create popular support for the funding of one kind of military force over another, e.g., Gen. Billy *Mitchell’s campaign to supplant battleships with bombers. In the assessment of one naval historian, the writings of Mahan himself were “weapons in rough-and-tumble debates between proponents and opponents of naval expansionism, colonialism, and aggressive mercantile capitalism.”

Secretaries and assistant secretaries of the navy, occasionally even presidents, have thought about making naval strategy their job. Benjamin Stoddert, Gideon *Welles, *Theodore *Roosevelt, Franklin D. *Roosevelt, and Josephus Daniels were among those secretaries or assistants to exercise their office vigorously toward a strategic design. Recently, Secretary John Lehman reprised that role but the Cold War rise of a national security establishment with a strong Secretary of Defense, a *primus inter pares* Chairman of the *Joint Chiefs of Staff, and the *National Security Council staff in the White House have seen the political locus of strategy making shift upward from the Navy Department and the process become more leaderless than ever.

Among naval officers Mahan’s emphasis on the primacy of the battle fleet helps fuel an enduring belief that the navy is best used independently, that it must be kept separate from the army. Without minimizing inter-service rivalry for funding, the record shows much more Army-Navy—and latterly Air Force-Navy—cooperation than myth would have it. Joint planning has been common and army generals have sometimes had much useful to say about Navy’s employment. Listen to Gen. George “Washington during the * Revolutionary War: “In any operation, and under all circumstances,” he declared, “a decisive naval

superiority is to be considered as a fundamental principle and the basis on which every hope of success must ultimately depend.” This was not mere theory. Though the rebel’s navy never rose much above haphazard operations by individual ships, the course of the Revolutionary War hinged repeatedly on the duel between Washington’s army and mobile, sea-borne British forces. Washington climaxed the struggle at the Battle of *Yorktown with the timely aid of a French fleet that blocked the threatening British ships. Stranded, Gen. Charles *Cornwallis offered the decisive surrender. Army officers ever since have closely attended their naval flanks, giving rise to a lasting struggle between two different visions of U.S. naval power. A requirement for the nation to go to war has usually found the army devising ways for the navy to transport and support land forces while naval officers instinctively incline to blue water schemes to defeat the enemy’s navy and interdict his shipping.

Pick up the narrative at the *Civil War. President Abraham *Lincoln’s successful “Anaconda Plan,” by which the navy would help encircle and split the Confederacy, was advanced very early in the war by army Commanding Gen. Winfield *Scott. The concept drew on Scott’s success during the *Mexican War when he and accompanying naval commanders innovated a huge amphibious landing at Vera Cruz. At the end of the nineteenth century, Mahan famously pushed the balance the other way with his arguments drawn from history that the central purpose of a navy was to defeat the enemy’s navy. Illustrated by Horatio Nelson’s victory over the French fleet at Trafalgar, a successful sea fight led to “sea control,” which delivered a decisive political outcome. Mahan-inspired battle fleets proliferated, but for the United States the Atlantic battles of World War I and World War II were shaped by the priorities of getting troops and supplies to Europe in the face of German *submarine attack. As foreseen in years of prior war gaming at the Naval War College, fleet vs. fleet fighting dominated the naval campaigns of World War II in the Pacific. But even in the Pacific, naval operations were also tied closely to the progress of Gen. Douglas *MacArthur’s island-hopping land forces. The *Korean War saw the navy back in close support of the land war; the *Vietnam War drew naval forces into riverine and coastal operations not seen since the Anaconda campaign a hundred years earlier.

At the height of the Cold War in the early and mid-1980s these tendencies to favor “ship vs. land” over “ship vs. ship” strategy reached their apotheosis in the “Maritime Strategy.” Devised by naval officers, the Maritime Strategy laid out in considerable detail the expected battles at sea when, at the beginning of a hypothetical World War III, the navy and its allies would attack the Soviet forces defending the seaward approaches to the USSR homeland. The Strategy made it clear, however, that the purpose of the ocean fighting was to clear the way rapidly for direct naval attacks on the Soviet Union. By doing so, the Strategy argued, naval forces operating far forward on several fronts would both diffuse the Soviet focus on Western Europe and forestall Soviet attempts to repeat World War-style battles for control of the Atlantic logistics lanes. The Strategy delivered two key benefits: extrapolating back from the successful battles it proposed in a future world war, it found its central purpose as a deterrent against the outbreak of that war. And with that portrait of present and future success, the Strategy provided a politically credible template for the

budget. Controversial as it was—the army, especially, doubted that the far forward campaign would indeed safeguard its cross-ocean logistics—the Maritime Strategy was widely influential. U.S. and *NATO military planners adopted its concepts until the end of the Cold War rendered it obsolete, closing what some had called a renaissance in naval strategic thinking.

With both the Soviet navy and the specter of World War III dissolved, the machinery of strategy making reverted to its habitual, diffused state. Funding for the fleet derived more from domestic politics and traditional preferences for big, flexible units; forward peace support missions, now labeled “operations other than war,” resumed their central place in fleet tasking. What did not change was the focus of war planning on the battle of the fleet against the shore. Absent any significant high seas competitor, the post-Cold War naval strategy, titled “... From the Sea,” could, at least *ad interim*, tie its offensive capabilities into multi-service operations ashore and base its defensive requirements on landward threats.

From the pure, Mahanian world of fleet-on-fleet warfare, the U.S. naval profession has gone deeper and deeper into matters of peace and war ashore. Mahan’s canonical world of seamanship, marine technology, and tactical competence, which held sway more in myth than history, has given way to a much more complex professional reality. At century’s end profound changes in the international geostrategic climate promise to draw naval strategy still further away from self-contained battle plans. Ahead is an even more messy world where international political calculations and the civil, humanitarian dimensions of international security policy are added to domestic political and inter-service dynamics and all is infused with torrents of information. Also ahead is a world of space-based systems, long-range aircraft, and remotely controlled devices that invade the navy’s traditional sea space. Reliance on strategy by muddling through in the era ahead—however much that might be the national style—seems unlikely to deliver the coherently designed and effectively deployed forces needed if the navy is to continue to be central to American security.

STRATEGY: AIR WARFARE STRATEGY

The military advantages of being able to fly above an enemy were evident from the earliest times, and strategies of aerial warfare had their origins in the musings of such science fiction writers as H. G. Wells. Their apocalyptic visions, however, outstripped the operational capabilities of early aircraft, and the emergence of air strategy had to

await the development of flying machines that could carry significant destructive payloads and institutions willing to expend the resources needed to exploit their capabilities. That combination appeared in 1915, when French and German airmen perceived that they could bomb targets whose destruction would affect the enemy’s strategic potential directly, rather than indirectly by influencing the outcome of a land or naval battle. This generally meant attacks on industrial targets close behind the front, for example, German munitions factories in the Saar, though the German Naval Air Service proposed to bring Britain to its knees by Zeppelin attacks on London targets such as the Bank of England, the city’s gasworks, and the Admiralty radio transmitter.

These schemes were frustrated by the feeble means available—inadequate bombloads and range in the first instance, and the vulnerability of hydrogen-filled Zeppelins in the second—but aircraft capabilities kept improving. The Italians bombed strategic Austrian targets from 1916, and in the spring of 1917, the German army attempted to destroy London with conventional bombers in a campaign that failed to achieve its primary purpose, but forced the British to shift significant air assets from the western front to home defense. The newly formed Royal Air Force mounted a strategic bombing offensive against German industry in 1918, the first to be formally labeled as such. Ambitious in concept, it achieved little.

While strategic airpower had little impact in World War I, airpower enthusiasts saw promise, notably in the panic sparked by the 1917 German raids on London. The indecisiveness of slaughter in the trenches was evident, as was the stalemate of Dreadnought battleship fleets. It was in this context that in 1921, Italian Lt. Col. Giulio *Douhet published *Command of the Air*, the first formal treatise on air strategy. Douhet received little attention beyond Italy, and his impact on American air strategists is uncertain; he was important mainly in articulating in extreme form ideas current among contemporary airmen. He argued that armies and navies had become irrelevant, and that a nation could be defeated by a single, massive air attack that destroyed its cities and centers of production under a rain of high-explosive, incendiary, and poison gas bombs, shattering civilian morale and producing Victory. There was no defense, he wrote, against such an attack, delivered by a fleet of swift battle planes, and victory would go to the side that got in the first blow. While Douhet’s arguments were extreme, heavy emphasis on bombardment was common among early airpower pioneers, notably Gen. Hugh Trenchard, the first head of the Royal Air Force.

Meanwhile, in America, Brig. Gen. Billy *Mitchell, drawing on his experience as commander of the American Expeditionary Force’s air component in 1917-18, had conceived a more pragmatic theory. While Mitchell, like Douhet, believed that airpower would be decisive in future wars, he considered bombardment as part of a spectrum in which the traditional missions—pursuit, observation, ground attack, and reconnaissance—retained their value, and saw a role for transport aviation and parachute troops. He believed, moreover, that defeat of the enemy air force was an air force’s first task. His main contribution was to argue that airpower was indivisible, and that all air assets should be concentrated under a single air commander rather than parceled out to the army and navy. Mitchell’s calls for the establishment of an independent air force produced a

strongly negative official response, and his predictions and opinions, widely published in popular magazines, became increasingly extreme. He eventually accused senior military leaders of criminal incompetence, leading to his court-martial in 1925 and dismissal from service in 1926.

Whether because or in spite of Mitchell's activism, the U.S. Army granted its airmen increasing autonomy, and 1920 saw the formation of the Air Corps Tactical School (ACTS) which, its name notwithstanding, became the first formally chartered air warfare strategic planning group. The ACTS approached war as an essentially economic phenomenon, and from the mid-1920s focused increasingly on the strategic use of heavy bombers. Implicitly rejecting the notion that victory could be achieved with a single, paralyzing blow, the ACTS planners sought ways in which attacks on carefully selected nodes of the industrial network could cause economic collapse. Refining their theories by analyzing the vulnerabilities of America's economy, they concluded by the mid-1930s that attacks on the appropriate node—electric power generation, for instance, or petroleum refining—could achieve the desired result. They concluded, moreover, that it could be done within the means available. The key caveat was that the requisite accuracy could be achieved only in daylight, which, in turn, meant high-altitude attacks to minimize the effectiveness of anti-aircraft artillery and fighter interception. In retrospect, their assumptions concerning bombing accuracy and, above all, the ability of unescorted bombers to protect themselves against fighter attack, were overoptimistic.

Applied by the U.S. Army Air Forces (USAAF) in mid-1943 against German ball-bearing production during World War II, the ACTS concepts produced major operational defeat; more remarkably, they provided a viable intellectual framework that, with the addition of long-range escort fighters, led to the defeat of the Luftwaffe. Though not strategically decisive in isolation, attacks on two nodes, petroleum production and the rail net, conducted from early 1944 in conjunction with RAF's Bomber Command, were pivotal in the defeat of the Third Reich. The other attempts of note to use airpower "strategically" in World War II were RAF Bomber Command's campaign against German cities and by the Luftwaffe, implicitly in the Battle of Britain and explicitly in 1943 on the eastern front, using a strategy much like that of the ACTS, though with grossly inadequate resources. Airpower proved decisive in the war at sea, but as an adjunct to battle fleets and in the "antisubmarine role. Indeed, air superiority was a decisive element of victory in virtually every campaign involving industrialized opponents, vindicating the validity of Mitchell's operational insight.

During World War II, the enormity of the strategic stakes and the totality of resources committed effectively erased the distinction between civilian and military targets, validating a central point of Douhet's theory. This appeared most dramatically in RAF Bomber Command's area bombing campaign against German cities from 1942 and in the USAAF's 1945 firebombing of Japanese cities; it found its ultimate expression in the atomic bombings of "Hiroshima and Nagasaki.

Influenced by the awesome power of nuclear and thermonuclear weapons, air strategies in the postwar era evolved along two distinct paths: nuclear and conventional. After the Soviet Union ended the United States's nuclear monopoly in 1949, American nuclear strategy re-

involved around two interlocked concepts: *massive retaliation*, aimed at deterring Soviet expression, especially in Western Europe; and "deterrence, intended to discourage a preemptive nuclear attack on the United States. The latter found definitive, if not final, expression in John F. "Kennedy's administration's concept of "Mutual Assured Destruction" (MAD). The manned bomber's monopoly as a nuclear delivery system was broken by intercontinental ballistic missiles (ICBMs) in the late 1950s and by submarine-launched ballistic missiles (SLBMs) in the mid-1960s, erasing the distinction between nuclear air strategy and nuclear strategy. It is worth noting, however, that the United States was unique in vesting responsibility for the planning and execution of nuclear strategy in its air force, all strategic "nuclear weapons coming under the operational control of the Strategic Air Command (SAC) from its inception in 1947 until it was disbanded in 1993.

In conventional air strategy, the USAF has followed the trajectory of Mitchell's ideas, arguing for the indivisibility of airpower and that all air forces should be placed under a single air force commander. That insistence on unity of command and a continued belief in the decisiveness of strategic bombing were hallmarks of the air force's approach to the Korean and Vietnam Wars, with at best uncertain results. The navy and Marine Corps, drawing on their successful experience in World War II, viewed aviation as an extension of naval and land forces, and resisted what they considered air force attempts to usurp their internal unity of command. The air force's insistence on indivisibility has yielded important strategic dividends in airlift and aerial refueling, two areas in which the USAF has been in a class by itself since the 1950s. Both capabilities played a large part in the "Cold War and in the 1991 "Persian Gulf War. In the latter conflict, newly matured technologies—laser-guided bombs, electronic warfare, electronic "communications, and stealth bombers—prompted adoption of a radical air strategy developed in the late 1970s by Air Force Col. John Warden. Rejecting the attritional gradualism used in the "Vietnam War, Warden's strategy was "inside out," targeting Iraqi command centers, communications, "radar, and power generation first, with attacks on traditional military and economic targets coming only after strategic paralysis was achieved. While the strategic decisiveness of the air campaign in the Persian Gulf War is hotly debated, its tactical and technological success is widely acknowledged.

—John F. Guilmartin, Jr.

STRATEGY: NUCLEAR WARFARE STRATEGY AND WAR PLANS

Within months of the atomic bombings of "Hiroshima and Nagasaki that devastated those two cities in early August 1945, the basic questions that have bedeviled nuclear strategists and war planners ever since became evident in congressional testimony and published treatises. The United States itself would be vulnerable to air attack in future war, Congress was told in November 1945 by Gen. Carl A. "Spaatz, head of U.S. Army Air Forces in Europe. Gen. "Hap" "Arnold, commanding general of the Army Air Forces, warned Congress that since air attack could arrive without warning, the basic defense against such an attack would have to be the ability to launch a rapid, powerful air offensive against the source of the

attack. "But, better still," Arnold declared, "the actual existence of these weapons ... in sufficient quantities and so located that a potential aggressor knows we can use them effectively against him, will have a very deterring effect, particularly if the aggressor does not know the whole story and only knows *part* of the story."

Within these assertions lay the roots of U.S. strategic doctrine that were to permeate the *Cold War: the concepts of *deterrence on one hand and defense by destruction of the enemy's capacity for offensive action on the other; the vulnerability of the United States to surprise attack through the air; the need for extensive forces, variously deployed and capable of rapid action; and the perceived need for secrecy. These initial military concerns were mirrored by two civilian theorists—Bernard Brodie and William Borden.

Brodie, a Yale scholar who had first studied war at sea and now turned his attention to war from the air, wrote a paper in November 1945 entitled "The Atomic Bomb and American Security," which was later included in expanded form as two chapters of *The Absolute Weapon* (1946), the first book published on nuclear strategy. In the paper, he staked out deterrence as the dominant concept of nuclear strategy. As he put it famously: "Thus far the chief purpose of our military establishment has been to win wars. From now on its chief purpose must be to avert them. It can have almost no other purpose." To achieve such deterrence, however, would require the United States "to take measures to guarantee to ourselves in case of attack the possibility of retaliation in kind." For the next two decades, particularly in 1951-66, while he worked at the RAND Corporation, a newly established national security research institution in Santa Monica, California, Brodie set the pace among civilian theorists of nuclear strategy. His next book, *Strategy in the Missile Age* (1959), remains even today the only true classic on the essential questions of nuclear force structure (how much is enough? and hence, enough for what?) and force postures (offensive, defensive, retaliatory, preemptive, and air-, land-, or sea-based).

In contrast to Brodie's emphasis on deterrence were the views of a colleague at Yale, William Borden, who wrote *There Will Be No Time: The Revolution in Strategy* (1946). Borden believed that atomic war was inevitable and would likely be fought by nuclear-tipped intercontinental-range rockets based in underground "hedgehogs" located far from cities and "on undersea platforms scattered throughout the world's oceans." These would be aimed against the enemy's military forces rather than cities. Borden concluded that such a war could be won decisively and with only limited civilian damage. However, because of the secrecy surrounding preparations for such a war and the unprecedented powers the president would be granted in peacetime, Borden surmised that American democracy would be inevitably diminished. As noted by Gregg Herken, "with minor variations, the positions taken by Brodie and Borden endured as the opposite poles of a debate that would rage for the next forty years...."

Thus, even before the end of 1946, most major issues, except those resulting from such unforeseen technological developments as antiballistic missile (ABM) defenses and satellite reconnaissance, were already recognized. These included deterrence as an end in itself; offensive readiness and threatened retaliatory capability (eventually including *missiles housed in silos in areas remote from popula-

tion centers or aboard *submarines in the ocean's depths) as the answer to defensive vulnerability; and the potential emergence of a "national security state." Still, very few Americans read Brodie or Borden or otherwise became engaged in questions of "atomic strategy." Most focused on the more pressing immediate problems of economic prosperity.

Within the military, during the administration of President Harry S. *Truman (1945-51), war planning for what some called the "air atomic age" was initially incoherent. It was severely limited by the extreme secrecy governing nuclear matters, incessant interservice *rivalry (such as the B-36 bomber vs. the supercarrier controversy of 1949), and the ambivalent attitude of Truman regarding the *nuclear weapons themselves. The planning process that evolved by the early 1950s was complex and variable, but can be sketched in broad outline. Initially, a Joint War Plans Committee (JWPC) in the * Pentagon had the lead, but following passage of the *National Security Act of 1947 and the creation of a U.S. Air Force separated from the army, an elaborately structured process of nuclear war planning emerged.

At its apex was the *National Security Council (NSC), chaired by the president, which spelled out national security objectives and provided overall guidance regarding nuclear weapons. Below that were the * Joint Chiefs of Staff (JCS), who were responsible for translating generalized NSC guidance into specific strategic plans. The Joint Strategic Capabilities Plan (JSCP) covered global war planning for the coming year and was prepared annually. In addition, the Joint Strategic Objectives Plan (JSOP) projected a four- to six-year time frame and was also prepared each year. The crucial elements of the nation's nuclear war plan—general guidance regarding target categories and desired damage levels—were contained in Annex C of the JSOP.

At the third level (below the NSC and JCS), the task was to identify specific targets and prepare operational plans detailing the means and timing of delivering the nuclear weapons to their targets. Until the late 1950s, identification of specific targets was the province of the Air Targets Division within the U.S. Air Force Directorate of Intelligence. Operational planning fell to the Strategic Air Command (SAC), which was moved in 1948 away from Washington, D.C., to the vicinity of Omaha, Nebraska.

Factors external to this formal planning process included intelligence estimates regarding the capability and vulnerability of the Soviet Union and technological change, especially as it affected the numbers, availability, and delivery modes of U.S. nuclear weapons. Also largely external to this process were the thoughts of the nuclear war theorists both within and outside the government, whose ideas, although they could affect public perceptions, were least important to the operational planners, whose work was directed essentially at pragmatic problem solving.

Nuclear war planning in the late 1940s and the 1950s can be summarized as follows: The people in the intelligence community, especially within the air force but also including the *Central Intelligence Agency (CIA), looked for targets, all the while fearing they might miss important ones and hence listing all they could find. The people who worked on development of nuclear weapons, especially those people in the Atomic Energy Commission, focused on reducing the size of warheads, improving their yield

(destructive power), and increasing their number to keep up with the growing target list. The people who planned the military operations—planners at SAC and later at the European, Atlantic, and Pacific unified commands (EU-COM, LANTCOM, and PACOM)—sought to match the available weapons to the designated targets.

Inevitably, given the compartmentalized secrecy governing the artificially separate elements of the nuclear war planning process, a certain dynamic arose. More targets required more weapons, which in turn required more delivery systems (aircraft, missiles, submarines). As a result, the day-to-day work of the operations planners had little to do with any subtleties of either nuclear strategy or deterrence theory. Rather, it had to do with deploying as effectively and efficiently as possible the weapons available against the targets assigned; in sum, pragmatic problem solving. It took a decade for the formal system to become fully institutionalized.

At first, however, prior to the 1949 test explosion of the first Soviet atomic bomb, things were simpler. During the years between 1946 and 1949, the war planners in the U.S. military envisioned that war with the Soviet Union would be like World War II but on a more destructive scale. The United States then had few atomic weapons, let alone aircraft equipped to carry what were then extremely large and heavy nuclear bombs. The atomic-capable "bomber" aircraft and their weapons would be "seeded" among normal B-29 bombers at one of the American forward overseas bases. The detailed war plans remained secret until the end of the "Cold War, when the early plans were declassified and published (1990) in fifteen volumes, edited by Steven T. Ross and David Alan Rosenberg, and entitled *America's Plans for War Against the Soviet Union, 1945-1950*. Plans since 1950 remain generally classified.

The initial scarcity of nuclear weapons was soon overcome. (The U.S. nuclear weapons stockpile grew from only a couple of warheads in 1945 to more than 500 in 1951, then exponentially to more than 1,000 in 1952, the last of which included 720 loadings on 660 bombers; by 1955, there were 2,250 warheads stockpiled with 1,755 loadings on 1,260 bombers.) The prodigious increase in the number of U.S. nuclear weapons resulted from a combination of technological breakthroughs and a dramatic surge in military spending, first by the Truman administration as a result of the "Korean War (1950-53) and then as a result of a decision by President Dwight D. "Eisenhower to emphasize the strategic nuclear forces while cutting back on the other armed services and reducing the overall defense budget.

In January 1954, following a year-long review of defense policy by the administration, Secretary of State John Foster "Dulles announced the doctrine of "Massive Retaliation": the administration would rely upon the threat of nuclear escalation, including massive destruction of the Soviet Union, to deter or stop Soviet-inspired local wars in the future. The policy was driven by the frustrations of the Korean War and Eisenhower's fears about the impact of increased defense spending upon the American economy. Essentially, it was an economic rather than a strategic decision, one that sought "more bang for the buck over the long haul."

Massive retaliation provoked immediate debate. Some theorists of nuclear strategy questioned the credibility of the threat of a full-scale nuclear attack on the Soviet Union

as the result of any conflict less than a Soviet invasion of Europe. Some questioned the sanity of introducing an "age of overkill," arguing instead that the ability to deliver with certainty a relatively few nuclear weapons would be sufficient for the needs of deterrence. The "finite deterrence" school, however, despite a strong effort by the U.S. Navy in 1957, was never really accepted in the United States, even though Eisenhower's own view was that it was not necessary to be able to destroy the entire Soviet Union in order to deter Moscow.

Despite Eisenhower's personal view, other matters intervened, always with political overtones, to increase the U.S. nuclear stockpile. This included 3,550 nuclear warheads in 1956, with 2,123 loadings on 1,470 bomber-based launchers, to 23,000 warheads stockpiled in 1961, with 3,153 loadings, including 3,083 on bombers, 57 on intercontinental ballistic missiles (ICBMs), and 80 on submarine-launched ballistic missiles (SLBMs). Among the developments that contributed to the increase were the test explosion of the first Soviet hydrogen bomb in 1953; a 1954 RAND study, led by theorist Albert Wohlschetter, on the perceived vulnerability of SAC's forward bases overseas; intelligence failures positing a "bomber gap" with the Soviets outproducing the Americans in bombers; the 1957 Gaither Report warning of an impending "missile gap" in favor of the USSR, followed immediately by the Soviet launching of Sputnik (the first space satellite), falsely taken to demonstrate such a gap (which in fact favored the Americans); and the shooting down by the Soviets of one of the American "U-2 spy planes over the USSR in 1960. Still, by the end of the 1950s, the open threat of massive retaliation became muted, and steps were begun at the end of the decade to improve conventional forces as an alternative to nuclear confrontation.

The increased emphasis on conventional forces under the doctrine of "Flexible Response was accelerated under President John F. "Kennedy, but the Kennedy administration (1961-63) also escalated the buildup of strategic nuclear forces to previously undreamt-of levels. Under Kennedy, this occurred primarily by switching from the emphasis on bombers to land- and sea-launched ballistic missiles, amounting to 1,000 Minuteman and 54 Titan land-based intercontinental ballistic missiles and a fleet of 41 Polaris-type submarines, each armed with 16 submarine-launched ballistic missiles. Kennedy used the overwhelming American strategic superiority to help convince Moscow to back down in the "Cuban Missile Crisis, leading the Soviets in the aftermath to increase dramatically their own strategic forces.

From 1948 through 1965, from President Truman to President Lyndon B. "Johnson, the most important nuclear strategist in the United States was Gen. Curtis E. "LeMay, who was commander of SAC (1948-57), U.S. Air Force vice chief of staff (1957-61), and air force chief of staff (1961-65). LeMay was absolutely determined to avoid a "nuclear Pearl Harbor" and was convinced that massive numerical superiority, with instant readiness, was the essence of deterrence. On several occasions, LeMay made it clear to his superiors that a preemptive attack option by the United States was written into the secret war plans (secret even from the JCS from 1951 to 1955). Furthermore, he had no interest in "this launch-under-attack business," but instead, he planned to launch on *warning* (never formally defined), and with virtually the entire SAC nuclear force.

By 1960, SAC planners had identified some 8,000 targets to be destroyed in a nuclear strike on the Soviet Union. Also by that date, the navy's Polaris missile had been successfully tested. In an attempt to impose order on the target planning process (and incessant wrangling among the services), the president established the multi-service Joint Strategic Target Planning Staff (JSTPS), which was directed to prepare a coordinated U.S. Single Integrated Operational Plan (SIOP). Its first edition, formally designated SIOP-62, became effective on 1 July 1961.

When briefed on the plan, President Kennedy and his defense secretary Robert S. McNamara found the existing SIOP wholly unacceptable, and they demanded changes to provide the president with a variety of options from which he could choose in a nuclear confrontation. As a result, the new "declared policy" emphasized the destruction of the enemy's military forces, not his civilian population; it was quickly dubbed the "counterforce" option as opposed to the previous "countervalue"—or city-destroying—strategy. Although General LeMay disagreed with the new emphasis, he went along, especially once he realized that a counterforce strategy would mean an increased number of targets and, therefore, increased strategic forces.

In actuality, despite the change in declared policy, the war plan was not radically changed but merely provided with more options. The so-called no-cities strategy was, in truth, a sham, given the location of key military targets in or near cities and given the residual effects of nuclear detonations. Indeed, before leaving office in 1967, McNamara abandoned counterforce in favor of a capability to threaten the "assured destruction" of "one-quarter to one-third of [the Soviet Union's] population and about two-thirds of its industrial capacity." To be sure, the SIOP would now list several lesser options that a president might choose, but assured destruction was surely massive retaliation by another name. Given the enormous strategic nuclear forces in both the United States and the Soviet Union, "Mutual Assured Destruction" (MAD), while never a formal policy, was an apt description.

Subsequent presidents, secretaries of defense (especially James R. Schlesinger, Harold Brown, and Caspar Weinberger), and national security advisers (particularly Henry Kissinger) made fitful attempts to modify the targeting criteria and options of the SIOP. Three such instances that were leaked to the public involved the Nuclear Weapons Employment Policy (NUWEP-1) signed by Schlesinger in April 1974; the Nuclear Targeting Policy Review of 1978; and Presidential Directive 59 (PD-59), signed by President Jimmy Carter in July 1980. In each case, the changes were more declaratory than substantive, although this was difficult to discern given all the hoopla generated by the press, especially regarding an alleged new emphasis on targeting the "recovery capability" of the Soviet Union.

Most attention during the 1970s focused on the extent to which technological advances appeared to undermine any hopes for the stability of emerging arms control efforts. The first Strategic Arms Limitation Treaty (SALT I), an attempt to cap the number of ICBMs and ABM defense systems, was signed by President Richard M. Nixon and Soviet premier Leonid I. Brezhnev in 1972. But it sidestepped the newly crucial issue of multiple, independently targetable reentry vehicles (MIRVs), whereby a single large ICBM could now carry as many as a dozen warheads that could, within trajectory limits, strike different targets. The

Soviet emphasis on large ICBMs, especially the SS-18 armed with MIRVs, quickly led to fears that the U.S. land-based missile force had suddenly become vulnerable to a disarming first (or surprise) strike. Why the Soviets might decide to attempt such a strike was an irrelevant question in the war planning culture. If they could, they might, so capabilities rather than intentions or likelihoods were important. And for those concerned with a Soviet first strike there was always the fear that Moscow's true goal might not be a disarming first strike at all, but rather a new ability in a crisis to impose "nuclear blackmail" based on U.S. perceptions of the vulnerability of its own forces and their allied mechanisms of command and control.

Abetted by exaggerated claims regarding the accuracy of Soviet missiles, the United States, it was argued, would soon face an emerging "window of vulnerability" unless drastic measures were taken to "modernize" its forces. This meant the production of the B-1 and B-2 bombers, the MX missile, Trident submarines, the "hardening" of command and control networks, and replacement of the existing inventory of nuclear warheads with new and improved models. (The number of warheads in the U.S. nuclear weapons stockpile had grown to 26,500 in 1962, 29,000 in 1963, 31,000 in 1964, and 31,500 in 1965 and 1966; it reached a peak of 32,000 in 1967; then began to drop, as older warheads were eliminated, to between 28,000 and 25,000 during the 1970s, where it remained until well into the 1980s. Meanwhile, the number of nuclear warheads loaded on various types of launchers averaged about 6,000 during the 1960s.) Critics of the argument about the need for such modernization to meet an alleged window of vulnerability were appalled. Their view was best encapsulated by Lord Solly Zuckerman, the British scientist, in his *Nuclear Illusion and Reality* (1982): "Once the numbers game took over, reason flew out the window."

President Ronald Reagan took office in 1981 fully committed to the direst possible view of the capabilities as well as the intentions of the Soviet Union. The SALT II talks, envisaging significant reductions, had begun in 1974, leading to a treaty signed by Carter and Brezhnev in June 1979. But divided American opinion led the Senate to delay action, and the Soviet invasion of Afghanistan in December 1979 effectively killed the treaty, at least until after the 1980 election.

The apparent enthusiasm with which the Reagan administration (1981-89) initially adopted the long dominant and prevailing views among war planners regarding "nuclear warfighting," "countervailing strategy," and other mantras going back to Herman Kahn's *On Nuclear War* (1960) frightened many Americans. Vice President George Bush's statement that a nuclear war was winnable, Secretary of State Alexander M. Haig's comment about "a nuclear demonstration shot," and the president's own musings on a European nuclear war, along with outlandish remarks by civil defense officials on the survivability of nuclear war—all had the unforeseen effect of capturing the attention of a public accustomed to ignoring such issues for the previous twenty years. Despite the protest from a sizable and vocal segment of the public, the Reagan administration's position on nuclear war planning was not significantly different from that of its predecessors. However, it had brought to the declarative level, and thus made openly public, the assumptions upon which the operational level planners had been working for years—and that had shocked a consider-

able and influential segment of the public.

The reaction that set in during 1982-83, symbolized by the Nuclear Freeze Campaign and an unusual pastoral letter against nuclear war from the Roman Catholic bishops' conference in America, may well have played some part in leading the Reagan administration to shift focus to an improbable antimissile defense, the so-called *Strategic Defense Initiative (SDI), and move to reconsider the SALT II treaty by reopening the talks, soon relabeled *START (Strategic Arms Reductions Talks). It was also during the Reagan administration that civilians began to assert somewhat more control over the war planning process, although the fundamentals were not changed.

In their analysis of the six Single Integrated Operational Plans (SIOPs) for U.S. nuclear strategy in effect from 1960 to 1985, Desmond Ball (with Jeffrey Richelson) concluded that the general categories and particular types of targets had remained remarkably resilient. They were the Soviet Union's military forces, its urban-industrial structure, and its leadership centers. "Two developments have occurred, however," Ball advised. "One is that the number of potential target installations ... increased enormously, from ... 4,100 in 1960 ... to some 50,000 _____. Second, these targets have been increasingly divided into a larger array of 'packages' of varying sizes and characteristics, providing ... 'customized' options for an extremely wide range of possible contingencies." In 1986, Ball saw little reason to expect these developments to change markedly.

But then came the dramatic events of 1989-91: the fall of the Berlin Wall, the disintegration of the *Warsaw Pact, and the collapse of the Soviet Union. The end of the Cold War threw all earlier calculations of nuclear war planning into doubt. In the initial transition, President George *Bush (1989-93) ordered a nuclear targeting review. Conducted in 1989-91, it did not result in any radical changes but did lead to significant reductions in the number of targets. In the Bush administration, nuclear arms control efforts moved to the forefront, initially confounded by the location of Soviet ICBMs in at least four of the "successor republics" to the Soviet Union. In 1991, the United States and the Russians signed the first Strategic Arms Reduction Treaty (START I). Under that treaty, the United States reduced its arsenal of strategic nuclear warheads loaded on launchers from 13,700 in 1987 down to about 7,000 in 1996. On his last day in office in January 1993, President Bush sent a second treaty, START II, to the Senate (which did not ratify it until January 1996; by the end of 1998, the Russian Duma still had not ratified the START II Treaty).

When President Bill *Clinton took office in 1993, the entire U.S. military establishment was in a state of flux, undergoing radical reductions in personnel and weapons, coincident with a wholesale reorganization of the armed services, especially the air force. In 1992, the Strategic Air Command was transformed into a joint command. This new Strategic Command was headed first by Air Force Gen. George Lee Butler, former head of SAC, and subsequently by either an air force general or navy admiral.

Considerable pressure mounted in the late 1990s for reducing the nuclear arsenal. In December 1996, sixty retired generals and admirals from a number of countries, including the former Soviet Union and the United States (the latter including General Butler, now retired), issued a call for long-term nuclear planning to be based on the assumption of eventual complete elimination of nuclear weapons. In

March 1997, President Clinton and Russian president Boris N. Yeltsin agreed that if and when the Russian legislators approved START II, the two nations would begin talks on further reductions, to perhaps 2,000-2,500 war heads. In November 1998, with the Russian Duma still delaying ratification of the START II Treaty, Pentagon officials, driven as much by budgetary constraints as by reduced security risks, recommended that the Clinton administration consider unilateral reductions in the U.S. nuclear arsenal, either reducing the number of loaded warheads from the approximately 7,000 that existed at the end of 1998 or eliminating some categories of strategic weapons.

The state of affairs in Eastern Europe and the former Soviet Union remained so uncertain and unpredictable that in the late 1990s, preexisting nuclear war plans, although placed in a tentative hold status, remained, as it were, on the shelf. Although the information is classified, it is possible that major changes in strategy and targeting have occurred or will occur. The principal concern of nuclear theorists, strategists, and war planners had become the proliferation—both real and potential—of nuclear capabilities around the world. President Clinton gave few indications that nuclear issues were high on his agenda, causing the very small percentage of the American public that pays attention to such matters considerable concern.

STRATIFICATION AND LABOR MARKET DYNAMICS IN THE MILITARY. When the United States ended military *conscription in 1973 and moved to an *All-Volunteer Force, some commentators suggested that labor market dynamics had been substituted for civic virtue as a means of manning the force. In fact, such dynamics have always affected the composition and rank structure of the

military. An understanding of internal and segmented labor markets helps explain variations in the social composition of the armed forces.

Military Forces as Internal Labor Markets. Neoclassical economics sees employment decisions controlled by labor supply and demand. The internal labor market perspective, by contrast, attributes variations in employment to organizations that control access to their labor force, start people at entry-level jobs, and promote them to higher-level positions along prescribed career paths. These processes characterize the armed forces.

In obtaining the bulk of enlisted personnel through conscription (e.g., during World War I and from World War II to 1973), the government controlled this market, drafting some people for military service and channeling others to essential civilian occupations through deferments and exemptions. Under volunteer conditions, the forces use recruiting resources to gain personnel with the characteristics they seek in competition with other potential employers. Within the force, the promotion system determines who moves up and who leaves the military. The services operate as independent internal labor markets, each recruiting at the entry level and promoting personnel internally. A person in one service is unlikely to transfer to another for career advancement. Each of the services can be regarded as a two-tiered internal labor market, with separate tracks and desired characteristics, entry points, and career structures for enlisted personnel and for commissioned officers.

The 85 percent of the force who enter military service as recruits (usually as high school graduates currently, and most commonly from working-class backgrounds) will serve in the enlisted ranks of that service, and some may progress to the highest noncommissioned officer grades. The 15 percent of personnel who come into the service as officers are most commonly commissioned as second lieutenants or ensigns through accession programs currently associated with receipt of a college degree ("ROTC or the service academies) and are likely to come from middle-class backgrounds. If they are successful and choose to remain in service, they will progress through the ranks. Otherwise they will return to civilian life.

The Military Workforce as a Segmented Labor Market. Internal labor markets are related to segmented labor markets, which identify distinct sectors of jobs and workers. The primary sector consists of appealing jobs, with high wages, good working conditions, chances for advancement, equity, and employment stability. Jobs in the secondary sector are low-paying, with poor working conditions, little chance of advancement, absence of equity, and little employment stability. Internal labor markets operate in the primary sector. Though it was not conventional to think of military service as a good job under conscription, the services have attempted to establish primary sector status in the transformation to a large All-Volunteer Force. They tried to compete effectively for personnel with the characteristics they sought by offering good jobs, competitive wages, high quality of work life, attractive benefits—including support for higher education—and opportunities for training, travel, advancement, and supervisory responsibility at a relatively young age.

Organizations that function as internal labor markets possess market power, usually because of the desirability of their jobs or the level of their wages. However, the most

successful internal labor market in terms of control of entry-level recruiting may have been the wartime military, which was based on selective conscription. It would take those people with the characteristics it wanted, largely independent of their volition, and could reject others. As an internal labor market, it would then seek to retain, through compensation and promotion, those it wanted to keep.

Workers, as well as jobs, are segmented into market sectors. Desirable workers may be defined in terms of their skills and the price of their labor, as well as other characteristics such as gender and race. Members of minority groups, historically relegated to the secondary labor market, must frequently have had to settle for jobs characterized by unpleasant working conditions, low prestige, and low potential for advancement. However, when primary sector employers cannot recruit sufficient primary sector employees, they will broaden their recruitment base.

Ability is a primary definitive characteristic of labor market sector. Since World War I, the armed forces have used tests to screen out the bottom of the mental aptitude distribution, and recruitment screening today takes into account both educational level, which is related to social class, and mental aptitude test scores. However, during World War II, the criterion of literacy was relaxed to expand the induction base and obtain a massive force.

Gender has also been important in segmenting the labor force. Military service, and particularly involvement in combat, has historically been primarily a male pursuit; women have traditionally been relegated to the secondary market. The numbers and roles of "women in the military have increased dramatically when the requisite numbers of men were not available, either because of the magnitude of mobilization (World War II), or because in the absence of conscription since 1973, sufficient numbers of men could not be recruited for a large standing force. Internally, women have done well in those career fields to which they have been admitted.

For most of American history, African Americans were regarded as a secondary source of labor, and the military was segregated from the early nineteenth century until the mid-twentieth century. Integration took place under the pressure to mobilize for the "Korean War from the small Depression generation and the World War II veterans. African Americans are now overrepresented in the enlisted grades, although underrepresented in the officers' grades.

In short, the military has historically defined young, white, unmarried, heterosexual males of high mental aptitude as its primary labor market, and has used these variables to segment the remainder of the market. When market conditions precluded filling all of the positions from the primary market, the services made decisions as to which segments to tap next. The services turned first to older married white men, then to African American men, then to women, ignoring sexual orientation until very recently. Even when secondary labor force segments are drawn upon for entry-level personnel, the people so recruited are disadvantaged. Their characteristics operate against them in competition for jobs that offer greater opportunity for retention and promotion, although there has been an increasing emphasis on ability and decreasing concern for secondary characteristics.

STUART, J. E. B. (1833-1864), Confederate cavalry commander. Virginia-born James Ewell Brown (Jeb) Stuart graduated from West Point in 1854, served on the Great Plains and in Kansas, and then helped capture John Brown at Harper's Ferry.

In 1861, he resigned from the U.S. Army to become a Confederate colonel of cavalry. Winning early distinction by protecting the Confederate left at the First Battle of *Bull Run, he became a brigadier general. In 1862, during Gen. George B. *McClellan's Peninsular Campaign, Stuart covered Robert E. *Lee's initial withdrawal, then gained enduring fame in a daring reconnaissance raid completely around McClellan's army, burning supplies and capturing documents on the Union forces' strength and employments that enabled Lee to plan his offensive in the *Seven Days' Battle.

As a major general in Lee's Army of Northern Virginia, Stuart continued to stage morale-boosting raids and performed well at the Second Battle of *Bull Run and at Fredericksburg. At the Battle of "Chancellorsville," he found Gen. Joseph "Hooker's flank exposed, and once "Stonewall" Jackson fell, mortally wounded, he swiftly assumed temporary command of Jackson's corps.

In 1863, Stuart suffered a number of setbacks. Union cavalry surprised him in the Battle of "Brandy Station, Virginia," in June. Most controversially, in Lee's second invasion of the North, Stuart allowed himself to be diverted from his primary mission of providing intelligence for the army. Riding behind Union lines, he became cut off for three days by the "Union army in motion, leaving Lee without information and arriving at the Battle of *Gettysburg after it was well underway.

In May 1864, when Union Gen. Philip H. "Sheridan threatened Richmond, Stuart met him at Yellow Tavern, just north of the capital. During a fierce encounter, Stuart turned back Sheridan, but was mortally wounded. He died the next day, 12 May 1864.

A highly romantic and spectacular figure, Stuart will always be remembered as the dashing cavalier—indeed, one of the finest cavalry commanders.

STUDENTS FOR A DEMOCRATIC SOCIETY. First organized in 1960 as the rejuvenated student arm of the venerable League for Industrial Democracy, Students for a Democratic Society (SDS) burst on the national scene in 1962 with its Port Huron Statement. Comparable to Karl Marx's *Communist Manifesto*, the statement laid out the organization's analysis of contemporary America and explained how through "participatory democracy" SDS would reform capitalism. The most important and influential of the New Left groups on college campuses in the 1960s, with as many as 400 chapters by 1968, SDS led the first mass "Vietnam Antiwar Movement demonstration on 17 April 1965 in Washington, D.C. After that point, despite

the fact that the organization strongly opposed the war, U.S. imperialism, and the Selective Service System, its leaders chose not to play a major role in other mass demonstrations. They and their members were deeply involved in many other antiwar activities, however, including Stop the Draft Week in October 1967 and the riots at the Democratic National Convention in Chicago in 1968. SDS self-destructed in 1969 as a result of sectarian infighting and after the nihilistic and violent Weathermen faction gave the organization—and the antiwar movement—a bad name.

SUBMARINES are special purpose naval vessels that use their submerged capability for protection. A submarine must possess a hull strong enough to withstand substantial water pressure; tanks for taking on and holding water to adjust buoyancy and facilitate diving below the water's surface; and a means of underwater propulsion. Typically, submarines carry "torpedoes as weapons, but some have carried ballistic "missiles.

David Bushnell's human-powered *Turtle* launched the first (unsuccessful) submarine attack in New York Harbor in September 1776 during the "Revolutionary War. In the "Civil War, Horace Hunley built the *David* craft for the "Confederate navy, one of which sank the USS *Housatonic* in July 1864, in Charleston, South Carolina, sinking itself in the process. In the late nineteenth century, John Holland, an Irish immigrant and inventor from Paterson, New Jersey, privately built a series of experimental craft culminating in a gasoline-powered submersible, *Holland VI* (1896). Due to its oxygen requirements, the boat's engine could only operate while it cruised on the surface, so the vessel also had an electric battery to provide submerged propulsion. Holland's design became the basis for submarines of the U.S. Navy, and the Royal Navy bought his design as well.

European technical developments paralleled U.S. efforts, especially in Germany and France. French naval theorists of the so-called young school (*jeune école*) provided submerged weapons for submarines by first combining them in 1893 with the self-propelled torpedo. In the view of most naval officers, submarines would be especially useful to defend a coast or for a relatively weak naval power to attack an enemy line of "battleships. Due to their low submerged speed, most submarines operated as temporarily submersible "torpedo boats, largely sailing and often attacking while surfaced.

During World War I, the submarines, and especially the German *Untersee* boats (U-boats), achieved prominence. Submarine crews gained a reputation as elite personnel who endured real hardships; few survived the sinking of a submarine. The submarines of all navies had internal combustion engines (usually diesel), a periscope, and a deck gun for surface combat, as well as torpedoes or mines. Early in the war, a submerged German U-boat torpedoed and sank three British "cruisers in one day; another was responsible for the sinking of **Lusitania* (1915). Against Allied merchant shipping, the long-range U-boat came into its own, evading the larger Royal Navy, and sometimes attacking even while surfaced until deterred by the U.S.

convoy system and vigorous U.S. antisubmarine efforts in 1917-18. Allied submarines, including American boats sent to Britain in 1918, focused upon attacking enemy surface ships but faced few targets due to the enemy's caution. Since the force almost succeeded in starving Britain, the Treaty of *Versailles forbade German possession of U-boats.

After World War I, the Washington Naval Arms Limitation Conference (1922) considered a complete ban on submarines. But opposition from the Italian and French governments guaranteed that submarines remained in the inventories of most navies, and they returned in Germany after 1935. Interwar developments included improved construction, more sophisticated torpedoes, better torpedo fire control systems, and even air conditioning in U.S. vessels. Submarine doctrine remained divided between those who desired to use the boats for commerce warfare, the German goal, and those who emphasized fleet reconnaissance and attacks on *warships, the policy in the U.S. and Imperial Japanese navies.

World War II saw accelerated building of submarines by both the Axis and the Allied sides, with almost 2,000 vessels serving. Overwhelmingly, submarines attacked enemy merchant shipping, despite prewar doctrines emphasizing fleet operations. Their patrols succeeded in sinking over 20 million tons of shipping, one-quarter by 300 American boats, which provided an effective naval blockade of Japan. U.S. design innovations included improved torpedoes and the addition of *radar for surface operations. Changes from 1943 onward in Germany included series construction, the snorkel, an air tube for submerged diesel use, and improvements in submarine battery power and submerged speed. All postwar diesel submarine designs made use of these German innovations.

During the *Cold War, submarine design incorporated *nuclear weapons and propulsion, as well as improved *sonar and reduced noise signatures. Nuclear weapons entered use as torpedoes, cruise missiles, and as the strategic ballistic missiles that the United States, Soviet Union, France, Britain, and the People's Republic of China added to their fleets. Ballistic missile submarines were a prominent nuclear deterrent. Nuclear propulsion, first introduced in the U.S. Navy by Adm. Hyman *Rickover, gave submarines virtually unlimited range and radically more underwater capability due to their power plants' independence of air supplies. With improved range and weapons, both diesel and nuclear submarines fully realized their capabilities, emerging as a versatile branch of modern navies.

SUBMARINE WARFARE. Modern navies employed submarines in combat, using their ability to proceed submerged, although not necessarily for an entire cruise. Their concealment meant that submarines were also ideal for allowing a weaker naval power to attack a stronger one. Smaller, less heavily armed, slower, and less expensive than

many surface warships, submarines could nonetheless employ a sort of guerrilla warfare at sea, using surprise and attacking the weakest points of their opponents' navies and maritime trade to great effect.

The large-scale use of submarines against surface warships began in World War I; both sides employed them in that role. German successes overshadowed those of the Allies, primarily because there were few German surface ships, which robbed Allied craft of targets. Still, both sides succeeded in sinking opposing warships, and the threat of submarines caused commanders to exercise greater caution in using their fleet units.

But it was the attack on Allied merchant shipping by German submarines (**Unterseeboots* or U-boats) that drew the most attention during World War I. The U-boats' ability to slip past the Allied naval *blockades of German ports allowed them to gain access to British sealanes, attacking shipping headed for Great Britain. When Royal Navy defensive measures made it difficult for surfaced U-boats to stop merchant ships at sea and board them, the German Navy resorted to "unrestricted submarine warfare," that is, sinking merchant shipping without warning. Such a German sinking of the **Lusitania*, in 1915, led to a dramatic worsening of relations with the neutral United States, and the return of the more limited submarine attacks. Germany's political and military leadership gambled in 1917 on a resumption of unrestricted submarine warfare to win the war quickly on neutral as well as belligerent shipping. This prompted the United States to enter on the Allied side in April 1917. Though the Germans sank over 11 million tons of ships, the submarine offensive failed to strangle trade with Britain due to the introduction of protected convoys of merchant ships by the Allies, and the availability of merchant vessels from neutral countries to help replace losses. The threat of submarine attack did compel the U.S. Navy to defend its troopship convoys across the Atlantic, a task accomplished without loss.

The U-boat campaign of World War II again raised the question of neutral American shipping and the possibility of German attacks. In response, President Franklin D. *Roosevelt extended a "neutrality zone" eastward from the North American coast ultimately to Iceland, patrolled by U.S. Navy warships before the official American entry in the war. On several occasions, U-boats clashed with American warships, in one case sinking the destroyer *Reuben James* in October 1941. After American entry into World War II, U-boats initially decimated American East Coast shipping almost with impunity. With the introduction of adequate antisubmarine forces, convoying, and decryption of German naval signals, however, American losses fell dramatically, and the U.S. Navy and Allied forces took the war to the U-boats in the central Atlantic with deadly effect.

Perhaps the most effective submarine campaign in history was the American Pacific Ocean submarine operation in World War II. This entailed many difficulties initially, including a dearth of bases, faulty *torpedoes, and many cautious submarine commanders. Submarine crews spent eight weeks at a time on patrol under cramped conditions and with few amenities. Still, submarines played a vital reconnaissance role from the start of the conflict. Eventually aided by *radar, the decryption of Imperial Japanese Navy radio signals (*MAGIC), and improved torpedoes, the greatly expanded submarine force scored notable sink-

ings, destroying one Japanese battleship, eight aircraft carriers, and eleven "cruisers. More significantly, the U.S. Navy's submarines crippled Japan's merchant marine, sinking 5.3 million tons, or over half of its ships, in the most successful campaign of the war. Groups of U.S. Navy submarines also emulated the German Navy's "wolf-pack" tactics to great effect against Japanese convoys. In the war's last days, American submarines ranged over the entire Pacific, even entering the Japanese Inland Sea. But these accomplishments came at a price; 22 percent of submarine personnel died during the conflict, the highest of any American service.

Following World War II, submarines gained new propulsion—nuclear-fueled. One of the new roles was in "antisubmarine warfare, using their own concealed operations, as well as improved "sonar and radar, to find opposing submarines. Another was submarine-launched ballistic "missiles as a part of the nuclear deterrent of the superpowers. Submarine combat operations remained limited after 1945, however. Just one ship—an Argentine cruiser—was sunk by a Royal Navy submarine during the Falkland War in 1982.

SUBSTANCE ABUSE. The Department of "Defense (DoD) defines substance abuse as the use of tobacco, illicit drugs, or excessive amounts of alcohol. Responsibility for controlling substance abuse has oscillated between the command structures and the medical departments of the services.

Political interest in regulating alcohol consumption in the United States emerged in the mid-nineteenth century, when eighteen states passed prohibition laws. Temperance organizations subsequently made drinking a national issue. In 1862, the traditional rum ration for naval personnel was discontinued, and in 1914, drinking by officers aboard navy ships was prohibited. The Prohibition Amendment was ratified in 1919. After Prohibition was repealed in 1933, drinking in the armed services became an almost obligatory social ritual. Command-sponsored club happy hours, airborne forces' "Prop Blast" parties, and naval aviators' Tailhook Conventions were organized around heavy drinking.

In 1970, PL 91-616, the Comprehensive Alcohol Abuse and Alcoholism Prevention, Treatment, and Rehabilitation Act, defined alcoholism as a disease and mandated that military alcohol abusers receive treatment in a nondiscriminatory and confidential context. The following year, Title V of the Selective Service Act, PL 92-129, required DoD to identify, treat, and rehabilitate alcoholics to prevent the loss of experienced personnel. The medical departments treated physiological and psychiatric conditions associated with drinking, and command conducted rehabilitation programs.

In 1980, DoD announced that alcohol abuse was incompatible with military discipline, performance, and readiness. Commanders were to deglamorize drinking, ed-

ucate service members on its harmful effects, punish drunken driving severely, and deemphasize alcohol at social functions. The 1986 DoD Health Promotion Program, designed to improve the quality of service members' lives and to enhance readiness, included programs to reduce the use of alcohol, tobacco, and drugs. By 1987, the services were operating the world's largest integrated occupational health program, with 47,000 enrollees. But alcoholic service members, suspecting that their careers would be compromised, were reluctant to ask for rehabilitation.

The DoD-sponsored *Worldwide Survey of Substance Abuse and Health Behaviors Among Military Personnel* began in 1980. Between 1980 and 1992, the proportion of drinkers among service members declined from 86.5 percent to 79.6 percent, and heavy drinkers declined from 20.8 percent to 14.5 percent. In contrast, 9.5 percent of civilians in 1991 were heavy drinkers.

Cigarettes became a ritual of relaxation during World War II. In 1964, Surgeon General Luther Terry made public the deleterious effects of smoking on health. In 1982, DoD began to track smoking on its *Worldwide Surveys*. As part of the 1986 Health Promotion Program, DoD limited smoking in workplaces; in 1994, it banned smoking indoors. Between 1980 and 1992, the proportion of military smokers declined from 51 percent of the force to 35 percent. During the same period, civilian smoking declined from 30 percent to 25 percent.

Use of illegal drugs and abuse of medicinal drugs became a problem in the armed forces in the late 1960s as a consequence of expanding drug use in the civil sector and easy availability of drugs in Vietnam. During the "Vietnam War, drug users were classified as addicts and evacuated through medical channels. In 1971, treatment and rehabilitation of drug as well as alcohol abusers was mandated.

The Boys in the Barracks, a landmark study of drug use in the U.S. Army in 1973-74 by L. H. Ingraham and F. J. Manning, revealed the psychological purposes served by drug abuse. Soldiers in dysfunctional units used drugs as a basis for establishing trust among themselves and bonding against authority. These findings led to initiatives to enhance cohesion around military values and to train leaders to care for and empower their subordinates. The first *Worldwide Survey* (1980) indicated that drug abuse was volitional rather than addictive behavior, and a 1980 DoD directive made commanders rather than the medical departments responsible for its control.

In 1984, random urinalysis made it difficult for drug users to escape detection, and in 1986 the Health Promotion Program introduced zero tolerance for drug use. Officers and noncommissioned officers caught using drugs were eliminated from the service. Commanders had discretion to give junior enlisted personnel a second chance by authorizing rehabilitation. Drug use fell from 27.6 percent of military personnel in 1980 to 3.4 percent in 1992. The latter figure compares favorably with 10 percent use in 1991 in the general population.

Since the mid-1980s, substance abuse has declined as commanders, supported by the medical departments, have assumed responsibility for promoting healthy behavior. Emphasis on cohesion, focus on wartime missions, and improved leadership have reduced the psychosocial needs for drugs, alcohol, and tobacco. The military population has become older and better educated, and more members are married—demographic characteristics negatively

correlated with substance abuse. Drug abuse has been almost eliminated. But both drinking and smoking—which military traditions define as characteristics of a fighting man—persist, particularly among the young, unmarried, and poorly educated.

Kirkland

SUPPORT SHIPS, as their name implies, are generally defined as noncombatant or defensively armed ships whose mission is to assist the fighting forces. While support ships are perhaps best known for their role in naval warfare, they have been employed since the American Revolution, have been operated by both the army and navy, and have provided support to all of the military services. During the *Revolutionary War and *Civil War, support ships were used primarily by the army as troop transports and logistical supply ships. In the Civil War, by early 1865 the Quartermaster Corps of the *Union army operated almost all of the nation's commercial vessels.

Prior to World War I, the U.S. *Navy utilized a small number of support ships, known as naval auxiliaries and consisting primarily of colliers and supply ships. These were manned by civilian crews but maintained by the navy and under naval control when operating with the fleet. After the United States entered World War I in April 1917, these auxiliaries were placed in full naval status under the Naval Overseas Transport Service (NOTS), which grew to over 450 ships by war's end. Even prior to the establishment of NOTS, the navy had acquired a number of non-combatant ships, including captured German vessels, ships taken over from the Shipping Board, and others received for the U.S. *Army. The army, which had established its own Transport Service in 1898 during the *Spanish-American War, continued to operate support ships and to maintain responsibility for overseas troop movements during both World Wars I and II.

By the end of World War I, NOTS ships had carried approximately 6 million tons of cargo, including over 3 million tons of supplies for the Army Expeditionary Force in France, 1 million tons for naval bases overseas, over 1 million tons of coal for the fleet, and food for all the Allies. While the majority of NOTS ships were general cargo, a substantial numbers of tankers, colliers, and refrigerator ships were also included, as well as four hospital ships.

Perhaps the best known ship operated by NOTS in 1917-18 was the collier USS *Jupiter*. Owned by the Shipping Board, received by NOTS in April 1918, and at war's end operated in the U.S. Navy's Pacific Train, the *Jupiter* was recommissioned in March 1922 as the USS *Langley* (CV 1), the first of the navy's *aircraft carriers, serving in

this capacity until 1936, when she was converted to a sea-plane tender.

In the interwar years the navy established a base force that evolved into the Atlantic and Pacific Service Forces, which provided mobile logistic support squadrons in both oceans as the fleets increased their ability to maintain themselves at sea for increasingly long periods. In addition, specialized ships such as aircraft, submarine, and destroyer tenders were added to the inventory.

World War II saw the advent of the fast carrier task force and with it the development of the doctrine of underway replenishment: supplies provided by ships of the mobile logistic support force allowed combat ships to stay at sea and fight for long periods of time far away from their advanced naval bases. Fast attack transports and cargo ships were added for use in the amphibious assaults of the Pacific War.

After World War II, the Army Transport Service and the Naval Transportation Service were combined to form the Military Sea Transport Service (MSTS). MSTS ships supplied U.S. forces overseas and, augmented by commercial ship charters and vessels from the Reserve Fleet, provided sealift support in every national emergency from the *Korean War to the *Vietnam War. MSTS was renamed the Military Sealift Command (MSC) in 1970 under the Department of *Defense (DoD), a single operating agency for sealift for all the military services.

As warfare doctrines and weapon systems evolved, support ships became more specialized. Ships for military research were added: oceanographic research ships (AGOR); missile range instrumentation ships (AGM); and exotic deep submergence research vessels such as the NR-1, a nuclear-propelled submarine, developed in great secrecy during the *Cold War and now made available to technical institutions and to the National Science Foundation for research. Vessels were configured for specific duties; for example, command ships (AGF, CC, CLC); guided missile ships (AVM); and for less obvious purposes, such as the ill-fated USS *Pueblo*, which was designated an environmental research ship (AEGR) but used for signals intelligence collection until captured by the North Koreans in the **Pueblo* Incident in 1968.

To meet the challenges of military logistic support in the post-Cold War era, the Defense Transportation System has been established to coordinate requirements for sealift, scheduling, and shipping during routine operations. When an overseas deployment, such as Operation Desert Shield in 1990, is ordered, all elements—air, ground, and shipping—including the Military Sealift Command, are drawn together under the DoD's Transportation Command to deliver the necessary forces and material.

In 1991, during Desert Shield/Desert Storm combat operations in the *Persian Gulf War, ships of the Military Sealift Command transported 95 percent of the supplies needed by U.S. forces in the most massive sealift operation since World War II. First to arrive were ships of the Strategic Sealift Force, pre-positioned in the Indian Ocean and fully loaded to support immediate combat operations, followed shortly thereafter by fast sealift ships and hospital and aviation support ships from U.S. ports. Additional support ships were drawn from the Ready Reserve Force and were chartered from U.S. and foreign shipowners as required.

Desert Storm demonstrated a particular need for roll

on/roll off-type support ships that could be loaded, held in an overseas area for immediate dispatch, and rapidly unloaded upon arrival. As the U.S. Navy shifts strategic emphasis from preparing for war at sea to seaward support of joint operations on land, the importance of support ships in the twenty-first century will become ever greater, with increased emphasis on afloat pre-positioning of fast sealift support ships. Budget constraints, declining numbers of U.S. flag merchant ships, and the real possibility that for political reasons foreign flag vessels may not be available for charter in future crises, combine to make the availability of support ships key in future military operations.

SUPREME COURT, WAR, AND THE MILITARY. Since its founding (1789), the U.S. Supreme Court generally has avoided questions of war, peace, and foreign affairs. In the relatively few such cases, the justices have usually supported the president over the Congress. Congress has generally acquiesced, and the Court sanctioned, presidential warmaking. However, in several dramatic exceptions the Court restrained the president's authority as commander in chief of the nation's armed forces.

Though the Constitution allocates all of the war powers to Congress, it confers the office of commander in chief on the president. In addition to the power to declare war, Congress has the constitutional authority to create and regulate the armed forces, allocate funds for the military, make rules of military conduct, and provide for organizing, arming, and disciplining the militia (the National Guard). Congress possesses all of the auxiliary war powers—the various powers necessary to wage war effectively. Constitutionally, Congress has the authority to decide when to wage war, to control the conduct of war, and to restore the nation to peace.

In granting the president the office of commander in chief, the framers of the Constitution had two basic objectives. First, they intended to secure civilian control over the military. Second, as the debates of the Constitutional Convention suggest, they gave the president authority to respond to sudden attacks on U.S. territory as well as U.S. citizens and the military at home and abroad. But they did not intend to grant the president authority to initiate war and hostilities. By separating the war powers from the office of commander in chief, the framers hoped to make it more difficult to go to war than to keep the peace.

Apparently, the framers believed in a distinction between aggressive or offensive war and defensive military measures. They recognized the necessity for dispatch in responding to sudden attacks, but wanted to assure democratic control over the decision to commit the nation to foreign wars. In a constitutional democracy, the separation and sharing of foreign affairs and other powers of external sovereignty was the best way to hold government accountable to the people. Despite the framers' intentions, a suc-

cession of strong presidents have presented Congress with military fait accomplis, which the justices generally have legitimized when called upon. The Marshall Court confirmed Congress's plenary authority to initiate and control the scope of hostilities during the Undeclared Naval War with *France (1798-1800) and the *War of 1812, but various presidents, beginning with Thomas *Jefferson, have initiated military actions without consulting Congress. In the wars against the Barbary powers (1801-05), Jefferson dispatched a naval squadron to protect American shipping in the Mediterranean, waiting nine months to inform Congress of his actions. In response, Congress passed a resolution (1802) authorizing the president to protect American seamen. Apparently, Jefferson began the now well accepted practice of presidential initiative, subsequent communication with Congress, and expectation of pliant legislative approval.

Between 12 April and 4 July 1861, following the Confederate capture of *Fort Sumter, Abraham *Lincoln waged "war" against the Confederacy without calling Congress into session. He proclaimed a blockade of the belligerent states, increased the army, and expended public funds without congressional approval. When Lincoln suspended the *Habeas Corpus Act, Chief Justice Roger Taney ordered the commanding general at Fort McHenry to release a military prisoner held without trial. Lincoln simply ordered General Cadwalader to ignore Taney's request (*Ex parte *Merryman*, 1861). Lincoln defended these actions as defensive measures necessary to the preservation of the Union and its government, and therefore essential to the salvation of the Constitution.

In the *Prize Cases* (1862), the Supreme Court sustained the president's maritime seizures. Speaking for a narrow majority, Justice Robert Grier argued that the chief executive had a constitutional duty to meet force with force. Justice Samuel Nelson dissented that only Congress has the authority to initiate war and authorize belligerent measures. Only after the *Civil War had ended, in *Ex parte *Milligan* (1866), did the Court attempt to curb the president's wartime power by denying that he had the constitutional authority to suspend the writ of habeas corpus and substitute military tribunals for civilian courts outside the military theater. Similarly, during World War II, the Supreme Court upheld the evacuation (*Hirabayashi v. U.S.*, 1943) and detention (*Korematsu v. U.S.*) of 112,000 Japanese Americans and legal resident aliens without civilian trials on charges of disloyalty or espionage (*Ex parte Endo*, 1944).

As the majority and dissenting opinions in the *Prize Cases* suggest, the distinction between defensive and offensive warfare is elusive. During the twentieth century, the emergence of *guerrilla warfare, insurgency and *counterinsurgency movements, wars of national liberation, and international *terrorism has all but erased the framers' differentiation between aggression and defensive warfare. How far can the president go in defending the nation's strategic interests without intruding on congressional authority to initiate and control military hostilities? The Supreme Court's *Curtiss-Wright* (1936) opinion holds that the president has inherent, extraconstitutional authority to protect the nation's military security, yet in *Youngstown Sheet & Tube v. Sawyer* (1952), the Court ruled that President Harry S. *Truman could not seize the nation's steel mills, contrary to congressional policy, even to assure the

delivery of essential war material during the "Korean War. But *Youngstown* stands as an isolated curb on presidential warmaking power.

The Supreme Court has evaded an authoritative response, but Congress has attempted to clarify the boundaries. In the "War Powers Resolution (1973), Congress sought to limit presidential authority to employ armed forces abroad without prior authorization. The resolution requires the president to report the commitment of armed forces to hostilities within forty-eight hours and to withdraw such forces within sixty to ninety days, unless Congress authorizes continuing operations. In effect, Congress delegated the war power to the presidency but reserved the right to force removal of the troops. The Supreme Court has not decided the constitutionality of delegating authority to initiate hostilities for such a limited period of time.

Despite congressional attempts to rein in presidential warmaking, virtually every president since Richard M. "Nixon has evaded the essential objective of the War Powers Resolution. By claiming that their actions were defensive, that hostilities were not present or imminent, or that U.S. forces were engaged in "peacekeeping operations, recent presidents have circumvented the reporting requirements. In the "Persian Gulf War, after Desert Shield, President George "Bush obtained congressional consent for the offensive, Operation Desert Storm, in January 1991. As a result, the clock did not begin to toll on the time limit for withdrawing troops. With military forces in the field committed to combat, Congress has been reluctant to challenge the authority of the president as "commander in chief.

At the beginning of the 104th Congress (1995-99), Senate majority leader Robert Dole suggested that the War Powers Resolution should either be amended or repealed because it had not restored legislative control over warmaking. Although Dole's argument was logically persuasive, unless Congress asserts its authority over foreign policy decisions, it is unlikely that lawmakers will alter the basic pattern of presidential initiative, legislative acquiescence, and judicial legitimization.

SURVEILLANCE, DOMESTIC. U.S. military surveillance operations within the United States have always been controversial because of the American tradition of individual liberty and civilian supremacy over the military. The public generally condones such counterintelligence operations only in wartime, and then only against enemy aliens or others involved in military espionage or sabotage.

Domestic military surveillance, first used on a significant scale under President Abraham "Lincoln during the Civil War, emerged in its modern form under the adminis-

tration of Woodrow "Wilson in World War I. The army General-Staff's Military Intelligence Division (MID) was created in 1917, in part to locate German spies or saboteurs. It found few enemy agents; but under its creator, Capt. (later Maj. Gen.) Ralph H. Van Deman, it turned during the war and postwar period to investigate Americans whom MID considered "dangerous." These included not simply enemy aliens and other immigrants but citizens who were labor unionists, pacifists, socialists, or civil rights activists. In the antiradicalism of the postwar era, MID, working with the newly created Federal Bureau of Investigation (FBI), as well as local police and vigilante groups, conducted illegal raids, made illegal arrests, and subjected many U.S. citizens to interrogation. It also developed an elaborate filing system for its dossiers on thousands of American citizens, and it helped local authorities crush major labor strikes and suppress racial disturbances.

In the 1920s, military intelligence sought, without real evidence, to link pacifist groups, including liberal women's and religious organizations, to an alleged Communist threat to U.S. internal security. Indeed, MID prepared "Emergency Plan White"—a detailed outline for army intervention to suppress what the conservative planners feared would be Communist-led civil disorder and armed insurrection in the United States.

In 1932, the U.S. Army used a modified version of Plan White against the unemployed veterans encamped in Washington, D.C., petitioning Congress for relief. Based upon an MID report that the veterans were led by Communists (an allegation denied by the Washington police chief), President Herbert C. "Hoover authorized the army to drive the men from the capital. Fear of foreign aggression and radicalism in the 1930s led MID to expand its domestic operations, increasing the surveillance of unionists, pacifists, civil rights activists, and Communists. Van Deman retired in 1938, but the agency continued to pursue radical specters at home more than foreign espionage and intelligence evaluations, a lesson brought home by the unanticipated attack on "Pearl Harbor in 1941.

During World War II, domestic military surveillance expanded substantially. President Franklin D. "Roosevelt gave military intelligence (now G-2) responsibility for protecting defense plants, and it established a network of thousands of informants. Although the FBI had primary jurisdiction over domestic investigation of civilians, it eventually cooperated with G-2 and with the army's new Counter Intelligence Corps (CIC). Almost half of CIC's 5,000 civilian agents operated undercover among various groups of civilians—particularly disaffected minority or political groups. In addition, G-2 continued to assemble data for Plan White, reporting on radical labor and political groups and what it called "semiradical" groups concerned with "pacifism and civil liberties. Military intelligence continued that policy throughout much of the "Cold War era.

In the 1950s, President Dwight D. "Eisenhower restricted the use of military-intelligence personnel in monitoring civil disturbances until a presidential authorization indicated that the use of federal troops was imminent. Only after the decision to use federal troops to enforce desegregation did G-2 and CIC join the FBI in monitoring groups of whites and blacks in Little Rock, Arkansas, in 1957-58. In the desegregation crisis at the University

of Mississippi in 1962, however, military intelligence agents violated regulations and conducted investigations of civilians without specific authorization from President John F. *Kennedy.

Domestic military surveillance expanded to an unprecedented extent in peacetime in the 1960s with the concern of Presidents Lyndon B. *Johnson and Richard M. *Nixon, among others, over threats to internal security in the United States as a result of the civil rights movement, the *Vietnam antiwar movement, and the urban disturbances. In 1965, a new intelligence command was established at Fort Holabird, Maryland. It began coordinating the work of counterintelligence agents at G-2 offices at each army command within the United States, preparing daily civil disturbance situation reports on right-wing and racial activists and on left-wing and antiwar dissidents. The widespread dissent, civil disorder, and violence in the 1960s led to the pre-positioning and occasionally active intervention of units of the army in American cities under President Johnson—Detroit in 1967 and Washington, D.C., Chicago, and Baltimore in 1968. President Nixon deployed troops at both the Democratic and Republic National Conventions in Miami Beach in 1972, and at his second inauguration in 1973.

By 1966, the U.S. Army's Intelligence Command at Fort Holabird had broadened its civilian surveillance, including operations violating regulations and probably done without knowledge of senior army commanders. By 1968, renamed Continental United States Intelligence (CONUS Intel), the Holabird center had computerized field reports on civilians composed by more than 1,000 plainclothes army agents, who monitored civil rights and antiwar organizations, infiltrated radical groups like the *Students for a Democratic Society, and sometimes engaged in provocative and illegal acts to discredit them.

Military intelligence crossed the dividing line into illegal, unconstitutional activity between 1963 and 1972, as it had in the period 1917-21. Violating laws and regulations restricting federal domestic investigatory activity to civilian agencies, primarily the FBI, the military's investigation of civilian protest went beyond immediate use in tactical operations. Instead, it intimidated and sometimes restrained legitimate exercise of civil and political rights. The use of the military against political criticism of the central government was precisely the kind of abuse of standing armies feared by Americans since the mid-eighteenth century.

The extent of domestic military surveillance became the center of controversy when it was exposed in *Washington Monthly* magazine in January 1970 by a former military intelligence officer. This led to the first full-scale public debate on the subject in America. Although the Supreme Court in *Laird v. Tatum* (1972) upheld the legitimacy of military surveillance for national security, a widespread public and congressional belief that the surveillance had become excessive, if not illegal, led the army to exercise greater control over its domestic military intelligence system.

SWAMP FOX. See Marion, Francis.

SWIFT BOATS. The U.S. Navy swift boat, or patrol craft, fast (PCF), was used extensively during the Vietnam War to inhibit the movement of enemy troops and supplies in the coastal waters and rivers of South Vietnam. Adapted from a civilian crew boat used to transport workers to and from offshore oil rigs in the Gulf of Mexico, this twin-screwed, aluminum-hulled vessel had an overall length of 50 feet, a beam of 13.5 feet, and at full load a draft of 4 feet 10 inches. It displaced 22.5 tons. Two 475-horsepower diesel engines gave it a maximum speed of 28 knots. Armament consisted of twin .50-caliber *machine guns mounted over the pilot house forward, and a single .50-caliber machine gun "piggy-backed" over an 81-mm mortar aft. It carried a crew of one officer-in-charge (ordinarily a lieutenant, junior grade) and five enlisted men. Despite the rigorous and often dangerous duty these men performed, swift boat sailors in Vietnam displayed unusually high morale and esprit de corps.

Principal swift boat bases in Vietnam were located at Da Nang, Chu Lai, Cam Ranh Bay, Qui Nhon, Cat Lo, and An Thoi. Originally employed almost exclusively in offshore waters, the SEALORDS strategy of Vice Adm. Elmo R. *Zumwalt, Jr., sent them increasingly into the rivers and canals of South Vietnam in the 1968-70 period on barrier patrols designed to interdict enemy supplies crossing from Cambodia.

During the course of the war, some 125 swift boats were built. Of these, 104 were transferred to the South Vietnamese Navy as U.S. Navy combat operations in the war were phased out.

SZILARD, LEO (1898-1964), physicist, molecular biologist, and arms control activist. Szilard was born in Budapest, Hungary. Educated at Budapest's Technical University, he earned a Ph.D. in physics at the University of Berlin in 1922. Fleeing to London in 1933, he conceived the nuclear chain reaction, which he patented in 1934 and assigned to the British Admiralty as a military secret. He pursued chain reaction research at Oxford until 1938, then emigrated to the United States.

At Columbia University in 1939, he codesigned with Enrico *Fermi the world's first nuclear reactor, and drafted for Albert Einstein the 2 August 1939 letter to President Franklin D. *Roosevelt that warned about German *nuclear weapons research. This letter eventually led to the American effort in 1942, known as the *Manhattan Project, to build the atomic bomb. Despite feuds over science and administration with the director, Gen. Leslie R. Groves, Szilard worked in 1942 and 1943 on reactor design, and by 1944 initiated postwar control schemes for atomic energy.

In 1945, Szilard organized an unsuccessful petition to President Harry S. Truman, urging that the atomic bomb be demonstrated before use against Japanese cities. He led the successful lobbying by scientists in 1945 to shift the atom's control from the army to the new, civilian Atomic Energy Commission, and thereafter worked against the proliferation of nuclear weapons.

In nuclear strategy, Szilard postulated in 1945 the concept of a "preventive" nuclear war, and in 1961 he proposed the balance of nuclear weapons necessary to assure minimal "deterrence among armed states. He met privately in 1960 with Nikita S. Khrushchev, gaining the Soviet leader's assent to a Moscow-Washington hot line. A founding participant from 1957 in the "arms control and

disarmament activities of the Pugwash Conferences on Science and World Affairs, Szilard created the first political action committee for arms control, the Council for a Livable World (1962). He also published both fiction and nonfiction positing wildly original and later useful techniques for nuclear arms control and verification.

TACTICS

Fundamentals

Land Warfare Tactics

Naval Warfare Tactics

Air Warfare Tactics

TACTICS: FUNDAMENTALS

Tactics are the art of using armed forces to fight battles. They include all actions taken in preparing for battle, including preliminary disposition, actual arrangement of forces and weapons systems, and combat actions. Tactics are the battlefield culmination of actions taken at the strategic and operational levels. They are both an art and a science, and writings on the subject have been in existence since the time of Sun Tzu, the unidentified Chinese author who wrote *The Art of War* (c. 500-320 B.C.). Tactics are executed by human beings who suffer fear, fatigue, hunger, exhilaration, and a multitude of other emotions. Psychological aspects are as important as physical ones.

At the basic level, tactics combine both offensive and defensive operations. Through history, tactics have been in a constant state of change, influenced by technology and leadership. Innovations and technology have had great impact throughout the ages: The stirrup allowed the mounted armored knight to dominate the battlefield for years. Gunpowder and the invention of reliable shoulder-fired weapons, in turn, afforded significant tactical advantage to the dismounted soldier, enabling infantry to replace the armored horseman as the dominant force. Refinements such as rifled *muskets and light field "artillery changed tactics. Later technological innovations such as *machine guns, rapid-firing artillery, *tanks, airplanes, *submarines, and "aircraft carriers have caused tactics to continue to evolve.

According to the great Prussian military writer Carl von * Clausewitz (1780-1831), and his book *On War*, tactics are the use of armed forces to win battles; strategy is the use of battles to win the war. Warfare can be considered at three levels, with inexact lines of distinction between those levels: *strategic*, *operational*, and *tactical*. Strategy is the concerted, coordinated use of all resources available to a nation in order to win a war. "Operational art lies between strategy and tactics: it orchestrates battlefield tactical actions into major operations and campaigns that can achieve the strategic goals. The strategic level is normally the realm of politicians and their senior advisers. The tactical level is that of the military. The operational level is a combination of political and military influences.

Although tactics are at the micro-level, the loss of a tactical battle can reverse well-designed strategic and opera-

tional-level plans. During the "Civil War, Maj. Gen. Joseph "Hooker devised an operational campaign in 1863 to outflank Gen. Robert E. "Lee's Army of Northern Virginia entrenched around Fredericksburg. Although the Union had overwhelming numerical superiority and initial surprise, Confederate Gen. "Stonewall" "Jackson's tactical attack against the open Union right flank caused Hooker to halt the campaign and retreat back to his original positions.

Similarly, tactical victory can be negated by failure at the operational and strategic levels. In World War I, for example, the German offensives of spring 1918, using new "infiltration tactics," had great tactical success. However, the German Army could not follow up at the operational level because of an ultimate lack of mobility and reserves. In the *Vietnam War, the United States never suffered a major tactical defeat, yet it lost the war at the strategic and political level.

At the beginning of the nuclear age, some futurists thought nuclear "super weapons" would bring an end to tactical operations. However, human ingenuity persevered, tactics were again modified, and battles at the tactical level continue to this day. The historical continuity of terrain, weather, "frictions" of war, and the indomitability of the human spirit cause tactics to change but still remain a critical element in warfare. Despite the advances of technology through the ages, tactical victory still goes to the force that is best able to combine technology with leadership, discipline, esprit, and moral force.

TACTICS: LAND WARFARE TACTICS

Tactics are the specific techniques used by military forces to win battles and engagements. Though the term is sometimes associated with the entire art of fighting, military theorists usually associate land warfare tactics with the organization and disposition of troops, use of weapons and equipment, and execution of movements in offense or defense. For much of the nineteenth and twentieth centuries, theorists distinguished between minor and grand tactics, and today they continue that distinction by associating grand tactics (or "strategy") with the "operational art of war and minor tactics with the tactical level. Such a

distinction leaves the tactician concerned primarily with the employment of small units in combat and focused on leading soldiers and solving problems amid the uncertainty and unpredictability of battle.

The first conclusive evidence of the use of ground warfare tactics comes from the Neolithic Age. Primitive warfare consisted of ambushes, raids, and skirmishes and relied on techniques and weapons closely associated with hunting. Although primitive warriors understood the importance of numbers, they knew little about tactical formations and less about command and control. These warriors nonetheless adopted the bow, sling, dagger, and mace between 12,000 and 8,000 B.C. and began deploying troops in column and line, firing arrows in volleys, and enveloping the flanks of an enemy line. Rough paintings of such actions from the Neolithic Age clearly indicate the existence of tactics in this early period.

By the fourth millennium B.C., tactics had advanced considerably. As the extraction and smelting of metals improved, bronze weapons became common, and battleaxes and metal arrowheads influenced many battles. The introduction of the wheel also permitted the invention of the war chariot, a vehicle that improved considerably in succeeding centuries. In the third millennium B.C., the Sumerians in the Euphrates Valley left written evidence of formally organized troop formations, with infantry equipped with body armor, spears, and shields and chariots occupied by soldiers carrying javelins. By 1468 B.C., the Egyptians had mastered the weapons of the Bronze Age and demonstrated the value of superior tactics in the Battle of Megiddo against the armies of Syria and Palestine.

The Greeks and Romans brought tactics to new levels of sophistication. The Greeks relied on the phalanx, which consisted of infantrymen carrying long spears, short swords, and heavy shields. By advancing shoulder to shoulder and presenting a massive array of overlapping shields and spear points, the Greeks could rupture an opponent's front and crush him. Philip of Macedonia and Alexander the Great achieved great success by skillfully employing the phalanx with cavalry, archers, and other lightly armed troops. To obtain greater flexibility, the Romans modified the phalanx and used the manipule and the cohort in their legions; but they did not abandon the idea of placing highly trained troops in carefully organized and equipped formations. Superior tactical methods and organizations proved essential for the establishment of the Greek and Roman empires.

Numerous changes occurred in tactics during the next 1,000 years, but none had a greater effect than the introduction of gunpowder. From the sixteenth to the nineteenth century, commanders adapted their tactics and made significant advances with formations such as the *tercio*, which combined hand-powered weapons with chemically powered ones. During the Thirty Years' War (1618–48), the Swedish king Gustavus Adolphus armed his infantry with muskets and pikes, his cavalry with wheel-lock pistols and sabers, and his artillery with mobile guns. Gustavus then created innovative tactics that relied on close cooperation between infantry, artillery, and cavalry, exploited firepower and shock, and performed well on the offense or defense. His methods demonstrated how the flexible adaptation of technology could profoundly affect battlefield tactics.

In the era of the French Revolution at the turn of the eighteenth century, the French developed tactics that en-

abled them to capitalize on the initiative and commitment of their highly motivated soldiers. Though some historians have dismissed these as "horde tactics," French commanders learned through trial and error how to change their formations quickly from column to line and from line to column; they also learned to precede their infantry with swarms of skirmishers and support their advance with concentrated artillery. The result was not an army prepared for the parade ground but one prepared to fight against Europe's best professional armies and defeat them. When Napoleon came to power, he made few changes in French tactics and relied on many of the innovations achieved in previous years, although he received credit for so-called *Napoleonic warfare. His eventual defeat came from his failed strategy and his inflated ego, not from the aggressive tactics he inherited from his predecessors.

Tactics continued to change in the nineteenth century. In the United States, Gen. Emory *Upton emerged as the most notable American thinker on the subject. A much decorated and wounded veteran of the *Civil War, Upton searched during that war for an alternative to the close order, linear tactics practiced by most units with resulting high *casualties. In 1867, the U.S. *Army adopted Upton's system of tactics, which included commands and formations enabling infantry, artillery, and cavalry to work together more closely. Recognizing the accuracy of the rifled *musket and the rapid fire of the breechloader, Upton proposed organizing the infantry in a single line, rather than two or three lines, and taking advantage of their breechloader's greater firepower. He also proposed making groups of four soldiers the basis of all infantry formations and training infantry to march in columns composed of "fours" and move quickly into line. Such an organization could face in any direction after receiving simple orders. Additionally, Upton emphasized the use of skirmishers to precede and protect the main body of the infantry. These tactics placed a premium on the initiative of individual soldiers and made infantry formations more flexible, but they were only a small step forward in the effort to develop new tactics for a battlefield increasingly dominated by firepower.

Numerous important innovations in tactics occurred during World War I. Many of these changes came from the changing relationship between artillery and infantry. As the artillery changed from a direct-fire to an indirect-fire role, and as the volume of fire increased dramatically, the coordination of infantry and artillery proved to be one of the most complex and enduring problems of the war. In essence, artillery support dictated the movement of the infantry and created conditions that made maneuver extremely difficult. The Germans became the most tactically innovative of the belligerents and eventually devised an elastic defense-in-depth and infiltration tactics. In both the offensive and defense, the Germans achieved excellent coordination of infantry and artillery, and relied on the maneuver of small units and the initiative of lower-level commanders. When the Americans entered the war in 1917, Gen. John J. *Pershing resolved to abandon *trench warfare and restore mobility to the battlefield; but the exhaustion of the belligerents and the tactical innovations of the Germans did more to restore mobility than the vast resources and new energy of the Americans in the brief period of major U.S. involvement.

Tactics continued to evolve prior to and during World War II. The most notable advances again came from the

Germans, this time with the integration of "tanks and aircraft into the battle. During the May-June 1940 campaign against the French, the Germans combined their infantry, artillery, tanks, and aircraft into a highly mobile, combined-arms team and drove quickly through Poland's and France's linear defenses. Ironically, the tanks and aircraft received most of the publicity, particularly after the invention of the term *Blitzkrieg* (lightning war) to describe the operation; but infantry and artillery proved vital to the Germans' success in many of the campaigns' key encounters. The 1940 defeat of France nonetheless marked the flourishing of mechanized tactics and provided a long-lived model of three-dimensional mobile warfare. Other innovations during World War II came with the development of "airborne warfare and "amphibious warfare; but once landed, the forces involved in such operations used tactics similar to those employed by standard infantry units.

In the decades following 1945, commanders faced many new questions about tactics. With the introduction of "nuclear weapons, the superpowers developed new methods for fighting on nuclear battlefields. In the United States, the army developed the "Pentomic" division and "checkerboard tactics," which permitted the dispersal and rapid concentration of units on a nuclear battlefield, but the transition from the doctrine of massive retaliation to that of "flexible response eventually resulted in the abandonment of methods appropriate only for a nuclear environment. The outbreak of revolutionary wars around the globe resulted in the development of tactics for "guerrilla warfare and "counterinsurgency, both of which relied on the initiative of small-unit commanders and the mobility of all units. In this environment, air-mobile operations proved useful, but neither the Americans in Vietnam nor the Russians in Afghanistan achieved strategic success, even though they won numerous tactical victories. By the end of the "Cold War, advances in technology had produced sophisticated weapons and equipment that promised many future modifications in tactics.

Through thousands of years, land warfare tactics have evolved as commanders have modified their methods, developed different organizations, and adopted new weapons. Though tactics remained subservient to strategy, the greatest tacticians have been those who recognized the constantly changing nature of tactics—and the unpredictability of battle.

TACTICS: NAVAL WARFARE TACTICS

Tactics are the handling of forces in battle. *Maneuver*, meaning movement, was once a near synonym for *tactics*, but over the past half century naval "maneuvers" have come to mean any set of tactical actions intended to gain a

combat advantage. Currently encompassed in the term *naval tactics* are effective search and detection (or scouting), the command and control of forces, and countermeasures that neutralize or degrade enemy actions, all of which have become as important as formations and firepower.

For roughly 400 years, guns were a fighting fleet's decisive weapon and a tightly spaced column was its advantageous formation. The tactical aim was to bring the maximum number of guns to bear on the enemy; massed forces was the tactical means. Then, in the twentieth century, aircraft introduced the possibility of massing the striking power without physically concentrating the "aircraft carriers that launched the planes. To that end, in World War II the Imperial Japanese Navy developed tactics based on separated carrier formations, sometimes supplemented with strikes from island airfields.

Nevertheless, by 1944, both sides in the Pacific War saw that concentration was still the superior tactic, principally for purposes of anti-aircraft defense based on counterfire from air and sea rather than primary reliance on protective armor plate. American ship defenses became so formidable that the Japanese resorted to kamikazes: manned aircraft acting as missiles on suicidal one-way missions.

At the end of World War II, defense through counterfire ended abruptly with the threat of air-dropped nuclear bombs. Dispersed formations were designed to conceal warships amid merchant shipping long enough for them to launch their own nuclear strikes. By the 1960s, this desperate tactic that was modified as counterfire was resumed through surface-to-air "missiles of the Terrier, Talos, and Tartar programs, and air-to-air missiles such as those of jet fighters like the F-14 "Tomcat." Tactics were further altered as the likelihood of nuclear war at sea waned and the principal threat to ships became conventional warheads in air-to-surface missiles instead of aerial gravity bombs.

By the 1960s, Soviet "submarines were armed with AS-CMs of such great range (some more than 300 miles) that American fleet defenses developed many layers, beginning with aerial surveillance and protection. But survival depended on adequate warning, plenty of sea room, depth of fire, and the absence of neutral aircraft and shipping.

As the reach and lethality of firepower increased, so did the need to detect the enemy at longer and longer ranges. In fact, the threat of large pulsed attacks from "torpedoes, aircraft, and missiles made apparent the enormous advantage of finding the enemy first and attacking before he could respond. In World War II, nothing but aerial scouts could hope to reach far enough to find the enemy, target him, and strike first. Submarines off enemy ports and straits gave strategic warning of enemy movements (and attacked if they could), but tactical detection and tracking were achieved by an unstinting aerial search. After World War II, aircraft continued their crucial scouting role, but concurrently highly sophisticated earth-orbiting satellites grew in significance, as did electronic search, both active and passive, conducted by ships, submarines, and land sites. Some sensors are able to detect ships and aircraft far over the horizon at ranges of thousands of miles. The moves and countermoves across the electromagnetic spectrum have become so intricate that the tactics of nonlethal "information warfare" have become as important as the missiles themselves in determining who will attack effectively first.

All naval warfare since World War II has been closely connected with conflict ashore. Thus, joint littoral opera-

tions have consistently defined modern naval warfare. Land-sea missile attacks such as a 1982 attack during the Falklands/Malvinas War on British warships by an Exocet missile launched from a land site in Argentina have added to the already prevalent strikes by aircraft to blur the tactical distinction between sea and land combat. More such littoral engagements seem certain, for the U.S. *Navy's most important contribution to future war overseas will be, as in the past, the safe delivery and sustainment of army, air force, and Marine elements that will engage the enemy on the land.

Because missiles are swift, accurate, lethal, and long-ranged, naval battle maneuvering has shifted from warship to weapon. Survivability is now largely dependent on quick defeat of attacking missiles. Counterfire with defensive missiles has had an insignificant effect, but chaff, jamming, and other defensive countermeasures have been highly successful when a defender was alerted. Thus, a scouting advantage and application of superior electronic tactics and technology has become vitally important as an advantage.

Over 400 guided missiles have been fired at merchant vessels and warships since 1967, when an Egyptian patrol craft launched 4 Soviet-made Styx missiles and sank the Israeli destroyer *Eilat*. Since 1967, torpedoes, *mines, aerial bombs, or shellfire have had considerable consequences, but ASCMs have inflicted by far the most damage and are the central weapon of naval tactics today.

Many in American policy circles believe that naval operations have changed radically since the collapse of the Soviet Union. Contemporary operations as disparate as the *Persian Gulf War, the interdiction of shipping in the Adriatic, and efforts to intercept both drugs and illegal immigrants in the Caribbean have all taken place in littoral waters. Consequently, a new concept called *joint littoral warfare* has developed, in which army, navy, air force, and Marine forces are concerted by joint commanders who conduct wide-ranging operations in the coastal regions of the world. The focus of U.S. naval operations has returned to its roots because throughout history most naval battles have been fought within 100 miles of land. Furthermore, during the Cold War, a dichotomy existed between U.S. Navy *war plans and actual force deployment. War plans were drawn to gain sea control, support a major *NATO war in Europe, and attack the Soviet homeland directly, with or without *nuclear weapons. The plans envisioned battles fought against Soviet submarines, long-range aircraft, and surface warships over the vastness of the ocean. Simultaneously, and paradoxically, the actual profitable deployment of American naval forces took place close inshore in a wide variety of circumstances and locales, involving air strikes, amphibious landings, and sustainment of forces fighting on land. The "new" littoral warfare tasks of the U.S. Navy at the end of the twentieth century are no different from those actually carried out in coastal waters by naval forces for the past fifty years, such as air strikes against North Vietnam and Libya, amphibious landings in Korea, Lebanon, and Grenada, coastal *blockades, and naval gunfire support.

Changes in tactics wrought by missiles are as far-reaching tactically as the shift from sail to steam or from battleship to aircraft carrier. Moreover, the great range of missiles coupled with the proximity to land creates a combat environment of intensified tactical interaction between the

sea and the land in which force on force is no longer exclusively, or even primarily, fleet against fleet.

Starting in World War I, mines, *torpedo boats, and coastal submarines forced surface fleets to back away from close coastal blockade. In World War II, aircraft extended the air-land interaction, as ships used planes to attack land targets and land-based planes attacked ships. In the missile age, while 'ships become targets of land-based missiles, ship-based missiles are used against land sites. Since the 1950s, submarines armed with nuclear ballistic missiles have been capable of striking deep inland. In the Persian Gulf War of 1991, nearly 300 American sea-launched cruise missiles struck military targets in Iraq with conventional warheads.

The revolution in naval tactics wrought by missiles, however, is far more extensive than a change in the principal weapon. Until World War II, fleet maneuvers were designed to achieve a positional advantage relative to the enemy. In the age of fighting sail, the weather gauge (upwind of the opposing fleet) was such a crucial advantage. In the battleship era, crossing the "T" (alignment of one's column across the head of the enemy's column) was the relative position sought. Then, in World War II, maneuvers by ships in formation were supplanted by the swifter movement of raids by aircraft carrying *bombs and torpedoes or salvos of torpedoes launched from destroyers and light *cruisers. These outperformed gunfire from heavy cruisers and *battleships. Today, small maneuverable missile craft have the capacity to put much larger warships out of action, especially in confined coastal waters; large salvos of fifty or more missiles can be rapidly and accurately launched against land targets from a comparatively small warship, as they were in the U.S. retaliatory attacks on purported terrorist sites in the Sudan and Afghanistan in August 1998. Aircraft carriers—so fragile and frequently sunk in World War II—now use their mobility to position themselves out of danger, yet where their aircraft can deliver telling, repeated attacks.

TACTICS: AIR WARFARE TACTICS

Tactics in air warfare consist of fundamental methods, skills, and techniques designed to lead to success in aerial combat. Subject to change as the result of the rapid and continuing improvements in aircraft, *weapons, and support technology over the last eighty years, *air warfare tactics nevertheless remain a natural outgrowth of the earliest use of military aircraft by the major belligerents during World War I.

The classic goal of air warfare is to deny an enemy the use of airspace and to exploit that airspace for *victory. Typically, this mandates the destruction of enemy air-

craft—either in the air or on the ground—and winning and maintaining air superiority. Success in the battle for air superiority permits one's aircraft to attack enemy ground or naval forces, deny the enemy logistic support, resupply friendly forces, collect photographic intelligence, and bring an enemy's country under long-range strategic bombardment. Scores of other missions exist as well, and are not confined to the atmosphere immediately surrounding the Earth. Space is a new arena for air warfare. At a fundamental level, military aviators create and modify air warfare tactics to maximize the impact and effectiveness of aircraft or aerospace vehicles—manned or unmanned—whatever the objective.

At the beginning of World War I, Germany and Britain used aircraft largely for straightforward reconnaissance, observation, and artillery-spotting purposes. In its earliest forms, air combat developed as an outgrowth of these missions. It was not long before airmen who had greeted each other with smiles and waves began shooting at each other with rifles and pistols. These weapons quickly gave way to "machine guns synchronized to fire through propellers. The German fighter pilot Max Immelmann is generally credited with developing in 1915 the first aerial maneuver designed to give an attacking aircraft a relative advantage over another. The 180-degree climbing turn that soon bore his name might accurately be thought of as the genesis of aerial tactical development. Another German aviator, Oswald Boelcke, developed seven fundamental rules of air combat, several of which survive to this day. The most enduring admonitions were to surprise the enemy and to maintain the offensive advantage. Boelcke was also among the earliest proponents of formation flying. Eschewing "lone-eagle" patrols, he believed aircraft attacking in pairs offered mutual support and enjoyed a greater chance of success against the enemy.

Boelcke's notions and techniques found widespread acceptance on both sides of the lines during World War I. At its most basic tactical level, fighter air combat consisted largely of seeing the enemy, deciding whether or not an attack was possible, closing by maneuver, firing, and escaping. If the original attack was unsuccessful, further maneuver was necessary either to reengage or to avoid further attack and survive. With allowances for vast increases in speed, target acquisition, and accuracy of weapons, these tenets are just as valid today as they were between 1914 and 1918.

By the end of World War I, air warfare tactics were remarkably sophisticated, and included concepts for the employment of large numbers of bombing and reconnaissance aircraft. All sides employed mass formations; aircraft attacked targets both on the immediate battlefield and deep within enemy country. Using lighter-than-air Zeppelins and large, specially designed long-range airplanes, the Germans undertook the first sustained strategic bombing campaign in history against London. Although it caused only minimal physical damage, its psychological impact was important. Moreover, the campaign spurred many of the doctrinal and tactical developments during the interior period.

The 1920s and 1930s were a fertile time for those thinking about the potential use of airpower. Airpower advocates in Britain and the United States, like Sir Hugh Trenchard and Gen. Billy "Mitchell, and Giulio "Douhet in Italy, suggested that large independent air forces, built

around long-range bombers, could have a winning impact. At a tactical level, they assumed that bombers were fast enough, well enough defended, and could fly high enough to avoid or defeat enemy interceptors. In their minds, this reduced or virtually eliminated the need for armed escort of fighter planes. Moreover, the most optimistic zealots confidently predicted that bombers would be able to obliterate their targets and terrorize civilian populations with little difficulty. Americans, less comfortable than their British counterparts with the notion of "bombing of civilians in cities, believed accurate U.S. bombsights and well-protected aircraft such as the B-24 and B-17 were capable of precision against industrial targets. A few, such as Claire "Chennault, advocated increased emphasis on "fighter aircraft.

The Germans developed their own views on the uses of airpower during this period. They were particularly impressed with the concept of terror bombing. Their success in the Spanish Civil War convinced them that bombers might play a significant role in reducing an enemy's morale and willingness to resist. Nevertheless, the Germans' principal contribution here related to the importance of ground support aviation. In the earliest campaigns of World War II, the *Luftwaffe* became a true extension of the German Army, and in many ways operated like mobile "artillery. German fighters, flying in flexible and mutually supporting formations, attacked first to sweep an enemy air force from the ground and sky. Subsequent waves of high- and low-altitude bombers attacked enemy airfields, transportation centers, fuel storage areas, and troop installations. Finally, highly accurate dive-bombers assisted the swift-moving columns of German "tanks as they swept through enemy defenses in deep, encircling penetrations. The rapid German victories in 1939 and 1940 astonished the world.

The Allies were also able to put the principal tactical elements of their air warfare doctrine to the test. Beginning in 1942, British and American bombers undertook an offensive against German-occupied Europe and the Nazi homeland. In an attempt to reduce casualty rates, the British bombed area targets largely by night. The Americans, convinced that high-altitude, daylight formation bombing was possible, attacked a succession of more precise industrial and military targets. Unfortunately, both air forces suffered huge "casualties, while German armament production rates actually increased. Employing "radar and an increasingly effective nighttime air and ground defense network, the *Luftwaffe* battled the British over the largest German cities. In the daytime, German fighters used heavier armament and increasingly sophisticated tactics to blast hundreds of U.S. bombers out of the sky. It was not until early 1944 and the employment of sizable numbers of new, long-range escort fighters like the P-51, that the American bomber formations became truly effective. Given the attritional nature of the air war in the proceeding months, it took an amazingly short time for the *Luftwaffe* to suffer the effects. In just six months American fighters largely swept the Germans from the skies, while Allied bombers finally concentrated on the target arrays that would bring the German military machine to a virtual halt—oil and "transportation.

Amphibious island-hopping actions and naval aviation dominated the Pacific War. Naval air warfare tactics were largely built around carrier-borne aircraft whose main

mission was to attack enemy ships. The primary targets in most engagements were enemy "aircraft carriers, and the best way to attack them was with coordinated formations of dive-bombers and torpedo planes. Navy fighter aircraft, in a way similar to their land-based counterparts, supported offensive air operations or flew in air defense roles. Long-range strategic bombing by the army air forces in the Pacific fell mainly to the American B-29. This aircraft, which eventually carried out the first atomic bomb attacks, was capable of large bomb loads and inflicted huge damage on Japanese cities in a series of incendiary raids between 1944 and 1945.

The development of "nuclear weapons appeared to fulfill the most visionary projections of the air power advocates. During many of the years of the "Cold War, the potential use of atom bomb-laden aircraft dominated the thinking of many leaders in the military and government. According to various airpower historians, the focus on strategic nuclear warfare in the U.S. "Air Force caused a corresponding atrophy in developments with regard to ground support or tactical aviation. High-altitude, long-range bombers like the Boeing B-52 and the medium-range, supersonic Convair B-58 came to symbolize the Cold War. Soviet air defense improvements predictably forced U.S. Air Force planners to develop increasingly sophisticated penetration tactics. At the same time, intercontinental ballistic "missiles (ICBMs) gradually took the place of the great masses of bombers at U.S. Cold War air bases. But the events of the "Korean War and the "Vietnam War also demonstrated that an air force organized and equipped mainly for a strategic nuclear mission was ill-suited for the demands of low-intensity conflict.

Vietnam validated the need for a well-balanced air force as well as principles that encompassed a broader base of air warfare tactics. The young U.S. Air Force aviators who had witnessed American defeat in Vietnam, and later rose to high rank, concentrated on doctrinal, organizational, technological, and tactical developments that would make their air force the most effective in the world. Both the air force and the navy established fighter weapon schools where classic air-to-air combat training with gun and missile could be conducted by experts. American aircraft industry produced a new generation of highly maneuverable and sophisticated jet aircraft, such as the Grumman F-14, the McDonnell-Douglas F-15, and the General Dynamics F-16. "Precision-guided munitions, the use of artificial intelligence, and the full exploitation of the electromagnetic and space environments all became part and parcel of the modern air battlefield. The air force devoted significant resources to data and intelligence collection as it became increasingly apparent that accurate targeting was the key to airpower's effectiveness. At intellectual resource centers like the U.S. Air Force Academy, Air Command and Staff College, the Air War College, and the National War College, officers began to think more critically about airpower. These myriad elements came together in the "Persian Gulf War of 1991, affording the world a powerful demonstration of the impact of modern airpower.

Despite the apparent technological domination of contemporary war, air warfare tactics show an unbroken human thread back to 1914-18. At its most fundamental level, air warfare continues to require a human being to shoot down an enemy aircraft or put munitions on target. As long as nations threaten each other, military airmen will

ponder the requirements for seizing control of the air and subsequently exploiting that control, much as they did during World War I.

TAFT, ROBERT (1889-1953), U.S. senator, isolationist. Born in Cincinnati, the son of William Howard Taft, later secretary of war and president, young Taft graduated from Yale University and Harvard Law School. He practiced law in Ohio and served in the state legislature before being elected to the U.S. Senate in 1938.

A conservative, isolationist midwestern Republican, Taft opposed most of the domestic and international policies of Democratic presidents Roosevelt and Truman. Favoring hemispheric rather than forward defense, he voted against the prewar draft in 1940 and Lend-Lease and the "Destroyers-for-Bases Agreement with Britain in 1941.

In the postwar era, he was not converted to "internationalism like former Republican isolationist Arthur Vandenberg of Michigan. Instead, although Taft voted for the establishment of the "United Nations, he came to believe it unsound and voted against U.S. participation in it. Taft opposed "NATO as a provocative and expensive act that would stimulate the "arms race and eventually force the United States to send troops to Europe. He later condemned President Harry S. "Truman's "Korean War policy, opposed his stand on Formosa, and challenged Secretary of State Dean "Acheson. Like former President Herbert C. "Hoover, Taft favored "neutrality and nonintervention, and recommended a defense policy based largely upon naval and airpower (called the "cavalry of the sky") rather than the deployment of U.S. ground forces.

Taft, "Mr. Republican," sought the presidential nomination in 1952 but lost to Dwight D. "Eisenhower, representing the GOP's eastern, internationalist wing. Taft extracted concessions for his support of Eisenhower, but he died within six months of becoming Senate majority leader.

TAIWAN STRAIT CRISES (1955; 1958). Several small, obscure island groups in the 100-mile-wide Taiwan Strait, which separates the Chinese mainland from Taiwan Island (also known as Formosa), twice became the center of world attention in the 1950s when conflicts between the Chinese Communists and the Chinese Nationalists threatened to draw the United States and other countries into wide-scale military conflict, including the use of "nuclear weapons. The U.S. handling of the crises also became an important issue in domestic politics, particularly during the 1960 presidential contest between John F. "Kennedy and Vice President Richard M. "Nixon.

After the triumph of the Communists over the Nationalists in 1949 on the mainland, the Chinese civil war continued in the offshore islands. The Nationalist forces of Chiang Kai-shek, in addition to holding Taiwan and Pescadores Island, also controlled several smaller islands, many just off the China coast, of which the most important were Quemoy and Matsu. The contending Chinese forces regularly fought for these small bits of territory, which were sparsely populated, economically unimportant, and of questionable military value.

During and after the * Korean War, the Nationalists used the islands as staging areas for harassment of the mainland and Communist shipping lanes. U.S. policy under both Truman and Eisenhower supported the Nationalists' retention of all territory under their control. Washington wanted no further territory to fall to the Communists. Elements of the U.S. Seventh Fleet had patrolled the strait since 1950 and U.S. military advisers were stationed on the islands.

The first major crisis began in September 1954, when Communist shore batteries heavily shelled Quemoy. The Nationalists retaliated with punishing air raids against the mainland and strengthened their island fortifications. Communist pressure on the islands continued, and top-level officials in President Dwight D. *Eisenhower's administration began to believe that the Communists were preparing to assault all the offshore islands and possibly even Taiwan itself. Washington strengthened its commitment to Chiang Kai-shek with a mutual defense treaty and congressional passage of the "Formosa Resolution," which allowed the president to commit U.S. forces to Taiwan's defense.

The crisis came in April 1955, when the United States threatened to use *nuclear weapons in the event of a Communist assault on Quemoy and Matsu. Simultaneously, Chinese premier Zhou Enlai signaled Beijing's willingness to negotiate with the United States. Tensions rapidly dissipated and direct talks between the two sides began in Warsaw. It does not appear, however, that the Communists were actually deterred by the nuclear threat.

In August 1958, during an international crisis in the Middle East, another U.S.-China confrontation broke out over Quemoy and Matsu, after the Communists again bombarded the islands from onshore batteries. This confrontation was shorter but more intense than the first one. For several weeks, it again appeared that the United States, which sent several carrier groups to the region, might be drawn into a war with China, and possibly with the Soviet Union, which publicly supported Beijing's "Liberate Taiwan" campaign. But like the first crisis, tensions broke as Washington and Beijing resumed negotiations and Beijing backed away from an assault.

Over the years, Beijing seized most of the offshore islands, except Quemoy and Matsu, which remain in Nationalist hands.

TANK DESTROYERS were the U.S. Army's response to Germany's *Blitzkrieg* armored victories over Poland and France in the early years of World War II. Lt. Gen. Lesley J. McNair, head of army doctrine and training, decided that mobile, powerfully gunned antitank units were the best way to defeat enemy tanks. In November 1941, the War Department ordered the creation of such units, designated "tank destroyer" battalions.

Tank destroyer weapons could be either towed or self-propelled. The towed weapons were 3-inch *artillery pieces pulled by half-tracks. Self-propelled tank destroyers had 3-inch, 76mm or (late in the war) 90mm guns mounted on tank chassis within fully rotating, open-topped turrets. These carried less armor and mounted more powerful guns than the standard M-4 Sherman tank.

Tank destroyer units were trained to operate aggressively and en masse to destroy enemy armor. In combat, however, they were usually dispersed among front-line units, where they provided their most valuable service as mobile artillery directly supporting the infantry. Paradoxically, U.S. tank destroyers that did encounter heavy German tanks were generally outgunned.

After World War II, the army decided that there was no functional difference between a tank destroyer and a medium tank. Thereafter, the tank destroyer's fire support and antitank missions were officially assigned to *tanks. The last tank destroyer units were disbanded in 1946.

—Christopher R. Gabel

TANKS. The tank, invented in *World War I out of military necessity, immediately captured the popular imagination. The machine's raw power, gadgetry, speed, and size, along with the secrecy with which it was developed, created for it a mystique. Initially, the very name *tank* was employed as part of a deception to shroud its true nature as a weapon.

The British first developed this mobile, armored war machine in a program initiated by E. D. Swinton and Maurice Hankey; Winston S. *Churchill, then first lord of the Admiralty, also supported the program. The first British tank, the Mark I, was a rhomboid-shaped, tracked heavy vehicle weighing 26 tons, with two 57mm guns and a speed of 3.7 mph. On 15 September 1916, at the Battle of the Somme, after horrific infantry losses, forty-nine Mark I tanks were sent in to support infantry attack across no-man's-land. Early critics charged they were committed in insufficient numbers to make a difference. In September 1917, the French introduced their Renault FT 17, a smaller (6-ton), lighter-armed (one 37mm gun), faster (4.8 mph) tank, with what became the classic tank design of a swivel turret. The Americans used mainly Renault tanks in France.

During the interwar years, the limited role assigned to tanks by U.S. infantry generals, as well as budget limitations, imposed serious constraints on design and development in the United States. J. Walter Christie, an American automotive engineer, developed a suspension system that allowed tanks high speed and overland performance. His

M1919 tank, which evolved into the M1928/1930 or T-3 medium tank, weighed 9 tons, carried a 37mm gun, and attained speeds of 27 mph. But the U.S. Army failed to continue Christie's contract.

In contrast, the Soviet Union used Christie's design and production techniques to develop by 1939-40 the T-34, a highly reliable and balanced tank weighing 29 tons, armed with a 76.2mm gun, and reaching a maximum speed of 34 mph. It became the Red Army's main battle tank in World War II and was used by North Korean forces in the "Korean War.

In Great Britain, military theorists J. F. C. Fuller and Basil H. "Liddell Hart envisioned a small but mobile army with tanks as the centerpiece. After many problems, the British introduced the Crusader (22 tons, 57mm gun, and 26 mph maximum speed), used early in World War II. But defects and battle experience led to its replacement in 1943 by the Cromwell (31 tons, 75mm gun, 31 mph).

French experimentation before 1939 developed the Heavy B (CHAR) tank, probably the best in the world at the onset of World War II. Huge for its day, it was heavily armored, weighing 34 tons, had a 75mm gun mounted on the front hull and a 47mm gun on the turret, but sacrificed maximum speed to only 17 mph. The tank's firepower and armor advantage were, however, offset in 1940 by French doctrinal and organizational failures.

In September 1939, when the German Army invaded Poland, it had not yet accepted Gen. Heinz Guderian's ideas about armored warfare and used tankette-type vehicles more suitable for training. But before invading France in May 1940, the Germans achieved great advances in doctrine, unit reorganization, and tank manufacture, incorporating superior *Panzer* tanks (23 tons, 24 mph, and guns increased from 37mm in the *Panzer* III to 75mm in the *Panzer* IV tanks). To counter the Soviet's effective T-34s, the Germans produced the *Panzer* V. This "Panther" tank, probably the best overall German tank, weighed 50 tons in later versions, with speeds of up to 28 mph and armed with a 75mm gun.

By 1942, the Germans fielded the Tiger tank, which challenged established ideas about armored warfare. Despite problems in maneuverability, serviceability, and speed (23 mph on roads, 12 mph cross-country), this heavy tank provided extraordinary armor protection (63 tons) and firepower with its 88mm gun.

In the United States, the M4-A Sherman replaced the awkward Grant early in World War II to become the main American battle tank. More than 45,000 of these reliable, rugged, and versatile medium tanks were produced for the U.S. Army, as well for Great Britain and the Soviet Union. The early model weighed 33 tons, had a speed of 23 mph, and was armed with a 75mm gun. Subsequent modifications in the A-3 increased weight to 35 tons, speed to 29 mph, and the gun to 76.2mm. Though the Sherman was no match individually with any German tank, and its gasoline rather than diesel fuel was highly explosive, it proved highly successful, due to the numbers committed and its reliability. In various forms Shermans were used by the United States in the "Korean War and by the Israel Defense Force in the Six-Day War of 1967 when a "Super Sherman" was mounted with a 105mm gun.

In 1945, the British produced a remarkable tank based on their war experiences, the Centurion, which became the backbone of British armored forces for a quarter of a cen-

tury. This tank was noted for its reliability and proved itself in combat in the Korean War. The Centurion I mounted a 17-pound gun and was produced in thirteen versions, the last manufactured in Israel. It was considered the best all-around tank in the West in the 1950s and 1960s. The final Israeli version weighed 54 tons, sported a 105mm gun, and traveled at 21 mph.

Tank design was revolutionized in 1945 by the new Soviet JS-3 Stalin heavy tank. This eventually evolved to the T-10 heavy in the 1950s. Its design allowed a tank of 51 tons at 23 mph and supported armament of a 122mm gun. During the "Cold War, the JS-3's low, sleek design was perpetuated by the West German Leopard, the French AMX 30, and the British Chieftain. The same turret design characterized the Soviets' medium tanks, evolving from the 1950s through the 1970s from T-54/55, T-62, and T-64 to T-80. Weight increased from 42 to 46 tons, speed from 31 to 46 mph, and armament from 100mm to 114mm and finally 125mm on the T-64 and T-80.

The United States pursued a different design approach. Its M-48 (1952) and M-60 (1960) main battle tanks sacrificed low weight and silhouette in favor of an excellent 105mm gun system and reliability. The M60A-3 version weighed 57 tons and attained 30 mph.

In 1973, man-packed wire-guided missiles caused massive tank losses in the Arab-Israeli War, which, along with "NATO's new "Active Defense" doctrine demanding high-speed lateral movement, resulted in major changes in tank tactics and development. When first produced in the mid-1970s, the U.S. Army's M-1 Abrams tank weighed 68 tons and was unique in using a multifuel turbine power plant and innovative suspension system allowing speeds over 45 mph. Initially armed with the reliable M-68 105mm gun, the Abrams in its subsequent models increased combat weight and armament to mount a smoothbore 120mm gun. The Abrams proved its technological superiority in NATO war games and in actual battle during the "Persian Gulf War.

In the 1990s, the tank of the future was being designed using such techniques as automatic loaders to reduce crew size, more efficient power plants, new reactive armor to defeat larger gun size and anti-tank "missiles, and special armor to increase protection and reduce weight for faster deployment.

TARAWA, BATTLE OF (1943). In June 1943, the "Joint Chiefs of Staff ordered Adm. Chester W. "Nimitz, Commander in Chief, Pacific Ocean Areas/Pacific Fleet, to invade the Japanese-held Gilbert Islands with a target date of November 15. The immediate objective of the Fifth Fleet would be Tarawa Atoll, with the target Betio Island. The Fifth Amphibious Force, under Rear Adm. Richmond Kelly Turner, would carry and support the V Amphibious Corps (VAC) under Marine Maj. Gen. Holland M. Smith. The landing force would be the 2d Marine Division. Betio

was two miles long, 500 yards wide at its broadest, and in no place more than 10 feet above sea level. Most of it was filled with an airstrip; the rest was comprised of fortifications and more than 200 guns including two British-made eight-inch naval rifles. The commander of the 5,000-man island garrison was Rear Adm. Keichi Shibasaki. The United States decided to land three battalions abreast on the northern, or lagoon, side of the island. The transports would have to stand outside the atoll, there would be a long approach of ten miles for the landing craft, and it was questionable if there would be enough water over the reef to allow them to get to the beach. As a result, the Marines would have to depend on thin-skinned amphibian tractors, or amtracs, barely tested at Guadalcanal. Just 100 were available, enough for the first three waves. In the assault was the 2d Marines, reinforced by the 8th Marines, also an infantry regiment. The 6th Marines, the third infantry regiment of the 2d Division, was held in corps reserve. H-hour was 8:30, November 20. The first waves touched down ashore at 9:14. Behind them, ordinary landing craft were stopped at the edge of the reef and Marines on board had to wade in a half mile under heavy fire. By nightfall, Marines held a shallow box-shaped perimeter with elements of four battalions, and another battalion held a tiny beachhead on the western end of the island. The remaining assault battalion was still afloat beyond the reef. On the morning of November 21, the Marines jumped off in the attack, and by evening reached the south side of the island. Sometime during the day, Admiral Shibasaki died in his bunker. On the west end of the island, a fresh battalion was landed. By the evening of November 22, the Marines held the western two-thirds of Betio. The next day, another previously uncommitted battalion continued the attack eastward. Maj. Gen. Julian C. Smith, commander of the 2d Marine Division, declared the island secured. His division, which had begun the battle with 18,600 Marines, counted 990 dead and 2,391 wounded. Four Marines were awarded the Medal of Honor, three posthumously. The Tarawa operation was the first assault in the Pacific War against a heavily defended island, and many lessons were learned from it, including the need for many more amtracs. The operation was extensively recorded on 35mm news film, subsequently shown in theaters across the country. Shots of dead Marines floating along the Tarawa beaches brought the war home graphically to the American people.

TAYLOR, MAXWELL (1901-1987), "World War II and "Korean War Veteran, chairman Joint Chiefs of Staff (JCS), ambassador to Vietnam. Maxwell Taylor graduated from West Point in 1922, being commissioned first in the engineers and subsequently in the field artillery. He spent thirteen of the interwar years in schools, either as teacher or student, culminating in his graduation from the Army War College in 1940.

In September 1943, while part of the 82nd Airborne Division during World War II, he entered Italy behind German lines on a secret mission for Gen. Dwight D. Eisenhower to assess the ability of the Italians to support an American airborne drop near Rome. On Taylor's advice, Eisenhower canceled the plan as a potential disaster.

In March 1944, Taylor assumed command of the 101st Airborne Division and at the "D-Day landing and parachuted with his division behind enemy lines, becoming the first American general to land in Nazi-occupied France. After the war, Taylor was appointed superintendent of West Point (1945-49) and thereafter held a series of increasingly important assignments until he assumed command of the U.S. Eighth Army in February 1953 during the Korean War. He served as chief of staff, 1955-59, during the Eisenhower presidency. At the end of his tour as he retired from the army, Taylor published *The Uncertain Trumpet*, a book critical of the Eisenhower administration's emphasis on reduced defense budgets and on airpower and nuclear "weaponry over ground forces.

But Taylor is best known for his involvement in the Vietnam War. In 1961, President John F. Kennedy recalled Taylor to active duty as his military representative and also named him chairman of the Special Group Counterinsurgency. Taylor participated in JFK's decision sharply to increase the scale of U.S. support for South Vietnam. Subsequently, after the president named him chairman of the JCS, Taylor was unsuccessful in opposing the U.S. decision to support the overthrow of Ngo Dinh Diem, the South Vietnamese chief of state.

In 1964, Lyndon B. Johnson appointed him ambassador to South Vietnam. Taylor strongly supported U.S. air strikes against North Vietnam, but unsuccessfully opposed LBJ's 1965 decision to introduce U.S. combat troops into the war. From 1965 to 1969, he served as special consultant to the president on Vietnam.

Maxwell Taylor was one of the major American military figures of the twentieth century. He was a transition figure—the last of the World War II heroic generals and the first of a new breed, the managerial generals. More soldier than statesman, his major involvement in the American political scene took place during the Vietnam War, in which his role was central but not decisive.

TAYLOR, ZACHARY (1784-1850), "Mexican War general and U.S. president. Elected president in 1848, Zachary Taylor served only sixteen months in office before his death in 1850. Despite holding the highest office in the land, Taylor is best remembered as a general in charge of the first campaign by the American forces against Mexico during the Mexican War.

Born in Virginia, the son of a prosperous landowner, Taylor grew up in Louisville. In 1808, he gained a commission and served in the "War of 1812. For the next three decades he participated in Indian wars and gained the rank of general with the nickname "Old Rough and Ready" during the "Seminoles Wars. As commander of the U.S. troops on the Mexican frontier with Texas, Taylor directed a series of battles near the Rio Grande. After victories at Palo Alto and Resaca de la Palma in May 1846, he pressed on into Mexico, eventually capturing Monterrey in September after a vigorous fight. In February 1847, his army barely repelled a powerful attack at Buena Vista.

A hero throughout the United States, Taylor was passed over as commander for the invasion of Mexico at Veracruz.

In 1848, Taylor ran for president as a Whig and was elected, only to die early in his term.

TECUMSEH (c. 1768-1813), Shawnee chief and leader of an Indian confederation. Born when the Shawnee Indians were fighting to defend their Kentucky and Ohio lands, Tecumseh lost his father at the Battle of Point Pleasant (1774), a brother in the American * Revolutionary War, and another in the wars that followed. He fought against Josiah Harmar (1790), Arthur St. Clair (1791), and Anthony Wayne (1794). He refused to sign the Treaty of Greenville (1795), which ceded most of Ohio to the United States, and in the next decade emerged as the leading opponent of American expansion.

In 1805, following a vision, Tecumseh's brother, Tenskwatawa, began to preach a return to traditional ways and rejection of white influences. Tecumseh broadened and directed the religious movement into a multiracial confederation opposed to further land cessions. A gifted orator, he carried his message of Indian unity from Canada to Florida.

In 1811, while Tecumseh was spreading his message in the South, William Henry Harrison, governor of Indiana Territory, attacked and burned Tenskwatawa's village at Tippecanoe, costing the Indian confederation much unity and momentum.

In the *War of 1812, Tecumseh allied with the British and assisted Gen. Isaac Brock in capturing Detroit. After Brock's death, however, the British-Indian alliance began to falter. Tecumseh despised the caution of the new commander, Col. Henry Proctor, but accompanied the British army on its retreat to Canada after the Americans won control of Lake Erie. He was killed during the Battle of the Thames in October 1813.

Tecumseh was not the first Indian to preach united resistance on the part of the tribes, but he was the most effective, forging a confederation of unprecedented range. Intra-tribal divisions—as many opposed as supported him among the Shawnees and other Indian nations—undermined his efforts to resist U.S. power. His death killed hopes for a united Indian state and ended major Indian resistance north of the Ohio River.

TELLER, EDWARD (1908-), nuclear physicist. The Hungarian-born physicist earned his Ph.D. in physical chemistry in Germany after academic study and research in Munich and Leipzig. In Germany during the Weimar years, Teller taught at the University of Göttingen while studying atomic physics under Niels *Bohr in Copenhagen. In 1935, he went to the United States to teach at George Washington University.

Teller worked with Enrico *Fermi at the University of Chicago to create the first self-sustaining nuclear chain reaction. In 1943, he was recruited to work with J. Robert *Oppenheimer on the fission bomb at the *Manhattan Project in Los Alamos, New Mexico. While at Los Alamos, Teller began his own research on the feasibility of a thermonuclear or hydrogen fusion bomb. The USSR's explosion of an atomic bomb in 1949 galvanized Teller strongly to advocate U.S. development of the hydrogen bomb. After President Harry S. *Truman approved the H-bomb project in 1950, Teller returned to Los Alamos to begin work on the new weapon. The collaboration between Teller and the physicist S. M. Ulam proved successful. The fusion concept was successfully tested in the Pacific at Enewetok atoll on 1 November 1952.

As the *Cold War intensified, Teller gave testimony at government hearings in 1954 that contributed to the removal of Oppenheimer's security clearance. After helping in 1952 to create the Lawrence Livermore nuclear laboratory in Berkeley, California, Teller divided his time between working at Livermore and teaching physics at Berkeley.

Teller has been a powerful policy advocate for many years. His strong anti-Communist views led him to oppose the 1963 *Limited Test Ban Treaty and to influence President Ronald *Reagan to propose the *Strategic Defense Initiative in 1983.

The TELLER AMENDMENT (1898), sponsored by Republican senator Henry M. Teller of Colorado, was adopted along with congressional authorization, 20 April 1898, for the use of U.S. military force to establish Cuban independence from Spain, following President William

• McKinley's request for force on 11 April. In the amendment, the United States disclaimed any "intention to exercise sovereignty, jurisdiction or control over [Cuba] except for the pacification thereof, and asserts its determination when that is accomplished to leave the government and control of the island to its people."

Teller was a friend of Cuban independence and had unsuccessfully supported U.S. recognition of the Cuban insurgents. The unanimous adoption of his amendment reflected considerable opposition to the annexation of Cuba on various grounds—racial, cultural, and economic (competition with U.S. sugar growers). It did not apply to other Spanish possessions such as Puerto Rico, Guam, and the Philippines. While foreclosing forcible annexation of Cuba, it did not prevent the postwar establishment of a U.S. protectorate over the island under Senator Orville Platt's amendment to the Army Appropriations Bill of 2 March 1901 (the *Platt Amendment), which was made part of the Cuban Constitution, 1901-34, and authorized U.S. military intervention in Cuba when deemed necessary.

TENURE OF OFFICE ACT (1867). This statute resulted from a fear on the part of congressional Republicans that

President Andrew "Johnson, in the course of a bitter dispute over "Reconstruction policy, would make sweeping removals of federal officeholders and replace them with Democrats. The law sought to protect officials appointed with Senate consent "until a successor shall have been in like manner appointed and duly qualified." Cabinet officers were to remain in place "for and during the term of the President by whom they may have been appointed, and for one month thereafter."

The latter provision appeared to protect Secretary of War Edwin M. "Stanton, who had allied himself with the congressional position on Reconstruction. Since the U.S. Army was the chief enforcement agency for federal policy in the South, control of the army, through the War Department, was vital to both Johnson and Congress. Johnson vetoed the measure as unconstitutional; Congress overrode the veto on 2 March 1867.

In February 1868, Johnson appeared to violate the act by removing Stanton. The House of Representatives impeached Johnson, citing his violation of the Tenure of Office Act as one reason. At the trial, the president's defense team raised serious questions about the statute's constitutionality. They also raised doubts that it even applied to Stanton, who had been appointed not by Johnson but by Abraham "Lincoln. These doubts, together with other considerations, caused enough senators to vote not guilty that Johnson escaped conviction by a single vote. Efforts to repeal the law began in 1869 and succeeded in 1887. In 1926, the Supreme Court, reviewing the presidential removal power in *Myers v. United States*, held unconstitutional the Tenure of Office Act and an 1876 successor.

TERRORISM AND COUNTERTERRORISM. Terrorism is defined in Title 22 of the United States Code, Section 2656f(d) as "premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents, usually intended to influence an audience." Terrorism falls into the spectrum of low intensity conflict, relying upon the methods and strategies of unconventional warfare in targeting businesspeople, tourists, and other civilians to gain exposure, pressure governments, and extort concessions.

It is important to differentiate among state terrorism, state-supported terrorism and sub-state terrorism.

"State terrorism" refers to the use of terror by a government, using the resources of the state—including the police, judiciary, military—against its own citizens to quell domestic opposition to its policies, as exemplified by the "dirty war" in Argentina during the 1970s and early 1980s in which an estimated 15,000 to 30,000 regime opponents were killed or disappeared. "State-supported terrorism" refers to situations where states provide logistical, financial and training support for a terrorist organization. In 1998, the U.S. Department of State designated Cuba, Iran, Iraq, Libya, North Korea, Sudan, and Syria as state sponsors of terrorism. Sub-state terrorism refers to acts of terrorism perpetrated by non-state actors.

In considering sub-state terrorism, one can distinguish between five principal varieties:

Social revolutionary terrorism, also known as terrorism of the left, includes those acts perpetrated by groups seeking to overthrow the capitalist economic and social order and was typified by the European "fighting communist organizations" active throughout the 1970s and 1980s (e.g., the Red Army Faction in Germany and the Red Brigades in Italy), though social revolutionary groups have been active around the world, including the Shining Path in Peru and the Japanese Red Army Faction in Japan.

Religious extremist terrorism is characterized by groups seeking to maintain or create a religious social and political order and has included groups representing established religious doctrines as well groups representing "new religions." Traditional groups include Christian, Jewish, and Islamic extremists, while new religions include groups like Aum Shinrikyo, responsible for the 1995 subway sarin attack in Tokyo, Japan.

Nationalist-separatist terrorists, also known as ethnonationalist terrorists, includes those groups fighting to establish a new political order or state based on ethnic dominance or homogeneity. The Irish Republican Army, the Liberation Tigers of Tamil Eelam (LTTE) of Sri Lanka, the Basque Fatherland and Liberty (ETA) in Spain, and the various groups representing Palestinian causes are prominent examples.

Right-wing terrorists comprise those groups seeking to maintain an extant political order or to return society to an idealized "golden age" of the past. Examples include neo-Nazi terrorist groups and groups espousing fascist ideology.

Single-issue terrorism, as the label suggests, represents groups acting on a single issue, such as the environment or animal rights.

The era of modern terrorism was ushered in by the dramatic slaying of Israeli athletes by the Palestinian group Black September during the globally televised 1972 Olympics in Munich, Germany. While terrorism prior to 1972 principally had been a domestic phenomenon, the Munich attack emphasized the expansion of tactics and targets to include exploitation of global mass communications networks and international aviation, internationalizing terrorism.

The relationship between terrorism and the media has been extensively studied (Nacos, 1994), and has been found to influence the tactics and strategies of modern terrorist groups. According to one estimate (Jenkins, 1985: 12), 95% of all terrorist attacks are designed to maximize exposure and influence through the media. The hijacking of airlines ("skyjackings") was particularly prevalent during the 1970s and early 1980s, as were hostage taking episodes. All received extensive media coverage.

The terrorist threat to the United States has traditionally come from two distinctly different strains of political terrorism: the leftist social revolutionary terrorists of Western Europe, attacking representatives of the United States as symbols of capitalism and Western militarism in the form of the North Atlantic Treaty Organization (NATO); and the national-separatist and religious fundamentalist groups of the Middle East—especially those connected with the liberation movements in Palestine—who attack U.S. forces and civilians first as supporters of Israel and second in connection with the rise of Islamic fundamentalism.

The German Red Army Faction (RAF) was responsible for numerous bombings of U.S. military installations. U.S. forces have also been targeted in Italy by the Red Brigades

and in Greece by the Revolutionary Organization "November 17." Apart from bombings, European social revolutionary groups have been engaged in assassination and kidnapping attempts against U.S. military and NATO leaders stationed in Europe.

While terrorism committed by the European leftist groups against U.S. targets in Europe remained fairly localized, terrorists operating out of the Middle East, especially those organizations supported by states hostile to U.S. interests, such as Syria, Libya, and Iran, have operated on a more global setting, taking advantage of air travel and modern mass communications to pressure the United States and its allies into withdrawing support for Israel and diminishing U.S. and Western influence in the region.

America's first prolonged experience with terrorism began in 1979 with the seizure of the U.S. Embassy in Tehran, Iran, and the ensuing hostage crisis in which U.S. diplomats were held for 444 days. U.S. airliners have been susceptible to skyjackings, such as the 1985 Trans World Airlines (TWA) flight 847 skyjacking by Abu Nidal terrorists resulting in the deaths of 2 Americans, and bombings, the most spectacular of which was the 1988 bombing of PAN AM flight 103 by suspected Libyan terrorists.

Terrorists operating out of the Middle East frequently target U.S. military personnel. PLO splinter groups were responsible for the 1983 bombing of the U.S. Embassy in Beirut, killing 86 and wounding 100, and the car-bombing of the U.S. Marine barracks at Beirut airport, resulting in the deaths of 241 U.S. servicemen. U.S. servicemen were targeted by Libyan terrorists in the 1986 bombing of a nightclub in Berlin, Germany. Following the "Persian Gulf War" in 1991, U.S. military bases in Saudi Arabia have become targets of Islamic groups heavily opposing U.S.-Saudi Arabian cooperation and the continued presence of U.S. forces on Saudi Arabian soil. The bombing of the Khobar Towers military residence in Dhahran, Saudi Arabia, resulted in 19 deaths and 500 wounded.

Evidence suggests changing trends in terrorism as the twentieth century draws to a close. First, there is a trend toward fewer, but more lethal acts. Second, there are fewer claims of responsibility being made for attacks, perhaps reflecting the growing prevalence of religious extremist terrorism and transnational terrorism. Third, the collapse of the Soviet Union has raised concern that poorly guarded nuclear, chemical, and biological materials might find their way into the hands of terrorists. Finally, international terrorists have for the first time attacked targets within the territorial United States with the World Trade Center bombing in 1993 and the subsequent conspiracy to bomb several other New York City landmarks by Middle East terrorists. The U.S. has also experienced its most devastating case of domestic anti-government terrorism with the 1995 bombing of the Alfred P. Murrah Federal Building in Oklahoma City, resulting in 168 deaths.

To combat terrorism, the United States' counterterrorism policy follows three general rules: the U.S. does not negotiate with terrorists; the U.S. will treat terrorists as criminals and pursue them aggressively; and the U.S. will apply maximum sanctions upon states supporting terrorism and encourage other states to do so as well (U.S. Department of State, 1996:iv). Accordingly, the U.S. has responded to the threat of modern international terrorism with a multi-tracked approach, including diplomatic and legal efforts and military interdiction and deterrence. The United States

is a party to nine major multilateral conventions that define states' responsibilities toward countering terrorism. Among them are treaties protecting diplomatic personnel and the safety of civil aviation and maritime navigation; outlawing the taking of hostages; the physical protection of nuclear materials; and the marking of explosives for identification.

Following the passage of the "long arm" anti-terrorism statute in 1984, the Department of Justice has been empowered to arrest foreign nationals who have committed acts of terrorism against U.S. citizens for trial in the U.S. court system. Fawaz Younis (1987) and Mohammed Al Rezaq (1995) were arrested abroad by agents of the Federal Bureau of Investigation and successfully tried in the U.S. The Department of Defense and U.S. military forces have played a mixed role in support of the United States' counterterrorism policy. Delta Force, the United States' secretive military unit specifically designed to counter terrorism, was founded during the Carter Administration (1976-1980). Modeled on the British Secret Air Services (SAS), Delta Force is comprised of elite commandos skilled in hostage rescue and incident interdiction. However, Delta Force's first deployment, Operation Eagle Claw (1980) to rescue the U.S. diplomats held hostage in Iran, proved a disastrous failure. Delta Force was joined in 1980 by a Navy counterpart, Seal Team 6, also tasked primarily with hostage rescue.

In addition to hostage rescue, U.S. military forces have been used to retaliate against states which have sponsored terrorist attacks against U.S. targets, such as the 1986 bombing raid on the Libyan capitol Tripoli in response to Libyan involvement in several dramatic acts of international terrorism in 1985 and 1986.

In a triumph of timely intelligence and coordination with the U.S. military, the aircraft carrying the hijackers of the Achille Lauro was intercepted by U.S. warplanes and forced to land at a U.S. Air Force base in Italy in October, 1985. The standoff at the airport between Italian and U.S. forces claiming jurisdiction over the captured terrorists, however, emphasizes the difficulties of pursuing U.S. counterterrorism policies abroad.

TET OFFENSIVE (1968). The attacks by Communist forces inside South Vietnam's major cities and towns that began around the Vietnamese New Year ("Tet") of 1 February 1968 were the peak of an offensive that took place

over a period of several months during the Vietnam War. Gen. William C. Westmoreland, the American commander in Vietnam, believed the attacks to be a last "throw of the dice" by the losing side. The attacks that Americans dubbed the "Tet Offensive" were just part of what the Communists called a "General Offensive and Uprising," designed to jolt the war into a new phase. The offensive ultimately achieved the Communists' aim, but at a price many of them thought excessive.

The offensive had long-term conceptual origins in Vietnam's August Revolution of 1945, in which the Communist-led Viet Minh had instigated popular uprisings in the cities to seize power from a puppet government Japan had installed before its defeat. Two decades later, as American commitment to the anti-Communist government in Saigon deepened in the early 1960s, the Communists looked to that earlier event for inspiration. Lacking the military power to inflict outright defeat on the American military, the Communists had somehow to destroy American confidence that "limited war" could eventually bring victory for the United States. By sending armed forces directly into the South's cities and fomenting rebellion there, the Communists hoped to pull down the Saigon government or facilitate the rise to power of neutralists who would demand the withdrawal of U.S. forces. Even if the offensive did not bring immediate victory, the Communists calculated it would allow rural forces to disrupt the Opacification program, destroy the American illusion of success, and induce the United States to enter negotiations in which Hanoi could bargain from a position of strength.

The plan formally approved by the Communist Party political bureau in Hanoi in July 1967 recognized that American, allied, and Saigon forces constituted a much more formidable foe than the shaky regime the August Revolution had toppled in 1945. The offensive therefore actually began in September 1967, with artillery-supported assaults by the People's Army of Vietnam (PAVN), supported from the North, on the U.S. combat bases located along route 9 just south of the demilitarized zone, and then with operations in the central highlands, to test American reactions. The tests revealed that the Americans would remain in defensive positions; and although PAVN troops would face devastating firepower, massing for attack on these positions in remote areas could lure significant forces away from population centers.

The American response encouraged the Communists to position up to 40,000 regulars of Divisions 304, 320, 325, and 324B in December 1967 around Khe Sanh, a U.S. Marine outpost near the western end of route 9. The outpost was an attractive target because it lay only fourteen kilometers beyond the terminus of an improved road over which the PAVN could move heavy equipment. Upon detecting the Communist buildup, the American command increased forces defending the base to 6,000 troops, including a battalion of Saigon's Army of the Republic of Vietnam (ARVN). After the PAVN opened the attack with a massive artillery barrage on 21 January, the United States shifted 15,000 more troops from the South's 5 northern provinces to route 9. Fifty thousand U.S. troops eventually fought at or supported the base.

Despite superficial similarities between the situation at Khe Sanh and Dien Bien Phu, where the PAVN had overrun a French force in 1954, PAVN commanders knew they could not duplicate that feat in the face of massive Ameri-

can air and ground firepower. The battle was worth the effort to them because of the attention and resources it drew from the lowlands. Still, their orders were to destroy if possible one or more of the route 9 bases to facilitate the movement of PAVN regulars into the South. Although unable to create a major breach, a PAVN regiment overran the Special Forces/Civil Indigenous Defense Group camp at Lang Vei, eight kilometers west of Khe Sanh, on 7 February. Soviet-supplied PT-76 light amphibious tanks of the People's Army made their first appearance of the war at Lang Vei.

Meanwhile, U.S. intelligence had detected preparations for attacks on urban centers, and in a few localities commanders had taken precautionary measures. But analysts did not believe the Communists were capable of achieving, or bold enough to attempt, what the evidence indicated they were planning. With General Westmoreland and Saigon's President Nguyen Van Thieu convinced that Khe Sanh was the Communists' primary target, Communist forces had begun attacking outposts around cities and towns. A mixed force of maneuver and guerrilla troops estimated at around 60,000 and composed largely of troops recruited and trained in the South, had then slipped past these outposts to enter 5 municipalities, 36 province capitals, and 64 district capitals.

In the night of 29 January, assault forces attacked government offices in Qui Nhon, Kontum, Pleiku, Darlac, and Nha Trang. Attacks in other cities began over the next two days. In Saigon, the sapper team that blasted into the U.S. Embassy compound captured the headlines, but attacks on Tan Son Nhut airfield, the ARVN general staff compound, government ministries, and the presidential palace involved larger forces and took greater effort to beat back. *Tanks and helicopter gunships striking a battalion-sized unit in Cholon leveled several city blocks. The attacks sputtered out in days, except in Hué, where a force of 7,500 Communist troops held out behind the walls of the old city until 24 February.

Only in scattered places did people join the Communists in demanding the establishment of "revolutionary administrations." Despite initial disarray, the ARVN and Saigon government rallied rather than disintegrated. Perhaps half of the assault forces died in the attacks or retreat. Although the Communists increased control in rural areas when U.S. and Saigon forces redeployed to route 9 and the cities, they were unable to defend these gains when U.S. and ARVN units returned to the countryside.

The Communists launched follow-up attacks against the cities in May and August, but the PAVN had taken such heavy casualties along route 9 that it could not move forward to support them, and forces attacking the lowlands suffered further grave depletion. The reasons for these disappointing results remained for years a source of controversy among the Communists themselves, who blamed inadequate PAVN involvement, too little time to organize popular participation, and decisions that left lowland forces too long in exposed positions. PAVN Gen. Tran Van Tra admitted in his memoir, *Concluding the Thirty Years War* (1982), that the offensive caused a decline in strength from which Communist forces did not recover for two years. With better planning, the Communists believed, the offensive could have brought the war to an end more quickly.

In the aftermath, General Westmoreland saw an opportunity to seize the initiative and requested 206,000 more

troops, but for many Americans both the offensive and the request discredited claims that the war could be won soon or at an acceptable cost. Westmoreland's defenders blamed media coverage for turning public opinion against the war, but in fact the press generally accepted the official interpretation of Tet as a major military defeat for the Communists. It was evident nonetheless that the United States could not control the war's scope and duration. President Lyndon B. Johnson sought the advice of dovish civilians, announced he would not seek nomination for another term, declared a bombing halt over most of North Vietnam, and called for peace talks, which opened in May 1968. The offensive thus titled the United States away from expanding involvement and toward eventual withdrawal.

TEXAS WAR OF INDEPENDENCE (1836). The origins of the Texas War for Independence were directly linked to the growth of the province following Mexico's own national independence in 1821. Mexican liberals bent on economic progress opened the borders to immigrants and provided them generous land grants and considerable local authority. The population grew tenfold by 1835 and the central government soon became concerned over the Anglo-American majority in the province. Disputes arose over Mexico City's efforts to govern Texas more firmly and prohibit the importation of more slaves. In 1835, President Antonio Lopez de "Santa Anna centralized the government, abolishing the 1824 constitution and snuffing out provincial rebellions. Many Anglo and Mexican residents of Texas protested. Resistance to the central government in turn created in Mexico a determination to rule Texas firmly and to reduce the malcontents to obedience by force.

Mexico City dispatched troops to Texas in the late summer of 1835, and fighting broke out that October. The campaign focused on the town of San Antonio de Béxar, which contained Mexico's major military garrisons and political offices. Hastily assembled Texas forces were organized loosely under colonizer Stephen F. Austin, who had difficulty disciplining the democratic-minded volunteers. Hostilities interrupted efforts to establish a stable provisional government and accentuated problems of supply and strategy. A "Consultation" held in November endorsed a compromise view of the purpose of the war (maintaining Texas rights under the 1824 constitution, including the right to import slaves) and created an unworkable interim political structure. The rebel Texan forces at Béxar, including a unit organized in the United States as the New Orleans Greys, conducted a loose siege spiced by a couple of skirmishes, and continued debates, until 5 December, when commander Edward Burleson ordered an assault.

Five days of house-to-house warfare ended with capitulation by the Mexican commandant, Martín Perfecto de Cos.

Most of the Texas residents returned home in the knowledge that volunteers were streaming in from the United States. A handful remained at Béxar, but most concentrated around Goliad near the coast. Sam Houston, a dynamic former governor of Tennessee who had moved to Texas in 1833, was appointed commander of the Texan revolutionary army and gave defensive orders.

Into this setting in February 1836, Santa Anna led an army of 5,000 regulars and conscripts to Texas on a march through cold, wet, and wind. This force had superiority in officer training, discipline in the ranks, and professional cavalry, as well as numbers, although the conscripted peasants were ill-prepared. The rebel army suffered from smaller numbers, disjointed command, and a defensive line stretching 200 miles, from Béxar to the coast. The Texans always fought better where terrain gave the advantage to accurate rifled weapons and minimized close order drill, horse, and "artillery. Such conditions did not prevail when 550 men under Mexican Gen. José de Urrea arrived from Matamoros and slashed up details of the Texas volunteers in engagements at the towns of San Patricio and Refugio, and at Agua Dulce creek in late February and March 1836.

These men, under command disputed between James Bowie and William Barrett Travis, concentrated in a walled mission in Béxar called the Alamo on 23 February 1836, when the advance units of Santa Anna's main army were first sighted. Both sides probably made significant errors. Travis ignored the consensus that the town was a death trap and relied on reinforcements from the ranks of unorganized settlers and the addled Fannin. Santa Anna yielded to his desire to avenge the Mexicans' December defeat and decided not to bypass Béxar. Further, he set aside the likelihood that siege guns and time would reduce the fortress. For twelve days the opponents squared off, pilloried surrender demands, and exchanged a few shots.

During the early morning assault of 6 March, both sides displayed remarkable courage, one in bitter defense against overwhelming odds and the other in open assault against fortified sharpshooters and about twenty artillery pieces. All 187 of the defenders died, including David Crockett and a few others who were executed after being captured at the end of the battle. Mexican losses totaled around 600 killed and wounded out of 3,000 troops.

On the political front, four days before the Alamo fell, a Texan convention 300 miles away adopted a Declaration of Independence and worked on a constitution. At Goliad, Col. James W. Fannin dispersed his men in vain efforts to save elements of his army, this time engaged at Refugio, 12-14 March. Not until 19 March did Fannin begin an ill-planned retreat, only to be caught by Urrea's cavalry on open ground short of Coletto Creek. After an afternoon of bloody fighting, he agreed to surrender on the morning of 20 March. On 27 March, the prisoners were executed; more than 340 Texans were killed in the Goliad massacre.

Houston took command of the new volunteers who assembled for renewed fighting. He confirmed the fate of the Alamo and began an unpopular retreat eastward, moving ever deeper into the Anglo population centers rather than making a stand on the Brazos or Colorado Rivers. Santa Anna divided his army into four and set off not after Houston's army but the leaders of the interim Texas government, barely missing them at Harrisburg as they left for

Galveston Island. This advance placed Santa Anna and 700 of his men further east than the rest of his army, except for a reinforcement of 350 on 20 April. Houston at last turned from the road leading to the United States to one approaching the Mexican Army, thoughtlessly placed with the San Jacinto River and marshlands barring retreat.

The 800 or so members of the vengeful Texas Army attacked in a long, thin line on the late afternoon of 21 April. The Battle of "San Jacinto took fewer than twenty minutes, but was followed by several hours of close order clubbing, knifing, and shooting. Santa Anna was captured and wrote out orders for his second in command to take the rest of his army out of Texas. He also signed a treaty pledging recognition of Texas, an act repudiated by the Mexican Congress.

The victory at San Jacinto gave the new republic a semblance of security and an opportunity to build a nation, though most of its citizens favored annexation. Sam Houston became president of the Republic of Texas in October 1836. Eight years later, annexation of Texas by the United States led to the "Mexican War.

TEXTBOOKS, WAR AND THE MILITARY IN. Five-sixths of all Americans never take a course in U.S. history beyond high school, so it is in high school, where textbooks dominate the teaching of history, that most Americans learn about their American military history.

Supporters of American history courses often claim that these courses lead to a more enlightened citizenry. A major duty of U.S. citizens is "to analyze issues and interpret events intelligently," one textbook says. Indeed, eighteen-year-olds (especially males) may be expected to fight, so such classes might encourage young people to understand why and how America has fought its wars.

Textbooks do give considerable coverage to war. *Triumph of the American Nation*, probably the best-selling "high school textbook of the 1980s and early 1990s, devotes about 17 percent of its text (150 pages) to U.S. military history. Another 2.5 percent relates closely to war. Included are 15 pages on the "Revolutionary War, 9 pages on the "War of 1812, 8 pages on the Texan and Mexican Wars, 29 pages on the "Civil War, 5 pages on the "Plains Indians Wars, 6 pages on the "Spanish-American War, 17 pages on World War I, 41 pages on World War II, 3 pages on the "Korean War, and 12 widely scattered pages on the "Vietnam War. This coverage is typical and the proportions are similar to coverage in shorter, easier texts. There is an almost complete lack of coverage of Indian wars in the colonial and early national periods.

Textbooks do make efforts to include various racial groups, but such attempts are often clumsy, probably because publishers want to win adoptions and avoid offense. Thus, 5,000 black soldiers fought alongside whites in the "Continental army, "with courage and skill," says *Triumph of the American Nation*. In reality, of course, some fought "with courage and skill"—like some white recruits—and some did not fire their guns and ran off—like some white recruits. A more important point would be that the British recruited African Americans, especially slaves, more easily than did the colonists, but this is not covered, presumably because it might offend some textbook adoption committees. Authors do a somewhat better job on "gender and war and "gender and the military.

Textbooks provide useful detail and good maps—particularly for the Revolutionary War and the Civil War. However, coverage on the home front is not nearly as good. The topic of internal opposition to the Confederacy, for example, gets little attention.

Layout editors often contribute a further obstacle by assuming that students have short attention spans and making frequent random topic changes. *Triumph of the American Nation* interrupts the outbreak of World War I to treat "The World's Ocean." And while describing the dismemberment of Poland in 1939 by Germany and the Soviet Union, the authors insert over a page on irrigation in the Western United States. Another popular textbook, *The American Pageant*, by Thomas Bailey and David Kennedy (1994), avoids such pitfalls. But some texts aimed at less advanced readers offer no coherent narrative of the Civil War, simply a series of boxed topics.

Who are the authors of most high school American history textbooks? According to Hillel Black, whose *The American Schoolbook* (1967) is probably still the most important study of this topic, the names on the cover of a textbook rarely represent the people who actually wrote it. Lewis Todd and Merle Curti may have written the first draft of *Rise of the American Nation* in 1949, but when its title changed to *Triumph of the American Nation* in 1986, Curti was almost ninety and Todd was dead. (For the latest incarnation, the title becomes *Todd and Curtis The American Nation*, 1994, with a new author listed.) In an article entitled "The Ghost Behind the Classroom Door" in *Today's Education* (April 1978), a person who never taught a history class or earned a history degree tells of writing textbooks and ancillary material for publishers. Since the history profession does not review high school texts, errors by these ghostwriters or even by professional historians may go uncorrected for years, including the claim by one text that Truman ended the Korean War by dropping the atomic bomb!

Two omissions loom even larger. First, coverage is often sanitized. The poet Walt Whitman wrote of the Civil War, "The real war will never get into the books." Certainly, the true nature of war does not get into most high school textbooks. James W. Loewen's analysis, in *Lies My Teacher Told Me* (1995), of the photographs used to illustrate the Vietnam War, demonstrates this clearly: rather than the famous photographs of the "My Lai Massacre or the napalmed girl running naked toward the camera, many publishers choose nondescript images of soldiers walking through rice paddies in Southeast Asia.

Second, authors and publishers often avoid moral and strategic issues. On 8 December 1941, the day after the attack on "Pearl Harbor, the United States in the Pacific War abandoned all international rules governing submarine warfare and began attacking Japanese shipping—military or commercial—without warning. This policy is defensible, but the defense might make awkward discussions in U.S. textbooks of Berlin's unrestricted submarine warfare as one of the reasons the United States entered World War I against Germany.

Similarly, America's atomic bombings of "Hiroshima and Nagasaki in World War II remain controversial. Because high school texts often avoid controversy, a typical account of the ending of World War II maintains that "Japan rejected [the call] for its unconditional surrender" on 29 July; "the United States dropped the atomic bomb on

Hiroshima" and "two days later" (actually three) "dropped a second atomic bomb on Nagasaki"; "on August 10 the Japanese government asked for peace"; and "on August 14, 1945, President Truman announced by radio that Japan had accepted the Allied peace terms." The clear implication is that the bombs alone forced Japan to accept unconditional surrender (from Todd and Curti, *Triumph of the American Nation*, 1986).

There are issues here of both fact and morality. What role did the announcement of Soviet entry in the war against Japan have in precipitating surrender? Given that Gen. Douglas *MacArthur acceded to Japan's condition that Emperor *Hirohito remain on the throne, is the surrender best understood as unconditional? Did the United States drop the Hiroshima bomb partly to influence the Soviet Union in the postwar period? Was it correct to drop either the first or second bomb? *The American Pageant* summarizes the bomb as "a fantastic ace up [America's] sleeve." Having witnessed the Smithsonian Institution's reversal on its *Enola Gay* display, most textbook publishers are unlikely to explore this controversy further.

As their titles imply, high school textbooks take a generally triumphal view of American history. They treat war as they do other topics, supplying detail about individual campaigns but little analysis and no moral judgments. Students memorize facts for exams but often forget most of them by the time they graduate. According to Diane Ravitch and Chester Finn in *What Do Our 17-Year-Olds Know?* (1987), two-thirds of American seventeen-year-olds cannot place the Civil War in the right half century. High school history textbooks currently fall far short in developing an adequate understanding of U.S. history, let alone America's military history.

THAYER, SYLVANUS (1785-1872), army engineer and putative "Father of the Military Academy." A native of Braintree, Massachusetts, Thayer attended Dartmouth for three years, then entered West Point, graduating in 1808. After coastal fortification service and participation in the *War of 1812, he spent two years in Europe studying military institutions. He became superintendent of the U.S. Military Academy in 1817. Backed by Secretary of War John C. *Calhoun, Thayer overhauled the academic and disciplinary systems. His reforms included organizing the corps of cadets into a battalion, establishing an academic board to oversee curricular matters, dividing classes into sections according to merit, and holding semiannual examinations. He also recruited several professors who achieved distinction, especially Dennis Hart Mahan. After a dispute with President Andrew *Jackson, Thayer resigned his office in 1833 and returned to coastal fortification duty. Upon retirement, he established an engineering school at Dartmouth.

Having created what he considered a perfect structure at the military academy, Thayer resisted all subsequent attempts at modification, blasting other reformers with his vitriolic pen despite their contributions to the institution. In some respects he succeeded. Key elements of the Thayer system remain in force at West Point today.

THEORISTS OF WAR. All warfare requires thought. Even the most primitive battle demands mental preparation, and it is not possible to control armed forces of any size without preconceived methods of organization and action. It is difficult, and perhaps unnecessary, to distinguish categorically between this kind of instrumental thinking and military theory more strictly understood, as a systematic attempt to link or subordinate the conduct of war to abstract analytic concepts or to broader social, political, or geographic relationships of which war is but a part. Such theorizing may aim at practical knowledge of how war can be conducted or averted, in which case its concerns may approach those of the strategist or military planner. Or, a theorist of war may simply seek understanding for its own sake. Yet these are not mutually exclusive impulses, and both are evident in varying degrees in the work of most serious students of war.

Until the end of the nineteenth century, military theory in the United States was dominated by European models, of which the most imposing was that provided by Antoine Henri * Jomini. Jomini, a staff officer in the French Army during the Napoleonic Wars, sought to codify the basic tenets of modern war in terms of a small number of timeless principles. He stressed the advantages of fighting on interior lines; of maintaining secure communications while seeking to attack those of the enemy; and above all, of concentrating one's forces at what he called "the decisive point." Jomini's work suggested that the chaos and uncertainty of war could be mastered by means of a positivistic social science, and also that the precise mental habits and systematic approach of the engineer and the industrial manager could find a use on the battlefield.

Jomini's ideas permeated the curriculum of the U.S. Military Academy at West Point in the antebellum era, and shaped the basic outlook of officers on both sides of the * Civil War. The protracted destructiveness of that conflict caused his reputation to recede, in part because he was thought to have held out a false promise: that war conducted on scientific principles would be more readily controlled than in the past. Yet no modern army has felt able to dispense with the notion, however tenuous, that there are in fact enduring Principles of War that matter to the conduct of operations and the education of officers. In this respect, Jomini remains among the most influential of modern military theorists.

The most creative of Jomini's American disciples was a naval officer, Alfred T. *Mahan, whose self-proclaimed intention was to do for naval warfare what Jomini had done for war on land. Mahan argued that "sea power," an expression he claimed to have coined, was the ultimate arbiter of world affairs. Its principal instrument was the battle fleet, built for the sole purpose of defeating or intimidating others of its kind. Mahan was among the first to articulate a comprehensive strategic vision for the steam-and-steel navies of the industrial era. In relation to the wooden-hulled vessels they displaced, the tactical superiority of such ships was absolute. Yet, because of their dependence upon a global infrastructure of coaling stations and secure

ports of call, their capacity to conduct traditional operations of close blockade, commerce raiding, and "amphibious warfare seemed far beneath what had been possible in the age of sail. Mahan, however, argued that all such techniques were secondary to, and dependent upon, the clash of battle fleets, whose outcome would decide any war in which a naval power might engage.

Like Jomini, Mahan's reputation suffered because the future failed to conform to his expectations. The battle fleets of the great powers did not determine the results of World War I, in part because new underwater weapons were already transforming combat at sea, in part because the belligerents were reluctant to risk the irreplaceable fleets they had built up at such great expense. The early twentieth century was also marked by a growing realization, stimulated in part by the work of the English geographer Halford Mackinder, that the saliency of seapower was being eroded by the spread of railroads, paved highways, and modern "communications. Certainly, these developments reduced the relative advantages of movement over water compared to land, and contributed to the growth of integrated continental economies relatively resistant to the effects of "blockades. At the same time, the attendant confidence that armies would be able to "outflank the sea," by reaching decisions on land before the attritional effects of naval war could be felt, would prove almost entirely illusory. Seapower thus remains an important theoretical conception, less because its possession ensures military success than because its absence continues to be disproportionately associated with military failure.

Jomini and Mahan exemplify theories of war based on a didactic reading of what they considered to be the relevant historical record—chiefly war in the West, particularly Europe, from the middle of the eighteenth century to the fall of Napoleon. This general point of view continues to prevail among students of what has increasingly been called "conventional" war, meaning combats between the organized forces of established states. In this arena, intellectual mastery includes a strong sense of historical continuity, and a pronounced respect for the "lessons" of at least the recent past. At the same time, technological and political developments have seemed sufficiently unprecedented to cast doubt on the continuing validity of such an approach.

In the decades between the world wars, for instance, proponents of strategic airpower argued that the advent of "bomber aircraft had rendered historical experience obsolete. Billy "Mitchell, a general in the U.S. Army Air Corps and the most prominent American champion of this new kind of war, regarded armies, navies, and civilian populations as equally vulnerable to air attack, against which neither geographic isolation nor human art could offer a defense. World War II demonstrated that this latter impression was mistaken, even as it inspired the development of weapons whose destructive power fully vindicated Mitchell's intuition of a world made new by technology. No country has relied more heavily on "nuclear weapons than the United States, and it is unsurprising that American nuclear war theorists like Herman Kahn, Thomas Schelling, and Bernard Brodie should occupy a preeminent place among those who have sought to analyze principles governing their use.

A comparable sense of novelty has prevailed among theorists of what in America is termed *revolutionary insurgency* or "low-intensity conflict. Here, too, the distinction

between armed forces and civil society, on which theories of "conventional" war depend, has threatened to dissolve. In Mao Zedong's famous (and often misunderstood) phrase, political power in revolutionary war grows out of the barrel of a gun, in the sense that it is through military effort that political authority is constituted and legitimized. The guerrilla fighter is accordingly conceived as a fish swimming in the sea of his countrymen, without the distinguishing marks that have allowed soldiers to recognize each other in the past.

America's encounters with "guerrilla warfare have given rise to an academic and professional literature that resembles the work of the nuclear theorists in being marked by deep pessimism and frustration and a strong sense that the best solution to conflicts of this kind is to avoid them. It has also contributed to a revival of interest in one of the greatest of all theoretical works on war, Sun-tzu's *The Art of War*. Sun-tzu's treatise dates from the Warring States period of Chinese history (c. 403-221 B.C.) and has been known in the West since the eighteenth century. Only since the 1960s, however, has it received sustained attention, by virtue of the inspiration it afforded Mao, and for the insight it offers into Asian ideas about war. These considerations do not exhaust Sun-tzu's contemporary appeal. By reaffirming the importance of intellect and technique in war, the central value of discipline and generalship, and the vital importance of avoiding escalation and attrition, *The Art of War* speaks to the dilemmas of modern war with a directness that few contemporary works can match.

Contemporary military theory thus finds itself confronted by three distinct modalities of conflict—conventional, nuclear, and revolutionary—that have proven strongly resistant to intellectual synthesis. One measure of the perplexity that has resulted is the exceptional status still accorded Carl von "Clausewitz's classic treatise *On War* (1832), whose intellectual range transcends the fragmentation of modern military experience. This Prussian military intellectual approached the theory of war by way of comprehensive historical study combined with a rigorous theoretical focus on war's fundamental elements. In Clausewitz's work, attack and defense, risk and decisiveness, combat and maneuver, politics and violence, appear not as static characteristics to be weighed up and accounted for once and for all, but as dynamic concepts that define and react upon each other. It is a method ill-suited to the development of prescriptive theory, but remarkably powerful as a means of grasping what Clausewitz called the chameleonlike nature of organized "violence.

THOMAS, GEORGE H. (1816-1870), Civil War general. A native of Southampton County, Virginia, Thomas

graduated from the U.S. Military Academy in 1840. Commissioned as an artilleryman, he won brevet promotions as a captain and major at Monterey and Buena Vista in the "Mexican War. Transferring to the cavalry in 1855, he served on the Texas plains until 1861. In the secession crisis, Thomas spurned a Virginia state commission and remained loyal to the Union. Promoted to brigadier general of volunteers in August 1861 and ordered to Kentucky, he gained public attention with a minor victory at Mill Springs in January 1862. Thereafter, he commanded a division in the Army of the Ohio at Shiloh and Corinth, rising to major general in April 1862. Offered command of that army in September, he declined and acted as Don Carlos Buell's deputy at the Battle of Perryville, Kentucky. Following Buell's relief, Thomas loyally served the new commander, William S. "Rosecrans, formerly his junior. Commanding the center of Rosecrans's Army of the Cumberland at the Battle of "Stones River, he performed brilliantly.

Subsequently, Thomas commanded the XIV Corps in the Tullahoma and Chickamauga campaigns in 1863. At the Battle of "Chickamauga, he and his command stood firm while Rosecrans and other corps commanders fled the field. Nicknamed the "Rock of Chickamauga," Thomas led the Army of the Cumberland to victory at Missionary Ridge and in the Atlanta campaign of 1864. Sent to Nashville at the time of "Sherman's march to the sea, Thomas destroyed John B. Hood's Army of Tennessee in December 1864. Postwar, he remained in the regular army, until his death in 1870 as commander of the Military Division of the Pacific.

Although Thomas's record in the Civil War as a consistently competent and tenacious tactician was unsurpassed, his unwillingness to promote himself meant he received less credit than was his due. Nevertheless, few Union officers made a greater contribution to the ultimate "victory.

THOMAS, NORMAN (1884-1968), minister, antiwar and civil rights activist, leader of the Socialist Party of America, and social critic. Preeminently in his generation, Norman Thomas secularized the pacifist impulse and criticized militarism in relation to social systems: ideology and institutions tending to impose military responses on political challenges.

Thomas was introduced to the religious Social Gospel at Union Theological Seminary and was immersed in the urban reality of an immigrant parish in New York. In World War I, he joined progressive peace organizations to prevent U.S. intervention. During U.S. belligerency, he resigned his pastorate, became the founding editor of the *World Tomorrow* (1918), and helped organize the National Civil Liberties Bureau, primarily to defend conscientious objectors.

He also joined the Socialist Party because of its social vision and antiwar stance. In the 1920s, Thomas became the party's acknowledged leader, its presidential candidate from 1928 to 1948. From that base he criticized the New Deal as inadequate and opposed the nation's rearmament and drift toward war.

Thomas gave critical support to the Roosevelt administration in World War II, but condemned internment of Japanese Americans and policies such as the "bombing of civilians and unconditional surrender. He lobbied for a postwar foreign policy that would address real conflicts of power by institutionalizing mutual interests. He advocated measuring power politics against social reconstruction and flexible and realistic policies against democratic and just principles. Skeptical of both unilateral disarmament and arms control, he helped to form the "National Committee for a Sane Nuclear Policy (1957).

Norman Thomas was significant precisely because he put military issues in their social context, warning that military approaches both reflect and reify arbitrary institutions and unjust social orders. War is therefore the crisis of democracy, and, whatever the merit of a specific conflict, does not offer a realistic or acceptable solution for political problems. In speeches, articles, and books, Thomas insisted that the alternative to war is social change that increases equity, democracy, and stability.

THOREAU, HENRY DAVID (1817-1862), transcendentalist writer, war protester. Henry David Thoreau was born in Concord, Massachusetts. A shy, quiet boy who loved the outdoors, Thoreau graduated from Harvard College in 1837, taught school intermittently until 1841, then turned to writing as a career. He subsequently led a simple life as one of the New England transcendentalists, writing poems, essays, and two books while trying to earn a living.

Although Thoreau may well have been the best remembered antiwar dissenter of his time, his protest against the "Mexican War had no discernible effect on public opinion, the antiwar effort, or the conduct of the war. In July 1846, Thoreau, who had not paid his Massachusetts poll tax for several years, denounced the war in his annual brush with the tax collector, refused again to pay, and spent one night in jail before one of his friends paid the tax without his consent and Thoreau was released. Though he believed the war an immoral conflict to extend slavery, Thoreau viewed his own dissent as an individual act of protest, not an effort to work with or mobilize others to end the war. To Thoreau, it was the duty of each honest citizen directly to resist his government when it condoned or perpetuated an evil such as slavery or war to extend slavery.

Thoreau immortalized his protest in the essay "Resistance to Civil Government," popularly known as "Civil Disobedience," which was published in 1849. Although his actions attracted only local attention at the time, his essay achieved fame as the clear, well-reasoned justification of an honest citizen protesting an immoral policy of his government. As such, "Civil Disobedience" became an influential manifesto for subsequent antiwar protesters and freedom fighters such as Mohandas K. Gandhi and Dr. Martin Luther "King, Jr.

TIDEWATER WARS. See Native American Wars: Wars Between Native Americans and Europeans and Euro-Americans.

TOJO, HIDEKI (1884-1948), Japanese general of the army and prime minister. Tojo, a graduate of the Japanese Military Staff College, was promoted to lieutenant general in 1936. By that time, he had become both pro-German and an ardent advocate of Japanese military *expansionism in China. In 1937, Tojo became chief of staff of the Kwantung Army in China, and in October 1941, he forced out and succeeded Prince Fumimaro Konoye as Japanese prime minister. Tojo took his country into World War II with the United States with the surprise attack on *Pearl Harbor in December 1941, and he remained prime minister until July 1944, after the fall of Saipan. In 1945, he attempted suicide, but was brought before the International Military Tribunal, Far East, for *war crimes and hanged in 1948.

Historians depict Tojo as a militant and expansionist nationalist who underestimated the United States's determination and industrial capacity to fight total war to defeat Japan. In a narrow sense, Tojo was a competent administrator (nicknamed "Razor Tojo"), but he was neither an imaginative strategist nor a skillful political leader. He accelerated Japan's atomic research, worshipped the emperor, and to the end clung to his belief in the innate spiritual strength and *victory of the Japanese.

TORPEDO BOATS. Functionally descended from Federico Gianibelli's sixteenth-century fireships, torpedo boats first emerged in the United States as semisubmersible bearers of "infernal machines," directed by David Bushnell's *Turtle* and Robert *Fulton's *Mute* against British blockaders during the * Revolutionary War and the *War of 1812. Advances in spar torpedo technology during the • Civil War spawned additional craft. Their capabilities were demonstrated in the historic attack by the Confederate submersible *H. L. Hunley* against the USS *Housatonic* off Charleston, and by Lt. W. B. Cushing's sinking of CSS *Albatross* with a picket boat carrying a spar torpedo.

Commercial introduction of the Whitehead self-propelled torpedo in 1875 triggered rapid development of coastal and seagoing torpedo boats in Europe. "Jeune Ecole" enthusiasts in France hailed growing squadrons of *torpilleurs* as effective counters to British naval superiority; yet by 1890, Britain, Germany, and Japan had acquired comparable flotillas. The U.S. Navy, amid post-Civil War doldrums, engaged yacht designer Nathaniel Herreshoff to construct swift torpedo craft, including the spar torpedo boat *Lightning* (1876); the *Stilletto* (1887), armed with John Howell's automotive torpedo; and finally the USS *Cushing* (1890), the navy's first steel-hulled torpedo boat.

Britain's introduction in 1893 of the torpedo boat destroyer, direct antecedent of the more seaworthy destroyer, dimmed prospects for the torpedo boat, whose influence on fleet operations during the *Spanish-American War proved less impressive than at Tsushima in the Russo-Japanese War. During World War I, German torpedo boats,

torpedo-armed destroyers, U-boats, and naval *mines combined to inhibit British Grand Fleet operations severely, but postwar naval designers showed little interest in the prevailing torpedo boat configuration. Torpedo attacks by surfaced U-boats accounted significantly for Allied merchant ship losses. Torpedo boats also reappeared during World War II in a smaller configuration, as wooden-hulled motor torpedo boats, swift launches active notably in the English Channel, Mediterranean, and (against Japanese supply barges) the Southwest Pacific. In postwar years, these short-lived craft were rapidly replaced by missile launches, terminating a century of torpedo boat development.

TORPEDOES. The torpedo, a self-propelled and self-guided underwater explosive device, was invented in 1866 by Robert Whitehead, a British engineer working for the Austro-Hungarian Navy. The U.S. Navy evinced early interest in the device and established in 1869 the Torpedo Station at Newport, Rhode Island. After pursuing a technological dead-end in the flywheel-driven Howell type, the navy turned back to the Whitehead in 1892. Improved models soon followed, with turbine propulsion introduced in 1905 and an air heater in 1910 that quintupled the range to 4,000 yards.

As the torpedo increased in capability, it naturally grew in size: by 1912, the 18-inch Mark 7 measured 17 feet in length, weighed 1,628 pounds, and carried a warhead of 326 pounds of TNT to a range of 6,000 yards at 35 knots. In 1914, the navy settled on a diameter of 21 inches for most of its new torpedoes—a standard that endured for the rest of the century.

Over the interwar period, Newport, under the guidance of the talented mechanical engineer and submariner Ralph Waldo Christie, pushed ahead with a number of advanced concepts: exotic propulsion systems using oxygen, hydrogen peroxide, or electric motors to give wakeless runs; large, air-dropped torpedoes; and magnetic exploders to increase lethality by detonating the torpedo under its target. As financial constraints prevented the navy from pursuing all of these promising leads, it concentrated on the last two. Introduced in 1936 was the Mark 13 air-dropped weapon, which imposed severe speed and altitude restrictions on the aircraft carrying it. Also flawed was the new Mark 6 magnetic exploder. Expensive and highly secret, it entered the inventory in the 1930s, but was neither tested extensively nor issued to the fleet until 1941.

World War II put U.S. torpedoes to the operational test for the first time, and they were found wanting. Following the Japanese attack on *Pearl Harbor, U.S. destroyers, *submarines, and aircraft were all hobbled by torpedo problems. American torpedo bombers at Midway suffered appalling losses as they made their low-level attacks. The Mark 6 exploder frequently failed, and its backup contact pistol proved too fragile. The Mark 14 submarine torpedo, introduced in 1931, left a prominent wake, tended to run deep, and sometimes even circled. A series of distressing incidents highlighted the problems. *Tang*, one of the

most successful submarines, was sunk by its own weapon. Two destroyers, ordered to scuttle the damaged *Hornet* after the Battle of Santa Cruz, fired sixteen torpedoes at the carrier without sinking it. In a particularly damning episode on 24 July 1943, the submarine *Tinosa* shot fifteen torpedoes into the largest tanker in the Japanese merchant fleet; only four exploded.

Hurried remedial measures developed by the navy, the scientific community, and industry resolved the difficulties. Aircraft torpedoes were modified so that they could be dropped at much faster speeds and higher altitudes. The Mark 6 magnetic exploder was deactivated. New types of torpedoes were hurried into production, the most important being the Mark 18 electric and the homing types. The former, built by Westinghouse and introduced in September 1943, offered the great advantage of leaving no bubble trail. By 1945, 65 percent of all shots were by electrics. Also strikingly successful was the acoustic homing torpedo developed by Bell Labs, General Electric, and Harvard for antisubmarine work. Dubbed for security reasons the Mine Mark 24, the torpedo followed sound pulses to its underwater target. Beginning in May 1943, the air-dropped Mark 24, nicknamed "Fido," sank thirty-one submarines; its surface ship variant claimed thirty-three additional victims.

Wartime expenditure of torpedoes was prodigious. U.S. submarines fired 14,748 torpedoes, sinking 214 warships and 1,178 merchant vessels. U.S. aircraft made 1,287 attacks, scoring 514 hits. Overall, about 33 percent of torpedoes fired hit their targets. The navy kept up with mushrooming demand by reopening its World War I facility at Alexandria, Virginia, and by contracting with private firms (Bliss, Pontiac, and Westinghouse). Overall production totaled 57,655 torpedoes between 1 January 1939 and 1 June 1946.

Although the last U.S. operational use of torpedoes came on 1 May 1951, when navy planes breached the Hwachon dam in North Korea during the "Korean War, development of the weapon continued apace, largely to match increasingly capable Soviet nuclear submarines. On operational service from 1958 to 1977 was the Mark 45 Astor, with a nuclear warhead. By the 1990s, two types remained in service: the 3,450-pound Mark 48 (range 35,000 yards, speed 55 knots, depth over 2,500 feet) and the Mark 46 lightweight torpedo for close-in use by aircraft or surface ships.

TOXIC AGENTS

Atomic Radiation Exposure
Agent Orange Exposure

TOXIC AGENTS: ATOMIC RADIATION EXPOSURE

From 1945 to 1963, radioactive fallout from U.S. above-ground "nuclear weapons tests exposed over 200,000 military personnel, as well as a large but indeterminate number of civilian test workers and and so-called downwinders,

people living near the test sites. Most exposures were very low, however, and clear evidence of injury was lacking.

Three military groups received the bulk of relatively high exposures: uniformed members of the test organizations (1945-63); members of the task forces required for Pacific testing (1946-62); and participants in Desert Rock training exercises for a nuclear battlefield, held in Nevada (1951-57).¹

Military members of the test organizations and Pacific task forces observed the same safety standards and procedures as other test workers, except for the crews of aircraft sampling clouds for radioactivity. Assigned much higher exposure limits than others, they occasionally received much higher doses as well. Consistently, the most heavily exposed among those without special limits were radiation monitors, military and civilian, chiefly because their work often placed them where fallout was most likely. Statistical analysis of evidence, however, does not indicate that aircrews or monitors suffered long-term deleterious effects.

When thermonuclear weapons testing began in 1952, the fallout problem intensified. The worst overexposure of civilians in test history, and the only documented instances of fallout-caused injury, followed the 1954 Castle Bravo test at Bikini atoll in the Pacific. Unexpectedly heavy fallout hit two groups 100 miles from ground zero: the 23-man crew of the Japanese fishing boat *Lucky Dragon* and 82 Marshallese on Rongelap in the Marshall Islands. One of the fishermen died six months later from complications of treatment, but the rest recovered without incident. Although all the Marshallese likewise recovered, thyroid problems attributed to fallout radioiodine surfaced two decades later among those who had been infants and children at the time. Heavy fallout from Bravo also dusted a twenty-eight-man U.S. Air Force weather unit on Rongerik and hundreds of other Marshallese on more distant atolls, none of whom displayed any symptoms of radiation injury.

The same absence of observable effects marked the very much lower doses associated with Desert Rock training exercises in Nevada. Expecting nuclear field training to be a onetime experience for any individual, the "Pentagon negotiated special rules to enhance its realism. Despite somewhat higher limits than test workers, however, few troops approached, or exceeded, normal test standards. Only one subgroup at Desert Rock, officers who volunteered to entrench relatively close to ground zero for some tests, received some sizable doses.

In addition, there is no unambiguous evidence of long-term radiation injury to participants in the Desert Rock exercises. The author of a widely publicized medical report claiming excess leukemia linked to the 1957 Smoky test (at the Nevada Test site) later corrected his initial findings. No other nuclear weapons test has shown any apparent linkage.

Evidence of injury to other exposed groups, test site workers and downwinders, is even less clear. The problem is that it is extremely difficult to tease out the possible effects of exposure to low-level radiation from other causes of illness. At present, the issue remains unresolved within the medical community.

TOXIC AGENTS: AGENT ORANGE EXPOSURE

Agent Orange, the toxic plant killer named after the color-coded stripe that was painted around the 55-gallon barrels in which it was stored, is a combination of two commercial herbicides: 2,4-D (n-butyl-2,4-dichlorophenoxyacetate) and 2,4,5-T (n-butyl-2,4,5-trichlorophenoxyacetate). First developed by the U.S. Army as an instrument of chemical warfare at Fort Detrick, Maryland, Agent Orange was so successful in destroying broad-leaf plants that Secretary of Defense Robert S. McNamara suggested further testing be done on jungle vegetation during the "Vietnam War. In 1962, the Department of "Defense commenced a program of systematically defoliating millions of acres of Vietnamese forests and croplands. By the time the program was called to a halt in 1971, herbicides had destroyed an estimated 4.5 million acres of countryside.

Agent Orange contains TCDD-dioxin, a substance so toxic to animals and humans that Dr. Jacqueline Verrett of the Food and Drug Administration called it "100,000 times more potent than thalidomide as a cause of birth defects in some species." Before he died of cancer in 1978 at the age of twenty-eight, Vietnam veteran Paul Reutershan concluded that his terminal cancer could be traced to his extensive exposure to Agent Orange in Vietnam. Reutershan founded Agent Orange Victims International, and began a \$100 million damage claim against Dow Chemical and other Agent Orange manufacturers. Reutershan's claim became a much larger class action lawsuit in which many Vietnam veterans and their families attempted to force Dow Chemical, Monsanto, Uniroyal, Diamond Shamrock, and Hercules to concede that Agent Orange had injured thousands of veterans, and to assume financial responsibility for manufacturing and selling a hazardous product.

Plaintiffs in the Agent Orange class action suit asked for a ban on all advertising, promotion, distribution, marketing, and sale of contaminated herbicides; for chemical companies to reveal all they knew about the dangers of contaminated herbicides; and for a tax-exempt fund to be set up to cover damages from exposure to herbicides.

In 1984, the Agent Orange class action suit was settled out of court for the sum of \$180 million. A number of plaintiffs were outraged that the case was not heard in court. At "Fairness Hearings" held in five American cities to ascertain the plaintiffs' reactions to the out-of-court settlement, Vietnam veterans and their wives denounced their own lawyers and the agreement, and demanded that the case be heard before a jury of their peers. Federal judge Julius Weinstein refused the plaintiffs' appeals, arguing that the settlement was fair and just.

Five years later, a decision was reached on how the \$180 million, ballooned by interest, would be distributed. The payment plan confirmed the fears expressed at the Fairness Hearings. A totally disabled Vietnam veteran would receive a maximum of \$12,000, spread out over a period of ten years. Further, disabled veterans receiving these payments could become ineligible for food stamps, public assistance, and government pensions. A widow of a Vietnam veteran who died from exposure to Agent Orange would receive \$3,700.

After years of stonewalling on the issue, the "Veterans Administration agreed to compensate certain illnesses related to exposure to dioxin. Nevertheless, the legacy is a deep bitterness among those who fought in Southeast Asia,

including Adm. Elmo Zumwalt, whose son died from exposure to Agent Orange in Vietnam. The Agent Orange issue remains one of the great tragedies of American military history.

TRACY, BENJAMIN F. (1830-1915), soldier, jurist, secretary of the navy. A small-town lawyer and Republican politician from Tioga County, New York, Tracy served in the state legislature before raising and commanding troops in the Civil War. He received a Medal of Honor (1897) for gallantry at the Battle of the Wilderness despite subsequent controversial administration of the Elmira, New York, prison camp. Elmira, with its prisoner death rate of 25 percent, held the distinction of being the worst Union prison, although more as a result of War Department policy and bureaucracy than Tracy's management. Moving to Brooklyn in 1865, he served as federal district attorney from 1866 to 1873, and chief justice of the state court of appeals in 1881 and 1882. Tracy's major contribution to national security came as secretary of the navy (1889-93) during Benjamin Harrison's presidency.

Tracy publicly championed Alfred T. Mahan's doctrine of seapower. He launched the navy upon battle fleet construction in support of that doctrine, as well as introducing a prototype "military-industrial complex through close relationships between government and the steel industry. He encouraged technology transfer from Europe, and shrewdly negotiated with Congress for increased naval budgets. He modernized operational planning through establishment of a policy board, organized the first tactical squadron of evolution for fleet maneuver training, and abolished the spoils system in navy yards in order to reform the shore establishment. His ventures in overseas naval base acquisitions in Samoa, Haiti, and Santo Domingo, as well as his response to revolutions in Chile and Hawaii, proved more controversial than successful. Tracy's active retirement included service in the boundary dispute over British Guiana and chairman of the greater New York Charter Commission in 1897.

TRADE, FOREIGN. *This essay on foreign trade as an instrument of foreign and defense policy is divided into three sections: Wartime provides an overview of the role of foreign trade in U.S. strategic and economic policies in wartime; Trade Restrictions examines the use of embargoes and economic sanctions as instruments of U.S. security policy against hostile nations; and Neutral Trade explores America's assertion of commercial rights when it was a neutral nation affected by other countries' wars.*

TRADE, FOREIGN: WARTIME

The drive for American national economic security has existed since 1776, and foreign trade has played a strategic and economic role in U.S. policy. The interaction of commerce and defense was necessary and obvious. Historians

have long argued over the relative importance of economic and strategic concerns in foreign policy, with revisionists emphasizing the profitability of trade expansion and realists stressing strategic defense imperatives. Regardless of this debate, the trade/security linkage has prevailed throughout the nation's history.

International commerce was central to the American search for independence in the "Revolutionary War. The alliance with France, 1778-1800, allowed trade to serve political purposes. As president, George "Washington perceived national security in terms of commercial relations and a military establishment, not entangling alliances, yet trade discrimination, mercantilism, and pirates threatened the security of the new nation. In response, Secretary of State Thomas "Jefferson issued a Report on Commerce in 1793 that would reflect trade ideology for the next two centuries. Recommending specialization at home, Jefferson demanded reciprocity treaties and equal access to markets abroad to enhance national defense. American commerce flourished in the early nineteenth century, but was inevitably vulnerable to reprisals from warring Europeans. Terminating the commercial alliance with France in 1800, the country still developed North Atlantic and western frontier trade. "Neutrality and trade expansion collided with British maritime coercion and led to mutual sanctions. The nearly disastrous "War of 1812 convinced U.S. policymakers farther that trade and military power were complementary.

Although American diplomacy was "altogether, of a commercial character," as the historian Theodore Lyman wrote in 1828, the dimension of power was integrated into the trade/security formula in the late nineteenth century. While it still neglected the merchant marine fleet, the government funded a modern navy in the 1880s to promote commercial penetration overseas. Seapower and vigorous trade were complementary, wrote Alfred T. "Mahan in promoting American greatness through imperialism, and pursuit of an interoceanic canal became part of this equation. By 1890, tariff policy shifted from protectionism to export expansion through reciprocity treaties as a way to boost American power. And trade and security—essential elements of international status—fused after the "Spanish-American War of 1898, as America acquired territories in the Caribbean and stepping-stone islands across the Pacific to the fabled China market.

Officials did not necessarily elevate trade over diplomatic issues, yet they understood that trade policy meshed with global strategic objectives. President Theodore "Roosevelt recognized the limits of American power in Asia, for instance, but viewed export growth as a component of military might, industrial strength, and domestic social order. Maintaining a balance of power in Europe, predominance in Latin America, and a presence in Asia all hinged on expanding and defending trade routes to U.S. possessions and markets. The building of the Panama Canal exemplified this coupling of commerce and security.

By World War I, this bond was inseparable. President Woodrow "Wilson's "Fourteen Points proposed that "peace and prosperity could exist only by equal access to markets and an end to trade conflict. In the 1920s, American officials such as Secretary of Commerce Herbert C. "Hoover also realized that America depended on foreign supplies of raw materials for its industrial production, which strengthened the country's military. Oil imports, for

instance, became a priority. Thus, the commercial retaliation of the early depression gave way to mutually beneficial negotiations under the Reciprocal Trade Agreements Act of 1934, the brainchild of Secretary of State Cordell Hull. Protectionism led to political strife, he claimed, and his proof was that no trade agreement signee ever fought America. In the movement toward World War II, the administration of Franklin D. "Roosevelt looked on German trade autarchy as a threat to U.S. commerce and peace, while American security required an export embargo to slow Japanese aggression in Asia. By the end of World War II, Washington planned for a cooperative, multilateral trade system based on nondiscriminatory commercial practices as the economic means to assure peace and security.

Multilateralism was a pillar of national security policies in the "Cold War. With unparalleled economic power, America forged a trade system under the General Agreement on Tariff and Trade (GATT) in 1947 that boosted the recovery and prosperity of its Cold War allies. GATT promoted trade liberalization among the capitalist nations, strengthened their economies, and thereby brought them political stability, rendering them invulnerable to Soviet penetration. Liberal trade with American allies, and commercial restrictions against Communist rivals, were hallmarks of the Cold War until the demise of the Soviet bloc by 1991. Every president since Harry S. "Truman has pursued liberal trade as a weapon against aggression and instability. Multilateralism built world trade equilibrium and interdependence among like-minded nations, continuing the service of trade to security imperatives.

TRADE, FOREIGN: TRADE RESTRICTIONS

A priority in U.S. wartime foreign policy has always been to restrict trade with the enemy; yet as America's global power changed, so too did the nature and scope of these constraints and their efficacy. Commercial sanctions usually hurt American enemies in wartime, but were often difficult to maintain effectively. Nonetheless, sanctions and embargoes were readily used tools of warfare, not as substitutes for, but usually complements to, military measures.

Trade with the enemy in the "Revolutionary War hinged on international law. The U.S. Model Commercial Treaty of 1776 and the Treaty of Amity and Commerce with France in 1778 struck at British control of the seas by asserting the rights of neutral trade from capture by belligerents. This "free ships make free goods" doctrine served military purposes. Joining with other small-navy nations to demand neutral rights, Americans sought to undercut Britain's maritime dominance and imperial power. This defensive approach helped win the war; thereafter, the doctrine of "neutrality remained an American trade weapon.

More aggressive approaches to trade restriction as a means of coercing other nations, however, became the policy rule, and frequently created equivocal or even detrimental results. Trade sanctions against Britain from 1806, in response to London's coercive Orders of Council on

U.S. shipping, helped cause the "War of 1812. But rather than unduly hurting Britain with its sanctions, America incurred losses as its merchants were driven from the seas and the Royal Navy blockaded the coast. Later in the century, the brevity of the "Mexican War and the "Spanish-American War made trade restrictions irrelevant; but the Union used sanctions successfully against the Confederacy in the "Civil War. A naval blockade hurt the southerners by cutting them off from cotton markets in Europe. Hindered by British acquiescence in the blockade, Confederate blockade runners tried to evade the U.S. "Navy. Although these missions were initially successful, the blockade took an increasing toll after 1862.

A Trading with the Enemy Act passed in 1917 and modified ever since has formed the legal basis for policies on trade coercion since World War I. Congress's authorization of an embargo on American exports—in tandem with a British blockade—was instrumental in strangling the central powers in 1917-18. Before and during World War II, the administration of Franklin D. "Roosevelt relied on the act to deny scarce materials to the Axis, utilizing export controls and other economic warfare measures to wield its trade restrictions effectively. Even so, some neutral nations had no incentive to cooperate with the Allied blockade of Germany until the tide of battle turned. Thus, the Nazis were able to stockpile supplies of iron ore and wolfram from neutral Sweden, Spain, and Portugal, better surviving the blockade in this world war than in the first. By contrast, the American embargo hurt Japan badly. America imposed a gradual embargo in the fourteen months leading up to the attack on "Pearl Harbor, as Japanese forces marched through China and Indochina. Designed to restrict Japan, the embargo helped drive Tokyo to war with the United States; but during the conflict, Japan could never capitalize on its conquests in Southeast Asia to ship home enough oil, tin, and other commodities. World War II thus revealed both the successes and the limitations of trade sanctions.

The realization of these limits, and pressure from America's "Cold War allies, led to a more flexible approach to trade with the enemy after 1945. Anti-Communist sentiment prompted Congress to restrict trade severely with the Soviet bloc under the Export Control Act of 1949. But U.S. allies depended on trade with the Communist nations, and with their recovery from the war stagnant, America allowed for the sale of nonstrategic goods to the East from the early 1950s onward. The Soviet Union's ability to develop substitute goods also weakened export control policy. American leaders realized that trade sanctions often-times alienated friends, diverted trade to other nations, and took away the country's leverage with the satellite nations. These problems, and the possibility of shaping Soviet behavior by economic contacts, resulted in a moderation of U.S. policy. Still, China remained under economic quarantine until 1972, while America used its Trading with the Enemy Act and other measures to halt commerce with Vietnam, Cuba, North Korea, and other hostile powers in the Cold War.

After the Cold War, the United States led the "United Nations to embargo Iraq's oil and other trade goods in an attempt to force that nation's retreat from Kuwait. In 1991, while most Democrats in Congress preferred economic sanctions to military measures, the country nonetheless fought the "Persian Gulf War. Regardless of their effective-

ness, then, trade sanctions in wartime have been viewed as necessary and natural complements to military efforts.

TRADE, FOREIGN: NEUTRAL TRADE

The United States has historically interpreted neutral commercial rights both legalistically and pragmatically as a tool of business and diplomacy. Entrepreneurs demanded an impartiality in international politics that permitted them freedom to export and import goods, while the government interpreted the "neutrality doctrine broadly to help friendly nations threatened by aggressors. Views of neutral trade policy, therefore, became entangled in debates over the proper role of commerce in wartime. In general, however, America exercised its neutral rights to enhance profits and security.

Beset with threats to U.S. commerce due to the European war led by Britain against France, President Thomas "Jefferson in 1803 sanctioned the practice of the broken voyage by which French West Indian goods were Americanized and then re-exported to British enemies as neutral trade. The United States held that neutrals had the right to trade noncontraband goods with belligerents, but such indirect trade naturally provoked Britain, which began taxing this neutral commerce and impressing American sailors into its navy. America nonetheless prospered from its clever policy, although an infuriated Congress passed the Non-importation Act of 1806 to counter British violations of neutrality. When Britain attacked the USS *Chesapeake* in 1807, Jefferson implemented both the act and an embargo on shipping and exports. Assertive action ultimately failed, however, and the "War of 1812 resulted largely from resentments that had accumulated over neutral rights.

World War I placed neutral trade again at the center of Anglo-American relations. During the "Civil War, Britain had honored the Union trade quarantine against the Confederacy, and in 1914, London expected Washington to follow this precedent of respecting a belligerent's blockade. Shutting down neutral trade to the central powers in 1914, Britain seized U.S. ships, expanded the list of contraband goods, and even flew the American flag on some of its merchant ships to avoid attacks from German "submarines. President Woodrow "Wilson largely acquiesced in these tactics, but they sparked debate over the character of neutrality. Germany had good cause to cry foul. U.S. exports to France and Britain rocketed to \$2.75 billion in 1916, aided by banking arrangements under which the House of Morgan loaned the Allies \$2.3 billion before 1917. By contrast, exports to Germany plummeted to \$2 million in 1916, and loans totaled only \$27 million in 1914-17. Trade and credit profited the United States as New York City came to dominate world finance by 1916. Improved Anglo-American

relations, British propaganda, and the huge English market for U.S. goods helped generate sympathy for the Allied war effort, while German aggression seemingly threatened U.S. power in the western hemisphere and on the seas. Wilson and his advisers, especially Edward House and Secretary of State Robert Lansing, clearly wanted Allied victory; Lansing developed a pro-British neutrality policy to secure it.

America maintained an increasingly technical neutrality. Wilson protested restraints on American trade, but because Britain controlled the seas, U.S. products ended up in Allied ports. Whether the United States pursued its neutral policies as a moneymaker for private interests remains a matter of debate. At any rate, German efforts to use submarine warfare to curb the trade flowing to Britain and France eventually brought America into the war.

In the 1930s, isolationists wanted stricter neutrality as war loomed again in Europe. Congress imposed an arms embargo and prohibited loans in the first of the *Neutrality Acts (1935). Isolationists claimed that the selfish economic interests of merchants and bankers had dragged America into World War I, but President Franklin D. *Roosevelt pressed for fewer restraints on arms and commercial trade, until by 1939, the most onerous provisions of the Neutrality Acts had been repealed. Despite U.S. neutrality in the event of war, foreign nations could buy U.S. goods as long as they paid in cash (which circumvented restrictions on loans) and carried the products away on their own ships (which kept American merchants out of the war zone). The revision of the acts allowed the United States to aid allies at war and maintain commercial profits, while remaining legally neutral. America had once again bent the concept of neutrality to suit its economic and political interests.

Unlike Wilson in World War I, however, Roosevelt tried to prevent private interests from trading with aggressors. Unfortunately for many victims of aggression and violence, the neutral trade policies of the United States worked all too well. Republicans fighting Franco's Fascist-backed forces in Spain, and Ethiopians struggling against Mussolini's Italian invasion, could not obtain vital war supplies. American exports of petroleum reached Mussolini's army in increasing amounts, while goods were denied to Ethiopia. Roosevelt sought an embargo against Italy, but American business saw no reason to curb sales with a nation at peace with the United States. Once war broke out in Europe, America remained neutral until the attack on

* Pearl Harbor in December 1941, but Roosevelt bent the rules even further to aid the Allies through loans, Lend-Lease assistance, and other means. Once again, the exercise of neutrality meant that trade would serve the economic, diplomatic, and military interests of the United States.

TRAIL OF TEARS (1838-39). In the late eighteenth century, the Cherokees led all other tribes in responding to George *Washington's policy of assimilation, establishing a written constitution, a bicameral legislature, and a supreme court. White Americans, however, sought their removal in order to use their land "more efficiently," and

President Andrew *Jackson asked Congress to remove them west of the Mississippi. The Removal Bill and the failure to enforce the *Worcester v. Georgia* (1832) decision sealed the Cherokees' doom. A few unauthorized headmen signed away the nation's remaining land at New Echota, in present day Georgia, in December 1835, and the government gave them two years to remove themselves.

By May 1838, only 2,000 of approximately 16,000 Cherokees had moved, and Maj. Gen. Winfield *Scott entered Cherokee territory with about 2,200 federal troops and nearly 5,000 state volunteers from Georgia, Alabama, North Carolina, and Tennessee. They herded the Cherokees into stockades, and then, in June, forced three groups—approximately 2,745 men, women, and children—to begin the 850-mile march from Tennessee to Indian territory. Sickness and death in the stockades led Chief John Ross to request a delay until cooler weather. The remainder were removed, in thirteen detachments, between 23 August and 5 December 1838. Approximately 4,000 died as a result of their ordeal, most not on the trail itself.

Cherokee removal—the Trail of Tears—remains one of the greatest tragedies that the United States has inflicted upon a minority population. Removal and assimilation, however, remained incomplete. Remnants of the tribe comprise the Eastern Band of Cherokees today, and many preserve traditional culture.

TRAINING AND INDOCTRINATION. The military has always recognized the importance of training in accomplishing its missions; indeed, training is often seen as decisive in combat. Considerable attention has therefore been paid to both collective and individual training. For most of the past 350 years, military leaders in, first, the American colonies and then the United States gave thought only sporadically to what constituted military training, defined as the inculcation of skills aimed at achieving maximum efficiency on the battlefield. When doing so, military and political leaders assumed that the task was straightforward. Training was drill, and drill embodied everything that soldiers needed in order to function in battle. However much the intricacies of drill might be enshrouded in arcane language and symbols, for the individual soldier and the unit of which he was a part, training was the mechanics of marching and firing.

At one level, this approach remains true today. Basic training, the preparation of individuals from civilian life for the demands of military life, provides physical conditioning and military fundamentals and imbues recruits with their particular service's point of view. Since military service requires fitness, discipline, and the ability to live and work in a highly structured organization, recruit training emphasizes military rules, discipline, social conduct, physical conditioning, self-confidence, and pride in being a member of the military.

Subsequently, individuals also go through a progression of skills training, depending on their roles and military occupational specialties. (This entry deals primarily with enlisted personnel; education and leadership training for

officers is examined mainly in the entries on Service "Academies and "ROTC.) Collective training, from unit field training exercises to complex, joint, or even multinational maneuvers, is designed to prepare cohesive groups to accomplish their missions.

In the colonial period, militia training days were a regular part of the calendar, particularly when the danger of war seemed imminent. Training of farmer militiamen involved mainly military drill and volley fire, often on the village green or nearby field. In the "Revolutionary War, the national "Continental army of longer service soldiers had little systematic training and discipline until Gen. Friedrich Wilhelm von "Steuben, formerly of the Prussian army, instituted regular training in marching, firing, and tactical maneuvers during the Valley Forge encampment in the winter of 1777. Steuben's *Regulations for the Order and Discipline of the Troops of the United States* (1778-79) remained the army's basic training manual for three decades. Smaller and less centralized, the "Continental navy drew upon experienced seamen and where necessary relied on training on shipboard.

Under the Constitution of 1787, military training was divided, as were the nation's military institutions, between the state militias and the regular army. The Constitution and the Uniform Militia Act (1792) prescribed standardized organization and training procedures for the state militias, but these were not enforced until the twentieth century. Uniform procedures were enforced, however, in the regular army and navy and Marines, where training was patterned largely along European lines. In the northern states, universal militia training was gradually abolished and the common militia was replaced by volunteer units of the "militia and National Guard; however, compulsory militia training continued in the white South until the "Civil War.

Primary reliance upon the ad hoc U.S. "Volunteers during the wars of the nineteenth century meant that the locally raised temporary wartime units of citizen-soldiers of the "War of 1812, the "Mexican War, the Civil War, and the "Spanish-American War were trained by their junior officers and noncommissioned officers from the same locale, many of whom had little more military knowledge than the enlisted men. Consequently, training and discipline were often haphazard. Regular forces, however, continued strict training and discipline by veteran NCOs, usually following European models. In the Mexican War, training took place at camps of instruction operated under the General Recruiting Service using Gen. Winfield "Scott's *Instructions for Field Artillery, Horse and Foot*, which became the standard training manual in 1845. The War Department never developed a comprehensive training program in the Civil War; instead, training depended upon the initiative of individual officers or division commanders.

Traditionally, the U.S. Navy relied on an apprentice system of shipboard training to produce able-bodied seamen; given the pattern of long-term shipboard assignments, that approach proved adequate. But in the late nineteenth century, creation of the steel-hulled, big-gun navy led to specialized training on shore for enlisted men, beginning with gunnery school in 1883 and electricity schools in 1899. In the 1890s, nativist fears caused by mass immigration and concerns of potential disloyalty by aliens in wartime led the military services to establish special training and "Americanization" schools for recruits who had not yet become

naturalized U.S. citizens. An enlarged modern fleet led the navy to create a series of specialized schools. Between 1901 and 1916, training programs for forty different trades, from bakers to woodworkers, were established at Norfolk or Newport. Collectively, the navy conducted squadron and fleet exercises in conformity to new naval doctrines.

The U.S. Army began systematic training as part of its modernization programs in the early twentieth century. Abandoning the little posts in the West, the army held its first division-sized maneuver in peacetime in 1911. However, training of recruits in peacetime remained a responsibility of the unit to which the fledgling soldier was assigned. The norm was customarily a nine-month apprenticeship. With U.S. entry into World War I and the rapid creation of a mass army, the War Department reduced the training of recruits to four months before new infantrymen were sent overseas. This "basic" training occurred in large, hastily erected training cantonments, drawing initially on French and British training and technical manuals; audiovisual aids (such as the motion picture series *The Training of a Soldier*) also were employed. (Because the army was racially segregated, training of blacks and whites took place in different locations.)

As a result, American troops and units reached France poorly prepared, and special schools were established to give infantrymen further training in military demeanor, marksmanship, and Gen. John J. "Pershing's offensively oriented tactics before being committed to combat. The army also established additional programs to train enlisted men in the use of new technology: "artillery, "machine guns, field telephones, trucks, "tanks, and airplanes. Similarly, the wartime navy expanded its training stations at Newport, Norfolk, the Great Lakes, and San Francisco, and compressed the normal training period so that "boot" camp became merely a brief introduction to navy life and discipline, with the majority of training occurring afterwards.

In the interwar period, the navy's training system included boot camp for new recruits, followed by shore schools for advanced instruction in specialties for non-rated enlisted personnel, advanced training for petty officers, and schools for such special duty assignments as submarines and aviation. Marine Corps drill instructors imbued recruits with discipline, traditions, and basic skills, while advanced units engaged in practice landings for the Marines' new mission: amphibious assaults. In World War II, both the navy and the Marine Corps greatly expanded their training facilities and programs.

Army proposals for short-term universal military training were rejected by Congress in the "National Defense Act of 1920; instead, while reducing the regular army, Washington put primary military reliance on the organized reserve and National Guard, which took their training on weekends and in the summer. The army retained its specialized schools. In particular, the Infantry School at Fort Benning, Georgia, and the Army War College gave attention to training issues.

During the period of prewar expansion (1940-41), the army conducted recruit training in Replacement Training Centers (RTCs) modeled on an improved version of World War I training and often using reactivated cantonments that featured precisely scripted instruction (typically thirteen weeks) in drill, military courtesy, hygiene, use and care of weapons, and small unit tactics. However, after U.S. entry into World War II in December 1941, this approach

was abandoned. For the remainder of the war, almost all draftees and volunteers underwent a battery of vocational and psychological tests in RTCs, then were assigned directly to a division or other large unit for eight weeks of basic training and participation in battalion, regimental, and divisional exercises. The aim was to match precisely individual capabilities with the rapidly proliferating requirements of modern warfare.

Following detailed training manuals and instructions, army drill sergeants taught the new recruits the rudiments of military discipline, familiarized them with their weapons and equipment, and sought to forge them into soldiers. Thereafter, individual training occurred in a specialized skill or branch or by happenstance for the bulk of infantry and artillery soldiers. The acute shortage of weapons and equipment for training in 1940-41 was eventually overcome; early neglect of tactical proficiency was to some degree corrected through intensive small unit training. Training manuals and films were revised throughout the war. Because the World War II U.S. Army was a mass citizen force raised primarily through "conscription, the War Department also sponsored educational programs to maintain health and troop "morale and to inform soldiers about why the United States had gone to war (most prominently in the *Why We Fight* film series). How best to motivate (indoctrinate) individual soldiers remained unresolved, with many asserting that combat performance was a function of leadership, others arguing that ideology was preeminent, and still others (including most "veterans) insisting that loyalty to one's buddies was pivotal. Again in World War II, the army enforced rigid racial segregation, with black soldiers being trained separately and mostly commanded by white officers.

Rapid increase of the number of pilots and planes in the Army Air Corps led to the creation in 1941 of a formal training program for technicians and ground and air crews to support them. To teach more than 300 skills, the Army Air Forces Training Command offered 80 courses, ranging from 4 to 44 weeks, and including airplane repair and maintenance, aviation engineering, armaments and equipment, weather, and photography.

Belated changes in training accompanied technological and structural developments in the U.S. armed forces during the "Cold War period and afterward. Evidence of inadequate training during the first weeks and months of the "Korean War led to important reforms affecting individual training, assignment, and motivation, and unit rotation policies. Racial desegregation, ordered by President Harry S. "Truman in 1948 and implemented during the Korean War, meant that blacks and whites now trained together. Creation of the North Atlantic Treaty Organization ("NATO) meant that by the late 1950s U.S. air, land, and naval forces engaged in joint training maneuvers and exercises with those of other NATO countries. In addition, increasingly sophisticated weaponry demanded that all the services develop expanded technical specialization training. Yet the U.S. armed forces also sought in the 1960s and 1970s to emphasize traditional military values and the sense that military service was more than simply an occupation. The army established the Non-Commissioned Officers Academy in 1966, created the position of sergeant major of the army, and in 1973 created a Sergeants Major Academy at Fort Bliss, Texas, to provide advanced leader-

ship training. In the 1980s, the air force created Project Warrior to emphasize the fighting spirit in an organization dominated numerically by support personnel.

After the military's problems in the "Vietnam War and the creation of the "All-Volunteer Force, the army in 1973 established the Training and Doctrine Command (TRADOC) at Fort Monroe, Hampton, Virginia, to improve the preparation of soldiers from basic training to such special centers for combat training and advanced courses as the First Special Operations Command (SO-COM), created at Fort Bragg, North Carolina, in 1982. TRADOC established prerequisites for all NCO and commissioned officer courses. Subsequently, the army set up a number of technologically sophisticated advanced training facilities, such as its National Training Center, established in 1982 at Fort Irwin in California's Mojave Desert. There on 1,000 square miles, battalion-sized combat units of armor and mechanized infantry rotated in up to a month of fighting scenarios, including force-on-force maneuvers and live fire missions. In the 1990s, faced with force reductions, the army emphasized training designed to be realistic, difficult, and performance-oriented, and it developed a program to enhance the combined training of active army and reserves.

Difficult issues remained unresolved. Efforts to confront the complex question of combat performance continued. Racial tensions were not entirely eradicated from promotion hearings and shipboard relationships. The integration into basic training of women, who by 1998 comprised 14 percent of the armed forces, remained as controversial as the assignment of women to combat roles. Integration of the sexes had varied by service since women had entered the regular military in large numbers in the 1970s. The air force integrated men and women in basic training in 1976; but the army, after conducting a short-lived trial in the late 1970s and early 1980s, did not do so until 1993, and the navy not until 1994. (The Marine Corps continued to retain sexually segregated basic training.) Debate persisted over basic training and the importance of male bonding and directed aggression for unit cohesion in ground combat. Following a series of highly publicized rape and assault charges at an army training facility in Maryland, a special panel recommended that men and women be separated in basic training. Although Secretary of Defense William S. Cohen rejected the recommendation in 1998, the issue of sexually integrated basic training remained controversial.

TRANSPORT AND SUPPLY AIRCRAFT. The U.S. Army Air Corps' interest in transport airplanes started in 1925 by acquiring the Douglas C-1, a single engine biplane with a maximum takeoff weight (Mtow) of 7400 pounds. In an airplane the figure for Mtow is similar to that of displacement tonnage for an oceangoing ship; it is the one figure that provides a definite measure of size and probable productivity. An airplane's payload is typically about 20 percent of its Mtow.

Built to Air Corps specifications, a C-1 had seats for eight passengers; alternatively, it could carry 2000 lbs of cargo. A C-1's range was 380 miles; its cruising speed 85 mph. This was the last transport prepared to an Air Corps specification for more than 15 years. Prior to World War II transport planes served the Air Corps' internal needs and rarely the Army at large so it was expedient to buy transports that had been designed for civilian airlines.

The demonstrated success of Nazi Germany's use of airborne troops in lightning conquests of Norway, Belgium, and the Netherlands in early 1940 moved the Air Corps to create an increasingly large transport force. The backbone of this force was the immediately available Douglas DC-3 and the Curtiss CW.20 then under development. Both were twin-engine civil airliners. The DC-3, 28,000 lb Mtow, became the military C-47 or C-53, the former being the cargo version, the latter a troop carrier. More than 10,000 C-47/C-53s were procured during World War II. The CW.20, 40,000 lb Mtow, became the C-46; more than 3,000 were procured.

A shortcoming of both types was that they had been designed in the mid-1930s, too soon to take advantage of the innovation of tricycle landing gear. The C-47, C-53, and C-46 were "taildraggers"; on the ground they sat on a tail-wheel with their noses up at an angle. This made the loading of heavy cargo difficult and unloading awkward. The Douglas DC-4 airliner which became available after 1942 as the C-54, 62,000 lb Mtow, was a versatile airplane but left something to be desired as a military transport. It sat up on tricycle gear which provided a level cabin on the ground, but like most airliners it was a low wing airplane. This required a tall landing gear to maintain propeller clearance with the ground, a result being an airplane that was so high off the ground that forklifts, elevated platforms, and other devices were necessary to gain access to its cabin for loading and unloading.

In 1947 the U.S. *Air Force was established as a separate service. Although the Air Force continues to adapt airline equipment to its transport needs, these airplanes only indirectly meet the Army's combat airlift requirements. Ideally, a military transport plane is a high wing airplane, its fuselage slung beneath the wing resulting in minimum clearance between its cabin floor and the ground. This facilitates loading and unloading, including roll-on and roll-off of wheeled vehicles with a bare minimum of auxiliary equipment. In 1941 a specification was prepared for such an airplane. This was the Fairchild C-82 known as the "Fly-

ing Boxcar," a twin engine airplane, 54,000 lb Mtow, but the prototype did not fly until late 1944; more than 200 were produced but they were too late for World War II.

The C-82 was redesigned in a larger and more powerful version, the C-119, 72,700 lb Mtow, more than 900 built. Both types were used in the Korean War and in Vietnam. After 1954, however, they were gradually supplanted by the ubiquitous 4-engine Lockheed C-130 Hercules. Whereas the C-82 and C-119 were powered by piston engines, the C-130 has turbine driven propellers. And the main element of the C-130's tricycle landing gear consists of four wheels "nested" into the sides of the fuselage. This distributes the airplane's weight across a broader "footprint," facilitating operations from unimproved airfields.

Initially 124,200 lb Mtow, with increases in engine power the C-130 has grown to more than 155,000 lb and built in more than four dozen variants for the U.S. Air Force, *Navy, *Marines, and *Coast Guard, and more than 60 of the world's air forces. More than 2100 C-130s have been built, and by the year 2004 it will have been in production for a half century.

By the late 1950s there was clearly a requirement for a high-speed transatlantic trooplift capability to reinforce NATO and it produced the Lockheed C-141A which flew in 1963. The C-141A was a 4-engine turbojet of 323,000 lb Mtow capable of lifting 138 equipped troops or 62,000 lb of cargo across 4100 miles. A total of 285 were built. In 1976 the fuselages of C-141As were "stretched" by some 23 feet to increase hull volume, were modified to be receivers of inflight refueling, and redesignated C-141Bs. In 1995 most C-141Bs were 30 years old; by the year 2005 it is expected that C-141Bs will have been replaced by the new McDonnell Douglas C-17A.

Although the C-141 met the requirements for trooplift and most cargo, it could not carry heavy tanks and other less heavy but bulky loads, such as Army troop-carrying *helicopters, all of which would be required in a reinforcement of NATO. The result was the Lockheed C-5A, 769,000 lb Mtow, which flew in 1968. Whereas the cabin cross-section of C-141B is 124 inches, that of a C-5A is 228 inches; usable cubic volumes of cargo spaces are 11,399 and 34,796 cubic feet, respectively. A versatile aspect of the C-5A is cargo doors in both the nose and tail permitting straight-through loading and unloading. An upper deck has seats for 75 troops who may be necessary to handle the cargo at terminal points.

The C-5A is the first U.S. military transport equipped to receive inflight refueling, a feature that proved invaluable in the resupply of Israel in the Arab-Israeli War of 1973. A specification for a transoceanic transport airplane usually described a range of 4000 miles, roughly the distance from bases in northeastern United States to bases in West Germany. It could be assumed that if operations were to be extended to the Eastern Mediterranean they could be staged through Western Europe. But the distance from the U.S. to Israel is about 6000 miles and during the 1973 War the Arabs pressured the nations of Western Europe to deny refueling services to the U.S. airlift to Israel. Although a C-5A could fly 6000 miles nonstop it could do so only with a reduced payload. However, refueled in flight by Boeing KC-135 tankers based in Spain and the Azores, C-5As were able to fly full loads from North America to Israel nonstop.

Flight operations revealed a flaw in the C-5A's wing structure that limited the wing's fatigue life to less than

expectations and in the 1980s all C-5As were re-winged. Concurrently, 50 C-5Bs were procured. Built with the new wing, they are essentially the same as the C-5A and increase the C-5 fleet to more than 120 airplanes.

With the C-141 fleet more than 30 years old and approaching the end of their fatigue lives, they are being replaced by the McDonnell Douglas C-17, a 4-engine jet transport of 580,000 lbs Mtow that is equipped for inflight refueling. The C-17 was first flown in 1991 and in 1995 it started to equip its first squadrons. At the turn of the century the backbone Air Force's Air Mobility Command will consist of C-5s, C-17s, and C-130s, served by some 500 KC-135 and 50 KC-10 tankers which provide the force with global range.

TRANSPORTATION is the key to successful military operations in peace and war. At both the strategic and the tactical level—on land and sea and in the air—transportation provides the essential means for assembling men, equipment, and supplies at the critical time and place. Military transportation includes planning and executing the movement of personnel, equipment, and supplies to the theater of operations (*strategic* transportation), within the theater (*operational* transportation), and on the battlefield (*tactical* transportation). Effective and efficient transportation involves *movement control* and the use of all modes of transportation: human and animal, transoceanic and inland water transport, rail, motor, air, and such other methods as pipelines and aerial tramways.

Movement control encompasses the planning, coordination, and supervision of military movement of all types and includes such subfunctions as scheduling personnel and cargo movement to maximize the use of available carriers and ensure that men and materiel arrive when and where needed; tracking the progress of movement; and regulating the frequency, speed, and density of movement in order to avoid congestion at any point along the route.

Human and animal transport have been used to move military forces since prehistoric times. Well into the twentieth century, most armies relied almost entirely upon human and animal bearers. Even today in more primitive areas, porters and pack animals are still the most effective means of moving military supplies. Able to operate under most weather conditions on all sorts of terrain, a human bearer can carry 60-80 pounds for fifteen miles in a day. Pack animals (horses, mules, bullocks, and camels) can carry about 200-250 pounds, and the standard U.S. Army four-horse wagon of the "Civil War period could haul over 1 ton of cargo. Human and animal transport is often critical to the success or failure of a military campaign. The terrible privations suffered by Washington's "Continental army at Valley Forge in the winter of 1777-78 during the "Revolutionary War were due more to the lack of adequate teams, wagons, and teamsters than to any absolute lack of food, clothing, and fuel in the rebellious colonies. However, by the end of the Civil War less than 100 years later, wagon transport had become a particularly effective means of moving supplies under the control of competent logisticians.

Water transport is essential to move men and materiel overseas, and both transoceanic and inland water trans-

port can move large numbers of troops and supplies in bulk over long distances. However, most water transport is relatively slow, and its effective utilization depends upon adequate loading and unloading facilities. Water transport has played an important role in all America's wars, especially since 1898, when overseas campaigns became the norm for U.S. forces. Beginning in 1948, the U.S. Navy assumed responsibility for managing water transport for all military services, but until after World War II, the army operated its own fleet of seagoing transports and cargo vessels under the direction of the Quartermaster Corps and, after 1942, the Transportation Corps.

Rail transport can haul large tonnages over great distances in all sorts of weather, but it is manpower-intensive, restricted to established routes, and quite vulnerable to enemy attack. Railroads were first used for military transportation in the United States during the "Mexican War of 1846-48, and they became an important factor in strategic and operational mobility during the Civil War. American railroads carried almost all military troops and cargo within the continental United States in World Wars I and II, but in recent years military rail movements have been largely supplanted by motor and air transport. Until the formation of the Army Transportation Corps in 1942, U.S. military railroads were operated by the U.S. "Army Corps of Engineers.

Motor transport is now the principal mode of military movement at the operational and tactical level. Such transport is flexible but requires a high expenditure of manpower and other resources, not only to operate and maintain the vehicles themselves but also to maintain roads capable of handling sustained military traffic. Motor transport is also relatively vulnerable to the effects of weather and enemy interdiction. The U.S. Army, which purchased its first motor vehicles in the 1890s, was one of the first armies in the world to achieve full mechanization of its tactical and logistical forces. Until 1942, motor transport was the responsibility of the Quartermaster Corps, although a distinct Motor Transport Corps existed for a short time in World War I.

Air transport first became a factor in modern warfare during World War II and has since assumed great importance. The rapid long-distance movement of substantial numbers of men and large quantities of cargo by air has revolutionized the strategic mobility of military forces. At the same time, tactical mobility has been enormously improved by the use of "helicopters. But air transport is very expensive and generally requires improved terminal facilities. The air force provides U.S. military forces with worldwide strategic airlifts and tactical airlifts of men and materiel, effecting deliveries by both air landing and parachute drop. The other services also operate their own tactical airlifts, principally in the form of troop and cargo-carrying helicopters. The "Persian Gulf War demonstrated the capabilities of adequate and properly managed air transport.

Pipelines, aerial tramways, hovercraft, and other means of transport supplement the principal modes. Pipelines, operated by the Army Quartermaster Corps, are particularly useful for the movement of bulk liquids and solids suspended in liquid (e.g., coal dust). They are, however, relatively inflexible, vulnerable to enemy action, and require substantial resources to build and maintain.

Since most modern military movement of any consequence involves more than one service, management at the

highest levels is a joint undertaking. The U.S. Transportation Command, a joint headquarters established in 1987, provides movement control and the allocation of strategic transportation resources for all the services. Close links are maintained with civilian enterprises (shipping and trucking companies, the railroads, and commercial air carriers), which in fact own and operate under government contract most of the equipment and facilities needed to meet military requirements, particularly within the United States and to the overseas theaters.

Modern military forces possess great destructive power, but that power must be positioned at the decisive time and place if "victory is to be attained. The only means for achieving the necessary concentration is transportation—by land, sea, or air. A military force without adequate transportation cannot achieve overwhelming superiority on the battlefield and is thus doomed to failure.

—Charles R. Shrader

TREASON—betraying the nation-state that the American military was created to defend—is among the most odious of crimes. Yet American history suggests how fine the line can be between patriot and traitor.

The founding fathers had to become traitors to their king in order to create the United States. The Declaration of Independence articulated the conditions—tyranny—under which a people might legitimately renounce their allegiance to one sovereign authority and transfer it to another.

Efforts to punish disloyalty to the new nation predated its independence. On 24 June, 1776, the Continental Congress adopted a motion by its Committee on Spies recommending that individual colonies punish those "who shall levy war against any of the said colonies ... or be adherent to the King of Great Britain..." Thus authorized, the revolutionary factions in the individual colonies punished as traitors avowed Tories, along with those who uttered favorable opinions about the king, had contact with the British, or entered British-controlled territories. The emphasis was on protecting the new nation, not the rights or intent of the accused. Punishment most often involved confiscation of property and exile. The revolutionaries justified such severity by the presumption that, as the Virginia treason statute suggested, "all countries have a Right to the personal services" of their inhabitants.

Treason was given an enduring symbol in 1780 when Gen. Benedict "Arnold, disillusioned with the revolutionary cause, unsuccessfully schemed to surrender the army garrison at West Point to the British, fleeing to the British after his plot was discovered. Arnold's name remains synonymous with betrayal in American history.

The excesses of the Revolution prompted the framers of the Constitution to restrict the definition of treason to "levying war against" the United States and providing "aid and comfort" to its enemies, and to require the testimony of two witnesses "to the same overt act" and the establishment of treasonous intent for conviction. They limited

punishment to the person charged, and abjured the attainder of the traitor's relatives or heirs. Thus the framers hoped to balance the security of the state with the protection of private property and individual rights and to prevent the charge of treason from becoming an instrument of political repression.

The first application of the Constitution's treason provisions occurred in 1794 with the "Whiskey Rebellion. Federal troops led by George "Washington quashed this challenge to central authority, and a federal circuit court condemned to death two men—whom Washington later pardoned—for treason.

A major landmark in the evolution of treason law occurred in the 1807 trial of Aaron Burr, who stood accused of attempting to establish an independent trans-Appalachian empire. Although circumstantial evidence pointed toward the defendant's guilt, the government's inability to prove that an overt act of treason had occurred resulted in Burr's acquittal. In a victory for a narrow interpretation of the law of treason, Chief Justice John Marshall ruled that "the difficulty of proving a fact will not justify conviction without proof."

During the "Mexican War (1846-48), religious allegiance took precedence over national loyalty for several hundred Irish immigrant U.S. troops who deserted to the Mexican Army when the Mexican government appealed to them to defend Catholicism and promised them land. The "San Patricio Brigade" put up fierce resistance against U.S. units at the Battle of Churubusco before surrendering to Gen. Winfield "Scott, who executed fifty of them for treason.

In 1859, John Brown and his followers, in the name of God and slave liberation, seized the Federal arsenal at Harpers Ferry, Virginia, as part of a plan to establish a free guerrilla state. Although Brown had attacked U.S. property, Governor Henry Wise had the conspirators tried for treason against Virginia. This assertion of state jurisdiction reflected the assumptions that soon produced the secession of the Southern states in 1861, the most significant act of treason in American history. Suppression of the rebellion was based on the assumption that the Union was permanent and that secession from it could never be justified.

Although the Constitution defines treason strictly, Congress has expanded the definition of treasonous behavior by legislation such as the "Alien and Sedition Acts of 1798 and the "Espionage and Sedition Acts of World War I (1917; 1918), which punished political expression deemed hazardous to the state. Both sets of legislation proved controversial. The acts of 1798 provoked the violent opposition of the emerging Jeffersonian Republican Party and facilitated the election of Thomas "Jefferson as president in 1801. The acts of 1917-18 legitimated a government crackdown on dissent of all kinds and foreshadowed the crisis atmosphere of the Red Scare of the 1920s.

The "Cold War saw the charge of treason used to build political careers and silence dissent. Congressman Richard M. "Nixon first came to prominence in 1948 investigating a State Department employee, Alger Hiss, for his alleged activities as a Communist Party contact in the 1930s. In 1952, Senator Joseph McCarthy, alleging "twenty years of treason," launched his campaign to eliminate alleged traitors in the federal government. McCarthyism made dissent tantamount to treason. Julius and Ethel Rosenberg, who were convicted and executed in 1953 for passing secrets to

the Soviets, were condemned by many for being traitors.

Jonathan Pollard, a Defense Department analyst convicted in 1985 of passing vital secrets to Israel, remains incarcerated in spite of continued pressure from the Israeli government for his release. The quantity and importance of the information Pollard leaked constitutes one of the most significant security breaches in U.S. history.

In recent years, treason has tended to be committed for monetary gain rather than ideological commitment. Typical of this trend are * Central Intelligence Agency (CIA) officials Aldrich Ames and Harold James Nicholson. Ames, before being discovered in 1994, passed extensive information on U.S. intelligence operatives abroad to Soviet and Russian agents. Nicholson, who confessed in March 1997 to passing secrets to the Russians, is the highest ranking CIA employee to be caught spying.

TRENCH WARFARE in the form of siege operations was already a developed art by the seventeenth century. The master of this form of warfare was the French marshal Vauban (1633-1707). His system set the stage for two centuries of siege warfare, and was used during the Crimean War (1854-56).

An American observer of that war, George B. *McClellan, noted the improved power of the entrenched defense, while the outstanding American military theorist of the time, Dennis Hart Mahan, advocated before the *Civil War an entrenched but active defense, and expressed doubts about the frontal assault of fortified positions. Mahan and his supporters represented one school of thought, and their concerns were reinforced by the introduction of the rifled musket in the mid-1850s. However, an opposite and more popular school of thought emphasized offensive *Napoleonic warfare. This approach also benefited from successful American assaults in the *Mexican War (1846-48).

Thus, in the first two years of the Civil War, entrenchments were often ignored. However, from 1863 on, as the rifled musket made an even greater impact, as infantry dominated the battlefield, as the cost of offensive warfare in *casualties climbed steeply, and as the *Confederate army went more frequently onto the defensive, entrenchments became much more significant. These often consisted of breastworks of logs, since engineers and digging tools were in short supply. But where possible, those who believed in the value of trenches used them, although others deprecated their use, believing that they lowered *troop morale. Still others, like Gen. Ulysses S. *Grant, were inconsistent in their attitude toward entrenchments.

This move toward trench warfare can be seen in sieges such as at Vicksburg (1863) and Petersburg (1864). At the Siege of *Vicksburg, for example, General Grant penned in a Confederate army, which constructed strongpoints and forts every few hundred yards for the *artillery, and linked these strongpoints with rifle pits and trenches. Grant tried two attacks upon these defenses, and both failed, with heavy loss of life. Grant then turned to Vauban-style be-

sieging tactics and began sapping and mining toward the defensive works. So close did the trench lines approach each other that the night pickets were able to fraternize. But with daylight it was "Watch out, Johnnie, and hunt your hole." Eventually, Grant wore down the defenders. Similarly, at the Siege of *Petersburg, the lengthy siege with trenchworks and mining failed to take the city, which only surrendered through lack of supplies and attrition.

Vicksburg and Petersburg showed the power of defensive entrenchments during sieges when protected by artillery and rifles. Equally, in the last three years of the Civil War, both offensive and defensive entrenchments revealed their value in battle, for example, at Cold Harbor (1864), and at Kennesaw Mountain (1864). Dennis Mahan's school of thought had been vindicated by the Civil War. However, other armies did not appreciate the change in warfare, as the shadow of Napoleon continued to emphasize offensive ideas. Thus, the Franco-Prussian War, the Boer War in South Africa, and the Russo-Japanese War all demonstrated the problems of taking entrenchments that were defended by improved rifles, long-range artillery, and increasingly, *machine guns.

Trench warfare of World War I continued the nineteenth- and early twentieth-century trend toward increased power of the entrenched defense. Weapons were now even more powerful, and these forced the infantry underground into long lines of trenches, which spread across the entire western front by late 1914. The United States entered the war in April 1917, under the command of Gen. John J. *Pershing, who hindered his troops' efficiency by advocating "open warfare." Pershing believed the French and British had bogged down in defeatist trench warfare, and that the American Expeditionary Forces (AEF) could break through enemy trenches and achieve open warfare by the use of initiative, the rifle, and the bayonet. Pershing stated that *victory "could not be won by the costly process of attrition, but it must be won by driving the enemy out into the open and engaging him in a war of movement." However, Pershing ignored the power of trench defenses, and so AEF troops frequently suffered heavy losses, such as the attack in June 1918 at the Battle of *Bellevue Wood, where the U.S. Second Division took nearly 9,000 casualties.

Nevertheless, Pershing felt vindicated by the AEF success at the Battle of *St. Mihiel in September 1918, where rapid advances did overrun trenches and barbed wire. Next, the AEF took part in the *Meuse-Argonne Offensive. This ran into logistical problems, but inexperience also led to underuse of hand grenades and gas masks, while frontal attacks against German trenches and positions created severe losses among the Americans. In fact, the AEF was actually waging costly attrition warfare, despite Pershing's ideas. Late in October 1918, the AEF reorganized and assimilated trench warfare lessons. Assault teams were created to deal with German machine guns, while the main offensive bypassed these strongpoints. This tactic, plus the use of other weapons, produced a combined arms approach to dealing with German defenses. In the early morning of 1 November 1918, the AEF's First Army attacked in this fashion and broke through all German defenses. Pershing's wish was finally achieved: open warfare had arrived.

Trench warfare, defined as combat with both sides in trenches, apparently came to an end with the armistice in 1918. However, dug-in positions remained a feature of war-

fare, as the later twentieth century showed. During World War II, in Normandy after the "D-Day landing, the defenses of the *bocage* (hedgerow) countryside slowed down Allied forces until an American sergeant devised steel teeth mounted on a Sherman tank to cut through the roots of the thick hedges. In the Pacific War, Japanese soldiers on Iwo Jima and Okinawa had to be driven out of their entrenchments and caves with artillery, "tanks, rockets, "flame-throwers, and dynamite. Then, in the "Korean War, especially between November 1951 and July 1953, both sides dug in and resumed a static World War I form of trench warfare on hilltops and mountain ridges, complete with "no-man's-land." During the "Vietnam War, U.S. forces occasionally came across remarkable series of enemy trenches and underground systems, such as the tunnels at Cu Chi. Finally, in the "Persian Gulf War, the Iraqi Army dug in with extensive defenses of sand berms, trenches, foxholes, and minefields. Led by American divisions, "United Nations forces used bulldozers and antimine tank plows to cut lanes through the defenses, as well as plowing under trenches that contained infantry resistors.

Recent conflicts show that trench warfare still continues. Yet the basic contradiction of this style of fighting remains—trench warfare is essentially defensive, but armies continually seek offensive success.

TRENTON AND PRINCETON, BATTLES OF (1776-77). When George "Washington's army captured the Hessian garrison of Trenton, New Jersey, on 26 December 1776, and parried the British relief column at Princeton on 3 January 1777, it won victories that marked the turning point of the Revolutionary War. Since August, Gen. William "Howe had forced the American army out of New York and hounded it across northern New Jersey in November, and might have destroyed it altogether, had not Washington crossed to the western shore of the Delaware River in mid-December, seizing all available boats as he went. Nearly destitute of food, clothing, and ammunition, with enlistments expiring and men abandoning what looked like a lost cause, the "Continental army was about to fade away. But Washington, unwilling to let the cause die without one last effort, was able to keep together a force large enough to attack a vulnerable part of the overextended British army as it settled down for the winter.

On Christmas night, in a storm of rain, hail, and snow, Washington led his remaining 2,400 men back across the Delaware, and just as dawn broke on the 26th, surprised and captured the 1,000-man Hessian garrison at Trenton.

Careful not to attempt too much with too little, Washington's army retraced its steps back across the Delaware, only to appear on 3 January 1777 at Princeton, ten miles

northeast of Trenton, outflanking British forces that had advanced to reclaim the town. The American army, reduced to 1,600 men, attacked 1,200 disorganized British troops at Princeton with modest success. Washington risked his life leading a charge against a British position, but kept his head and broke off the engagement before British reinforcements under Charles "Cornwallis arrived from Trenton. The Continentals withdrew to the northwest and went into winter quarters at Morristown in mid-January. Washington and his little army had foiled the British conquest of northern New Jersey and showed the world that the rebellion was not dead yet.

TRIPOLITAN WAR (1801-05). Late eighteenth-century European powers paid the Barbary states (Morocco, Algiers, Tunis, and Tripoli, called *Barbary* for the Berber people of North Africa) to capture their competitors' ships. Sometimes known as "Barbary pirates," the North African sea raiders seized ships for both profit and political reasons. The raiding was an organized government activity, not piracy; the United States and other powers negotiated treaties with the North African states to protect their commerce. In 1785, Great Britain encouraged Algiers to capture two ships from the newly independent United States.

While the captive American sailors languished, the U.S. minister to France, Thomas "Jefferson, tried to enlist Portugal, Naples, Sardinia, and Russia in an alliance against Algiers. France refused to cooperate. In 1793, Britain promulgated a fraudulent treaty between Algiers and Portugal, after which Algiers captured a dozen American ships and over 100 American sailors. American envoys negotiated a treaty in 1795, pledging an annual tribute in naval supplies, and a frigate as a gift to the dey, or ruler, of Algiers. Richard O'Brien, captive in Algiers since 1785, negotiated similar treaties with Tunis and Tripoli.

But the United States was slow to send tribute. When Jefferson became president in 1801, Tripoli's Pasha Yusuf Qaramanli, demanding his tribute, had all but declared war. Although Jefferson, determined to cut military spending, had sold or decommissioned most of the U.S. Navy's ships, he sent what was left to the Mediterranean with instructions to cooperate with Sweden, Sicily, Malta, Portugal, and Morocco against Tripoli. This coalition forced Qaramanli to back down, ultimately giving the United States a victory, even with a minimal navy.

For two years a small U.S. squadron (one frigate and its consorts) patrolled the Tripolitan coast. When the frigate USS *Philadelphia* ran aground in October 1803, Tripoli captured the 300 men on board and prepared to use the ship against the Americans. Jefferson's political opponents accused him of fighting a war without sufficient resources, but Lt. Stephen "Decatur silenced the critics in February 1804 when he entered Tripoli Harbor with a small crew and burned the *Philadelphia*. Decatur, promoted to captain, became a national hero; the navy increased its bombardments of Tripoli.

William Eaton, American consul to Tunis, proposed an alliance with Ahmed Qaramanli, Yusuf's brother, whom

the pasha had deposed in 1795. Eaton organized an army of Arabs, Greeks, and U.S. Marines to reinstall Ahmed as ruler, in the expectation that he would make a favorable treaty with the United States. Jefferson neither supported the plan nor discouraged it. Eaton's force marched from Egypt to the city of Derne, which it captured in June 1805, just as the United States made peace with Yusuf. The government ransomed the *Philadelphia's* crew, and Tripoli promised not to attack American ships. The diplomatic results were less impressive than the patriotic effusions in the United States: paintings, songs, poems, plays, and statues celebrated America's victory over its Muslim enemies.

In 1807, Algiers declared war on the United States, but the embargo and the "War of 1812 kept American shipping out of the Mediterranean. In 1815, the Madison administration sent Decatur to settle the dispute. Algiers promised not to take American ships, and a few months later an English fleet forced Algiers to renounce attacks on European shipping. Great Britain no longer needed Algiers to fight its enemies. In 1830, France invaded Algiers, beginning a century of European colonization in North Africa.

TRUMAN, HARRY S. (1884-1972), thirty-third U.S. president. Born in Lamar, Missouri, a poor farmer's son, Harry Truman abandoned hope of a West Point education because of poor eyesight, but joined the National Guard in 1905. In World War I, 1917-18, Captain Harry Truman commanded Battery D, 129th Field Artillery, 35th Division, at the Battle of "St. Mihiel, Varennes, the "Meuse-Argonne Offensive, and Metz. Back home as a protégé of the Democratic Pendergast machine of Kansas City, Truman won several local elections before his election as a U.S. senator in 1934. During World War II, in 1941-44, he chaired a special Senate committee investigating defense spending. He became President Franklin D. "Roosevelt's vice presidential running mate in 1944, and succeeded to the presidency upon Roosevelt's death, 12 April 1945.

After the successful test of the atomic bomb in New Mexico in July 1945, Truman maintained the unconditional surrender demand toward Japan and took an increasingly hard line toward the Soviet Union. He approved the bombings of "Hiroshima and Nagasaki that brought about the end of the war.

As president, 1945-53, Truman shaped U.S. foreign and defense policy in the early "Cold War. His "internationalism—more accurately, militant "nationalism—depended heavily on military preparedness, a result of his belief in dealing from strength and his own combative personality. He relied upon particularly cosmopolitan, hard-line advisers, especially Secretaries of State George C. "Marshall and Dean "Acheson and the U.S. ambassador to Moscow, W. Averell Harriman; but he prided himself on making the final decisions.

Responding to Josef "Stalin's imposition of Soviet control in Eastern Europe and American fears of a global expansion of communism, the Truman administration sought to create a postwar order of democracy, self-government, and expanding world trade. But the "Truman

Doctrine of "containment" announced originally in 1947 as political and economic soon because militarized, as did the "Marshall Plan of 1948 and "NATO, created in 1949. The administration began to support a variety of anti-Communist efforts in Europe and Asia.

U.S.-Soviet relations had become confrontational in 1946. By 1948, in a dispute over Germany, Stalin blockaded Berlin; Truman responded with the Berlin airlift. In 1949, after the Soviet A-bomb test, Truman ordered U.S. development of the hydrogen bomb.

The Truman administration in the late 1940s had sought an expanded military within a restricted budget. It failed to achieve universal military training for the army and in 1948 accepted a selective draft. In 1949, when it canceled the navy's supercarrier, it faced a "Revolt of the Admirals." Primary reliance was placed on atomic "bomber aircraft of the U.S. Air Force, made independent by the "National Security Act of 1947.

The "Korean War changed the budget picture and led to the enormous expansion of all the armed services. It also led to desegregation of the armed services, ordered by Truman in 1948. Yet the frustrations of this limited war precipitated a major crisis in civil-military relations: Gen. Douglas "MacArthur's public challenge to the administration's restrictions against attacking China itself. Consequently, President Truman relieved him of command.

Although the Truman administration was highly unpopular when it left office in 1953, admiration for Truman rose in the 1970s over his plain and honest style, decisiveness, and many of his Cold War policies, which some in the 1990s credited with ultimately defeating the Soviet Union. Yet a number of scholars believe that Truman's get-tough style and hard-line policies interacting with Stalin's paranoia and ruthlessly blunt policies served to escalate rather than diminish the Cold War.

TRUMAN DOCTRINE. In 1947, Soviet-American tensions developed along the "northern tier" of the Mediterranean and culminated in the Truman Doctrine. The Soviet Union, recently rebuffed in Iran, seemed determined to stage a Communist takeover in Greece and wrest the Dardenelles Straits—connecting the Black Sea with the Mediterranean—from Turkey. Although it is doubtful that the Soviets were either directly involved in the Greek troubles or actually prepared to take military action against Turkey, the perception of danger distorted reality. The Truman administration feared that the Soviets sought access to the Persian Gulf, the Mediterranean, and ultimately the entire Middle East. Soviet hegemony in this oil-rich region could promote the collapse of Western Europe.

The immediate concern was Greece. The British supported the restoration of the monarchy after World War II, but opposition came from numerous groups, including the Greek Communist Party. Fighting had broken out in

Athens in late 1944, which resulted in an uneasy truce in February 1946; but in August, Greek guerrillas raided a number of villages and towns, and soon received assistance from the Communist regimes in Yugoslavia, Albania, and Bulgaria. By the spring of 1947, the U.S. government regarded Greece as the supreme test of the free world.

Turkey was also crucial. Located along the Soviet border, it controlled the Dardanelles and was vital to the Soviets' push for a warm-water link to the Middle East. By early 1947, Soviet troops had amassed along the common border, causing a war of nerves that forced the Turkish government into military preparations.

The crisis in the Mediterranean became an American problem in February 1947, when the British government declared itself financially incapable of maintaining long-standing commitments in Greece and Turkey. Secretary of State George C. *Marshall had already instructed his undersecretary, Dean *Acheson, to prepare an economic and military assistance plan for Greece. Congressional members from both parties received invitations to the White House to join the administration in halting a Communist drive allegedly engineered by the Kremlin. Because of traditional American *isolationism, what lay ahead, President Harry S. *Truman remarked, was "the greatest selling job ever facing a President."

The result was the Truman Doctrine. Before a joint session of Congress on 12 March 1947, the president outlined the dangers in Greece and Turkey. "I believe," he emphasized, "that it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures." To save Greece and Turkey, he called on Congress to authorize a military and economic aid program of \$400 million.

Widespread resistance arose against this policy. Marshall and State Department adviser George F. *Kennan thought the anti-Communist tone of the message too severe. Isolationist Republican senator Robert *Taft argued against assuming Britain's responsibilities, and columnist Walter Lippmann warned that the administration had not distinguished which areas were vital to U.S. interests and was heading toward a worldwide ideological crusade. Containment, Lippmann asserted, was a "strategic monstrosity." Acheson insisted that the Truman Doctrine applied specifically to Greece and Turkey, and that the administration would consider aid to other countries only on their "individual merits."

The arguments continued for weeks, but in May 1947 Congress approved the Greek-Turkish aid bills by a wide, bipartisan margin, and American aid was soon en route to both countries.

The Truman Doctrine stabilized Greece and Turkey, thereby appearing to establish the credibility of containment. Nearly 300 U.S. military and civilian personnel provided advisory assistance to the Greek Army in its war against the guerrillas. American weaponry also proved essential to the government's victory, although the growing rift between Yugoslav leader Marshal Tito (Josip Broz) and the Soviet Union played an important role. A year after his defection from the Cominform in July 1948, Tito closed the border and effectively denied the Greek guerrillas further refuge and assistance. In October 1949, the

royalist army scattered them into the northern mountains of Greece and into Albania, and the fighting came to an end. The crisis in Turkey likewise passed as America's military assistance and advice bolstered the country against Soviet pressure.

Containment brought mixed results. It yielded a monumental triumph in the Near East, and hence in the Cold War. Yet the administration's rhetoric and emergency tactics encouraged a Red Scare during the 1950s, known as *McCarthyism*. More far-reaching, American policymakers later ignored the restraints implanted in the Truman Doctrine to launch the global crusade Lippmann had warned against. Indeed, containment became heavily military in orientation, as exemplified by the establishment of *NATO in 1949 and the later U.S. involvement in Vietnam.

TWINING, NATHAN F. (1897-1982), World War II general. Twining was a 1918 graduate of U.S. Military Academy and served in U.S. National Guard during * World War I. Throughout his career, from private to Chairman of the * Joint Chiefs of Staff (JCS), Twining never lost touch with his great fund of common sense or his ability to work with others. After becoming a pilot in 1924, Twining served in various postings until joining the Air Corps Staff in 1940. In January 1943 Twining became commander of the Thirteenth Air Force, in the south Pacific—a job that placed him, for practical purposes, under U.S. *Navy command. General Twining almost died when he and fourteen others spent six days in a life raft after crashing into the ocean. In January 1944, he assumed command of the Fifteenth Air Force in Italy, in a theater dominated by the British. This posting reinforced his belief in strategic bombing. After V-E Day he returned to the Pacific to take charge of the Twentieth Air Force. He ordered both atomic bomb missions. In 1950 the service promoted him to USAF Vice Chief of Staff—the person responsible for the day-to-day operations of the U.S. *Air Force (USAF). In 1953 he became USAF Chief of Staff and in 1957 President Dwight D. *Eisenhower appointed him Chairman of the JCS. Twining's views on strategic deterrence and cooperation among the armed services meshed perfectly with the administration's emphasis on collegiality and a defense strategy based on atomic weapons. Twining retired in 1960.

U

ULTRA became the code word the Allies used to identify intelligence produced by decrypting enemy communications during World War II. The British Admiralty first used the term in May 1940 to enable commanders to evaluate the source of the intelligence dispatched to them. By 1945, ULTRA was in official use by American, Australian, Canadian, and British intelligence agencies and field armies and navies worldwide. ULTRA's sources were mainly decrypted German and Japanese military and naval ciphers, although some codebreaking successes were achieved against the Italian armed forces as well. In general terms, the Germans relied on numerous machine-generated ciphers, while the Japanese resorted to multiple book-based cipher systems. Success in reading one code did not translate into a wholesale breakthrough into all existing code systems. Nor did breaking one code guarantee continual solution of the system because the enemy introduced changes on a routine basis to preclude just such a possibility.

The first German code penetrated was the German *Luftwaffe* (Air Force) system. It relied for security on an ENIGMA machine to encrypt messages. The British began their uninterrupted reading of this cipher in May 1940 and used its secrets to great advantage during the Battle of Britain. Of greater importance was the breaking of the German U-boat cipher. Some penetrations were made in the system in 1940, but not until April 1943 did sustained and timely decryption of German submarine messages become possible. ULTRA's contribution to victory in the Atlantic cannot be overstated. By enabling the Allies to know where German "submarines lurked, ULTRA allowed commanders to reroute convoys around the wolf packs or to direct aircraft and warships to attack the submarines. Depriving the U-boats of their greatest advantage, stealth, ULTRA made possible the great trans-Atlantic convoys that first kept Britain in the war, then fed the buildup for the "D-Day landing, and finally nourished the Allied drive across Western Europe.

ULTRA's role in the ground war in the west was a mixed one. The Allies deciphered few German Army messages until the summer of 1942. By reading the porous *Luftwaffe* ciphers, however, they gained significant intelligence about ground dispositions. Yet it required a frustrating learning period to develop a system to distribute ULTRA where it was most needed—into the hands of the field commanders. In 1941, for instance, ULTRA revealed in precise detail the German plan to attack the Mediterranean island of Crete. Without a distribution system for the precious intelligence, London could order immediate action, but field commanders hesitated, either unsure about the reliability of the source or fearful of betraying it by acting on its revelations. The story in the seesaw "North Africa Campaign of

the western desert against Erwin "Rommel's Afrika Korps between November 1941 and June 1942 was initially similar until the British deployed ULTRA intelligence analysts to field commands and institutionalized a system for distributing ULTRA to operational headquarters.

Perhaps ULTRA's greatest contribution to "victory in the west was its cumulative accretion of details about the German "order of battle. This priceless intelligence, communicated unwittingly in the Germans' own words, enabled the Allies to make accurate assessments of German strengths and weaknesses; to exploit German preconceptions; and sometimes to disrupt German plans.

In European war, ULTRA was never distributed to field commanders below army level. Each army headquarters had an assigned special liaison officer or special security officer. They received ULTRA intelligence from Bletchley Park in Buckinghamshire, northwest of London, and hand-carried it to the army commander as well as his immediate staff. A series of Anglo-American arrangements concluded in 1942 and 1943 also made ULTRA the universal code word for such intelligence and established the distribution system used in the western theater throughout the war. Furthermore, the major Allies divided the ULTRA world between themselves. The British took responsibility for ULTRA in the "China-Burma-India theater; the Americans in the Pacific; and both shared the Atlantic, Mediterranean, and European theaters.

In the Pacific, the situation was far less centralized. American, British, and Australian naval cryptanalysts worked against Imperial Japanese Navy book codes. The U.S. Army's cryptanalytic arm, the Signal Intelligence Service, attacked Japanese Army code systems and foreign ministry communications from Arlington Hall in the Washington, D.C., suburbs. German ciphers were the main British targets, but Bletchley Park and the Wireless Experimentation Center in India also played major roles in solving the Japanese Army Air Force's ciphers and air-ground codes. And a combined American, Australian, British, and Canadian organization, Central Bureau, served as Gen. Douglas "MacArthur's independent cryptanalytic agency. Since the Japanese Army and Navy used different cryptologic systems, there was little exchange of technical cryptanalytic data. ULTRA intelligence, however, was exchanged on a routine basis.

Before the Japanese attack on "Pearl Harbor, in December 1941, both the U.S. Army and Navy were devoting most of their slim cryptanalytic resources to solving Japanese diplomatic ciphers, notably the foreign ministry's PURPLE machine. The U.S. Navy, together with British cryptanalysts at Singapore, was analyzing the Japanese naval cipher and indeed had broken into the system in

September 1940. A change to the key register in 1941 prevented further exploitation of the initial success. Thus, at the time of Pearl Harbor, the Allies were not breaking any Japanese high-level military ciphers.

Because of its prewar experience, the U.S. Navy was able to solve portions of the Japanese Navy's main administrative code, JN-25, in early 1942. Intelligence gleaned from this source proved crucial to the Allies' deflection of the Japanese naval thrust against Port Moresby, Papua New Guinea, in May 1942, and decisive in the Battle of "Midway" the following month. Sustained and timely reading of the naval cipher, with occasional periods of blackout, typified the next three years of the naval war in the Pacific. ULTRA uncovered numerous Japanese seaborne reinforcement schemes for eastern New Guinea and the Solomons. In March 1943, ULTRA forewarning led to the Battle of the Bismarck Sea, where the loss of sixteen ships crammed with Japanese reinforcements shifted the strategic initiative to the Allies in the southwest Pacific. ULTRA was especially valuable to the American submarine campaign in the Pacific. The Allies' ability to read the Japanese Army and Navy water transport codes enabled them to pinpoint convoy routes, times, and locations for Japanese convoys.

In the early days of the war, Central Bureau received responsibility for solving Japanese naval land-based aircraft codes and ciphers. Within nine months of its establishment in April 1942, Central Bureau cryptanalysts had solved the naval land-based air cipher; the army air force's air-ground code; and the Japanese weather cipher. This intelligence enabled Allied air commanders to marshal their forces to meet enemy raiders and later to catch Japanese aircraft on the ground.

Allied success in the great air battles over Guadalcanal, the central Solomons, and Papua, New Guinea in late 1942 and early 1943 owed much to alerts provided by ULTRA. Probably the most notable example was to shoot down the aircraft carrying Adm. Isoroku "Yamamoto" after a decrypted message betrayed the admiral's itinerary. Other major success included the destruction of the Japanese air forces in eastern New Guinea, at Wewak in August 1943 and at Hollandia in March 1944.

The main Japanese Army codes, both strategic and tactical, resisted all cryptanalytic attempts to break them. Then, in January 1944, Australian troops pursuing the retreating Japanese in eastern New Guinea discovered a steel box containing the complete cryptologic library of the Japanese 20th Infantry Division. These captured codebooks enabled the Allies to read the Japanese Army's main code system until April 1944, when changes appeared. By that time, however, MacArthur had capitalized on this newly available source to put forces ashore some 200 miles behind the main Japanese units in eastern New Guinea. His surprise landings at Hollandia and Aitape in April

1944 severed Japanese forces in New Guinea, completely isolated Rabaul, and opened the route for his return to the Philippines.

In the Philippines and the Central Pacific campaigns, ULTRA enabled U.S. submarines to interdict Japanese reinforcements. Heavy losses of troops and supplies intended for Saipan, Okinawa, Luzon, Leyte, and Iwo Jima weakened those garrisons, although the Japanese still exacted a terrible toll of U.S. "casualties in those grim struggles. ULTRA's contribution to British Gen. William J. C. Slim's brilliant campaigns in India and Burma is less certain, awaiting fur-

ther declassification of pertinent documents. There can be no doubt about ULTRA's prowess in the summer of 1945. By that time, the Allies could solve all major Japanese Army and Navy code systems. ULTRA uncovered the massive Japanese reinforcement of Kyushu, the next target on the Allied drive to Tokyo, thereby certainly influencing the decision to use atomic "bombs against Japan.

The release of ULTRA documents in 1977 opened the way for numerous historical reassessments of generalship and strategic decision making in World War II. Revisionists initially emphasized the spectacular intelligence coups ULTRA provided; but subsequent scholarship, by placing codebreaking triumphs in a larger context, makes more modest claims for the cryptanalytic warriors. The continuing declassification of records and firsthand published accounts is helping to fill still significant gaps about this marvelous intelligence source. Even without complete documentation, however, ULTRA surely shortened the war in east and west, enabling the Allies to win it with fewer losses than might otherwise have been the case.

UNIFICATION OF THE ARMED SERVICES. See National Security Act.

UNIFORM CODE OF MILITARY JUSTICE. See Justice, Military: Uniform Code of Military Justice.

UNIFORMS. In the modern sense, uniforms appeared in seventeenth-century Europe with the development of professional armies; functionally, they identify members of the military, distinguish units, and help establish group cohesion. They reflect the hierarchical structure of the military, and they entice recruits to join the service.

The United States provides clothing to enlisted members of the armed forces, while officers outfit themselves. Although tradition remains central, uniforms constantly evolve: cost, efficiency, fashion, comfort, and critical materials all affect pattern and use.

Although the U.S. "Army is the oldest service, its uniforms include some of the newest. They reflect frequent changes in mission, "logistics, and public opinion. During the "Revolutionary War, blue was chosen as the primary color for the uniforms of "Continental army soldiers, in contrast to British red and Royal French white. In the eighteenth century, the American soldiers' blue coats had button-back lapels and cuffs forming contrasting facings,

adapted from gentleman's attire by European armies, with artillery yellow or infantry white metal buttons and lace and crossed white shoulder belts to attach cartridge box and bayonet. The influence in the next century of *Napoleonic warfare reduced the coat with a cut-in skirt and exchanged the three-cornered or cocked hat for a cap (*shako*), on which metal branch *insignia appeared in 1832.

Sky blue trousers replaced white to avoid the winter mud, and the French full-skirt frock coat with black accoutrements added branch colors by 1851. During the *Civil War, the Union forces continued to wear blue, but the Confederate forces chose gray, the economical color of state units and West Point since 1816. From the * Union army, the blue sack-coat fatigue blouse and French forage cap emerged as postwar duty wear, with officers adding the national eagle to their caps in 1895, and moving branch insignia to their collars, along with "U.S." for the regular army.

In 1902, need for a seasonal service uniform and enhanced concealment from rapid and smokeless-rifle fire led to field uniforms of cotton khaki and wool olive drab, limiting army blue to dress uniforms only. The forage cap became the service cap, and the blouse became the pocketed service coat, worn with pegged breeches, leggings, and russet footwear.

World War I added the colorful shoulder-sleeve insignia, British-pattern steel helmet, and French pocket-size overseas or garrison cap. Britain shared the belt created and named for one-armed Gen. Sam Browne and the contrasting-shade officer uniform, "pinks and greens."

World War II G.I.s had the M-1 steel helmet and liner, cargo pocket "fatigues," parachute-jumper combat boots, and the olive drab-7 cotton M-1943 field jacket with its layering arrangement.

Beginning in 1956, Army Green-44 replaced olive drab, while seasonal khaki lasted until 1985. The 1946 Doolittle Board ended distinctive officer and enlisted uniforms, and the 1949 Uniform Board separated garrison from field uniforms. Black accessories now matched the other services, and a black trouser stripe, with gold chin strap and visor cap embroidery, identified officers. The *Cold War saw starched olive green-107 fatigues, with name tapes and us ARMY added by 1954. Tropical combat clothing with subdued insignia was adopted for the * Vietnam War. A military beret in green distinguished the Special Forces by 1961, followed by ranger black in 1975, and airborne maroon in 1980.

Navy uniforms, which vary in cut according to rank, resemble the dress of other seafarers rather than any national identity. Their dark blue and summer white reflects British influence. Traditionally similar, Coast Guard uniforms, identified by a national shield, changed to a distinctive light blue in 1973.

Naval officers dress as military commanders. Prescribed a blue coat faced red in the *Continental navy, they obtained blue with gold lace in 1802. Their service dress evolved from an 1852 jacket into the double-breasted blue coat by 1919, adding the line star to the gold cuff stripes in 1863. The cloth cap replaced the cocked hat for duty in 1841, displaying the current device by 1883 and the gold-embroidered visor in 1897. The summer white coat with shoulder marks appeared in 1901. Finally, shipboard officers had khaki working dress by 1941.

Sailors in the U.S. *Navy, except for senior petty officers,

dressed in open-neck occupational clothing. Early *slops* (wide-legged breeches) stores provided blue jackets, vests, shirts, trousers, black neckerchiefs, and canvas hats. Their frocks or jumpers had deep collars decorated with white tape by 1879. An overcoat (Dutch "pea coat") eased out the round jacket in 1885. The blue broadfall trousers gained their 13 buttons in 1902. The stitched white hat arrived in 1885, replacing the 1859 blue cloth cap ("flat hat") by 1963. World War II brought blue denim and chambray dungarees for working seamen, while the postwar bell-bottom ("cracker jack") uniform yielded to a coat and tie in 1975, only to return, by sailor demand, in 1978.

Marines are seagoing soldiers whose dress reflects both military and naval service. Nicknamed "Leathernecks" (soldier's neck stock) by open-collar sailors, the U.S. *Marine Corps is a small, proud organization that has helped maintain its identity by establishing strong uniform traditions.

Continental Marines wore green coats faced white or red; but since 1797, French-inspired blue, faced red, with yellow-metal buttons has been the custom. The current enlisted blue dress coat with slash cuff appeared in 1892, gaining pockets by 1949. Officers had the blue coat by 1909, now worn with a cloth belt, plus the 1839 sixteen-button mess jacket and 1825 Mameluke sword from the Barbary Wars.

Since 1912, the Marine Corps has worn a forest green service uniform with pointed cuffs, and cloth belt after 1943. Officers have the quatrefoil on their service caps, and all wear the bronze 1868 globe and anchor and khaki shirts with neckties. The camouflage helmet cover and usMC-monogrammed utilities appeared for World War II, while the 1944-pattern utility ("cover") cap still distinguishes a Marine.

The uniforms of the U.S. *Air Force, separated from the army in 1947, look to the future. Like the navy, their uniforms have a stronger affiliation to air forces in general than to national identity. Individual, independent, and often engaged in dangerous missions, pilots have affected rakish appearances since World War I. By 1942, the Army Air Forces permitted the "50-mission crush" for a pilot's service cap by removing its grommet, and crews decorated their leather A-2 and B-3 shearling-lined flying jackets.

In 1950, the air force selected a distinctive uniform of lighter blue (blue-84) wool, with notched lapels, bellows pockets, and silver insignia. Senior officers had silver visor ornamentation of lightning bolts, and aircraft markings formed the noncommissioned-officer blue and gray chevrons. Changes have been few, except for darker shades of blue and the elimination of bellows pockets in 1969. But in 1993, the Air Force Chief of Staff introduced a novel business suit uniform, with silver cuff stripes for officer grades.

The entry of women into the armed forces led to special uniforms that reflect common factors rather than service differences. The challenge remains to comply with male traditions and fashion while reflecting the changing roles and images of women in American society and the military.

For women in World War I, the need for street uniforms was met by the roll-collar Norfolk suit, worn with felt or straw hat. Army and navy nurses and navy female yeomen wore blue, while female Marines wore forest green uniforms. By World War II, each service chose distinctive

headgear. The army nurse had a soft visor cap, and * WACS the stiff olive drab or khaki "Hobby hat" (named after the first head of the WACS). The navy nurse wore a visorless cap, while "WAVES and Coast Guard "SPARS received Mainbocher-designed sailor hats. Women Marines matched the cords of their forest green service caps with Montezuma red lipstick.

In 1947, Christian Dior's "New Look" calf-length skirt showed uniforms a need for fashion. Designer Hattie Carnegie created an army taupe-shade ensemble in 1951, and Mainbocher revised the Marine wardrobe. In 1950, the air force gave WAFS the blue-84 uniform, with a stitched flight cap, but the 1970s brought a modern double-breasted box jacket, short skirt, and felt beret. The army changed to green in 1959, adding the "pot hat" in 1963, while the Coast Guard switched to a light blue uniform designed by Edith Head.

Modern armed forces uniforms utilize synthetic materials, nonseasonal schemes, and increased informality, doffing the coat and tie for open-collar casualness. A common Department of "Defense supply system has standardized many items, such as the "wooly-pully" sweater, zipper windbreaker, shoulder marks, camouflage Battle Dress Uniform, and the female overblouse and maternity uniform.

The future looks both to "one service-one uniform" and to gender-neutral clothing. Conflicts over tradition and function will continue. But the principles of recognition will surely remain as the appropriate appearance of soldiers, sailors, flyers, and Marines continues to evolve.

UNION ARMY. Although the United States had a regular army of 16,000 career soldiers when the Civil War began, throughout the conflict it placed chief reliance on an ad hoc force of U.S. "Volunteers, the Union army. On 15 April 1861, President Abraham Lincoln summoned 75,000 militia to serve for three months. (Oversubscribed, 91,816 were actually accepted.) Then, without legal authority, he increased the regular army by 22,714 men and called for 42,034 three-year volunteers. In July 1861, the U.S. Congress sanctioned Lincoln's extralegal acts and authorized 500,000 additional volunteers.

The Union army grew steadily throughout the war, from 186,751 in July 1861 to 1,000,516 in May 1865. By war's end, about 2 million men had served in the army, a figure that includes 179,000 African Americans and 100,000 white unionist Southerners from the Confederate states. However, at any given time as many as one-third of Union soldiers might be absent through illness, transfer, or some other cause—including desertion, which accounted for about 200,000 men absent during the course of the war.

Like its Confederate counterpart, the Union army was one of the first great military formations created by mass

politics. States and localities played a critical role in its recruitment. Typically, a community leader such as a lawyer or politician with the volunteer rank of captain would encourage men to join his company, which when filled would be offered to the state governor. The governor then assigned ten companies to a numbered regiment and appointed a colonel (frequently yet another community leader) to command the regiment. At that point the new regiment would be mustered into federal service and thenceforth paid, fed, and equipped at national expense.

The system had pronounced strengths and weaknesses. On the positive side, it tended to maximize popular support, and the decentralized nature of American society made it practically the only workable system anyway. But the governors tended to see it as a vast opportunity for political patronage, which meant that as regimental numbers diminished through battle "casualties and disease, the tendency was to create new regiments rather than make good losses in existing ones. Only Wisconsin maintained an efficient system of replacements to keep veteran units up to strength.

Politics also played a significant role in the motivation of Union soldiers. Although they might have many reasons to enlist, surviving letters and diaries strongly suggest that many were politically aware and had a strong grasp of the stakes of the struggle, which most understood to be the future of self-government (a much smaller percentage were animated by antislavery views). This political commitment to the Union cause was one of the most important factors holding the army together during four bloody and often discouraging years of war.

The first wave of Union volunteers achieved significant success in early 1862. But military reversals during the summer of 1862 spurred a call for 300,000 additional three-year volunteers (which actually produced 421,000 new troops). This outpouring was assisted by the Militia Act of 17 July 1862, which empowered the president to set quotas of troops to be raised by each state, and authorized him to enforce the quota through a special militia draft if a given state failed to supply enough volunteers.

The threat of "conscription as a tactic to secure more volunteers was applied systematically in the Enrollment Act of 3 March 1863, by which all able-bodied males between twenty and forty-five became liable for military service. But under terms of the act, conscription would be applied only to communities that failed to supply their quota of volunteers. As a result, most communities adopted the practice of paying a cash bounty to men willing to enlist. By 1864, a typical recruit could pocket as much as \$1,000 in local, state, and federal bounties. Unsurprisingly, this system was flamboyantly abused. Numerous "bounty jumpers" deserted their units at first opportunity and repeatedly reenlisted, each time pocketing a bounty.

The Union conscription system had three other bad features. First, although the draft law nominally permitted few exemptions, over 50 percent of Northern draftees exploited the exemption categories that did exist and thereby escaped service. Second, it was possible for a man to pay \$300 (a year's wages for a worker) and avoid being drafted in any given call-up. Third, a man could also gain permanent exemption by hiring a substitute to serve in his place. Both the \$300 commutation fee and the hiring of substitutes fueled bitter complaints that it was "a rich man's war and a poor man's fight." Draft riots and other significant

disorders resulted, and at least thirty-eight federal provost marshals were killed trying to enforce the draft. Conscription directly accounted for only 13 percent of Union soldiers, but by the last two years of the war it undoubtedly encouraged a large number of voluntary enlistments.

The basic organization of the Union army was the regiment, theoretically composed of just under 1,000 men but usually operating at half strength or less. Four or five regiments generally made up a brigade, and two or three brigades typically comprised a division. Two or more divisions comprised a corps; several corps comprised an army. The principal Union field armies, named after major rivers in their area, were the Army of the Potomac, the Tennessee, the Cumberland, the Ohio, and the James. But these formations never contained even half the total strength available because many troops garrisoned strategic points or guarded important railroads.

Presiding over the Union army was the secretary of war. Simon Cameron initially held the post, but he resigned in January 1862 amid charges of corruption and incompetence. He was replaced by Edwin M. Stanton, who served forcefully and effectively for the rest of the war. The top military leader was the general in chief, of whom there were four: Lt. Gen. Winfield "Scott" (April-November 1861); Maj. Gen. George B. "McClellan, Jr." (November 1861-March 1862); Maj. Gen. Henry W. Halleck (July 1862-March 1864); and Lt. Gen. Ulysses S. "Grant" (March 1864-May 1865). Of these, only Grant exercised sustained control over the army; the others tended to plan, propose, and advise, but not direct. President Abraham Lincoln was, of course, commander in chief.

Equipping and supplying the Union army was a formidable task that demanded high professionalism and efficiency. Fortunately, Quartermaster General Montgomery "Meigs performed ably, as did David C. McCallum, superintendent of the U.S. Military Railroads, which proved quite successful in its vital "transportation task of ferrying troops and supplies within the sprawling war zone. All in all, the Union army possessed an impressive "logistics network, and the Union soldier was so lavishly equipped and supplied that European observers, to say nothing of his "Confederate army counterpart, frequently expressed amazement.

Of the 583 Union generals, only 217 were West Point graduates, but most had previous military experience. Quite a few owed their appointments to political considerations, particularly their influence over important constituencies. Such "political generals" seldom won battlefield success, although Gen. John "Logan, an Illinois congressman who commanded a corps in William Tecumseh "Sherman's Army of the Tennessee, was an able exception. They often had substantial administrative abilities and popularity with their troops—no mean consideration in a civil war. Maj. Gen. Nathaniel P. Banks, for example, was a former Speaker of the House and an important Democrat. Although a poor combat commander, he performed a considerable service by presiding over a crucial experiment in wartime "Reconstruction in Louisiana.

Although at first the goal was primarily to capture Richmond, the Confederate capital, Union strategy eventually focused on the destruction of Confederate armies and (after 1863) the destruction of Confederate war resources, including crops and livestock. The Union army's battlefield performance varied. The Army of the Potomac proved un-

able to win a decisive victory in Virginia until the closing days of the war, leading some historians to speculate that it suffered from a cultural inferiority complex. The Army of the James's record was even more dismal. But in the western theater, the Army of the Tennessee went from success to success, while the Armies of the Cumberland and the Ohio also achieved significant victories. In every case, however, success or failure owed mainly to the quality of the senior leadership. The rank and file fought with determination and élan in almost every engagement.

Officially, total Union army deaths from all causes are placed at 360,222. Of these, 110,100 were killed or mortally wounded in battle. Most of the rest died of disease. Indeed, a Union soldier stood a 1 in 13.5 chance of dying of illness as opposed to a 1 in 65 risk of being killed in action. An additional 275,175 Union troops were wounded, while some 211,411 became "prisoners of war. Proud of their efforts, Union army veterans created the Grand Army of the Republic (GAR) in 1868. By the 1880s, it was a potent force in American politics, and remained so for the rest of the century. Unlike most similar organizations, membership in the GAR was open neither to veterans of other wars nor to the veterans' own sons. Their service to the country in saving the Union, Northern veterans believed, was unique.

UNION NAVY. The Civil War caught the U.S. Navy unprepared. President Abraham "Lincoln proclaimed a blockade of Southern ports the week after "Fort Sumter fell; but the U.S. Navy had no more than ninety ships, about half that number in service. Commanding general of the army Winfield "Scott proposed an "Anaconda plan" to constrict the Confederacy between the army on land and a blockade by sea; however, eight ships comprised the Home Squadron, only four of them screw steamers. Other squadrons routinely assigned to protect American commerce around the globe could not be recalled for months. Thus, as states seceded, the Union could not halt the seizure of ports, ships, and naval facilities from Norfolk to New Orleans.

Union unpreparedness did not prevent a "paper blockade" of Southern ports. Official proclamations were published in Southern papers, and ships were dispatched to give due notice of the Union policy to neutrals and Confederates in the most populous of 189 harbors, rivers, and inlets along 3,500 miles of Southern coast.

An "effective blockade"—actually preventing entry and exit at Southern ports—would require 600 ships. As the Union tripled the navy's manpower with a call for 18,000 "volunteers, 21 percent of U.S. naval officers joined the fledgling "Confederate navy.

"Mobilization on that scale required new navy secretary Gideon "Welles to appoint Gustavus V. Fox assistant secre-

tary for operations to work with the chief clerk and naval bureaus. Boards to plan blockade strategy and ironclads soon followed. Construction was authorized for 52 new ships: ironclad "turtles," monitors, and steamers; 136 vessels were acquired, including merchantmen, tugs, and ferries.

The blockade strategy evolved as four blockading squadrons: North Atlantic on the Virginia-North Carolina coast; South Atlantic from Charleston and Savannah to Key West; East Gulf from Key West to St. Andrews Bay; and the West Gulf from Pensacola past Mobile, New Orleans, and Galveston to the Rio Grande. Union commanders David Farragut, David Dixon Porter, and John Dahlgren were especially successful, and within a year after the Blockade Proclamation, the Union had recaptured Norfolk, Pensacola, and New Orleans as the Anaconda plan tightened the blockade.

Union blockaders pursued blockade runners and searched out any vessels to be found in coastal and inland waters, always examining ships' papers to distinguish neutrals from Confederates. Blockade activities came to include destroying sand forts and saltworks ashore; receiving and transferring refugees, escaping slaves, and Confederate deserters; volunteering medical aid, purchasing supplies, and hiring local civilians.

This change in naval operations brought endless frustrations of operating seagoing vessels in shallow coastal waters. Pursuit of blockade runners often ran them aground, costing officers and crew the prize money awarded for captures. Mastering new steam and ironclad technologies placed complex demands on crews; added peril came from engaging new Confederate technologies, including ironclad ships, mined harbors and rivers, spar torpedo boats, and the primitive submarine *Hunley* at Mobile and Charleston. Sheer numbers of ships and men taxed Union naval resources—all told, 600 ships and 51,000 men at full strength, though a total of 120,000 were enlisted in 1861-65, at least 20,000 of them African Americans.

For all the promise of prize money, the 'blockades added increments of difficulty to a service already known for hardships and deprivation. Serving on sweltering ironclads and steamers or on marginally seaworthy vessels required increased attention to medical care, nutrition, and morale for volunteer citizen-sailors. Malaria and yellow fever were special concerns in Southern waters. Temperance replaced the time-honored daily grog ration. Boredom was an ever-present enemy.

The Union strategy combined army-navy expeditions on a large scale. The numbers engaged at Port Royal would not be matched until World War II. On the Potomac and the James Rivers, naval bombardment reinforced army field artillery. On the Mississippi, Tennessee, and Cumberland Rivers, combined army-navy operations at Forts Henry and Donelson, at Vicksburg, and elsewhere added dramatic chapters to riverine history.

A civil war in home waters in no way diminished the navy's international role. The United States ran afoul of Britain's neutral rights when Confederate officials were removed from the British vessel *Trent*. Diplomatic tensions continued into the 1870s with U.S. claims against England because British-built Confederate commerce raiders preyed upon American merchantmen and whalers. Despite those losses, the Union won one of history's most famous sea battles when the *Kearsarge* sank the *Alabama* in the English Channel.

The Union navy's response to the Civil War was heroic in its rapid mobilization and in combining a traditional blockade with innovative administration, operations, and weaponry.

UNITED KINGDOM, U.S. MILITARY INVOLVEMENT IN THE. Following the U.S. entry into World War II, the United Kingdom became a springboard for Allied bombing offensives against the Axis countries as well as the assembly point for Allied invasion forces prior to the *D-Day landing (1944). A series of Anglo-American military operations, such as the *North Africa Campaign, paved the way for D-Day and the final assault on Germany in June 1944. The joint U.S.-British invasion of 'Normandy (Operation Overlord) marked the largest combined operation in the history of warfare. By 11 days after D-Day, 641,170 British, Canadians, and Americans had crossed the English Channel and landed in northwest France. The United Kingdom's role as a deployment base for operations on the Continent was to continue after the war when, in Churchill's words, the United Kingdom became an unsinkable aircraft carrier for U.S. forces.

During the 'Cold War, before development of the B-52 intercontinental bomber in the early 1950s, the United Kingdom was of crucial strategic importance for USAF bombers defending Western Europe. The first B-29s capable of carrying atomic munitions arrived in the summer of 1949 in East Anglia. This and the outbreak of the 'Korean War in 1950 led to British demands for more formal understandings about U.S. basing. Meetings between Prime Ministers Clement Attlee and Winston S. Churchill with President Harry S. Truman in 1950 and 1952, respectively, resulted in the controversial understanding that the use of the bases would be a "matter for joint decision" by the two governments "in the light of the circumstances prevailing at the time." American concerns centered on whether this implied a British veto; British concerns centered on the possible use of U.S. 'nuclear weapons without consultation.

Throughout the 1950s, the number of air bases grew. Strategic Air Command (SAC) operations in Britain were overseen by the Seventh Air Division (headquarters in Omaha, Nebraska), while the Third Air Force (headquarters at RAF Mildenhall) assumed responsibility for all tactical and logistical activities. The number of U.S. military personnel grew to around 30,000 deployed on 9 major bases and 30 smaller locations.

The growing importance of 'missiles was stressed in

1957, when intermediate-range ballistic missiles were introduced into Britain, as well as into Italy and Turkey, to balance a perceived Soviet advantage in the number of intercontinental ballistic missiles. Special emphasis was placed on low-level penetration of "Warsaw Pact nations' air defenses, a role assumed by the Third Air Force and the F-111 aircraft based in Oxfordshire and East Anglia. The advent of longer-range missiles also raised concerns about the vulnerability of air bases and heavy "bomber aircraft, which led to the deactivation of the Seventh Air Division in 1965.

The U.S. "Navy assumed a significant role in 1960 in an agreement between President John F. "Kennedy and Prime Minister Harold Macmillan to use Holy Loch in Scotland for deployment of nuclear-armed Polaris (later Trident) "submarines. In spite of the cutback in SAC operations, the number of U.S. military personnel remained constant, due to the naval presence and the influx of U.S. military personnel from France in 1967 following withdrawal of French forces from "NATO.

Public opposition to the U.S. military presence in the United Kingdom was primarily antinuclear (with the British Campaign for Nuclear Disarmament taking a leading role), notably against the Thor missiles, Polaris and Trident submarines, and the deployment of ground-launched Pershing cruise missiles following the 1979 North Atlantic Council decision. The use of U.S. bases in East Anglia for the 1986 air strike against Libya also prompted public opposition, although the raid had the full support of Margaret Thatcher's government.

The end of the Cold War and the dissolution of the Warsaw Pact saw a reduction in the number of American service personnel in the United Kingdom. By mid-1995, there were 18 U.S. bases or facilities in the United Kingdom and nearly 14,000 active duty personnel, 2,384 civilian personnel, and 10,281 dependents.

UNITED NATIONS (est. 1945). President Franklin D. "Roosevelt foresaw the need for "Four Policemen"—the United States, the Soviet Union, Britain, and China (France was added later)—to order the post-World War II world and repel all attempts at "aggression and violence. Meeting in San Francisco in 1945, the founders of the "United Nations tried to fulfill that vision by creating a Security Council with five permanent members charged with saving "succeeding generations from the scourge of war."

The UN Charter set up a military staff committee—consisting of the chiefs of staff or their representatives from the five permanent members—to take over the strategic direction of any military operation of the Security Council. Although this committee has met regularly for more than a half century, it has never directed any UN military operation. During the "Cold War, the United States and the Soviet Union could never agree sufficiently

on military issues to share a joint command. Even after the Cold War, this kind of cooperation proved impractical. Yet, despite an inert military staff committee, the United Nations has been heavily involved in military action.

In one instance, the North Korean invasion of South Korea in June 1950, the Security Council did act like a team of Roosevelt-inspired policemen. The Council condemned North Korean aggression, called on the world to aid South Korea, and authorized a UN command under U.S. Gen. Douglas A. "MacArthur. But the United Nations managed to do all this only because the Soviet Union was boycotting sessions of the Security Council to protest the denial of a Council seat to Communist China. Although fifteen other countries dispatched troops or air support to Korea under a UN flag, the Americans commanded and dominated the UN force and fought the three-year "Korean War as if it were their own.

Aside from the accident of the Soviet boycott during the initial Korean crisis, the United Nations had no significant role in dealing with the Cold War. During the "Cuban Missile Crisis of 1962, for example, the United Nations served as no more than a theater as U.S. ambassador Adlai Stevenson displayed photographic evidence of the Soviet Union installing missiles and launchers in Cuba. And Secretary General U Thant earned only contempt from President Lyndon B. "Johnson during the late 1960s for trying to mediate an end to the "Vietnam War.

The United Nations dealt instead with crises on the periphery of the Cold War. A major innovation in UN work arose from the Suez Canal crisis of 1956. Looking for a way to ease the British, French, and Israeli troops out of Egypt after their ill-fated intervention, Dag Hammarskjöld, the urbane Swedish bureaucrat who headed the United Nations as secretary general, persuaded all sides to accept UN troops in their place. That had never been done before. In a remarkable feat of management and energy, Hammarskjöld and his chief aide, the African American Nobel Peace Prize laureate Ralph Bunche, put together in one week the United Nations' first "peacekeeping force—6,000 troops from 9 countries. The United States offered surplus helmets, which were quickly painted blue and passed to the troops, the first "Blue Helmets," as UN peacekeepers would come to be known.

In 1960, the United Nations dispatched Blue Helmets to the former Belgian Congo (now the Democratic Republic of the Congo) to restore law and order out of bloody chaos and replace the Belgian troops, who no longer had any place in an independent African country. Hammarskjöld, who would die in a plane crash while on a Congo mission, interpreted Security Council resolutions as broadly as possible and directed his troops to put down the secession of Katanga. The suppression was so controversial and bloody, however, that UN peacekeepers would not engage in military offensives for another thirty years. Quiet patrolling of cease-fire lines in trouble spots like Cyprus (between Greek and Turkish Cypriots), the Sinai (between Egyptians and Israelis), and the Golan Heights (between Syrians and Israelis) would become the hallmark of UN peacekeepers, earning them the Nobel Peace Prize in 1988.

The character of UN peacekeeping was transformed by the collapse of the Berlin Wall in 1989 and the end of the Cold War. Euphoria over the "Persian Gulf War of 1991 contributed to the change. Although this war was not officially declared a UN war as the Korean War had been, the

Security Council played a key role with resolutions authorizing the United States and its Coalition partners to drive Iraq out of Kuwait. The war persuaded UN diplomats and bureaucrats that the Security Council, as long as the United States and Russia agreed, could now literally attempt anything. Some analysts felt that Franklin Roosevelt's dream would be realized at last.

The United Nations found itself dealing with a host of crises in different ways: monitoring human rights violations, supervising elections, creating democratic institutions, feeding the hungry, as well as policing the peace in such flashpoints as El Salvador, Cambodia, Angola, Haiti, and Rwanda. But its new confidence was swiftly shattered by ill-fated missions to Somalia and Bosnia.

When eighteen U.S. Army Rangers died in Mogadishu in October 1993 during their abortive manhunt for a Somali warlord, President Bill Clinton decided to withdraw all U.S. troops, crippling the mission. Although the fallen rangers had operated outside UN command, aides of Clinton unjustly put the blame on Secretary General Boutros Boutros-Ghali, despoiling the image of the United Nations in American eyes. That image worsened in the "Bosnian crisis (1992-95). The United Nations proved incapable of halting Serb aggression and protecting Muslim civilian populations from massacre in towns that had been designated "safe areas" by the Security Council. This impotence stemmed from the failure of the United States and its European allies to agree on a strategy for dealing with Serb aggression. UN peacekeepers found themselves patrolling Bosnia under the authority of scores of contradictory toothless resolutions from the Security Council. When the United States brokered a peace agreement at Dayton, Ohio, in 1995, NATO troops supplanted the UN peacekeepers and enforced the agreement.

The animosity toward the United Nations so intensified in the United States that Congress refused to pay all the assessments that Washington owed, precipitating a financial crisis. UN diplomats and officials commemorated the fiftieth anniversary in October 1995 in a depressed mood, convinced that the United Nations no longer would have the funds or public support to mount many peacekeeping missions.

UPTON, EMORY (1838-1881), "Civil War general, military educator and reformer. Emory Upton, born in Batavia, New York, graduated eighth in the U.S. Military Academy's Class of May 1861. In four years, during the Civil War, he rose from second lieutenant to brevet (temporary) major general. First commanding a Regular Army artillery battery and later serving as divisional chief of artillery, he became colonel of the 121st New York Infantry in October 1862. Upton won special distinction at Spotsylvania on 10 May 1864 when his twelve-regiment assaulting column successfully pierced the Confederate salient, the deployment offering an alternative to traditional and

costly linear tactics; he won promotion to brigadier general two days later. After recovering from a wound suffered in September 1864, Upton actively led a cavalry division at war's end.

After the war, Upton became an articulate advocate of military efficiency and effectiveness. He drew upon his own broad experience to begin substantial revisions of the army's infantry, cavalry, and "artillery tactics, an ambitious and contentious effort he continued to supervise while commandant of cadets at West Point (1870-75). The protégé of Gen. William Tecumseh "Sherman, he went on a multinational tour of military establishments and published his observations in *The Armies of Asia and Europe* (1878), in part to suggest ways in which organizational and personnel reforms might create a more professional U.S. army.

As superintendent of the Artillery School at Fort Monroe (1877-80), Upton introduced combined arms training and theory-based case studies to add intellectual rigor to its limited practical curriculum. His institution became the model for advanced officer education throughout the army. Years after Upton committed suicide in March 1881 (the reasons for which remain uncertain) the reformist secretary of war Elihu Root published Upton's most enduring work, *The Military Policy of the United States* (1904), a treatise that challenged contemporary notions of the "minuteman tradition," arguing instead for a professional army, headed by a General Staff, to be the proper foundation for national defense.

USO—the United Service Organizations—is a civilian, voluntary, nonprofit organization serving the morale needs of U.S. military personnel and their families worldwide. Although congressionally chartered, it is not a government agency and is supported by individual and corporate donations, United Way, and Combined Federal Campaign. USO was created on 4 February 1941 by President Franklin D. Roosevelt, who determined that private organizations should handle the on-leave recreation of the rapidly growing U.S. military. Six civilian agencies—the Salvation Army, Young Men's Christian Association (YMCA), Young Women's Christian Association (YWCA), National Catholic Community Services, National Travelers Aid Association, and National Jewish Welfare Board—coordinated their civilian war efforts to form the USO.

During World War II, USO became the G.I.'s "home away from home," and began a tradition of entertaining the troops that continues today. Comedian Bob Hope presented his first USO tour in 1942, a practice he continued into the 1990s. USO regrouped in 1950 for the "Korean War, after which it was recommended that USO also provide peacetime services. During the "Vietnam War, USOs were located in combat zones.

USO began a new era of social services in the 1970s and 1980s. A 1987 Memorandum of Understanding between USO and the Department of "Defense named USO as the principal channel representing civilian concern for American forces worldwide. In the 1990s USO delivered services

to 5 million active duty service members and their families. Through 125 airport, fleet, family and community centers, mobile canteens, and celebrity entertainment, USO continues to be a touch of home to America's troops.

U-2 INCIDENT (1960). On 1 May 1960, a U.S. spy plane—a U-2—departed from Peshawar, Pakistan, on a reconnaissance mission over the Soviet Union. It never arrived at its destination—Bodo, Norway. On 6 May, Soviet premier Nikita Khrushchev announced that the aircraft had been shot down by a surface-to-air missile deep inside Soviet territory. Washington countered by saying that the aircraft was on a weather research mission when it strayed off course after the pilot's oxygen system failed. Khrushchev then revealed that the U-2's film magazines had been recovered and that the pilot, Francis Gary Powers, was alive and in Soviet custody.

The incident created a sensation and threatened to scuttle the Soviet-American summit conference scheduled to convene in Paris on 16 May. In a controversial move, President Dwight D. Eisenhower accepted responsibility for the flights rather than let the world believe that lower-level functionaries had such authority. He also promised an end to the missions, but refused to apologize. The overflights, he asserted, had been necessary to safeguard American security. An angry Khrushchev refused to attend the summit conference.

The summit's cancellation was both a public humiliation and a personal blow to Eisenhower. He had hoped to make what would have been his final summit meeting a fitting capstone to his presidency by reaching agreement on a number of critical issues. The president even spoke of resigning, but soon changed his mind.

Powers was convicted of espionage by a Soviet court and sentenced to ten years' "deprivation of liberty," the first three to be served in prison. He served less than two years before being exchanged in January 1962 for a Soviet agent in Western custody. He died in a helicopter crash in 1977.

U-2 SPY PLANES. To avert a surprise nuclear attack, some American intelligence analysts immediately after World War II believed that "pre-hostilities reconnaissance" over potential enemy territory would be prudent. But since the Soviet Union, the only nation capable of threatening the United States, had few long-range 'bomber aircraft and no 'nuclear weapons, American reconnaissance aircraft were ordered to respect Soviet air space.

The deepening 'Cold War and Moscow's growing inventory of nuclear weapons changed attitudes in the early 1950s. In 1954, Lockheed Aircraft Corporation began work on an aircraft that could fly above Soviet air defenses. Modifying an F-104 interceptor fuselage and giving it a wingspan of almost 100 feet, Lockheed first tested the U-2 aircraft in August 1955. Essentially a powered glider, the U-2 could climb over 70,000 feet and had a range of 3,000 miles. The 'Central Intelligence Agency exercised operational management, but overflights of Soviet air space needed presidential approval. In all, the U-2 flew twenty-four missions over the Soviet Union.

In June 1956, American U-2s began periodic flights over the Sino-Soviet bloc, carrying cameras as their main sensors, supplemented by communications and electronic intercept equipment. The Royal Air Force also flew overflight missions under the authority of the British prime minister.

The overflights ended in May 1960 after the Soviets shot down a U-2, but the U-2's service continued. Several planes were given to the Nationalist Chinese for missions over the People's Republic of China. In October 1962, a U-2 discovered Soviet offensive missiles in Cuba, precipitating the 'Cuban Missile Crisis. U-2s flew missions during the *Vietnam War, collected radioactive debris from other nations' nuclear tests, monitored the cease-fire that ended the 1973 Yom Kippur War, and served in the 'Persian Gulf War. They will fly well into the next century.

V

VALLANDIGHAM, CLEMENT L. (1820-1871), Democratic congressman, leading critic of the Lincoln administration during the "Civil War. A lawyer and editor active in Democratic party politics from the 1840s, Vallandigham entered Congress in 1858. During the Civil War, he stridently opposed slave emancipation, the growth of central government power, and a harsh war policy against the South, demanding instead a negotiated peace to save the Constitution from Republican depredations. His opponents claimed that he was so militantly antiwar that he espoused "treason. He came under military surveillance and was arrested by Gen. Ambrose "Burnside after a speech in 1863 whose General Order No. 38 forbade any "habit of declaring sympathies for the enemy" in Ohio. He was tried and convicted by a military commission, not a civil court, and sentenced to prison.

President Abraham "Lincoln, sensitive to the potential political damage of a civil liberties martyr, ordered him deported to Confederate territory. Vallandigham went on to Canada, from where he ran for governor of Ohio in 1863; he was soundly beaten. In 1864, his continued peace advocacy cost the Democrats dearly. Whatever their commitment to constitutional liberties, Northern voters were hostile to the Democrats' apparent support for the nation's enemies. The issues of free expression and opposition to wartime policies, even the war itself, raised by Vallandigham's experiences were to reappear in America's later wars and have never been comfortably settled to everyone's satisfaction.

VALLEY FORGE NATIONAL PARK. Although the 1777-78 winter encampment at Valley Forge is a familiar metaphor for the sufferings of the "Continental army during the Revolutionary War and a part of the nation's folklore, other winter ordeals were probably worse. Valley Forge's reputation for misery arose because Gen. George "Washington, hoping for greater support, stressed the Continentals' sufferings there in his correspondence with Congress. However, during that same winter, the army made significant progress in discipline under Friedrich Wilhelm von "Steuben's tutelage, and Nathanael "Greene greatly improved its "logistics system. In this sense, the encampment marked a turning point for the army; more broadly, its popular importance remains symbolic of endurance in adversity.

Pennsylvania created the Valley Forge State Park on 30 May 1893. It remained a state institution until the mid-1970s, when individuals and citizens' groups, fearing deterioration, urged its transfer to the U.S. Park Service. This was accomplished when President Gerald "Ford signed the legislation creating Valley Forge National Historical Park on 4 July 1976, emphasizing the site's mythic character by making it a focus for bicentennial observances. With the new focus on social history, Park Service interpreters now treat the site less as a shrine to democracy than as a venue for describing the daily life of Revolutionary-era soldiers to the approximately 4 million people who visit the park annually.

VANDENBERG, HOYT (1899-1954), air force general. A 1923 graduate of West Point, Vandenberg was handsome, affable, and the nephew of a senator. He began his career in ground support aviation. In the mid-1930s, he attended professional schools, including the Command and General Staff School at Leavenworth, where he met Carl A. "Spaatz, a senior air officer. In 1939, Spaatz assigned Vandenberg to the Plans Section, the key office in Air Corps expansion. Vandenberg spent eight months in headquarters, in 1942, before becoming chief of staff, Twelfth Air Force, in August. He served in North Africa and the Mediterranean until summoned to Washington. In November 1943, in Moscow, he negotiated to obtain Soviet bases for shuttle flights for American "bomber aircraft. As a result of Dwight D. "Eisenhower's appeal, Vandenberg received the post of deputy commander of the Allied Expeditionary Air Force in March 1944. This position required tact and a personality forceful enough to defend U.S. interests. Vandenberg succeeded, and in August 1944 he took command of the Ninth Air Force, the world's most powerful tactical air force. The Ninth supported Bradley's Twelfth Army Group, through the Battle of the "Bulge and victory in the battle for "Germany.

In 1946, Vandenberg became the assistant chief of staff, Intelligence, and then director, Central Intelligence Group, the "Central Intelligence Agency's predecessor. He worked aggressively to improve intelligence collection and the CIA's status. In October 1947, during the "Cold War, he became the first vice chief of staff, U.S. Air Force. After General Spaatz's brief tenure, Vandenberg was appointed USAF's second chief of staff in April 1948, a position he occupied until retirement, June 1953. He proved an able

officer for the rapid expansion of the air force. His relationships with important army officers eased negotiations within the "Joint Chiefs of Staff, while his knowledge of personnel enabled him to make key appointments, such as Curtis E. "LeMay to the Strategic Air Command. Vandenberg maintained excellent relations with Congress in a time of first budget cuts and interservice squabbles and then military buildup. He also led the independent service through the "Korean War. He died prematurely, of cancer, at age fifty-five.

VENEREAL DISEASES. See Diseases, Sexually Transmitted.

VERSAILLES, TREATY OF (1919). The Treaty of Versailles ended World War I between Germany and the Allied nations. On 6 October 1918, Prince Max von Baden, the Reich Chancellor, appealed to President Woodrow "Wilson to take steps leading to an armistice based on Wilson's "Fourteen Points. The Allies had never endorsed this progressive peace program; they acceded to most of it, however, because in the armistice negotiations Wilson had managed the confiscation or internment of virtually all Germany's machines of war.

At the Paris Peace Conference, the president's priority was the inclusion of the Covenant of the "League of Nations as an integral part of the treaty. Despite grave reservations, the British, French, and Italian leaders bowed to the massive public support Wilson's proposal enjoyed throughout Europe. But the peacemakers used their acceptance as a lever to gain concessions from him on other vital issues. For example, Australia, New Zealand, and South Africa coveted the captured colonies of (respectively) New Guinea, Samoa, and German Southwest Africa. These claims defied the idea of "mandates," the League's arrangement for guiding incipient states along the path to self-government. In this, as in other quarrels, Wilson found himself in a minority of one. The territories were designated as mandatories but were ultimately assigned on the basis of military occupation.

At another juncture, Georges Clemenceau, implying that he might withdraw his endorsement of the League, demanded for France the coal-rich Saar basin and military occupation of the Rhineland. Vittorio Orlando claimed for Italy the Yugoslav port city of Fiume and left when Wilson refused to indulge him. Japan, too, threatened to bolt as it insisted on retaining economic control over Shantung. Wilson was able to moderate some of these demands, albeit in less than satisfactory compromises. From Japan, he wrung a pledge (honored in 1922) to restore Chinese sovereignty in Shantung through mediation by the League. In the case of France, he and Clemenceau settled on a fifteen-year occupation of the Rhineland. The crisis over Fiume, alas, was never resolved at Paris.

The acrimony came to a head when British prime minister David Lloyd George added military pensions to the already astronomical reparations bill that France had presented against Germany. On the verge of physical collapse, Wilson at last capitulated. Then came Article 231—a declaration

saddling Germany with the moral responsibility for allegedly having started the war. The reparations section and the "war-guilt" clause would spark unending controversy. In all of this, Wilson anticipated that, once wartime passions had cooled, the League could redress the injustices.

Because he had so many difficulties in keeping faith with the spirit of the Fourteen Points, and because (largely for other reasons) the Senate refused to ratify the Treaty of Versailles, Wilson, in his own time and in history, would bear the main burden for its shortcomings. Yet many scholars today contend that the territorial provisions were not nearly as bad as disillusioned contemporaries and revisionist historians believed them to be; and that, without the president's intermittent heroic exertions, some of the settlement's 440 conditions would have been far more severe. Nevertheless, this remains the most controversial peace treaty of the twentieth century.

VERTICAL TAKEOFF AND LANDING AIRCRAFT (known as VTOL aircraft) debuted in the "Korean War primarily in the medevac role. The venerable piston-powered Bell 47 (H-13) helicopter provided the U.S. "Army with an unprecedented ability to rapidly evacuate wounded personnel for lifesaving treatment. VTOL technology was first used in a significant combat role by U.S. forces during the "Vietnam War. This was made possible by the advent of a practical turbine engine, providing excellent horsepower-to-weight ratios, coupled with advances in lightweight aluminum honeycomb construction techniques and epoxies that made strong, lightweight airframes possible, and rotor systems vastly improved over the older wooden blades. These technologies culminated in the Bell UH-1 (Huey), OH-58 (Kiowa), and AH-1 (Cobra), the Boeing Vertol CH-47 (Chinook), the Sikorsky CH-54 (SkyCrane), and the Hughes OH-6 (Cayuse). The civilian helicopter fleet during and after the Vietnam War was an outgrowth of the technology pioneered by the military, in which many aircraft were nearly indistinguishable from their military cousins.

One unique VTOL aircraft is the USMC single-pilot Harrier ground attack/fighter aircraft. Developed by British Aerospace in the 1960s, the Harrier flies in the vertical flight mode solely by vectored thrust from a single engine, allowing overflight with transition to forward jet flight at the flick of a wrist. While rather fuel-inefficient and very noisy, the Harrier stands alone as the only operational VTOL jet worldwide.

VTOL aircraft have revolutionized combat for the ground forces over the last fifty years, and the technology developed has found numerous uses in the civilian world. Improvements in VTOL technology, such as the U.S. Navy/Marine V-22 "Osprey" tilt-rotor aircraft, may someday make VTOL aircraft the rule and eliminate the need for runways in either military or civilian aviation.

—Mark Cannon

VESSEY, JOHN (1922-), army general and chairman of the 'Joint Chiefs of Staff (JCS). Vessey hailed from Minnesota. After high school, he enlisted in the National Guard and was called to active duty in 1941. He served as an artillery sergeant in the 'North Africa Campaign and received a battlefield commission at the Battle of 'Anzio in 1944. After the war he remained in the army, rising to deputy chief of staff, operations and plans, and commander of the Eighth Army during the 'Korean War. Vessey was army vice chief of staff when President Ronald 'Reagan named him tenth chairman of the JCS in 1982. He saw no need for the major changes in the joint system proposed by his predecessor, Gen. David 'Jones. Instead, he moved to improve the system within the existing framework. Plainspoken and with a ready wit, he often induced his JCS colleagues to rise above service positions on controversial issues. To improve advice to the president, Vessey arranged quarterly meetings for the chiefs with the president and brought the major operational commanders into the budget and strategic planning process. Nevertheless, U.S. intervention in 'Grenada and the terrorist bombing of the U.S. Marine barracks in Lebanon (both in 1983) raised criticisms about poor service cooperation and a cumbersome chain of command, which helped to bring about passage of the 'Goldwater-Nichols Act in 1986, a year after Vessey's retirement.

 Vietnam War

VETERANS: OVERVIEW

Two major changes have taken place in the relation of the American veteran to civilian society, especially since 1865: the growth of veterans' groups as nationalist lobbies, and the rapid expansion of a military pension system that some scholars see as the template for the twentieth-century American welfare state. Even before the 'Revolutionary War ended, however, questions of veteran/civilian relations had arisen. In 1776, the Continental Congress pensioned veterans disabled in war, but beyond this step (which had long colonial and English precedents) there was sharp disagreement. Some representatives embraced the ideal of the civilian volunteer, and argued that the service pensions Congress had promised in 1778 represented an entering wedge for standing armies. Such worries were heightened when officers of Washington's army encamped at Newburgh, New York, demanded pensions or a cash equivalent as the price of their disbandment in 1783, and formed a hereditary order, the Society of the 'Cincinnati. Among enlisted personnel, indigent veterans would finally be pensioned in 1818, but full service pensions did not arrive until 1832. Thus, from its inception, the U.S. military

pension system drew distinctions between three classes of the deserving: war invalids; indigent "dependents"; and soldiers whose only claim to benefits was their service.

As a result of the Newburgh remonstrances, Congress, in the Commutation Act of 1783, provided officers with five years' full pay in lieu of half-pay pensions for life. Because the federal government continued in default until 1791, however, many officers sold their commutation certificates for as little as 12 1/2 cents on the dollar, a fate that also befell many enlisted veteran holders of Continental land warrants. Under acts of 1776 and 1780, Congress had promised the veterans large tracts of the public domain, mostly in the Northwest and Southwest territories; land-rich states such as Virginia and New York made additional grants. But conflicting state land claims, wars with Indian nations, and land sales restrictions made land warrants of small value to most veterans until the late 1790s, by which time most had sold their warrants to speculators. Eventually, title to 2,666,080 acres of public lands was issued on the basis of Revolutionary claims.

Revolutionary War veterans never organized for mass politics and had little public visibility in the early republic. Many of the estimated 232,000 men who served had been militiamen, whose irregular, seasonal war service produced scant national consciousness (it also excluded them from pension benefits, much to the disgust of those who saw volunteer militias as bulwarks of liberty). Even Continental regulars often had little contact with soldiers from states other than their own, and consequently Revolutionary veterans' organizations were limited in scope. The Society of the 'Cincinnati declined to only six state chapters, all in the Northeast, by 1832; the Society of St. Tammany, founded by New York City veterans in 1789, quickly evolved into a Democratic political club.

The wars of the early nineteenth century likewise produced few veterans' groups, in part because they produced few veterans: 28,186 were demobilized from the 'War of 1812, 139,036 from the 'Mexican War. A tiny Society of the War of 1812 led a fitful existence from 1853 into the 1890s, when it became a hereditary order; the National Association of Mexican War Veterans was not formed until 1874, and lasted barely into the twentieth century. Veterans of both wars benefited immediately from federal land grants and invalid pensions, but dependent and service pensions came only as part of the tremendous pension rush following the 'Civil War—to War of 1812 veterans in 1871 and to Mexican War veterans in 1887 (dependent) and 1907 (service). Because most Mexican War volunteers had been southerners, there was great resistance to pensioning them in the post-Civil War era, and the law of 1887 excluded those whose wounds had been sustained in Confederate service or who were politically disbarred by the Fourteenth Amendment.

The Civil War revolutionized the relationship of veteran to society. The number of troops involved was unprecedented: at least 2 million men fought for the Union, some 750,000 for the Confederacy. More important, veterans of the 'Union army in 1866 created a powerful mass organization, the 'Grand Army of the Republic (GAR), to lobby for their interests and promote loyalty to the nation-state. Nearly every Northern town had a GAR post, and with more than 400,000 members by 1890, the GAR was a voting machine for the Republican Party. Politicians of both parties vied for the veterans' favor with generous pension

legislation, especially the Arrears Act (1879) and Dependent Pension Act (1890), the latter granting a virtual service pension to Union veterans at a time when many were still in their fifties. By 1891, military pensions accounted for one dollar of every three spent by the federal government, and at the peak in 1902, 999,446 persons (including widows and dependents) were on the pension rolls. By 1917, the nation had spent approximately \$5 billion on Civil War pensions. Reformers attacked the frauds that riddled this system.

Beyond pensions, Civil War veterans occupied the center of a postwar culture that in each region venerated its ex-soldiers. In the North, cities erected expensive monuments; Gettysburg was preserved as a historical park; and Grand Army men lectured schoolchildren on patriotic holidays, including Memorial Day, first proclaimed by GAR commander in chief John Logan in 1868 to honor the Union dead. By 1888, twelve northern states and the federal government had erected soldiers' homes. Union veterans won land grants, special treatment under the Homestead Act, and preference in hiring—by law in some states, de facto in federal agencies such as the Pension Bureau. The most important aspect of Union veteran culture, however, was its intensely conservative "nationalism, visible in the GAR's crusades against anarchy, flag desecration, and "impure" school textbooks in the 1890s. Veterans of the Union army were the first to assert a privileged relation to the national state.

In the South, Confederate veterans organized late, at least partly in reaction to the GAR. Barred from federal entitlements, they obtained pensions and soldiers' homes from most southern states, though such benefits usually were quite modest. (Georgia's Confederate disability pensions, for example, averaged 14% of the federal rate.) The United Confederate Veterans (1889) presided over a veteran culture that shifted ground from intransigence in the 1870s to a romantic "Lost Cause" sensibility in the 1890s that even Union veterans could accept with some reservations.

The legacy of Civil War veterans was immense. First, the Civil War pension system provided the United States's first significant encounter with entitlement spending. When other groups—mothers, workers, the unemployed—sought state aid after 1900, their claims were evaluated in light of the partisanship, nationalistic rhetoric, and fraud that had characterized the Civil War system. Second, the GAR provided an organizational model and political agenda that twentieth-century veterans' groups copied. Founded after World War I, the "American Legion adopted the GAR's internal structure and consulted with aging GAR members on political strategy. All veterans' organizations until the "Vietnam War continued the GAR program of flag ritualism, "patriotic instruction," and unqualified nationalism.

The Spanish-American War produced only two significant organizations: the United Spanish War Veterans (1904), which soon faded, and the "Veterans of Foreign Wars (VFW), founded in 1913. Unlike the GAR and United Confederate Veterans, the VFW admitted all overseas veterans, not just those from one war, a policy that has allowed it to persevere to the present. On the other hand, the VFW policy of limiting membership to overseas veterans initially hampered the organization in competition with the more inclusive American Legion.

The approximately 4 million veterans of World War I returned to a situation markedly different from that following the Civil War. High unemployment marked both periods, but the soldiers of 1865 came back mostly to farms, while those of 1919 returned primarily to cities, where joblessness was acute and vocational training scarce. Rural land grants proposed by Interior Secretary Franklin Lane in 1919 proved impracticable in any case, since most arable public land had already been given away. Meanwhile, labor and political strife were rampant—revolution in Russia, chaos in Germany, a general strike in Seattle, a race riot in Chicago, and indices of class and racial turmoil elsewhere in the United States.

Under such circumstances, the American Legion (founded at Paris in 1919) came out immediately against "Bolshevism" and other radicalism, which it defined broadly to include everyone from the Communist Party to the League of Women Voters. Legion members helped break strikes of Kansas coal miners and Boston police in the summer of 1919, and from the 1920s through the 1950s made a war on "reds" one of their main activities. Legionnaires helped bring a House Un-American Activities Committee into existence in 1938 and aided FBI probes of subversion thereafter. The interwar Legion was strongest in smaller cities and among prosperous members of the middle class. Like the GAR, it left racial matters largely to localities, which in practice usually meant segregated posts.

The War Risk Act of 1917 was intended to avoid the expense and abuses of the Civil War pension system by allowing World War I soldiers to pay small premiums in return for life insurance and future medical care. Administration of the act was inefficient, however, and veterans' hospitals proved too few in number and unable to cope with late-developing disabilities and shell shock. The first vocational training and rehabilitation programs for veterans, established in 1917, similarly suffered from underfunding, poor teaching, and the tendency of veterans to treat "training" grants as pensions. Veteran protests brought about the consolidation of medical and educational programs in the Veterans Bureau (1921), which in 1930 became the Veterans Administration (VA). It was not until Frank Hines replaced the corrupt Charles Forbes in 1923, however, that the bureau began to function effectively.

World War I veterans never received service pensions and were eligible for nonservice-related disability pensions only briefly, from 1930 to 1933. Instead, attention focused on "adjusted compensation," a bonus approved by Congress in 1924 and payable in 1945, designed to make up for wartime inflation and lost earnings. Veterans were seriously divided on the propriety of the bonus, even after depression hardships drove 20,000 of them to march on Washington in 1932 as a "Bonus Army" demanding its immediate payment. Although troops led by Gen. Douglas "MacArthur violently expelled the veterans from the city, the bonus was finally paid in 1936.

The rise of a general social welfare system under the New Deal decreased the need for military pensions and made aid to ex-soldiers seem less like "special benefits." Thus, when the 12 million veterans of World War II returned home, debate was minimal over the largest package of veterans' benefits in American history. The "G.I. Bill (1944), drafted by former Legion commander Harry Colmery, provided

World War II veterans with free college education and medical care, unemployment insurance for one year, and guaranteed loans up to \$4,000 to buy homes or businesses. Other legislation guaranteed farmers loans on crops, reinstated vocational training, and tried to safeguard the jobs of returning employees. By the 1970s, VA spending was greater than all but three cabinet departments (it achieved cabinet status in 1989). By 1980, benefits distributed under the G.I. Bill totaled \$120 billion, an enormous investment in "social capital" and social mobility.

Unlike previous wars, World War II was fought mostly by conscripts, which may have made taxpayers more willing to compensate them for "forced labor." These veterans were slightly younger and better educated than World War I veterans; they were mustered out into considerably less class and racial strife than the veterans of 1919. Still, they joined older veterans' groups rather than forming significant new ones: American Legion membership, which had fluctuated between 600,000 and 1 million before 1941, reached a record 3.5 million in 1946, while VFW membership rose from 300,000 to 2 million. Among liberal alternative groups founded in 1945, only AM VETS reached 250,000 members.

The Korean and Vietnam conflicts produced none of the triumphalism that followed World War II. Although the VA continued to grow—its 1995 budget was \$37.4 billion, more than half of it earmarked for benefits—the Legion and VFW struggled throughout the 1960s and 1970s to attract new veterans. After the "Vietnam War, which the older organizations supported fiercely, young veterans felt alienated from a society that often ignored or pitied them. In 1967, they formed the first significant antiwar veterans' group, the Vietnam Veterans Against the War (VAVW; after 1983, the Vietnam Veterans of America, VOWA). With less than 20,000 members, the VAVW publicized war "atrocities and lobbied for American withdrawal. In the 1980s, more Vietnam veterans began to join the Legion and VFW, bringing those groups up to their 1995 memberships of approximately 3 million and 2 million, respectively. Yet the Vietnam Veterans War Memorial, dedicated at Washington in 1982, remains starkly noncelebratory: a sunken black granite wall listing names of the dead.

More recent health problems of "Persian Gulf War veterans have highlighted the special needs of servicemen and women.

VETERANS: REVOLUTIONARY WAR

Because inadequate records were kept, the exact number of Americans who fought in the "Continental army and in state militia units during the "Revolutionary War (1775-83) is unknown. Most former members of the Continental army officer corps became ardent nationalists as a result of their military service and pressed to replace the Articles of Confederation with a new constitution. President George Washington placed a number of his former Continental army officers in executive positions in the new federal government.

Continental officers created the Society of the "Cincinnati for themselves, but no national veterans' organizations emerged for the common soldiers. Many veterans of the Revolution continued to serve in the militia after 1783, and for numerous Americans the militia embodied the republican ideals of the "citizen-soldier. The heightened "nationalism that emerged after the "War of 1812 helped turn the aging and shrinking ranks of Revolutionary War veterans into symbols of civic virtue in the eyes of politicians and the public. In communities across the country, these gray-haired ex-soldiers often received honored places at the head of Fourth of July parades and other rituals honoring the Revolution and the Republic.

In 1818, responding to the public's growing esteem for the Revolutionary veteran, the U.S. Congress for the first time offered pensions to any veteran of the Continental army who had demonstrated financial need and had served for at least nine months. This differed from previous pensions offered only to officers and also to those soldiers permanently injured in battle. In 1832, Congress further liberalized these requirements and granted pensions to all living veterans, including militia members, regardless of financial need, if they had served for six months. This pension system set important precedents for the relationship of the veteran and the federal government. Subsequently, after every major war, veterans often received pensions and other benefits by virtue of their wartime service.

VETERANS: CIVIL WAR

The Civil War produced more than 2 million veterans of both armies; as late as 1890, the federal census found 1,034,073 surviving Union ex-soldiers and 432,020 former Confederates. At the war's close, both groups faced dim employment prospects, civilian indifference, and the lingering effects of wounds and disease—13.9 percent of Union veterans and probably 20 percent of ex-Confederates suffered from wounds alone. Union veterans in 1866 organized the "Grand Army of the Republic (GAR), which grew to more 400,000 members by 1890 and became probably the most powerful political lobby of the Gilded Age. Smaller groups included the Union Veteran Legion, the Veterans Rights Union (VRU), and the officers-only Military Order of the Loyal Legion of the United States (MOLLUS). Union veteran political pressure helped bring about the Arrears Act of 1879, which doubled pension expendi-

tures in less than two years, and the Dependent Pension Act of 1890, which created a service pension system in all but name. The number of Union pensioners (including widows) reached a peak of 969,711 in 1901. In 1874, Congress mandated preference for disabled veterans in federal hiring, and New York and Kansas enacted general veteran preference laws; twelve new state soldiers' homes opened between 1879 and 1888. Federal largess to veterans, which represented the United States's first foray into social welfare spending, drew the fire of genteel reformers such as E. L. Godkin in the 1890s.

Confederate veterans organized much later. The largest Confederate veterans' group, the United Confederate Veterans (UCV), was founded in 1889, and had an estimated 80,000 members by 1903; before 1885, the more exclusive Association of the Army of Northern Virginia (AANV) predominated. Ex-Confederates were ineligible for federal pensions and hiring preferences, though individual southern states erected sixteen soldiers' homes to care for the wounded and indigent, and some provided modest pensions. Much of Confederate veteran culture, especially after 1890, was tied to a developing Lost Cause mythology that helped southerners cope with defeat while reintegrating themselves within the nation.

The attitudes of Civil War veterans toward each other, and toward noncombatants, were exceedingly complex. Wartime hatreds never really disappeared, as suggested by Grover Cleveland's hasty retraction, under GAR pressure, of an 1887 order to return captured Confederate battle flags to the South, or by ex-Confederate veneration of Jefferson Davis and his daughter Varina Anne Davis on their tour of the South in 1886. Union and Confederate veterans also skirmished throughout the 1890s over the proper telling of Civil War history in school textbooks. But veterans of both sides also were prone to idealize each other at the expense of "civilians." Between 1884 and 1887, the *Centurys* widely read "Battles and Leaders of the Civil War" avoided politics and balanced northern and southern viewpoints, while local Blue-Gray reunions beginning in the 1880s culminated in a gigantic fiftieth anniversary reunion at Gettysburg in 1913. In their memoirs, veterans from both sides tended to emphasize Union, states' rights, and personal heroism and to downplay slavery and race.

VETERANS: WORLD WAR I

There were approximately 4.5 million veterans of the eighteen-month U.S. participation in World War I. The average had served twelve months. About half went overseas for an average of 5.5 months. Some 1.1 million actually saw combat; of these, 204,000 were wounded or otherwise disabled. Veterans were simply mustered out of service from their bases in the United States. The government was unprepared to deal with the problems faced by returning veterans, especially unemployed or disabled veterans. A brief postwar recession in which unemployment reached 16 percent ended by 1921, the year in which the Veterans Bureau (forerunner of the Veterans Administration) was created. A system of veterans' hospitals was established

that provided long-term care especially for war-related wounds and illnesses, tuberculosis caused by poison gas, and mental illness caused by "shell shock."

Throughout the 1920s, veterans' benefits averaged \$650 million per year, about 20 percent of the federal budget. In 1924, Congress, under pressure, acknowledged that the dollar per day enlisted men received had been outpaced by wartime inflation and voted World War I veterans an "adjusted compensation" ("the Bonus"), to be paid in 1945. During the Great Depression, unemployed veterans, calling themselves the "forgotten men," demanded immediate payment of the bonus. Congress agreed, but President Herbert C. Hoover vetoed it. When many "Bonus Army" marchers remained camped in Washington, D.C., U.S. Army troops under Gen. Douglas MacArthur used tanks and tear gas to clear the capital of the protestors.

In the 1936 election year, the bonus was paid ahead of schedule at a cost of \$3.9 billion of a total federal budget of \$8.4 billion. In addition to the "Bonus," hospitals, and disability benefits, World War I veterans also received civil service preference at all levels of government. Between one-fifth and one-third of surviving veterans belonged to the American Legion, formed by World War I veterans in 1919. Having served briefly and gloriously in the Great War, most veterans valued their experience in uniform for comradeship and travel, especially as three-quarters of the veterans had never seen combat.

VETERANS: WORLD WAR II

Over 16 million American men and women served in World War II, and their return home had a profound impact on them and on society. The sudden end of the war in September 1945 complicated demobilization. A shortage of transports as well as the need to maintain occupation forces in Japan and Germany meant long delays in bringing some troops home, especially from the Pacific theater. G.I.s staged demonstrations in Manila, Calcutta, Paris, and several other cities, demanding an immediate return. They were supported by their families. As portrayed in films like *The Best Years of Our Lives* (1946), once they returned to the United States, they sought in various ways to resume their civilian lives and put the war behind them.

Despite the fears expressed by some social commentators about the destructive influences of war on combatants, the reintegration of veterans into American society produced neither economic upheaval nor a dangerous new class of men unable to accept the norms of civilian life. Returning G.I.s and their families faced a severe shortage of housing; consumer goods also remained in short supply in 1946 and 1947. The generous adjustment allowances provided by the G.I. Bill smoothed the transition of many ex-servicemen and -women into civilian life. Military service did take a significant emotional toll on a number of former servicepeople, especially those who had been in combat. There were also many disabled veterans. But the majority of veterans returned successfully to a society that vindicated their efforts on behalf of the "Good War." In turn, many returning veterans expressed the strong desire to "get on with their lives," and after V-J Day both marriage and birth rates

soared as scores of former servicepeople started families.

As a political force, the impact of the World War II veterans on American politics remained important, if often elusive. Their numbers as a potential voting bloc helped explain why politicians showered such an array of benefits, including property tax breaks, educational benefits, and preferences of public employment. Every U.S. president from 1953 to 1992 had served in World War II, and veterans of this conflict also made up a significant portion of both houses of Congress in the period.

The "American Legion, the "Veterans of Foreign Wars, and the Disabled American Veterans attracted a significant share of eligible former servicemen and -women. Efforts on the part of some liberal left veterans to create a new mass-based veterans' organization, the American Veterans Committee (AVC), failed. Tarred by critics for being a Communist front organization, the AVC won the allegiance of only a small fraction of veterans. Even after the "Good War," the majority of veterans never joined any established veterans' organization. Furthermore, in contrast to veterans of the "Civil War, World War I, and later the "Vietnam War, the World War II veterans expressed little interest in sponsoring or lobbying for either local or national monuments marking their service, at least until the fiftieth anniversary of the war in the 1990s, when many of its veterans were already passing from the scene.

VETERANS: KOREAN WAR

Over 6 million Americans served in the armed forces during the era of the "Korean War (1950-53), but they represented a smaller cohort demographically than their counterparts in World War II and they failed to garner the same public attention and acclaim. An unpopular war with limited "mobilization, the Korean conflict ended in a stalemate instead of total "victory. In 1952, the U.S. Congress enacted a Veterans' Readjustment Assistance Act providing Korean veterans with educational benefits similar to but less than those offered World War II veterans under the "G.I. Bill.

Further tarnishing the image, a handful of American servicemen captured by the enemy renounced their U.S. citizenship and a small number of American "prisoners of war who participated in anti-U.S. propaganda were put on trial by the U.S. government after their exchange for collaborating with the enemy. Some political commentators voiced concerns that captured American soldiers had been "brainwashed" by their Communist captors and now posed a threat of internal infiltration. This theme would be reflected in a controversial 1962 film, *The Manchurian Candidate*.

By the 1970s, the Korean War became "the forgotten war," but during the 1980s restored pride in the armed forces and the dedication of the national Vietnam Veterans Memorial (1982) sparked renewed interest among Korean War veterans and political leaders to build a similar national monument honoring those who served in Korea. Authorized by the U.S. Congress in 1986, built with private

funds by the American Battle Monuments Commission, the Korean War Veterans Memorial was dedicated in Washington, D.C. in 1995.

VETERANS: VIETNAM WAR

The Department of "Defense (DoD) and the Department of Veterans' Affairs (DVA) define the 9,656,000 men and 178,000 women who served on active duty in the armed forces between August 1964 and May 1975 as Vietnam-era veterans. Of these, 2,586,152 men and 7,848 women served in the war in Vietnam.

Public attitudes toward veterans of the Vietnam War shifted from respect in 1965-67 to disdain following an antiwar movement that developed in 1968-70. Veterans and their problems became an embarrassment to the voters and the government as reminders of a war that had lost much popular support. The press highlighted veterans who engaged in violent crime, though they were not significantly overrepresented in crime, drinking, or drug use compared to nonveterans in their age cohort. In the early 1980s, popular sentiment began to change again. The dedication of the Vietnam Veterans Memorial in Washington in 1982 marked the beginning of a national commitment to honoring veterans of the war.

Veterans who served in Vietnam faced unique biological and psychological problems. The most serious and widespread biological matter was exposure to dioxin in Agent Orange, a defoliant sprayed by aircraft. The effects of dioxin poisoning, which appeared several months after exposure, included chloracne (skin lesions), peripheral neuropathy (loss of feeling in the extremities), hepatic dysfunction (liver failure), non-Hodgkin's lymphoma and soft tissue sarcomas (cancers), and porphyria and hypertriglyceridemia (metabolic disorders). None of these conditions was amenable to cure; treatment could only alleviate symptoms.

Approximately 30 percent of veterans of the war suffered from posttraumatic stress disorder (PTSD). Symptoms appeared gradually, and could include recurrent intrusive dreams and memories, feelings of estrangement from others, flat affect, survival guilt, impaired memory and concentration, exaggerated startle response, and sleep disorders. Veterans experienced higher than expected mortality rates from motor vehicle wrecks, suicide, homicide, and drug-related medical conditions. PTSD resulted principally from the abrupt rupture of powerful emotional relationships when servicemen left their comrades in the war zone, the lack of opportunity to process traumatic events with those who had shared them, and hostile or indifferent responses to veterans and their experiences by civilians back home. PTSD was most common among the psychologically vulnerable.

Vietnam veterans made up small minorities (24-28 percent) within the memberships of the existing veterans' organizations. The "Veterans of Foreign Wars opposed measures that would benefit Vietnam veterans if those programs competed for dollars with programs to improve

benefits for veterans of earlier wars. The "American Legion was passive until 1982 with respect to programs for Vietnam veterans. The Disabled American Veterans, the most active advocate of Vietnam veterans' needs, took positive action to support veterans' mental health with storefront clinics.

The Veterans' Education and Training Amendments Act of 1970 (PL 91-219) was the first of a series of acts to enhance educational benefits for Vietnam-era veterans. Others include Public Laws 92-540, 93-508, 94-502, and 95-202. In 1979, 740,000 veterans were enrolled in education or vocational training under these programs. PL 93-508 also required federal contractors to take affirmative action to hire disabled and Vietnam-era veterans. Health benefits lagged until popular feelings toward veterans became more favorable in the 1980s. The DoD and DVA were slow to recognize dioxin poisoning and PTSD as service-connected.

A measure to provide readjustment counseling to victims of PTSD was held up for several years in the House Veterans' Affairs Committee before it was enacted in 1979 (PL 96-22). In 1981, the Congress gave the Veterans Administration discretionary authority to treat victims of dioxin poisoning, and in 1984, PL 98-542 established standards for compensation. Not until 1991 was a presumption of service connection established for chloracne, non-Hodgkin's lymphoma, and soft tissue sarcomas (PL 102-4). In 1993, DVA established a presumptive service connection for porphyria, Hodgkin's disease, and other cancers.

The VETERANS ADMINISTRATION (VA) is an independent federal agency administering benefits and programs to veterans; it achieved cabinet-level status as the Department of Veterans Affairs in 1988. Established by Congress in 1930, the VA absorbed three separate agencies: the Bureau of Pensions, established in 1833; the National Homes of Disabled Volunteer Soldiers, founded in 1866; and the Veteran's Bureau, created in 1921.

Brig. Gen. Franklin T. Hines served as the first administrator of the VA in 1930-45. Originally called to Washington in 1923, this Utah native reformed the Veterans' Bureau, which had been mired in scandal under Charles R. Forbes, a political crony of President Warren G. Harding. Hines's longevity in office stemmed from his nonpartisanship, hard work, and efficiency, as well as his ability to maintain good relations with Congress and national veterans' organizations, especially the "American Legion.

In 1944, Congress vested the agency with responsibility for administering the "G.I. Bill for over 16 million eligible veterans. In 1945, President Harry S. "Truman named Gen. Omar N. "Bradley to head the agency and carry out a series of much needed reforms for its larger roles. Under Bradley's three-year tenure as administrator, the agency embarked on a massive program of hospital construction and made major improvements in the delivery of medical

care to disabled veterans, including the establishment of a Department of Medicine within the agency and the formal affiliation of VA Hospitals with major medical schools.

In 1953, President Dwight D. "Eisenhower implemented the recommendation of a private consultant to streamline the VA and created three major departments within the agency: Medicine and Surgery; Insurance; and Benefits. This newly configured VA administrated less generous packages of "G.I. Bill benefits for veterans of wars in Korea and later Vietnam. In 1973, the VA also assumed responsibility from the Department of the Army for military "cemeteries.

During the late 1960s, the VA, geared to serving an aging population of veterans from two world wars, came under criticism for failing to provide adequate acute care for servicemen and -women injured in the "Vietnam War and for a general insensitivity to the particular needs of veterans of that war. For example, many veterans and their supporters protested the reluctance of the agency to acknowledge the long-term effects of the herbicide Agent Orange. In 1977, President Jimmy "Carter appointed Max Cleland, a double amputee, as the first Vietnam veteran to head the VA.

In 1988, Congress elevated the VA to a cabinet-level department, and in 1989, Republican congressman Edward J. Derwinski of Illinois became the first secretary of Veterans Affairs. After the "Persian Gulf War (1991), the Department of Veterans Affairs, along with the Department of "Defense, was criticized for failing to recognize or treat "Gulf War syndrome," allegedly caused by exposure to biological and chemical weapons.

The VETERANS OF FOREIGN WARS (VFW) was organized in 1913 with the emergence of two organizations of "Spanish-American War veterans. Formed as an association of "veterans who served overseas, its membership, which consisted of over 1 million in the aftermath of World War II, includes veterans from every war in the twentieth century. Its headquarters is in Kansas City. Like its chief rival organization, the "American Legion, the VFW established local posts throughout the United States and wielded political influence in Washington as a voice for veterans and a strong foreign and military policy.

The VFW saw its lobbying efforts in the context of peacetime "patriotism that called the nation not to forget the soldiers who defended American freedom and to be vigilant against internal as well as external threats. Contradictions between the celebration of soldier solidarity and individual heroism, between collective responsibility for veteran welfare and extremist individualism, and between pervasive antistatist rhetoric and arguments for expanded state benefits for veterans permeate the history of veteran groups in general and of the VFW in particular.

In one of its most successful political efforts, the VFW achieved in 1924 what was called "the Soldier's Bonus": the World War Veterans Adjusted Compensation Act. This act granted veterans a cash payment for the sacrifice of wages due to wartime service. The VFW also was instrumental

in the passage in 1946 of the Servicemen's Adjustment Act, or *G.I. Bill, under which World War II veterans received unprecedented employment preference, education, and loan guarantees.

VICHY FRANCE. See France, U.S. Military Involvement

VICKSBURG, SIEGE OF (1862-63). During the Civil War, Vicksburg, a port city above the Mississippi River at the mouth of the Yazoo, was a key link between the eastern and the trans-Mississippi areas of the Confederacy. In May 1862, 3,000 Confederate troops under Brig. Gen. Martin L. Smith occupied the town. Smith began fortifying the 200-foot bluffs. With the siege of *New Orleans and the fall of Memphis, Vicksburg quickly became the only bastion on the Mississippi blocking Union river traffic.

On 28 May 1862, the USS *Oneida* arrived and opened fire upon Vicksburg. Additional vessels under Flag Officer David *Farragut joined the bombardment in the coming weeks, augmented by mortar schooners under Cmdr. David Dixon *Porter. Lacking sufficient forces for a land assault, the *Fédérés* attempted to dig a canal across the peninsula opposite the town. On 28 June, Farragut's ships steamed upstream and joined Charles H. Davis's gunboat squadron. On 15 July, however, the CSS *Arkansas*, an iron-clad riverboat, ran the gauntlet of Union vessels to anchor safely below Vicksburg. Farragut's vessels failed to destroy the *Arkansas* when they returned downstream that night. Low water ended construction on the canal and threatened to strand the deep-draft vessels.

When the Union fleets departed on 25 July, both sides understood that only a Union army could capture Vicksburg. To prevent that possibility, Smith's successor, Maj. Gen. Earl Van Dorn, ringed Vicksburg with earthworks and fortified Port Hudson. On 14 October, Confederate Maj. Gen. John C. Pemberton assumed command of Mississippi and eastern Louisiana.

Ulysses S. *Grant marched southward on 2 November from Grand Junction with 30,000 men and outmaneuvered Pemberton, who fell back to Grenada. While Grant continued overland, William Tecumseh *Sherman moved via the Mississippi to Vicksburg. Grant's advance stalled after Confederate cavalry disrupted his rail communications and destroyed his supply base at Holly Springs on 20 December. The following week, Sherman's 32,000 troops landed near Vicksburg, but in fighting 27-29 December they suffered a repulse at Chickasaw Bluffs. Sherman withdrew on 2 January 1863.

Undeterred, Grant decided to isolate Vicksburg from the east while supplying his entire army via the Mississippi. However, that required Union transports below or behind Vicksburg. Attempts to complete the canal and to create an all-water route west of the Mississippi proved fruitless. Fort Pemberton prevented Union vessels from entering the Yazoo River above Vicksburg, and attempts to bypass the fort failed.

On 31 March, Grant started two corps down the west side of the Mississippi. To distract Pemberton, Sherman's

corps remained near Vicksburg and 1,700 Union cavalrymen under Col. Benjamin H. Grierson conducted a raid that disrupted Confederate *communications throughout Mississippi. On the night of 16 April, nine Federal gunboats and two Union troop transports steamed past Vicksburg, followed six nights later by five transports and six barges of supplies. From 30 April through 1 May, 23,000 Union soldiers crossed the Mississippi and disembarked at Bruinsburg.

Grant's maneuvering baffled Pemberton, who was further impaired by conflicting orders. His immediate superior, Joseph E. *Johnston, instructed him to concentrate and defeat Grant; but Pemberton focused on Grierson's cavalry and followed President Jefferson *Davis's mandate to hold Vicksburg and Port Hudson. Pemberton's confusion enabled Grant to defeat Confederate detachments at Port Gibson and Grand Gulf. After securing the latter on 3 May and being joined by Sherman, Grant marched toward Jackson, Mississippi. He encountered no serious resistance until 12 May, when Confederates made a stand near Raymond. Fearing an enemy concentration, Grant sent James B. McPherson's corps and Sherman's to Jackson; John A. McClelland's corps remained in reserve to block any Confederate advance from Vicksburg.

That same day, General Johnston arrived in Jackson and took command of all Confederate forces in Mississippi; but Grant's deployment prevented him from establishing reliable communications with Pemberton. Pemberton finally led 17,500 Confederates from Vicksburg on 12 May, but when he failed to join Johnston, Grant proceeded to defeat the two Confederate armies, one at a time. After driving Johnston's 6,000 troops from Jackson on 14 May Grant turned and defeated Pemberton at Champion Hill on 16 May and at Big Black River on 17 May. Pemberton then withdrew to Vicksburg.

Eager to avoid a lengthy siege, Grant launched several unsuccessful assaults against the bastion, but his troops suffered heavy *casualties. Union engineers began constructing 12 miles of earthworks, about 600 yards from the 9-mile-long Confederate *fortifications. By 1 June, Grant had 50,000 troops surrounding 30,000 Confederates; an additional 27,000 Union soldiers arrived by mid-June.

Anxious to aid Pemberton, Johnston organized an army near Jackson. When he claimed his 24,000 troops were insufficient, he received 7,000 reinforcements. A trans-Mississippi division also attempted to destroy Grant's supply base at Milliken's Bend. On 15 June, Johnston notified President Jefferson that he could not save Vicksburg. Grant deployed Sherman with 34,000 men east of Vicksburg to block Johnston.

Believing that Pemberton could hold out until 10 July, Johnston dispatched a courier to notify Pemberton that he would make a diversionary attack to enable the garrison to escape. Johnston could do no more because of *transportation and *logistics problems, unreliable communications, and inferior numbers against an entrenched enemy.

However, Pemberton never received the message, and conditions at Vicksburg deteriorated more rapidly than anticipated. Dwindling foodstuffs, insufficient water, and daily bombardments took a heavy toll on civilians and soldiers alike. Pemberton concluded his men were too weak to fight their way out.

On 3 July, he met with Grant and agreed to surrender the following day. At the surrender on 4 July 1863—the

same week as The Battle of "Gettysburg—the garrison consisted of 2,166 officers, 27,230 enlisted men, 115 civilian employees, 172 cannon, and 60,000 long arms. Casualties during the Vicksburg campaign totaled about 9,000 for the Union and 10,000 for the Confederacy, not counting Confederate prisoners. The victory further elevated Grant's prominence. Johnston learned of the surrender on 5 July, and after skirmishing with Sherman, withdrew. On 9 July, Port Hudson surrendered, giving the Union complete control of the Mississippi and dividing the Confederacy in half.

VICTORY. Although it can denote simply success in a single engagement or operation, victory is one of the most basic yet elusive concepts in military thought when applied to war. American experience reaffirms Carl von Clausewitz's argument in *On War* (1832) that victory in the broader sense results from a balance between war's inner logic of force begetting more force, pushing a conflict toward a "war of annihilation," and the limitations imposed by friction and political objectives. For most of American history, factors such as geographic isolation and a small professional military have acted as friction.

From the seventeenth to the twentieth century, victory was achieved in two separate phases: limited military operations and diplomatic negotiations. As colonists, Americans witnessed their wars of empire settled in Europe, often well after hostilities ended in North America. The signing of the Treaty of Paris in 1783, ending the "Revolutionary War," occurred two years after major military operations ceased. Perhaps most famously, Andrew Jackson's defeat of the British in the Battle of New Orleans occurred after the Treaty of Ghent concluded the "War of 1812. Similarly, negotiations ended the "Mexican War and the "Spanish-American War after the United States achieved strategic advantage in limited military operations.

There were notable exceptions: the "Civil War and wars with Native Americans. Both belligerents entered the Civil War hoping to achieve victory quickly and with limited engagements. Initially, the opponents' conceptions of victory mirrored one another: for the Confederacy, independence; for the Union, reunion. Steadily, however, the war evolved into a protracted struggle. This led to an expansion of the Union's aims to include the elimination of slavery. President Abraham Lincoln as commander in chief integrated these political objectives with military "strategy. Although scholars debate whether the Civil War was the first "modern" or "total war," the combination of Ulysses S. Grant's campaign of attrition against the Army of Virginia and William Tecumseh Sherman's strike at the heart of the Confederacy's economy and civilian morale with his drive to Atlanta and then his "march to the sea represented means to victory hitherto unprecedented in American history. Despite his expressed willingness to negotiate

with the Confederacy, Lincoln's insistence on reunion and abolition „of slavery as preconditions for any settlement linked "unconditional surrender" to the end of the war in popular memory.

In their wars against Native American nations, Americans rejected limited objectives and sought instead the forcible relocation or elimination of entire peoples. Therefore, from the Pequot War to the slaughter at the Battle of "Wounded Knee, South Dakota, on 29 December 1890, America's pursuit of victory against Native Americans approached wars of annihilation by means of bounties, fire, opportunistic alliances, and eventually superior firepower and mobility.

After the outbreak of World War I, President Woodrow Wilson hoped that the United States could serve as an impartial mediator to end the conflict. In this context, Wilson sought in his "Peace Without Victory" address (1917) to redefine "victory" as the imposition of a settlement by the victor upon the vanquished, a condition that inevitably bred resentment and undermined prospects for long-term peace. Wilson juxtaposed against this portrait of traditional victory his vision of "peace based upon the interests of all nations and the repudiation of traditional power politics. Although after the United States entered the war, he embraced "complete victory" and oversaw a "mobilization that eclipsed the Civil War experience, Wilson nonetheless conceived of an American victory in the distinctive terms of creating a new international order as suggested in his "Fourteen Points. But the compromises of the Treaty of "Versailles, the American failure to join the "League of Nations, and the subsequent deterioration of European stability all disenchanted Americans, until the entire experience seemed not a "peace without victory" but a military victory without meaningful peace.

This bitter experience shaped Americans' views of victory during World War II. President Franklin D. Roosevelt proclaimed the objective of "absolute victory." He then supervised the formulation of American strategy as Lincoln had. "V for Victory" symbolized a hybrid Wilsonian idealism and realpolitik. Such pronouncements as FDR's "Four Freedoms" Speech (6 January 1941), the Atlantic Charter (14 August 1941), and the "United Nations Declaration (2 January 1942) linked victory to both the elimination of the military and ideological threat posed by the Axis powers and the creation of a new international order. Yet the United Nations' prospects for success were predicated on the continued leadership and cooperation of the Grand Alliance. For rhetorical and policy reasons, FDR resurrected "unconditional surrender" at the Casablanca Conference (1943) as a vital prerequisite for victory. To win such a victory, the United States adopted means approaching pure total war by expanding the boundaries of what Americans considered militarily legitimate—for example, the atomic bombings of "Hiroshima and Nagasaki.

After World War II, the United States confronted a new strategic environment dominated by the "Cold War with the USSR. The idea of seeking unconditional surrender in any future war with the USSR appeared fantastic. Against this backdrop, the United States intervened in the "Korean War in June 1950, sought the reunification of the peninsula by force, and then changed its objectives to a return to the status quo ante bellum and circumscribed its means following the Communist Chinese intervention in late 1950. A new class of civilian strategists developed theories

of Limited War, which postulated the Korean War as the likely norm in a world of two nuclear-armed superpowers. Such ideas provided the intellectual foundation for the Kennedy and Johnson administrations' "Flexible Response strategy. When applied to Vietnam, however, a policy emerged that did not emphasize American victory but rather the denial of victory to the Vietnamese Communists. President Lyndon B. "Johnson's strategy led to a prolonged attrition of American will and ultimate failure.

This failure stimulated a reassessment of the relationship between military and political factors in war. As articulated in the so-called Weinberger and Powell Doctrines and implemented in Panama (1989-90) and the "Persian Gulf War (1991), current U.S. strategy emphasizes the application of overwhelming military force to terminate a conflict swiftly and decisively. Yet, despite the unmistakable battlefield triumph in the Gulf War, many doubt whether the final outcome constituted a true victory because of the perseverance of Saddam "Hussein's regime. Therefore, even though the United States approached the end of the twentieth century as the world's sole superpower, it still confronted the central dilemma of achieving victory: finding the proper balance between political objectives and military means.

VIETNAM ANTIWAR MOVEMENT. Though the first American protests against U.S. intervention in Vietnam took place in 1963, the antiwar movement did not begin in earnest until nearly two years later, when President Lyndon B.

"Johnson ordered massive U.S. military intervention and the sustained bombing of North Vietnam. In the spring of 1965, "teach-ins" against the war were held on many college campuses. "Students for a Democratic Society (SDS) organized the first national antiwar demonstration in Washington; 20,000 people, mainly students, attended.

As the war expanded—over 400,000 U.S. troops would be in Vietnam by 1967—so did the antiwar movement, attracting growing support off the campuses. The movement was less a unified army than a rich mix of political notions and visions. The tactics used were diverse: legal demonstrations, grassroots organizing, congressional lobbying, electoral challenges, civil disobedience, "draft resistance, self-immolations, political violence. Some peace activists traveled to North Vietnam. "Quakers and others provided medical aid to Vietnamese civilian victims of the war. Some G.I.s protested the war.

In March 1967, a national organization of draft resisters was formed; the Resistance would subsequently hold several national draft card turn-ins. In April 1967, more than 300,000 people demonstrated against the war in New York. Six months later, 50,000 surrounded the "Pentagon, sparking nearly 700 arrests. By now, senior Johnson administration officials typically encountered demonstrators when speaking in public, forcing them to restrict their outside

appearances. Many also had sons, daughters, or wives who opposed the war, fueling the sense of besiegement. Prominent participants in the antiwar movement included Dr. Benjamin Spock, Robert Lowell, Harry Belafonte, and Rev. Martin Luther "King, Jr. Encouraged by the movement, Senator Eugene McCarthy announced in late 1967 that he was challenging Johnson in the 1968 Democratic primaries; his later strong showing in New Hampshire was seen as a major defeat for Johnson and a repudiation of his war policies.

The Johnson administration took numerous measures to the antiwar movement, most notably undertaking close surveillance and tarnishing its public image, sending speakers to campuses, and fostering pro-war activity. Many administration officials felt foreign Communists were aiding and abetting the movement, despite the failure of both the "Central Intelligence Agency and the FBI to uncover such support.

In 1965, a majority of Americans supported U.S. policies in Vietnam; by the fall of 1967, only 35 percent did so. For the first time, more people thought U.S. intervention in Vietnam had been a mistake than did not. Blacks and women were the most dovish social groups. Later research found that antiwar sentiment was inversely correlated with people's socioeconomic level. Many Americans also disliked antiwar protesters, and the movement was frequently denounced by media commentators, legislators, and other public figures.

By 1968, faced with widespread public opposition to the war and troubling prospects in Vietnam, the Johnson administration halted the bombing of North Vietnam and stabilized the ground war. This policy reversal was the major turning point. U.S. troop strength in Vietnam would crest at 543,000.

The antiwar movement reached its zenith under President Richard M. "Nixon. In October 1969, more than 2 million people participated in Vietnam Moratorium protests across the country. The following month, over 500,000 demonstrated in Washington and 150,000 in San Francisco. Militant protest, mainly youthful, continued to spread, leading many Americans to wonder whether the war was worth a split society. And other forms of antiwar activity persisted. The Nixon administration took a host of measures to blunt the movement, mainly mobilizing supporters, smearing the movement, tracking it, withdrawing U.S. troops from Vietnam, instituting a draft lottery, and eventually ending draft calls.

Two long-standing problems continued to plague the antiwar movement. Many participants questioned its effectiveness, spawning dropouts, hindering the organization of protests and the maintenance of antiwar groups, and aggravating dissension over strategies and tactics. And infighting continued to sap energy, alienate activists, and hamper antiwar planning. The strife was fanned by the U.S. government, but it was largely internally generated.

In the spring of 1970, President Nixon's invasion of Cambodia and the Kent State shootings (followed by those at Jackson State) sparked the greatest display of campus protest in U.S. history. A national student strike completely shut down over 500 colleges and universities. Other Americans protested in cities across the country; many lobbied White House officials and members of Congress. Over 100,000 demonstrated in Washington, despite only a week's prior notice. Senators John Sherman Cooper and Frank

Church sponsored legislation (later passed) prohibiting funding of U.S. ground forces and advisers in Cambodia. Many labor leaders spoke out for the first time, and blue-collar workers joined antiwar activities in unprecedented numbers. However, construction workers in New York assaulted a group of peaceful student demonstrators, and (with White House assistance) some union leaders organized pro-administration rallies.

Despite worsening internal divisions and a flagging movement, 500,000 people demonstrated against the war in Washington in April 1971. Vietnam Veterans Against the War also staged protests, and other demonstrators engaged in mass civil disobedience, prompting 12,000 arrests. The former Pentagon aide Daniel Ellsberg leaked the *Pentagon Papers to the *New York Times*. Meanwhile, the morale and discipline of U.S. soldiers in Vietnam was deteriorating seriously: drug abuse was rampant, combat refusals and racial strife were mounting, and some soldiers were even murdering their own officers.

With U.S. troops coming home, the antiwar movement gradually declined between 1971 and 1975. The many remaining activists protested continued U.S. bombing, the plight of South Vietnamese political prisoners, and U.S. funding of the war.

The American movement against the Vietnam War was the most successful antiwar movement in U.S. history. During the Johnson administration, it played a significant role in constraining the war and was a major factor in the administration's policy reversal in 1968. During the Nixon years, it hastened U.S. troop withdrawals, continued to restrain the war, fed the deterioration in U.S. troop morale and discipline (which provided additional impetus to U.S. troop withdrawals), and promoted congressional legislation that severed U.S. funds for the war. The movement also fostered aspects of the Watergate scandal, which ultimately played a significant role in ending the war by undermining Nixon's authority in Congress and thus his ability to continue the war. It gave rise to the infamous "Huston Plan"; inspired Daniel Ellsberg, whose release of the Pentagon Papers led to the formation of the Plumbers; and fed the Nixon administration's paranoia about its political enemies, which played a major part in concocting the Watergate break-in itself.

VIETNAM WAR (1960-75): CAUSES

Most American wars have obvious starting points or precipitating causes: the Battles of *Lexington and Concord in

1775, the capture of *Fort Sumter in 1861, the attack on *Pearl Harbor in 1941, and the North Korean invasion of South Korea in June 1950, for example. But there was no fixed beginning for the U.S. war in Vietnam. The United States entered that war incrementally, in a series of steps between 1950 and 1965. In May 1950, President Harry S. *Truman authorized a modest program of economic and military aid to the French, who were fighting to retain control of their Indochina colony, including Laos and Cambodia as well as Vietnam. When the Vietnamese Nationalist (and Communist-led) Vietminh army defeated French forces at Dienbienphu in 1954, the French were compelled to accede to the creation of a Communist Vietnam north of the 17th parallel while leaving a non-Communist entity south of that line. The United States refused to accept the arrangement. The administration of President Dwight D. *Eisenhower undertook instead to build a nation from the spurious political entity that was South Vietnam by fabricating a government there, taking over control from the French, dispatching military advisers to train a South Vietnamese army, and unleashing the *Central Intelligence Agency (CIA) to conduct psychological warfare against the North.

President John F. *Kennedy rounded another turning point in early 1961, when he secretly sent 400 *Special Operations Forces-trained (Green Beret) soldiers to teach the South Vietnamese how to fight what was called *counterinsurgency* war against Communist guerrillas in South Vietnam. When Kennedy was assassinated in November 1963, there were more than 16,000 U.S. military advisers in South Vietnam, and more than 100 Americans had been killed. Kennedy's successor, Lyndon B. *Johnson, committed the United States most fully to the war. In August 1964, he secured from Congress a functional (not actual) declaration of war: the Tonkin Gulf Resolution. Then, in February and March 1965, Johnson authorized the sustained bombing, by U.S. aircraft, of targets north of the 17th parallel, and on 8 March dispatched 3,500 Marines to South Vietnam. Legal declaration or no, the United States was now at war.

The multiple starting dates for the war complicate efforts to describe the causes of U.S. entry. The United States became involved in the war for a number of reasons, and these evolved and shifted over time. Primarily, every American president regarded the enemy in Vietnam—the Vietminh; its 1960s successor, the National Liberation Front (NLF); and the government of North Vietnam, led by *Ho Chi Minh—as agents of global communism. U.S. policymakers, and most Americans, regarded communism as the antithesis of all they held dear. Communists scorned democracy, violated human rights, pursued military aggression, and created closed state economies that barely traded with capitalist countries. Americans compared communism to a contagious disease. If it took hold in one nation, U.S. policymakers expected contiguous nations to fall to communism, too, as if nations were dominoes lined up on end. In 1949, when the Communist Party came to power in China, Washington feared that Vietnam would become the next Asian domino. That was one reason for Truman's 1950 decision to give aid to the French who were fighting the Vietminh.

Truman also hoped that assisting the French in Vietnam would help to shore up the developed, non-Communist nations, whose fates were in surprising ways tied to the

preservation of Vietnam and, given the domino theory, all of Southeast Asia. Free world dominion over the region would provide markets for Japan, rebuilding with American help after the Pacific War. U.S. involvement in Vietnam reassured the British, who linked their postwar recovery to the revival of the rubber and tin industries in their colony of Malaya, one of Vietnam's neighbors. And with U.S. aid, the French could concentrate on economic recovery at home, and could hope ultimately to recall their Indochina officer corps to oversee the rearmament of West Germany, a "Cold War measure deemed essential by the Americans. These ambitions formed a second set of reasons why the United States became involved in Vietnam.

As presidents committed the United States to conflict bit by bit, many of these ambitions were forgotten. Instead, inertia developed against withdrawing from Vietnam. Washington believed that U.S. withdrawal would result in a Communist victory—Eisenhower acknowledged that, had elections been held as scheduled in Vietnam in 1956, "Ho Chi Minh would have won 80% of the vote"—and no U.S. president wanted to lose a country to communism. Democrats in particular, like Kennedy and Johnson, feared a right-wing backlash should they give up the fight; they remembered vividly the accusatory tone of the Republicans' 1950 question, "Who lost China?" The commitment to Vietnam itself, passed from administration to administration, took on validity aside from any rational basis it might once have had. Truman, Eisenhower, and Kennedy all gave their word that the United States would stand by its South Vietnamese allies. If the United States abandoned the South Vietnamese, its word would be regarded as unreliable by other governments, friendly or not. So U.S. credibility seemed at stake.

Along with the larger structural and ideological causes of the war in Vietnam, the experience, personality, and temperament of each president played a role in deepening the U.S. commitment. Dwight Eisenhower restrained U.S. involvement because, having commanded troops in battle, he doubted the United States could fight a land war in Southeast Asia. The youthful John Kennedy, on the other hand, felt he had to prove his resolve to the American people and his Communist adversaries, especially in the aftermath of several foreign policy blunders early in his administration. Lyndon Johnson saw the Vietnam War as a test of his mettle, as a southerner and as a man. He exhorted his soldiers to "nail the coonskin to the wall" in Vietnam, likening "victory to a successful hunting expedition.

When Johnson began bombing North Vietnam and sent the Marines to South Vietnam in early 1965, he had every intention of fighting a limited war. He and his advisers worried that too lavish a use of U.S. firepower might prompt the Chinese to enter the conflict. It was not expected that the North Vietnamese and the NLF would hold out long against the American military. And yet U.S. policymakers never managed to fit military "strategy to U.S. goals in Vietnam. Massive bombing had little effect against a decentralized economy like North Vietnam's. Kennedy had favored counterinsurgency warfare in the South Vietnamese countryside, and Johnson endorsed this strategy, but the political side of counterinsurgency—the effort to win the "hearts and minds" of the Vietnamese peasantry—was at best underdeveloped and probably doomed. Presidents proved reluctant to mobilize American society to the extent the generals thought necessary to defeat the enemy.

As the United States went to war in 1965, a few voices were raised in dissent. Within the Johnson administration, Undersecretary of State George Ball warned that the South Vietnamese government was a functional nonentity and simply could not be sustained by the United States, even with a major effort. Antiwar protest groups formed on many of the nation's campuses; in June, the leftist organization "Students for a Democratic Society decided to make the war its principal target. But major dissent would not begin until 1966 or later. By and large in 1965, Americans supported the administration's claim that it was fighting to stop communism in Southeast Asia, or people simply shrugged and went about their daily lives, unaware that this gradually escalating war would tear American society apart.

VIETNAM WAR (1960-1975): MILITARY AND DIPLOMATIC COURSE

The Vietnam War was the longest deployment of U.S. forces in hostile action in the history of the American republic. Although there is no formal declaration of war from which to date U.S. entry, President John F. Kennedy's decision to send over 2,000 military advisers to South Vietnam in 1961 marked the beginning of twelve years of American military combat. U.S. unit combat began in 1965. The number of U.S. troops steadily increased until it reached a peak of 543,400 in April 1969. The total number of Americans who served in South Vietnam was 2.7 million. Of these, more than 58,000 died or remain missing, and 300,000 others were wounded. The U.S. government spent more than \$140 billion on the war. Despite this enormous military effort, the United States failed to achieve its objective of preserving an independent, non-communist state in South Vietnam. This failure has led to searching questions about why and how the war was fought and whether a better diplomatic and military outcome was possible for the United States.

Escalation. By 1961, guerrilla warfare was widespread in South Vietnam. Communist-led troops of the National Liberation Front (NLF) of South Vietnam, commonly referred to as Vietcong, were initiating hundreds of terrorist and small unit attacks per month. Saigon's military, the Army of the Republic of Vietnam (ARVN), was not able to contain this growing insurgency. During the administration of President Dwight D. "Eisenhower, a small U.S. Military Assistance Advisory Group (MAAG), never numbering more than 740 uniformed soldiers, had provided training and logistics assistance to the ARVN. The Kennedy administration determined that the size and

mission of the U.S. advisory effort must change if the U.S.-backed government of Ngo Dinh Diem in Saigon was to survive. Some of Kennedy's aides proposed a negotiated settlement in Vietnam similar to that which recognized Laos as a neutral country. Having just suffered international embarrassment in Cuba and Berlin, the president rejected compromise and chose to strengthen U.S. support of Saigon.

In May 1961, Kennedy sent 400 U.S. Army Special Forces (Green Beret) troops into South Vietnam's Central Highlands to train Montagnard tribesmen in counterinsurgency tactics. He also tripled the level of aid to South Vietnam. A steady stream of airplanes, helicopters, armored personnel carriers (APCs), and other equipment poured into the South. By the end of 1962, there were 9,000 U.S. military advisers under the direction of a newly-created Strategic Assistance Command Vietnam (MACV), commanded by U.S. Army Gen. Paul Harkins. Under U.S. guidance, the Diem government also began construction of "strategic hamlets." These fortified villages were intended to insulate rural Vietnamese from Vietcong intimidation and propaganda.

U.S. and South Vietnamese leaders were cautiously optimistic that increased U.S. assistance finally was enabling the Saigon government to defend itself. On 2 January 1963, however, at Ap Bac on the Plain of Reeds southwest of Saigon, a Vietcong battalion of about 320 men inflicted heavy damage on an ARVN force of 3,000 equipped with troop-carrying helicopters, new UH-1 ("Huey") helicopter gunships, tactical bombers, and APCs. Ap Bac represented a leadership failure for the ARVN and a major morale boost for the antigovernment forces. The absence of fighting spirit in the ARVN mirrored the continuing inability of the Saigon regime to win political support. Indeed, many South Vietnamese perceived the strategic hamlets as government oppression, not protection, because people were forced to leave their ancestral homes for the new settlements.

While Vietcong guerrillas scored military successes, leaders of Vietnam's Buddhist majority protested against what they saw as the Diem regime's religious persecution. In June, a monk dramatically burned himself to death at a busy Saigon intersection. The "Buddhist crisis" and dissatisfaction with Diem by top Vietnamese Army leaders made U.S. officials receptive to the idea of a change in South Vietnam's leadership. Ambassador Henry Cabot "Lodge" and the Central Intelligence Agency (CIA) did not interfere as a group of ARVN officers plotted a coup. On 1 November 1963, the generals seized power, and Diem and his unpopular brother Ngo Dinh Nhu were murdered. Three weeks later, President Kennedy was assassinated, and U.S. policy in Vietnam was again at a crossroads. If the new government in Saigon failed to show progress against the insurgency, would the United States withdraw its support from a lost cause, or would it escalate the effort to preserve South Vietnam as an anticommunist outpost in Asia?

Lyndon B. Johnson inherited the Vietnam dilemma. As Senate majority leader in the 1950s and as vice-president, he had supported Eisenhower's and Kennedy's decisions to aid South Vietnam. Four days after Kennedy's death, Johnson, now president, reaffirmed in National Security Action Memorandum (NSAM) 273 that the U.S. goal was to assist South Vietnam in its "contest against the externally directed and supported communist conspiracy." U.S. policy defined the Vietnam War as North Vietnamese aggression

against South Vietnam. North Vietnam infiltrated troops and matériel into South Vietnam by sea and along the so-called Ho Chi Minh Trail in Laos. Throughout his administration, Johnson insisted that the only possible negotiated settlement of the conflict would be one in which North Vietnam recognized the legitimacy of South Vietnam's government. Without such recognition, the United States would continue to provide Saigon as much help as it needed to survive.

The critical military questions were how much U.S. assistance was enough and what form it should take. By the spring of 1964, the Vietcong controlled vast areas of South Vietnam, the strategic hamlet program had essentially ceased, and North Vietnam's aid to the southern insurgents had grown. In June, Johnson named one of the army's most distinguished officers, Gen. William C. "Westmoreland," then commandant of West Point, as commander U.S. MACV. Westmoreland immediately asked for more men, and by the end of 1964 U.S. personnel in the South exceeded 23,000. Increasingly, however, the U.S. effort focused on the North. Secretary of Defense Robert S. "McNamara," Secretary of State Dean Rusk, and other key White House aides remained convinced that the assault on South Vietnam originated in the ambitious designs of Hanoi backed by Moscow and Beijing.

Throughout 1964, the United States assisted South Vietnam in covert operations to gather intelligence, disseminate propaganda, and harass the North. On the night of 2 August, North Vietnamese gunboats fired on the *USS Maddox*, a destroyer on an intelligence-collecting mission, in the same area of the Gulf of Tonkin where South Vietnamese commandos were conducting raids against the North Vietnamese coast. Two nights later, under stormy conditions, the *Maddox* and another destroyer, the *Turner Joy*, reported a gunboat attack. Although doubts existed about these reports, the president ordered retaliatory air strikes against the North Vietnamese port of Vinh. The White House had expected that some type of incident would occur eventually, and it had prepared the text of a congressional resolution authorizing the president to use armed force to protect U.S. forces and to deter further aggression from North Vietnam. On 7 August 1964, Johnson secured almost unanimous consent from Congress (414-0 in the House; 88-2 in the Senate) for his Gulf of Tonkin Resolution, which became the principal legislative basis for all subsequent military deployment in Southeast Asia.

Johnson's decisive but restrained response to the "Gulf of Tonkin incidents" helped him win the 1964 election, but Saigon's prospects continued to decline. The president wanted to concentrate on his ambitious domestic program, the Great Society, but his political instincts told him that his leadership would be damaged fatally if America's client state in South Vietnam succumbed. Instability mounted in South Vietnam as rival military and civilian factions vied for power and as Vietcong strength grew. A consensus formed among Johnson's advisers that the United States would have to initiate air warfare against North Vietnam. Bombing could boost Saigon's morale and might persuade the North to cease its support of the insurgency. The "Joint Chiefs of Staff (JCS) favored a massive bombing campaign, but civilians in the State and Defense Departments preferred a gradual escalation.

Using as a pretext a Vietcong attack on 7 February 1965 at Pleiku that killed eight American soldiers, Johnson or-

dered retaliatory bombing north of the Demilitarized Zone along the 17th parallel that divided North and South Vietnam. Within a week, the administration began ROLLING THUNDER, a gradually intensifying air bombardment of military bases, supply depots, and infiltration routes in North Vietnam. Flying out of bases in Thailand, U.S. Air Force fighter-bombers—primarily F-105 Thunderchiefs and later F-4 Phantoms—joined U.S. Navy Phantoms and A-4 Skyhawks from a powerful carrier task force located at a point called Yankee Station, seventy-five miles off the North Vietnamese coast in the Gulf of Tonkin. In 1965, U.S. aircraft flew 25,000 sorties against North Vietnam, and that number grew to 79,000 in 1966 and 108,000 in 1967. In 1967 annual bombing tonnage reached almost a quarter million. Targets expanded to include the Ho Chi Minh Trail in Laos and factories, farms, and railroads in North Vietnam.

From the beginning of the bombing, American strategists debated the effectiveness of air power in defeating a political insurgency in a predominantly agricultural country. Despite the American bombs, dollars, and military advisers, the Vietcong continued to inflict heavy casualties on the ARVN, and the political situation in Saigon grew worse. By June 1965, there had been five governments in the South since Diem's death, and the newest regime, headed by General Nguyen Van Thieu and Air Marshall Nguyen Cao Ky, inspired little confidence. To stave off defeat, the JCS endorsed Westmoreland's request for 150,000 U.S. troops to take the ground offensive in the South. When McNamara concurred, Johnson decided to commit the forces. The buildup of formal U.S. military units had begun on 8 March 1965, when two battalions of Marines landed at Da Nang. In June, Marine and army units began offensive unit operations—"search and destroy" missions. On 28 July, Johnson announced that 50,000 U.S. troops would go to South Vietnam immediately. By the end of the year, there were 184,300 U.S. personnel in the South.

Although Johnson's actions meant that the United States had crossed the line from advising the ARVN to actually fighting the war against the Vietcong, the president downplayed the move. The JCS wanted a mobilization of the reserves and National Guard, and McNamara proposed levying war taxes. Such actions would have placed the United States on a war footing. With his ambitious social reform program facing crucial votes in Congress, the president wanted to avoid giving congressional conservatives an opportunity to use mobilization to block his domestic agenda. Consequently, he relied on other means. Monthly draft calls increased from 17,000 to 35,000 to meet manpower needs, and deficit spending, with its inherent inflationary impact, funded the escalation.

With U.S. bombs pounding North Vietnam, Westmoreland turned America's massive firepower on the southern insurgents. Johnson's choice of gradual escalation of bombing and incremental troop deployments was based upon the concept of limited warfare. Risks of a wider war with China and the Soviet Union meant that the United States would not go all out to annihilate North Vietnam. Thus, Westmoreland chose a strategy of attrition in the South. Using mobility and powerful weapons, the MACV commander could limit U.S. * casualties while exhausting the enemy, that is, inflicting heavier losses than could be replaced.

Escalation of the air and ground war in 1965 provoked

Hanoi to begin deploying into the South increasing units of the regular North Vietnamese Army (NVA), or People's Army of Vietnam (PAVN), as it was called. In October, Gen. Vo Nguyen *Giap, the PAVN commander, launched a major offensive in the Central Highlands, southwest of Pleiku. Westmoreland responded with the 1st Air Cavalry Division (Air Mobile). Through much of November, in the Battle of the *Ia Drang Valley, U.S. and North Vietnamese forces engaged each other in heavy combat for the first time. The Americans ultimately forced the NVA out of the valley and killed ten times as many enemy soldiers as they lost. Westmoreland used helicopters extensively for troop movements, resupply, medical evacuation, and tactical air support. USAF tactical bombers and even huge B-52 strategic bombers attacked enemy positions. The battle convinced the U.S. commander that "search and destroy" tactics using air mobility would work in accomplishing the attrition strategy. Soon after the PAVN departed the battlefield, however, so too did the American air "cavalry." Clearly, control of territory was not the U.S. military objective.

During 1966 Westmoreland requested more ground troops, and by year's end the U.S. ground force level "in country" reached 385,000. These were organized into seven divisions and other specialized airborne, armored, special forces, and logistical units. With U.S. aid, the ARVN also expanded to eleven divisions, supplemented by local and irregular units. While MACV was getting men and munitions in place for large-unit search and destroy operations, army and marine units conducted smaller operations. Although the "body count"—the estimated number of enemy killed—mounted, attrition was not changing the political equation in South Vietnam. The NLF continued to exercise more effective control in many areas than did the government, and Vietcong guerrillas, who often disappeared when U.S. forces entered an area, quickly reappeared when the Americans left.

In 1967, Westmoreland made his big push to win the war. With South Vietnam's forces assigned primarily to occupation, pacification, and security duties, massive U.S. combat sweeps moved to locate and destroy the enemy. In January, Operation Cedar Falls was a 30,000-man assault on the Iron Triangle, an enemy base area forty miles north of Saigon. From February through April, Operation Junction City was an even larger attack on nearby War Zone C. There was major fighting in the Central Highlands, climaxing in the battle of Dak To in November 1967. U.S. forces killed many enemy soldiers and destroyed large amounts of supplies. MACV declared vast areas to be "free-fire zones," which meant that U.S. and ARVN artillery and tactical aircraft, as well as B-52 "carpet bombing," could target anyone or anything in the area. In Operation RANCH HAND, the USAF sprayed the defoliant Agent Orange to deprive the guerrillas of cover and food supplies. Controversy about the use of Agent Orange erupted in 1969 when reports appeared that the chemical caused serious damage to humans as well as to plants.

Late in 1967, with 485,600 U.S. troops in Vietnam, Westmoreland announced that, although much fighting remained, a cross-over point had arrived in the war of attrition; that is, the losses to the NVA and Vietcong were greater than they could replace. This assessment was debatable, and there was considerable evidence that the so-called "other war" for political support in South Vietnam was not going well. Corruption, factionalism, and

continued Buddhist protests plagued the Thieu-Ky government. Despite incredible losses, the Vietcong still controlled many areas. A diplomatic resolution of the conflict remained elusive. Several third countries, such as Poland and Great Britain, offered proposals intended to facilitate negotiations. These formulas typically called upon the United States and DRV to coordinate mutual reduction of their military activities in South Vietnam, but both Washington and Hanoi firmly resisted even interim compromises with the other. The war was at a stalemate.

De-escalation. The decisive year was 1968. In the early morning of 30 January, Vietcong forces launched the "Tet Offensive, named for the Vietnamese holiday then being observed. In coordinated attacks throughout South Vietnam, the Vietcong assaulted major urban areas and military installations in an attempt to spark a popular uprising against the Saigon regime and its American backers. Heavy fighting ensued for three weeks, some of the most brutal at Huế. Westmoreland claimed victory because no cities were lost and thousands of casualties were inflicted upon the attackers. Indeed, the Vietcong lost so many soldiers that thereafter the PAVN took over much of the conduct of the war. The "Tet Offensive, however, was a great strategic gain for North Vietnam and its southern adherents. U.S. and ARVN losses were high, and the fighting generated thousands of refugees that further destabilized the South. Most importantly, as a result of the massive surprise attack and the pictures from Saigon, the U.S. press and public began to challenge the Johnson administration's assurances of success and to question the value of the increasingly costly war.

At the same time as the Tet Offensive, the siege of Khe Sanh underscored the image of the war as an endless, costly, and pointless struggle. From 20 January to 14 April 1968, 30,000 to 40,000 NVA forces surrounded 6,000 U.S. Marines and ARVN at the remote hilltop outpost of Khe Sanh in the northwest corner of South Vietnam. Using artillery and air power, including B-52 strikes, the United States eventually broke the siege and forced an NVA withdrawal. At the end of June, however, the Marines abandoned the base to adopt a more mobile form of fighting in the DMZ area. Once again, a major engagement left seemingly intangible results.

In March 1968, Johnson decided that the size of the U.S. effort in Vietnam had grown as large as could be justified. Prompted by a request from Westmoreland and JCS Chairman General Earle G. "Wheeler for 206,000 more men, the president asked his new secretary of defense, Clark "Clifford, for a thorough policy review. Johnson's sense that a limit had been reached seemed confirmed when the "Wise Men," a group of outside advisers including such elder statesmen as former Secretary of State Dean "Acheson and Gen. Omar "Bradley, recommended against further increases. The president authorized only 13,500 more soldiers and bluntly informed Thieu and Ky that their forces would have to carry more of the fighting. He then announced on television on 31 March 1968 that the United States would restrict the bombing of North Vietnam and pursue a negotiated settlement with Hanoi. Johnson also revealed that he would not seek reelection.

Meanwhile, combat raged in South Vietnam. Over 14,000 Americans were killed in action in Vietnam in 1968, the highest annual U.S. death toll of the war. The worst U.S. war crime of the conflict occurred on 16 March 1968 (although not revealed in the press until 6 November

1969) when American infantrymen massacred some 500 unresisting civilians, including babies, in the village of "My Lai. In April and May 1968 the largest ground operation of the war, with 110,000 U.S. and ARVN troops, targeted Vietcong and NVA forces near Saigon. Peace talks began in Paris on 13 May but immediately deadlocked. On 10 June 1968, Gen. Creighton "Abrams succeeded Westmoreland as MACV commander. In the fall Abrams began to shift U.S. strategy from attrition to a greater emphasis on combined operations, pacification area security, and what was called "Vietnamization," that is, preparing the ARVN to do more of the fighting.

When Richard M. "Nixon became president in 1969, the U.S. war effort remained massive, but the basic decision to de-escalate had already been reached. Nixon owed his political victory to voter expectation that somehow he would end the war. He and his principal foreign policy adviser, Henry "Kissinger, rejected precipitate U.S. withdrawal. With the ground war stalemated, the new administration turned increasingly to air bombardment and secretly expanded the air war to neutral Cambodia. Publicly the White House announced in June the first withdrawal of 25,000 U.S. troops and heralded Vietnamization as effective. In fact, South Vietnam's armed forces remained problem-plagued. To bolster the South, the administration leaked to the press dire threats of a "go for broke" air and naval assault on the North—possibly including nuclear weapons. Kissinger also began secret meetings with North Vietnamese representatives in Paris hoping to arrange a diplomatic breakthrough.

The morale and discipline of U.S. troops declined in 1969 as the futility of the ground war and the beginnings of U.S. withdrawal became more obvious. After an intense ten-day battle in May, infantrymen of the 101st Airborne Division (Air Mobile) took a ridge in the A Shau Valley that they had dubbed "Hamburger Hill. Having fought bravely and suffered significant losses, the soldiers were bitter when the site soon was abandoned. Such inability to see progress, and an awareness among the troops that politicians back home were giving up on the war, helped undermine military effectiveness. Simple survival of their twelve-month tour of duty became the only motivation for many soldiers. Incidents of insubordination, mutiny, fatal assaults on officers, drug use, racial tensions, and other serious problems increased.

Faced with mounting public dissatisfaction, the slow pace of Vietnamization, and diplomatic frustration, Nixon boldly sent U.S. units into Cambodia in April 1970. U.S. military leaders had long complained about the sanctuary that neutral Cambodia provided Vietcong and NVA forces. This Cambodian incursion lasted until the end of June and provided some tactical gains, but it also sparked sharp controversy and demonstrations by the "Vietnam antiwar movement in the United States over what seemed an expansion of the war to another country. U.S. troop reductions continued with only 334,600 in the South as 1970 ended.

Nixon stuck with more of the same in 1971. Responding to domestic critics, he continued to order U.S. troops home, leaving only 156,000 by December. To support Vietnamization, heavy U.S. air attacks continued against Communist supply lines in Laos and Cambodia, and so-called protective-reaction strikes hit military targets north of the Demilitarized Zone and near Hanoi and its port city of

Haiphong. Tactical air support continued, with the heaviest coming in March during a South Vietnamese assault into Laos. Code named Lam Son 719, this operation ended in a confused retreat by the ARVN that further sullied the notion of Vietnamization.

During 1971, Kissinger made progress in the secret negotiations by offering to separate the arrangement of a ceasefire from discussion of the future of the Saigon government. In 1972 Nixon traveled to China and the USSR in diplomatic initiatives, trying to isolate Hanoi from its suppliers. With the shrinking American forces nearing 100,000 (only a small portion being combat troops), General Giap launched a spring 1972 offensive by Communist forces against the northern provinces of South Vietnam, the Central Highlands, and provinces northwest of Saigon. In most of the battles, the ARVN was saved by massive B-52 bombing. Nixon also launched the heavy bombers against North Vietnam itself in a campaign called Linebacker, and the United States mined the harbor at Haiphong. Over the course of the war, total U.S. bombing tonnage far exceeded that dropped on Germany, Italy, and Japan in World War II.

Wearied by the latest round of fighting, the United States and North Vietnamese governments agreed in October on a ceasefire, return of U.S. prisoners of war (POWs), at least the temporary continuation of Thieu's government, and, most controversially, permission for NVA troops to remain in the South. Objections from Thieu caused Nixon to hesitate, which in turn led Hanoi to harden its position. In December, the United States hit North Vietnam again with repeated B-52 attacks, codenamed Linebacker II and labeled the Christmas Bombing by journalists. On 27 January 1973, the United States, North Vietnam, South Vietnam, and the Provisional Revolutionary Government representing the NLF signed the "Paris Peace Agreements Ending the War and Restoring Peace in Vietnam, which basically confirmed the October terms.

By 1 April 1973, U.S. forces were out of Vietnam (except for a few embassy guards and attaches) and 587 POWs had returned home (about 2,500 other Americans remained missing in action). Congress cut off funds for the air war in Cambodia, and bombing there ended in August. Over Nixon's veto, Congress passed the "War Powers Resolution in November 1973. It limited presidential power to deploy U.S. forces in hostile action without congressional approval.

Nixon characterized the Paris Peace Agreements of 1973 as "peace with honor," but primarily they allowed the U.S. military to leave Vietnam without resolving the issue of the country's political future. Without U.S. air and ground support, South Vietnam's military defenses steadily deteriorated. In the spring of 1975, an NVA thrust into the Central Highlands turned into an ARVN rout. On 30 April, as NVA and Vietcong soldiers entered the city, the last remaining Americans abandoned the U.S. embassy in Saigon in a dramatic rooftop evacuation by "helicopters.

The United States failure in Vietnam raised important questions. Should the United States have fought the war at all? Did the United States fight the war the wrong way? Many analysts believe that the strategic importance of Vietnam was vastly exaggerated and, furthermore, that the nationalism driving Vietnam's history and politics could not be altered by U.S. military power, no matter how great. An alternative view is that even if the odds were poor for

U.S. success, the United States had to make the effort to maintain its moral and strategic credibility in the world. On the question of how the war was fought, the debate centers on whether the United States used its military power adequately and effectively. Assuming that more is better, some critics argue that a greater use of U.S. force, either against North Vietnam or to isolate the battlefield in South Vietnam, would have produced victory. Throughout the conflict, however, the Saigon regime proved incapable of translating military success into political success. Also, massive U.S. assistance seemed to prove North Vietnam's and the Vietcong's claims that South Vietnam was not a Vietnamese but an American creation. Finally, a larger war would have risked a dangerous military conflict with China and the Soviet Union. Most scholars conclude that the Vietnam War was a tragic event whose costs far exceeded any benefits for the United States.

VIETNAM WAR (1960-75): DOMESTIC COURSE

When President Lyndon B. "Johnson made the war in Vietnam an American war in 1965, he worried about the impact of his policies on the home front. He could have rallied support for his decisions to bomb North Vietnam and assume the dominant ground combat role by telling the nation that it faced a crisis vital to its national security. But he feared that in response to such a message, the public would demand a full-scale, no-holds-barred war that could have led to Chinese and Russian intervention. For Johnson and his advisers, the Vietnam War was the prototype for future limited wars in the Third World that would have to be fought without arousing public passion. However, by underselling the war, the president presented an opening to critics who asked why he was expending so much human and material treasure in such a remote conflict.

Johnson had another motive for playing down the commitment in Southeast Asia. After the Democrats won by a landslide in the 1964 election, the president believed he had a two-year window of opportunity to push through Congress legislation for his Great Society, the most ambitious set of reforms since the New Deal. He was painfully aware of what happened to Woodrow "Wilson's and Franklin D. "Roosevelt's comparable reform programs when they fell victim to "guns-over-butter" decisions. Escalating by stealth in Vietnam, Johnson was able to have "guns and butter" without increasing taxes to pay for both projects. This irresponsible decision had a profound impact on the American economy.

Johnson's failure to rally the public around the commitment in Vietnam led to the growth of the largest and most

effective antiwar movement in American history. Beginning in 1966, through mass demonstrations, petitioning, teach-ins, electoral politics, civil disobedience, and countless other individual and collective forms of protests, millions of Americans challenged administration policies. Although a majority of the population found aspects of the campus-based movement repellent, it did attract support in many important sectors of the society and contributed to the collapse of the bipartisan *Cold War consensus that had held since 1947.

Moreover, on at least two occasions, the antiwar movement dramatically affected policy. After 35,000 mostly young people besieged the * Pentagon on 21-22 October 1967, Lyndon Johnson launched a public relations campaign that emphasized how well the war was going. When the Communists launched their seemingly successful nationwide *Tet Offensive on 30 January 1968, most Americans felt that they had been deceived by their own government. That widespread public disaffection led to Johnson's decision on 31 March 1968 not to escalate further and not to stand for reelection. He also faced serious challenges for the nomination from antiwar senators Eugene McCarthy (D-Minn.) and Robert F. Kennedy (D-N.Y.).

A little more than a year later, Republican president Richard M. *Nixon sent an ultimatum to Hanoi to alter its bargaining position at the Paris Peace Talks by 1 November or confront a major escalation. The North Vietnamese called Nixon's bluff, and he did not escalate, in good measure because of the depth and breadth of antiwar sentiment reflected in the largest antiwar activity of the period, the 15 October 1969 Moratorium, a peaceful and dignified protest involving many middle-class adults. Nixon's decision was also influenced by his advisers' determination that no matter what form the proposed escalation (Operation Duck Hook) took, it was unlikely to end the war.

Finally, both Johnson and Nixon were convinced that the perceived popularity of the antiwar movement influenced the Vietnamese Communists. Thus, both presidents' policies were affected, to some degree, by how they thought Hanoi interpreted the success of the movement. That relative success led Johnson, and especially Nixon, to take extralegal and illegal actions against antiwar critics and organizations. Some of those actions became part of the Watergate scandal, the series of crimes and misdemeanors that ultimately led to Nixon's resignation. For example, Nixon first authorized illegal wiretaps in May 1969 to find the leaker who told a *New York Times* reporter that the United States was secretly bombing Cambodia.

Johnson and Nixon also confronted spirited challenges to their foreign policymaking authority on Capitol Hill. Beginning in the winter of 1966 with hearings held by Senate Foreign Relations Committee Chairman J. William Fulbright (D-Ark.), and increasing to a crescendo after 1968 when the Democratic legislature confronted a Republican president, Congress began to rein in what had come to be called the "imperial presidency." It was true that 95 percent of those legislators present and voting approved of war-related appropriation bills from 1965 through 1972. Nevertheless, during the invasion of Cambodia in the spring of 1970, the Senate voted to repeal the Gulf of Tonkin Resolution and to cut off funds for the operation after 30 June. Moreover, from 1973 through 1975, Congress passed several resolutions that restricted the use of troops and airpower in Southeast Asia and rejected presidential requests

for further aid to South Vietnam. Most important, in 1973 it passed, over Nixon's veto, the *War Powers Resolution, which sought to restrict the president's ability to send American troops into combat without informing Congress or obtaining its approval for an extended commitment.

The war affected as well the presidential elections of 1968 and 1972. In 1968, the candidacy of Hubert H. Humphrey was significantly weakened by the bloody confrontations in Chicago at the Democratic National Convention between youthful critics of the war and the police. In addition, Lyndon Johnson announced a complete bombing halt one week before the election in an "October Surprise," which aided his vice president. For his part, Richard Nixon suggested obliquely that he had a plan (it did not exist) to end the war. In a law and order campaign, he also appealed to those who abhorred antiwar and other unruly demonstrators.

After Nixon was unable to end the war on his terms during his first year in office, he and his aides encouraged the growth of the POW-MIA movement, which was concerned about the treatment of the known prisoners of war (POWs) in Communist captivity and the whereabouts of those classified as missing in action (MIA), some of whom were also suspected to be among those languishing, undocumented, in camps in North and South Vietnam and Laos. Nixon then contended from 1970 through 1972 that during the extended public and secret peace talks, the North Vietnamese were recalcitrant on the emotional POW-MIA issue. Undoubtedly, the president was concerned about how the sort of peace he obtained in Vietnam would affect his prospects in his reelection campaign.

One week before the 1972 election, Nixon's national security adviser, Henry *Kissinger, offered a Republican "October Surprise" when he announced that "peace is at hand." The North Vietnamese forced Kissinger to make this statement when they announced on 25 October that they and the Americans had finally agreed on terms for ending the war. Hanoi went public with the arrangements because it feared, correctly, that Washington and especially Saigon were reneging on the provisional agreement reached on 21 October. What the national security adviser did not reveal then—or even after the election—was that he had been unable to convince the South Vietnamese government to accept the terms he had negotiated with the North Vietnamese. Nonetheless, Kissinger's announcement effectively took away Democratic antiwar candidate George McGovern's most important issue. McGovern had obtained the nomination in good measure because of reforms adopted by his party in the wake of the Chicago riots.

Some of those who opposed the war were driven by the fact that as Johnson's policy escalated, more and more young people were drafted into the armed services and sent to Vietnam. By 1967, almost 50 percent of the enlisted men in the army were draftees. By 1969, draftees comprised over 50 percent of all combat deaths and 88 percent of army infantrymen in Vietnam.

No war since the *Civil War produced so much opposition to the draft. Part of the problem had to do with its perceived unfairness. Undergraduates and, until 1968, graduate students could defer military service until they completed their programs. In addition, many young men, often from the middle class, joined the National Guard and Reserves on the likely gamble that they would not be called up for duty in Southeast Asia. Consequently, the Vietnam

War appeared to many to be a "working-class war," with draftees and enlisted men coming disproportionately from blue-collar backgrounds. At first, from 1965 through 1967, African Americans especially served and died in Vietnam in disproportionate numbers. By the end of the war, however, they accounted for 12 percent of the combat deaths, a figure close to their actual percentage in the population.

Of the 27 million men eligible for "conscription during the Vietnam era, 8,720,000 enlisted, often to beat the draft; 2,215,000 were drafted; and almost 16 million never served. Of that 16 million, 15,410,000 were deferred, exempted, or disqualified, and an estimated 570,000 were draft offenders. Of that number, over 209,517 were accused of draft violations, 8,750 were convicted, and 3,250 were imprisoned. The number of violators swamped the judiciary system.

During the war, the Selective Service System, prodded by the Supreme Court, relaxed its definition of "conscientious objection. As a consequence, 170,000 men received that status, of whom close to one-third evaded alternate service. Between 60,000 and 100,000 young men chose exile to avoid the draft, with Canada and Sweden the favorite sanctuaries. The prospect of the draft also affected millions of eligible males' decisions to marry, have children, or continue their education.

Widespread draft resistance—including flamboyant acts of civil and not so civil disobedience that impeded the operation of the system—and severe discipline problems posed by obstreperous and poorly motivated draftees in the field led to dramatic reform. First, on the eve of the Moratorium in October 1969, Nixon removed the unpopular Gen. Lewis B. Hershey, who had been in charge of the Selective Service System since World War II. The president instituted a lottery system two months later in an attempt to make the system somewhat fairer. In September 1971, Congress passed his proposal for an "All-Volunteer Force, and in July 1973, Nixon terminated the draft.

As important as these reforms were to the American military and society in general in the years from 1973 to the present, the impact of the Vietnam War on the economy during the same period was even more important. For many economists, the last truly good years for the economy were 1962-65, with almost full employment; very low inflation; respectable growth in productivity, gross national product, and national income; and a favorable balance of trade.

On the last issue, an increasingly unfavorable balance of trade, related in part to spending for the war abroad, contributed to an international monetary crisis involving a threat to U.S. gold reserves in 1967-68. That threat helped convince some administration officials and Wall Street analysts that the United States could no longer afford the war.

As early as the winter of 1965, Lyndon Johnson's economic advisers, who worried about the imminent overheating of the economy, recommended a tax increase to help pay for the increasingly expensive war and to hold down inflation. For domestic political reasons, Johnson refused to accept their advice until 1968, when he introduced a 10 percent income tax surcharge, which, economists now claim, was too little and too late.

For most of Johnson's term, however, the inflation figures remained relatively low, reaching 4 percent in 1968. Nixon had to deal with the economic problems caused in part by war spending. His attempts to solve the unique

"stagflation," rising inflation and rising unemployment, included a variety of fiscal and monetary adjustments, and ultimately wage and price controls in August 1971 through April 1973. That Democratic solution, which was influenced by Nixon's decision to end the convertibility of the dollar to gold, was one way to stabilize the economy until the 1972 election.

As early as the Johnson administration, the Vietnam War, which civil rights leader Martin Luther "King, Jr., called "America's tragic distraction," began significantly to affect domestic reform. Although critics continue to disagree about the design and relative success of the vast array of Great Society programs, there is no doubt that Johnson would have spent more on them had he not had to pay for the war. In fact, Congress would not give him his 1968 surcharge until he agreed to cut \$6 billion from non-defense programs.

Inflation, sparked by the war, contributed to the rise in oil prices in 1973 because of the impact of the devaluation of the dollar on oil producers. It also led to the real estate boom of the 1970s, and because of the built-in expectation of inflation, the introduction of variable interest rates and certificates of deposit by banks and offshore banking.

The Department of "Defense placed the direct costs of the Vietnam War at \$173 billion. To that could be added potential veterans' benefits costs of \$220 billion and interest of \$31 billion. Of course, veterans did receive educational and other benefits; research and design in certain fields were enhanced; and expenditures in the defense industry provided jobs for millions that might not have been there in other circumstances.

Despite its limited scope, in many ways the Vietnam War influenced the future course of events on the home front as dramatically as the two world wars. Whether the focus is on domestic politics, the economy, the armed services, or even the way presidents have thought about future military interventions, the war profoundly affected all aspects of American life.

VIETNAM WAR (1960-75): POSTWAR IMPACT

Following the end of America's combat role in Vietnam in 1973, and the subsequent fall of Saigon to the North Vietnamese Army (NVA) in 1975, the often prophesied ?nd much feared resurgence of McCarthyite Red-baiting, the bitter accusations of "who lost Vietnam?" barely transpired. Rather than massive recriminations, a collective amnesia took hold. The majority of Americans, it appeared, neither wanted to talk or think about their nation's longest and

most debilitating war—the only war the United States ever lost. That forgetfulness gave way in the early 1980s to a renewed interest in the war: Hollywood, network television, and the music industry made Vietnam a staple of popular culture; and scholars, journalists, and Vietnam veterans produced a flood of literature on the conflict, especially concerning its lessons and legacies. Much of it, emphasizing the enormity of the damage done to American attitudes, institutions, and foreign policy by the Vietnam ordeal, echoed George F. "Kennan's depiction of the Vietnam War as "the most disastrous of all America's undertakings over the whole two hundred years of its history."

Initially, the humiliating defeat imposed by a nation Secretary of State Henry "Kissinger had described as "a fourth-rate power" caused a loss of pride and self-confidence in a people that liked to think of the United States as invincible. An agonizing reappraisal of American power and glory dampened the celebration of the Bicentennial birthday in 1976. So did the economic woes then afflicting the United States, which many blamed on the estimated \$167 billion spent on the war. President Lyndon B. "Johnson's decision to finance a major war and the Great Society simultaneously, without a significant increase in taxation, launched a runaway double-digit inflation and mounting federal debt that ravaged the American economy and eroded living standards from the late 1960s into the 1990s.

The United States also paid a high political cost for the Vietnam War. It weakened public faith in government, and in the honesty and competence of its leaders. Indeed, skepticism, if not cynicism, and a high degree of suspicion of and distrust toward authority of all kind characterized the views of an increasing number of Americans in the wake of the war. The military, especially, was discredited for years. It would gradually rebound to become once again one of the most highly esteemed organizations in the United States. In the main, however, as never before, Americans after the Vietnam War neither respected nor trusted public institutions.

They were wary of official calls to intervene abroad in the cause of democracy and freedom, and the bipartisan consensus that had supported American foreign policy since the 1940s dissolved. Democrats, in particular, questioned the need to contain communism everywhere around the globe and to play the role of the planet's policeman. The Democratic majority in Congress would enact the 1973 "War Powers Resolution, ostensibly forbidding the president from sending U.S. troops into combat for more than ninety days without congressional consent. Exercising a greater assertiveness in matters of foreign policy, Congress increasingly emphasized the limits of American power, and the ceiling on the cost Americans would pay in pursuit of specific foreign policy objectives. The fear of getting bogged down in another quagmire made a majority of Americans reluctant to intervene militarily in Third World countries. The neo-isolationist tendency that former President Richard M. "Nixon called "the Vietnam syndrome" would be most manifest in the public debates over President Ronald "Reagan's interventionist policies in Nicaragua and President George "Bush's decision to drive Iraqi forces out of Kuwait. Despite the victorious outcome of the "Persian Gulf War for the United States and its allies, and President Bush's declaration in March 1991—"By God, we've kicked the Vietnam syndrome once and for all!"—the fear of intervention would reappear in the pub-

lic debate over President Bill "Clinton's commitment of U.S. "peacekeeping forces in Somalia and Bosnia. Quite clearly, for at least a quarter of a century after the Vietnam War ended, that conflict continued to loom large in the minds of Americans. Accordingly, a new consensus among foreign policy makers, reflecting the lessons learned from the Vietnam War, became manifest: the United States should use military force only as a last resort; only where the national interest is clearly involved; only when there is strong public support; and only in the likelihood of a relatively quick, inexpensive victory.

Another consensus also gradually emerged. At first, rather than giving returning veterans of the war welcoming parades, Americans seemed to shun, if not denigrate, the 2 million-plus Americans who went to Vietnam, the 1.6 million who served in combat, the 300,000 physically wounded, the many more who bore psychological scars, the 2,387 listed as "missing in action," and the more than 58,000 who died. Virtually nothing was done to aid veterans and their loved ones who needed assistance in adjusting. Then a torrent of fiction, films, and television programs depicted Vietnam vets as drug-crazed psychotic killers, as vicious executioners in Vietnam and equally vicious menaces at home. Not until after the 1982 dedication of the Vietnam Veterans Memorial in Washington, D.C., did American culture acknowledge their sacrifice and suffering, and concede that most had been good soldiers in a bad war.

Yet this altered view of the Vietnam veterans as victims as much as victimizers, if not as brave heroes, was not accompanied by new public policies. Although most veterans did succeed in making the transition to ordinary civilian life, many did not. More Vietnam veterans committed suicide after the war than had died in it. Even more—perhaps three-quarters of a million—became part of the lost army of the homeless. And the nearly 700,000 draftees, many of them poor, badly educated, and nonwhite, who had received less than honorable discharges, depriving them of educational and medical benefits, found it especially difficult to get and keep jobs, to maintain family relationships, and to stay out of jail. Although a majority of Americans came to view dysfunctional veterans as needing support and medical attention rather than moral condemnation, the "Veterans Administration, reluctant to admit the special difficulties faced by these veterans and their need for additional benefits, first denied the harm done by chemicals like Agent Orange and by the posttraumatic stress disorder (PTSD) afflicting as many as 700,000, and then stalled on providing treatment.

Although diminishing, the troublesome specter of the Vietnam War continued to divide Americans and haunt the national psyche. It surfaced again in 1988 when Bush's running mate, Dan Quayle, had to defend his reputation against revelations that he had used family political connections to be admitted into the Indiana National Guard in 1969 to avoid the draft and a possible tour of duty in Vietnam. It emerged four years later when Bill "Clinton, the Democratic candidate for president, faced accusations that he had evaded the draft and then organized antiwar demonstrations in 1969 while he was a Rhodes scholar in England. In each instance, such charges reminded Americans of the difficult choices young Americans had to make in what many saw as at best a morally ambiguous war.

Mostly, remembrances continue to be stirred by the

Vietnam Veterans Memorial, the most visited site in the nation's capital. Its stark black granite reflecting panels, covered with the names of the more than 58,000 American men and women who died in Vietnam, is a shrine to the dead, a tombstone in a sloping valley of death. Lacking all the symbols of heroism, glory, patriotism, and moral certainty that more conventional war memorials possess, the Vietnam Veterans' Memorial is a somber reminder of the loss of too many young Americans, and of what the war did to the United States and its messianic belief in its own overweening virtue.

VIETNAM WAR (1960-75): CHANGING INTERPRETATIONS

Interpretations of the Vietnam War have departed significantly from typical patterns both during and after most of America's previous wars. Instead of reflecting, defending, and bolstering official accounts of the war, as occurred with World Wars I and II, early historical assessments of the Vietnam conflict were for the most part highly critical of U.S. policy. The most widely read works on the Vietnam War during the late 1960s and early 1970s—including those of journalists Bernard Fall, Robert Shaplen, and David Halberstam, and historians Arthur M. Schlesinger, Jr., and George McT. Kahin and John W. Lewis—indicted government policy, often quite harshly. Those works presented a radically different version of the war's origins, purpose, and efficacy than that offered by Washington officialdom. Only in the late 1970s, following North Vietnam's military triumph and the extended soul-searching it occasioned throughout the United States, did a revisionist school of thought emerge. Ironically, the Vietnam revisionists mounted a belated defense of the American war effort, venting much of their anger at the prevailing liberal orthodoxy, which, they insisted, wrongly considered the Indochina war to be unwinnable or—even more egregious from their perspective—immoral.

Despite the broad agreement among early writers that the Vietnam War represented a colossal mistake for the United States, and that American policy was plagued persistently by errors, blunders, misperceptions, and miscalculations, significant interpretive differences still existed within that literature. In their influential book, *The Irony of Vietnam: The System Worked* (1979), Leslie H. Gelb and Richard K. Betts identified no less than nine distinct explanations advanced by experts during the 1960s and 1970s for America's failed intervention in Vietnam. They ranged from economic imperialism to idealistic imperialism, from bureaucratic politics to domestic politics, and from misperceptions and ethnocentrism to ideological blinders and the imperatives of international power politics. Analysts disagreed from the first, then, not just about the reasons for the U.S. failure in Vietnam, but about the relative weight of the factors that precipitated and sustained the American commitment.

Two sharply differentiated views emerged in that first

wave of scholarship about the Vietnam War, views that continue to be echoed in today's debates. The first characterizes American involvement in the war as an avoidable tragedy. American policymakers, according to this liberal realist perspective, foolishly exaggerated Vietnam's importance to the United States. Had they more soberly assessed its true value to the economic and security interests of the United States, recognized the popular appeal of revolutionary nationalism within the country, and appreciated the limits of American power, then the ensuing tragedy might well have been averted.

That view remains the dominant interpretation of the Vietnam War. Most books and articles about American involvement, for all the different emphases that naturally distinguish the work of individual authors, fall within its wide boundaries. Major overviews of the war by such experts as George C. Herring, Stanley Karnow, Gary R. Hess, George McT. Kahin, William S. Turley, Neal Sheehan, and William J. Duiker take as a basic point of departure the notion that the Vietnam conflict was a tragic misadventure that could have been avoided had American leaders only been wiser, more prudent, and less wedded to the assumptions of the past. The former defense secretary Robert S. McNamara's memoir, *In Retrospect* (1995), also falls within this interpretive school.

The other major interpretive approach offers a far more radical critique of American intentions and behavior. It depicts the United States as a global hegemony, concerned primarily with its own economic expansion, and reflexively opposed to communism, indigenous revolution, or any other challenge to its authority. Authors writing from this perspective typically characterize American intervention in Indochina as the necessary and logical consequence of a rapacious superpower's drive for world dominance. Although scholarly and polemical treatments of the war have been written in this vein since the late 1960s, Gabriel Kolko's seminal *Anatomy of a War* represents the most sophisticated and comprehensive formulation of the radical perspective. Kolko sees U.S. intervention in Vietnam as a predictable consequence of the American ruling class's determination to exert control over the world capitalist system. The U.S. political economy's need for raw materials, investment outlets, and the integration between capitalist core states and the developing regions of the periphery set Washington on a collision course with revolutionary nationalist currents throughout the Third World.

By the early 1980s, a conservative revisionism had emerged that, at least temporarily, shifted the terms of a debate that up to then had largely pitted liberal realists against radical neo-Marxists. The Vietnam revisionist perspective was spearheaded by three former U.S. Army officers, Harry G. Summers, Jr., Bruce Palmer, Jr., and Philip B. Davidson, all veterans of the war. In separate books, each vehemently criticized U.S. policy. Summers, Palmer, and Davidson asserted that military and civilian leaders failed to develop realistic plans for achieving American politico-military objectives in Vietnam, failed to assess accurately the capabilities and intentions of their adversaries, and failed to coordinate specific battlefield tactics with an overall strategy for securing victory. The conservative critique of America's Vietnam policy scored points with academic and nonacademic audiences alike, while calling attention to fundamental shortcomings in the American approach to warfare in Southeast Asia. Another group of conservative revisionists

also emerged during the 1980s. This group, which included such diverse authorities as R. B. Smith, Larry Cable, Andrew Krepinevich, Walt W. Rostow, and William Colby, insisted that real benefits accrued to the non-Communist nations of Southeast Asia as a result of U.S. intervention, and argued that the "pacification" campaign pursued by the United States could have succeeded.

For all the attention accorded it by the media and by politicians, the conservative revisionist wave has not fundamentally altered our understanding of the Vietnam War. The revisionists may, ironically, have bolstered the central premises of the liberal realists more than they have overturned them. The chief faultline in the literature continues to lie between the liberal realists, on the one hand, and their left radical critics on the other—much as it has for the past three decades. That faultline will not soon be closed since the core issues at stake concern matters much broader than the mere origins and outcome of a war. They encompass as well such fundamental questions as the purpose of American foreign relations, the nature of American society, and the meaning of the American historical experience. That is why, perhaps, debates about the Vietnam conflict remain as hotly contested years after the war's end as they were at the height of U.S. involvement in the late 1960s.

VIETNAM WAR, U.S. AIR OPERATIONS IN THE. During the Vietnam War, airpower commanded more American resources than any other aspect of the struggle. More than half of the hundreds of billions of dollars America invested in the war was devoted to U.S. "Air Force, Army, and Navy air operations. The United States dropped over 8 million tons of bombs on Vietnam, Laos, and Cambodia from 1962 to 1973 and lost over 8,588 fixed-wing aircraft and "helicopters. U.S. military air crew losses totaled 4,302 by 1973. For all this investment, airpower, while occasionally influential, was never decisive.

The U.S. Air Force dates its involvement in Vietnam to the summer of 1950, when it sent advisers to help France maintain and operate U.S.-manufactured aircraft in the war with the Viet Minh. After the Viet Minh victory and the partitioning of the country into North and South in 1955, America continued sending air advisers to Vietnam. By 1961, six South Vietnamese squadrons were ready for combat, supported by an American combat training detachment known as "Farm Gate." The boundary between fighting and training for U.S. Air Force personnel during the early 1960s was never clearly defined. The Farm Gate commandos believed they were primarily to fly close air support missions for the Army of the Republic of Vietnam (ARVN), but their official rules of engagement precluded them from engaging in combat without a member of the South Vietnamese Air Force in the aircraft or in self-defense.

By the end of 1962, more than 3,000 U.S. Air Force advisers were serving in Vietnam. American pilots flew air

support and reconnaissance missions; they also transported ARVN troops around the country, and defoliated jungle areas with C-123 "Ranch Hand" aircraft. During the latter program, which lasted over ten years, the air force sprayed 19.22 million gallons of herbicides and defoliants over approximately 5.96 million acres of the country.

After the Tonkin Gulf incidents in August 1964 and a surprise Viet Cong sapper attack on the U.S. air base at Bien Hoa in November, President Lyndon B. "Johnson" slowly began to raise the intensity of the air war. He initiated Operation Barrel Roll, a series of interdiction missions flown along the infiltration routes developing in the Laotian panhandle. When the Viet Cong attacked a second air base at Pleiku in February 1965, Johnson retaliated with raids against targets just north of the demilitarized zone (DMZ). Initially known as Flaming Dart, these reprisal missions evolved into a sustained air campaign, Operation Rolling Thunder, beginning in March 1965.

Rolling Thunder was the longest air campaign in American military history. Between March 1965 and November 1968, navy, air force, and Marine aviation flew 2 million sorties and dropped 1 million tons of "bombs on North Vietnam. Rolling Thunder had several objectives. One was to persuade Hanoi to abandon its support of the southern insurgency; another was to raise the morale of military and political elites in South Vietnam; and the third was interdiction—strikes against "logistics targets such as bridges, roads, and railroads designed to reduce Hanoi's ability to support the war in the South.

Though Rolling Thunder attacked strategic targets such as electric plants and fuel storage facilities, the limited number of these targets and restrictions against bombing near Hanoi, Haiphong, and the Chinese border made interdiction its prime focus. Throughout the campaign, American pilots clamored to "go downtown" (bomb Hanoi), but President Johnson, who approved and sometimes picked the targets, constantly turned down these requests. He believed the threat of more intensive destruction implicit in limited, incremental bombing would have a greater impact on Hanoi's willingness to negotiate than an all-out terror offensive. He also believed that this gradualist approach would stave off possible Chinese intervention.

For pilots, the most frustrating aspect of the bombing restrictions was that most North Vietnamese fighter bases and surface-to-air missile (SAM) batteries fell within restricted areas. To cope with these defenses, the services developed elaborate "strike packages" consisting of fighter-bombers, fighter escorts, electronic warfare aircraft, search and rescue planes, and airborne command and control aircraft. Yet North Vietnamese air defenses claimed over 900 American aircraft during Rolling Thunder. Most of these aircraft were downed by simple 23-100 mm antiaircraft "artillery. The North used high-altitude SAMs to compel American aircraft to fly low, thereby bringing them within range of their guns. Russian-built MiGs were used sparingly, generally making just one pass before retreating home. These "guerilla" tactics yielded meager results: only seventy-six planes shot down during the war, or about 7 percent of U.S. fixed-wing losses over the North. On the other hand, such caution made the U.S. kill ratio just 2.5 to 1 from 1965 to 1973; consequently only five Americans qualified as aces (with five or more "kills").

Overall, Rolling Thunder failed to accomplish its major objectives. Although the bombing caused an estimated

\$600 million worth of damage to North Vietnam, it did not prevent the Communist forces from launching the "Tet Offensive" in 1968, nor did it bring about a negotiated peace settlement.

Most histories of the air war focus on the bombing of North Vietnam; yet the United States dropped far more tonnage in the South over the course of the war. By 1973, the year of U.S. withdrawal, the "in-country" war claimed 4 million tons. By contrast, only 1 million tons had been dropped on North Vietnam. To begin this effort, 21,000 air force personnel and 500 aircraft were deployed to South Vietnam in 1965.

The impetus behind this massive buildup was close air support. These missions were generally flown by small fighters like the F-100 Supersabre, but beginning in June 1965, B-52s (U.S. strategic bombers) being flown from Guam were used as well. By the end of the war, 75 percent of all B-52 "Arc Light" strikes had flown against targets in South Vietnam, 20 percent to Laos, and 5 percent against the North. During the siege of Khe Sanh, B-52s dropped 60,000 tons of bombs on North Vietnamese positions just outside the Marine base. This joint operation, dubbed Niagara, is generally credited with compelling the North Vietnamese to lift their siege of the beleaguered outpost.

Besides close air support, B-52s also flew interdiction missions in Cambodia and Laos during 1968-72. President Richard M. Nixon employed B-52s to pulverize supply storage areas along the Ho Chi Minh Trail in Cambodia. Beginning on March 1969, these secret "Menu" bombings in Cambodia lasted 14 months, during which B-52s flew 3,630 sorties into Cambodia and dropped 100,000 tons of bombs. In Laos, B-52s created landslides in mountain passes vital to Ho Chi Minh's logistical system. These missions fell under the rubric of Operation Commando Hunt, an interdiction campaign that lasted from November 1968 to April 1972.

The many exotic weapons used during Commando Hunt included an elaborate sensor system known as Igloo White, antipersonnel mines, and AC-130 Specter gunships. B-52s established blocking belts by creating landslides and sewing roads with mines. After mines were laid and major passes blocked, air force planners would send in Specter gunships to blast resulting traffic bottlenecks with their 20- and 40mm cannons and 105mm howitzers. The Specters even located trucks and personnel at night, using low-light television cameras and infrared "heat-seeking" technology.

For all its wizardry, Commando Hunt had little impact upon the Communist ability to wage war. In fact, the North launched its biggest offensive to date in 1972, with over 120,000 regulars and 200 armored vehicles. President Nixon responded to this "Easter Offensive" by launching a new wave of air attacks against North Vietnam. The resulting Linebacker I raids were designed to hinder the North Vietnamese invasion of the South by destroying its petroleum storage facilities, power-generating plants, and major bridges. This campaign became a watershed in airpower history because it was the first to place heavy reliance on "precision-guided munitions. Laser- and television-guided bombs enabled small numbers of aircraft to destroy heavily defended targets from extreme distances. By the end of June, the air force and navy had demolished or damaged 400 bridges in North Vietnam, including ones, such as the Paul Doumer Bridge, Hanoi, that had been bombed repeatedly earlier to no effect.

In October 1972, peace seemed close at hand and Nixon halted the bombing of the North. Le Duc Tho, the North's chief negotiator, had presented substantially new terms and a settlement seemed imminent. However, South Vietnamese demands for changes stalled the talks. By early December, agreement was in shambles, and Nixon launched a second series of Linebacker attacks. Known as the "Christmas bombings," the eleven-day Linebacker II campaign in late December was the most intense air assault of the war. Tactical aircraft flew more than 1,000 sorties and B-52s about 740 against targets in the heart of Hanoi and Haiphong. The North Vietnamese fought back with everything available and destroyed twenty-seven American aircraft, including eighteen B-52s; but by the end of the campaign, Hanoi had expended its entire supply of antiaircraft "missiles and B-52s could fly over the North Vietnamese cities with impunity.

The eleven-day air campaign and its impact upon the peace negotiations is still a point of controversy in Vietnam War historiography. "Revisionist" histories of the war, mostly written by participants, argue that such a campaign early in the struggle could have yielded an American victory. Recently, a second group of historians has challenged this conventional wisdom. Mark Clodfelter (1989) argues that the Linebacker campaigns "worked" in 1972 because Nixon's political goals were limited to securing an American withdrawal and a cease-fire. Moreover, the nature of the ground war in 1972 was conventional. Such an approach, maintains Clodfelter, could not have been replicated earlier on during the guerrilla struggle, when America's goal was to defeat a popular insurgency in the South. Earl H. Tilford (1991) takes the argument a step further. He contends that, in the final analysis, "it was the Air Force and Navy's very own leaders that failed to develop a strategy appropriate for the war at hand." Could any air strategy, though, have won the conflict? "Joint Chiefs of Staff chairman Maxwell 'Taylor's response in 1975 was an unequivocal no. According to him, 'we didn't know our ally. Secondly, we knew even less about the enemy. And the last, most inexcusable of our mistakes, was not knowing our own people.'"

VIETNAM WAR, U.S. NAVAL OPERATIONS IN THE. The U.S. Navy's ability to project its combat power ashore in Southeast Asia, control the coastal waters off Vietnam, and provide logistic support for a major U.S. overseas military commitment mandated its heavy involvement in the Vietnam War. Naval operations took place in the South

China Sea, among myriad islands, along the coastline of Vietnam, and on thousands of nautical miles of rivers and canals.

The first significant U.S. naval engagement of the war was the famous Tonkin Gulf incident of 1964. On the afternoon of 2 August, three North Vietnamese motor torpedo boats attacked the destroyer *Maddox* in the Gulf of Tonkin with gunfire and *torpedoes. On the night of 4 August, *Maddox* and another destroyer, *Turner Joy*, reported fighting a running battle with hostile patrol craft in the middle of the gulf. Communications intercepts and other relevant information convinced Washington that an attack had taken place. At President Lyndon B. *Johnson's direction, on 5 August navy carrier forces bombed North Vietnam. Two days later, the U.S. Congress overwhelmingly passed the Tonkin Gulf Resolution, which Johnson thereafter used to wage war in Vietnam.

Even though Washington did not pursue a traditional military victory in the war, the navy made a major effort on the operational and tactical levels. Carrier aircraft of the Seventh Fleet executed round-the-clock bombing of enemy *logistics facilities, fuel and supply depots, power plants, bridges, and railroads in Laos, North Vietnam, and after 1970, Cambodia. The air campaigns produced no decisive results, and they cost the navy 900 aircraft lost and 881 pilots and other air crew killed or captured. These operations, however, hindered the enemy's resupply efforts and shortened Hanoi's ground offensives in South Vietnam. In addition, the navy-air force bombing and the navy's simultaneous mining of North Vietnam's ports during 1972 and 1973 helped ease the U.S. withdrawal from the conflict.

Navy and Marine Corps aircraft also flew close air support for allied units battling Viet Cong and North Vietnamese Army forces in South Vietnam. Carrier-based search and rescue *helicopters retrieved hundreds of American aviators whose aircraft were shot down ashore or at sea.

The battleship *New Jersey* and numerous *cruisers and destroyers shelled bridges, rail lines, *radar sites, *artillery batteries, and small vessels along the North Vietnamese coast and Communist troops, fortifications, and supply caches along the coasts and waterways of South Vietnam. During the Communist *Easter Offensive of 1972, U.S. naval gunfire devastated enemy armor and infantry units on the northern coast of South Vietnam.

The U.S. Coastal Patrol Force and South Vietnamese naval units mounted Operation Market Time, which limited Communist seaborne infiltration of supplies into South Vietnam. The allied forces destroyed or turned back all but two of the fifty Communist steel-hulled trawlers discovered heading for the South Vietnamese coast between 1965 and 1972.

Navy-Marine Corps amphibious units exploited the fleet's mobility to carry out assaults from the sea along the coast of South Vietnam. In 1967 and 1968, naval leaders increasingly used the amphibious force as a floating reserve for Marine units fighting near the demilitarized zone.

Commander U.S. Naval Forces, Vietnam (COMNAVFORV) also took advantage of the waterways that crisscrossed the Mekong Delta region to deploy combat forces deep into enemy-controlled territory in South Vietnam. The *Swift boats (river patrol craft) and SEAL commandos of COMNAVFORV's River Patrol Force, in Operation

Game Warden, disrupted Communist supply traffic on the main rivers. Also important to the inland effort was the army-navy Mobile Riverine Force of heavily armed and armored monitors. Both forces prompted the Communists to divert their sampans and other supply craft to smaller rivers and canals.

In 1968, an energetic COMNAVFORV, Vice Adm. Elmo R. *Zumwalt, Jr., adopted an innovative strategic approach, which he called SEALORDS. In a comprehensive campaign, U.S. and Vietnamese river forces put the enemy on the defensive by setting up patrol boat barriers along the Cambodian border and by penetrating areas deep in the Mekong Delta. Hence, the Communists were unable to mount a major attack there during the Easter Offensive.

The navy also directed the seaborne logistic operation that sustained the American forces and their allies in Southeast Asia. The merchantmen of the navy's Military Sealift Command delivered 95 percent of the vehicles, ammunition, fuel, equipment, and other military supplies that entered the ports of South Vietnam. In addition, navy Seabee construction units developed enormous logistic support bases at Da Nang and Saigon.

The decade of heavy commitment to the war in Southeast Asia, which ended on 30 April 1975, cost the U.S. Navy dearly. Of the 1,842,000 Navy men and women who served in the combat theater, over 2,600 were killed in action and 10,000 were wounded. The navy also had to contend with serious morale, drug abuse, and disciplinary problems. Racial conflict hampered operations on board two Pacific Fleet carriers, *Kitty Hawk* and *Constellation*.

Equally serious, the war's high operating costs limited the funds available for needed repairs and for the design and construction of newer and better ships. To help pay for the war, the Ford and Carter administrations reduced the navy's Vietnam era fleet of 769 ships to just over 450.

In some ways, however, the Vietnam experience strengthened the navy. The conflict reaffirmed the critical importance of naval forces to the conduct of warfare in distant waters. Vietnam influenced a whole generation of midlevel naval officers, many of whom rose to prominent command in later years, to recommend to political leaders that they use force judiciously when faced with crises in Central America, Africa, and the Middle East.

VILLARD, OSWALD and FANNY GARRISON, pacifists, antiracists, and feminists. This mother and son team carried on the political tradition of Fanny Garrison Villard's father, reformer William Lloyd *Garrison.

Fanny Garrison (1844-1928) married the German-born business entrepreneur and newspaperman Henry Villard in 1866. Her adult political work had begun with efforts to help newly freed slaves during *Reconstruction. She continued her charity work through the Diet Kitchen Association (dedicated to improving nutrition for the poor), the New York Infirmary for Women and Children,

and the Woman's Exchange. In 1898, both she and her youngest son, Oswald (1872-1949), spoke against the imperialist position taken by the United States in the "Spanish-American War. In 1914, both became active in the anti-World War I movement. Fanny acted through the Woman's Peace Party and the suffrage movement; Oswald, for a time, through the "Fellowship of Reconciliation. More notably, Oswald, like his grandfather, voiced his anti-war sentiment as a journalist and publisher, first via the *New York Evening Post* and then the *Nation* (founded in part by his uncle, Wendell).

Fanny's voice continued from 1919 to her death in 1928 through the Women's Peace Society, an "absolutely" pacifist organization. Oswald also stood for "pacifism to his death in 1949. Both were also among the founders and activists of the National Association for the Advancement of Colored People.

VINSON, CARL (1883-1981), Chair, House Naval Affairs Committee and Armed Services Committee. A rural Georgia lawyer and Democrat, Vinson was elected to the House of Representatives in 1914. He was appointed to the House Naval Affairs Committee in his first term, and throughout his fifty-year career in the House, he would remain an advocate of strong military defense. In 1931, Vinson became chair of the committee and worked, with the support of President Franklin D. "Roosevelt, for naval expansion. The "Vinson-Trammell Act (1934) authorized construction of 102 warships. The Naval Act (1938) provided for a ten-year, \$1.1 billion building program, including all categories of ships, and a doubling of the U.S. Navy's airplanes. In July 1940, Vinson won an emergency "Two Ocean Navy" act, doubling the size of the combat fleet and including the new fast carriers and "battleships that would begin to join the fleet in 1943. During World War II, Vinson sponsored bills to curb strikes in defense industries and called for a ban on employment in those industries for anyone suspected of un-American activities.

Vinson remained head of the Naval Affairs Committee until 1947, and from 1949 to his retirement in 1964, he chaired the House Armed Services Committee, a strong advocate of national defense and containment of communism. A stern taskmaster and skillful legislator, Vinson lost only three floor fights on bills reported by his committee between 1940 and 1964. The navy named a nuclear carrier after him.

—John Whiteclay Chambers II

The VINSON-TRAMMEL ACT (1934), cosponsored by Georgia Democrat Carl "Vinson, chair of the House Naval Affairs Committee, was part of the naval expansion program of the administration of President Franklin D.

"Roosevelt during the Great Depression. Elected in 1932, ten years after the "Washington Naval Arms Limitation Treaty, Roosevelt issued an executive order in 1933 allowing \$238 million in emergency public works funds to be used to build thirty-two warships over the next three years. Undeterred by critics' accusations that the United States was initiating another naval arms race, Vinson crafted the Vinson-Trammell Naval Act of 1934, which authorized the navy to construct 102 new warships over the next eight years. This would bring the U.S. Navy up to the full strength authorized by the treaty. By 1937, the year after Japan renounced any treaty limitations, the U.S. Navy had under construction three new "aircraft carriers, ten "cruisers, forty-one destroyers, and fifteen "submarines, most of which would join the fleet at the end of the decade. By 1939, the United States had fifteen "battleships, the Japanese ten, but Japan had six aircraft carriers compared to five in the U.S. Navy. Congress authorized further naval construction in 1938 and 1940.

VIOLENCE. See Aggression and Violence.

VOLUNTEERS, U.S. The U.S. Volunteers was the federal government's primary mechanism in the nineteenth century for raising large forces of "citizen-soldiers needed in wartime to augment the small regular army and organized "militia and National Guard. These ad hoc units were locally raised and led, but funded by the federal government and under the overall command of U.S. Army generals.

With congressional authorization, governors nominated local notables whom the president commissioned as temporary officers. These recruited local men into temporary units up to regiments. In keeping with militia traditions, enlisted men elected the junior officers.

The system drew upon the essentially local basis of American society in the nineteenth century in order to serve national purposes. It enabled the central government to raise a sizable wartime force in a country where political power was fragmented by federalism.

Raised only when needed, the U.S. Volunteers did not exist in peacetime. Unlike the militia, which, by law, could not be kept in federal service for more than nine months nor sent outside the country, the U.S. Volunteers were enlisted for terms of one to three years, and between 1794 and 1902 fought outside the country in the "Mexican War, the Spanish-American War, and the "Philippine-American War. Within the United States, they fought in the Indian wars, the "War of 1812, and the "Civil War.

Use of U.S. Volunteers ended in the twentieth century when a strong federal government drew draftees and volunteers into a truly national army.

W

WAC. Half a year before the attack on "Pearl Harbor, Congresswoman Edith Nourse Rogers of Massachusetts introduced a bill in Congress on 28 May 1941, to establish a Women's Army Auxiliary Corps (WAAC) within the U.S. Army. Mrs. Rogers's bill aroused immediate controversy: most men in Congress and the War Department opposed the idea of women in the military.

To gain passage, Mrs. Rogers had to accept changes in the WAAC bill. When it was finally passed on 14 May 1942, it provided for a corps of 25,000, to be an auxiliary to the U.S. Army without military status. Later that year, the corps was authorized to increase to 150,000. The WAACs would serve under women commanders, be given duty at army posts in the United States and overseas, have separate grade titles and pay schedules from men, be noncombatants, wear "uniforms, and serve under WAAC rather than army regulations. The head of the corps would have the title of colonel but receive the lower pay of an army major. Ironically, bills enacted later in 1942 permitted women to serve in the U.S. Navy and Marine Corps as reservists on active duty with the same military status, pay, and benefits as men.

On 1 September 1943, Congress gave the WAACs military status and eliminated "Auxiliary" from the title. (Over 60,000 members were on active duty then; 937 in North Africa and England.) Members of the new Women's Army Corps (WAC) now had the same grade titles, pay, benefits, and privileges as men in the army. But they could not command men's units, participate in combat, rise to a grade higher than lieutenant colonel, or automatically receive pay and benefits for their dependents as men did. One woman, the director, Oveta Culp "Hobby, received the title and pay of a full colonel.

Initially, as WAACs, women were limited to work as clerks, cooks, drivers, and telephone operators. After receiving military status, the WACs were assigned to an increasing variety of army jobs. By war's end, they were serving in all theaters of war and almost every noncombat job. Nearly 100,000 were on active duty on 30 April 1945—over 16,000 serving overseas.

After World War II, the new chief of staff of the army, Gen. Dwight D. "Eisenhower, asked Congress to enact legislation to make the Women's Army Corps part of the Regular Army and the Organized Reserve Corps (later U.S. Army Reserve). He wanted WACs permanently in the army to do the work they had done so well in wartime. The bill was enacted 12 July 1948. The WAC then became a separate corps (or branch) of the Regular Army. WAC officers and NCOs commanded units of enlisted women, who were housed in separate detachments, companies, or battalions on army posts. WAC officers and enlisted women

were assigned, sent to schools, discharged, and retired by Department of the Army orders.

When the "Korean War began on 25 June 1950, WAC strength was 7,300, but it increased to 12,000 a year later. In Korea, the combat zone was so fluid and unpredictable that a noncombatant WAC unit could not be assigned in the country. Only a half-dozen WAC officers and enlisted women served as stenographers and interpreters.

After the war ended (1953), WAC strength fell to 7,800. The corps was rejuvenated when the army built a permanent WAC training center and school (1954) at Fort McClellan, Alabama. (Today, the Women's Army Corps is located there.) New opportunities opened for women officers and enlisted women in "communications, intelligence, "logistics, and "transportation.

During the Berlin crisis (1961) and the "Cuban Missile Crisis (1962), both active duty and reserve WACs participated in logistical efforts. In June 1962, WAC strength was 11,113; following the pattern after crises, it fell to 8,700 by June 1964.

Early in the 1960s, South Vietnam requested and obtained U.S. advisers to help train defense forces. In January 1965, the U.S. Army began sending one WAC officer and one NCO to Saigon each year for a one-year tour. They helped the South Vietnam government organize and train a Women's Armed Forces Corps. In 1967, a WAC unit of 100 arrived for duty with the U.S. Army, Vietnam, at Long Binh; others worked in Saigon as clerk-typists, stenographers, finance and supply clerks, intelligence technicians, and communications specialists. By 1972, opposition to the war caused President Richard M. "Nixon to order the withdrawal of U.S. forces from Vietnam. The WAC detachment left in October 1972.

For years, directors of the WAC and heads of the other women's services had tried to obtain equality of promotion and retirement for women officers. Finally, on 8 November 1967, Congress enacted a bill to equalize retirement eligibility and remove restrictions, making women officers eligible to compete for promotion to general and flag rank. On 10 June 1971, WAC director Elizabeth P. Hoisington, was the first WAC officer to be promoted to brigadier general.

After 1967, WAC directors obtained other important policy and statutory changes. Women could command men's units, serve in "ROTC, be assigned to combat support positions, become pilots of noncombat planes, remain on active duty while pregnant, and attend senior service colleges. Separate WAC units and the position of WAC staff adviser were eliminated in 1973 and 1974, respectively. Except in combat units and combat jobs, army men and women were assigned interchangeably to positions in

the United States and overseas. In 1974, WAC officers were released from WAC branch and assigned to other noncombat branches of the army. In 1976, women entered the U.S. Military Academy at West Point, New York.

The remaining vestiges of the Women's Army Corps were eliminated by Congress in 1978 so that women in the army could be more fully assimilated into the overall army structure. The positions of director and deputy director were abolished, April 1978; Congress then disestablished the WAC as a separate corps of the army, October 1978. Corps strength at that time was 52,997.

The action taken by Congress was not popular with the majority of corps members. They missed the cohesiveness of their units, the esprit fostered by individual and unit achievements, their role models, and the camaraderie of working together as a unit. By the 1990s, women served in most units and branches of the army except Infantry, Armor, and short-range Artillery.

WADE, BENJAMIN FRANKLIN (1800-1878), radical Republican senator in the *Civil War. Born in Massachusetts, Wade settled in Jefferson, Ohio, to practice law, was elected to the legislature as a Whig, and rose to become a presiding judge of the third Ohio district. In 1850, he was sent to the U.S. Senate by a combination of Whigs and Free Soilers.

An outspoken opponent of slavery, when the Civil War broke out, Wade, now chairman of the Committee on Territories, attempted to arrest the rout at the First Battle of *Bull Run by putting his carriage across the road and turning back the retreating troops with his rifle, an experience that caused him to develop a great mistrust of West Point leadership. Also serving as chairman of the Joint Committee on the Conduct of the War, he sought to further the antislavery cause by badgering President Abraham *Lincoln to dismiss conservative generals in favor of their radical counterparts. In investigations of the battles of Bull Run, Balls Bluff, and the *Seven Days' Battle, he attempted to induce Lincoln to dismiss Gen. George B. *McClellan, and (unsuccessfully) in later hearings to retire Gen. George Gordon *Meade, while vigorously defending Joseph *Hooker, Dan *Sickles, Benjamin F. *Butler, and others. Wade also chaired investigations of the Fort Pillow Massacre and of Confederate *atrocities against *prisoners of war, the results of which were published as powerful propaganda for the Union cause.

In 1864, the senator was the co-author of the Wade-Davis Reconstruction bill, which was more radical than Lincoln's plan. As president pro tem of the Senate, Wade would have become president had Andrew *Johnson been convicted in his impeachment trial. Wade was forced to retire in 1869 after the Democrats captured the Ohio legislature.

WAINWRIGHT, JONATHAN (1883-1953), U.S. general in World War II. Graduating from West Point in 1906,

Wainwright served in World War I as a captain. In 1940, as major general, he assumed command of the Philippines Division. Commanding North Luzon forces during the opening days of the Japanese invasion in December 1941, he redeployed American forces to defensive positions on the Bataan Peninsula.

On 11 March 1942, after Gen. Douglas *MacArthur left for Australia, Wainwright assumed command of U.S. forces on Bataan and the island fortress of Corregidor in Manila Bay. Promoted to lieutenant general and put in command of all U.S. forces in the Philippines, Wainwright proved unable to prevent the collapse of resistance on Bataan on 8 April. In order to ensure continued resistance of U.S. forces in other areas of the Philippines, he released them from his control shortly before he surrendered the U.S. forces on Corregidor on 6 May. Gen. Homma Masahura, commander of a Japanese force invading Corregidor, refused to accept this partial surrender. Out of concern for those already in captivity, Wainwright ordered the capitulation of all U.S. forces, and more than 80,000, Americans and Filipinos then surrendered to the Japanese.

Wainwright spent the remainder of the war in a series of Japanese prisoner-of-war camps. Liberated in Manchuria in 1945, the frail, emaciated general took part in the formal surrender ceremonies aboard the USS *Missouri* in Tokyo Bay. Greeted with a hero's welcome upon his return to the United States, Wainwright resumed active service for a brief time before retiring in 1947.

WAR. This essay consists of five articles, which deal broadly with different large aspects of war. The first provides an interpretation of the changing Nature of War from ancient times to the present. The second examines Levels of War—tactical, operational, strategic—comparing recent historical examples with modern American military thought. The third explores the degree to which there has been an American Way of War. The fourth, which shows American perspectives on the Causes of War, assesses historic interpretations of the causes of war by American policymakers, scholars, and activists. The fifth, examining the American experience, probes the debate over the Effects of War on the Economy.

WAR: NATURE OF WAR

Definitions of war have varied, but any attempt to understand it must include the following critical elements. First, war is an organized violent activity, waged not by individuals but by men (sometimes joined by women) in groups. Second, war is a mutual activity; whatever takes place in it relates, or should relate, primarily to the enemy's movements with the aim of defeating him and avoid being defeated oneself. Third, the conduct of war is conditioned on the hope for * victory, or at the very least self-preservation. Where that hope does not exist there can be no war, only suicide.

War being an organized activity, the best way to classify it is neither by *tactics nor by * weaponry but by the nature of the human communities that wage it. Thus we find that some very small and very loosely organized communities,

such as the South African Bushmen or Arctic Eskimo, did not have war but merely more or less violent duels among individuals. More complex "tribes without rulers," such as the Indians of the North American Plains, did engage in war; yet there was still no specialized organization for waging it, since every healthy adult male was a warrior by definition. Probably the first individuals who were in any sense specialized warriors were the retainers of tribal chiefs such as still existed in areas of Africa until recently. The classical Mediterranean city-states were, in this respect, less advanced: they did not have armies but only militias that were mustered as war broke out and went home as it ended. The task of building standing forces was left to empires, like those of ancient Egypt or Assyria or China or Rome. For a long time these remained the strongest military-political organizations.

The characteristic modern way of organizing war, which grew out of the transformation of feudal into modern society, is to entrust it to be directed by the "state. For 300 years, since the Treaty of Westphalia in 1648 ended the Thirty Years "War, states alone have been authorized to wage war; conversely, whenever "aggression and violence were used by individuals, or by other groups and organizations, it was known as crime, uprising, rebellion, or civil war. Inside each state a distinction was drawn between the government, which alone could conduct the war at the highest level; the armed forces, whose task was to fight; and the civilian population, whose assigned role was to pay and sustain the effort. By setting up an organization whose members, even at the higher levels, were selected for their professionalism rather than their loyalty (which had been the case in empires and feudal societies) and who were dedicated solely to war, the state and its resources led the way to unprecedented technological development in the military field. So great were the modern state's military and warmaking capabilities that by 1914, some half-dozen industrialized states had come virtually to dominate the world.

Not only did the modern state wage war more effectively than any other organization, but war itself played a great role in the construction of the modern state. First came the establishment of civilian bureaucracies, whose primary function was to obtain resources for war and extract the taxes that would be used to pay the troops. Next came such institutions as the national debt and paper money, both of which had their origin in the need to finance war. During the nineteenth century, the advent of railways and telegraphs for the first time enabled large states to begin to harness virtually their entire resources for military purposes; this culminated in the era of "total war" (1914–45) when such governments took over control of almost every aspect of their citizens' lives from the wages that they were paid to the temperature of the water in which they could bathe. These trends affected the United States, which was relatively isolated and safe, much later than they did the main European powers, which confronted each other directly. Still, even in the United States the task of building a strong centralized state was linked to war, initially in the "Civil War, but more dramatically in World War I and World War II. In the long run, the United States built a "military-industrial complex larger than any other in the world.

As the warmaking communities developed and became more sophisticated, so did the scale on which they fought

and the methods they used. Early tribal societies counted their warriors in the dozens and knew only the raid, the ambush, the skirmish, and sometimes the setpiece encounter (agreed upon in advance) that can be seen as part war, part sport. With the establishment of chiefdoms, there appeared forces numbering in the hundreds or at most thousands, as well as battle and siege operations, whereas empires could count their troops in the hundreds of thousands and were capable of conducting sophisticated operations that lasted for years on end. However, all premodern political entities were hampered in their conduct of war by problems of both "logistics and "communications. The former meant that armed forces spent more time looking after their supplies than actively campaigning, and indeed that war itself was usually a seasonal activity—in the summer. The latter not only prevented the coordination of operations from the capital but made it virtually impossible for the armed forces of any one state to cooperate with each other on anything larger than a tactical scale once they had been united on the battlefield.

Modern technology during the late eighteenth and early nineteenth century put an end to these limitations. Instead of coming about by tacit agreement between the commanders on both sides, battles could be developed into coherent campaigns; campaigns waged in different theaters could be integrated with the conduct of war as a whole, and the latter coordinated from the national capital, which also controlled the "mobilization of demographic and economic resources. The different "levels of war—from minor tactics through tactics and the "operational art and "strategy all the way to grand strategy—made their appearance. More and more, war came to be waged by vast powers or coalitions of powers, each counting their subjects in the dozens if not hundreds of millions. Once unleashed by the Industrial Revolution, military technology mushroomed. Between 1815 and 1945, it took war from flintlocks to "tanks and from foot-slogging soldiers to long-range "bomber aircraft and the first ballistic "missiles.

Throughout these millennia of organizational and technological growth, the character of war as a mutual activity remained unchanged. War involves the use of organized violence to achieve one's end, often to the maximum extent possible; but that violence is directed against a living, reacting enemy, who in turn uses violence to achieve *his* ends. Hence, the real essence of war, in whatever form and at whatever level, is the interplay between the two sides' moves and countermoves.

Assuming that the force on one side is not overwhelming—in which case little or no military art will be required—to achieve victory it is necessary to strike at a point that is both vital and vulnerable. To force the enemy to expose his vulnerable point, it is necessary to deceive him as to one's intentions. To deceive him, it is usually necessary to pretend to strike at some other point or points; but this in turn means diverting force for the purpose, which will weaken one's ability to launch the decisive stroke as well as to defend oneself.

In this way, war is subject to a peculiar logic of its own, which has been aptly called "paradoxical." It differs from engineering activities, whose object is to mold inorganic matter, but in some ways resembles games such as football or chess; like them, it consists of action, counteraction, and counter-counteraction, all of which are accompanied by a bodyguard of secrecy, lies, feints, and sometimes even espi-

onage. The resulting uncertainty, the friction that is inherent in the activity of large bodies of people, and the sheer risk to life and limb that is involved, combine to make the conduct of war extraordinarily difficult. As Napoleon once said, intellectually it poses problems worthy of a Newton or an Euler; however, the character attributes that it demands—such as courage, endurance, determination, the ability to keep one's mind clear in a crisis—are, if anything, even greater.

Still, assuming a rough balance between opposing sides, in theory, victory goes to the side that, reading the enemy's intentions while concealing its own, is able to strike hardest at the decisive point without exposing itself. In practice, the necessary calculations are often much too complicated for any one brain or combination of brains, with the result that, as in the case of many games, the outcome depends on making the fewest mistakes, as well as pure chance.

With the advent of "nuclear weapons—themselves made possible by the tremendous scientific and industrial resources at the disposal of the modern state—warfare seems to have undergone a decisive change. Hitherto, it had often been possible for one side to use some combination of force and guile in order to achieve victory at a cost acceptable to itself. Now, the prospect had to be faced that victory, instead of guaranteeing one's existence, would lead to annihilation as the defeated side fell on the nuclear button. Indeed, the more resounding the victory, the more acute the danger that this would happen. Under such circumstances, it is scant wonder that those states that possessed nuclear weapons—meaning, by and large, the most powerful ones—generally began taking very good care not to commit suicide and to avoid escalating conflicts between each other. The more nuclear weapons proliferated, the less important and less powerful the states against which large-scale, conventional warfare (as in the period 1648-1945) could still be fought.

Reflecting these developments, military organization and military technology reversed direction. Throughout the years since A.D. 1000, armies and navies had been getting larger and larger, culminating in the tens of millions of uniformed personnel who served during World Wars I and II; now, all of a sudden, they began to shrink as the most important states abandoned the system of mass mobilization of the kind that initially appeared after 1789. For the first time in history, some weapons—specifically, the most important ones by far—were deliberately made less, rather than more, powerful. Neither the most powerful missiles, such as the American Titan, nor the monster hydrogen bomb of 58 megatons (58 million tons of TNT) that the Soviets exploded in 1961 had successors. Research and development were redirected in an effort to develop more accurate delivery systems such as multiple independent reentry vehicles (MIRVs) and cruise missiles carrying more limited warheads: Both reflected the feeling that their city-destroying predecessors had grown too indiscriminate and too dangerous to serve any useful purpose.

As nuclear weapons put a ceiling on the size and violence of wars between nations, such wars became rarer at the end of the twentieth century. Beginning in the so-called Third World and spreading to the Second, their place as an agent of political change was increasingly taken by another form of war. This new form of war was not based on the customary division of labor among government, armed forces, and people. Since it did not require a

large, continuous, statelike territorial basis, it was immune to those weapons and could be waged even in their presence. "Guerrilla warfare and "terrorism and counterterrorism were, in fact, anything but new phenomena; however, the fact that they were directed against the occupying Axis powers during World War II had given them a new respectability as well as legitimacy in international law. As Europe's overseas "expansionism shows, until 1914 its armies had usually been able to confront with overwhelming force peoples who did not have states, governments, or regular armed forces. But from the moment Adolf Hitler invaded Yugoslavia in 1941, this clearly ceased to be the case, as the Yugoslav partisans prevented even the German Wehrmacht from conquering all of their country.

Though the forces at their disposal were usually small and their weapons primitive, guerrillas and terrorists in dozens upon dozens of cases since 1945 have defeated the most modern armies and the most powerful modern states that ever existed. In the 1990s, they continued to resist successfully the armed forces of many states around the world, nor, to judge by cases from Algeria to Bosnia to Somalia, does it appear modern states know how to deal with them. For those states and their armed forces, the writing is on the wall. Under the shadow of the mushroom cloud, a new form of war that is simultaneously very old is reemerging and asserting itself. Either modern states learn to cope with it, or they themselves will soon disappear into the dustbin of history.

WAR: LEVELS OF WAR

Modern military analysts view warfare as an undertaking that can be broadly examined on three complementary and somewhat overlapping levels: " *tactics*, " *operational art*, and " *strategy*. Recent American military thinking, influenced by the "Vietnam War and then accelerated by the "Goldwater-Nichols Act of 1986, has matured and become much more sophisticated in its analysis and understanding of the nature and conduct of war. With the notable exceptions of Alfred T. "Mahan and Billy "Mitchell, until recently civilian defense analysts have done the majority of innovative theoretical thinking in the United States about warfare. There is now, however, an intellectual renaissance within the ranks of the government defense community. Still prodded by civilian thinkers and critics, the American military establishment has recently developed a paradigm that views warfare as an activity to be conducted and understood on the three levels: tactical, operational, and strategic. The latest and least-developed concept concerns the nature and conduct of war at the strategic level.

The United States's military "education system, particularly its Senior Service Colleges (War Colleges), provides a thorough grounding in the classics of military thinking. Sun Tzu, Antoine Henri "Jomini, Carl von "Clausewitz, and others are studied in depth for applicable lessons for current military practitioners. Learning from the past, from recent military experiences, and from a study of foreign armies, particularly in the former Soviet Union, American military thinkers have begun to view war in somewhat overlapping constructs. These *levels of war* are

useful in framing activities by military echelons within a theater of operations and in establishing a structure for ordering activities in time and space. They provide civilian decision-makers and military commanders with a method to visualize an orderly sequence of operations, the resources necessary, and the specific tasks to be accomplished. Each level of warfare is defined by the intended outcome and not by the size of the specific unit tasked to accomplish it.

The most basic and thoroughly understood is the *tactical level* of warfare. It is concerned with the planning and executing of battles and engagements to accomplish military objectives that are assigned to tactical units or to task forces. With army and Marine forces, these are normally division-size units or smaller; in the air force and navy, the force size is roughly the squadron and battle group level, respectively. At the tactical level, the focus of activities is the ordered arrangement and maneuver of combat elements to achieve combat objectives. Actions here are focused on specific missions, and "victory in battle and engagements is attained by achieving superiority over an enemy by exercising adroitly the *principles of war: objective, initiative, maneuver, mass, surprise, security, simplicity, economy of force, and unity of command. Success or failure at this level may determine victory or defeat at the operational and ultimately strategic levels. Tactics employ both the art and science of warfare to use all available means to defeat the enemy; normally, there is more emphasis on the science and less on the art of warfare. In essence, the tactical level of warfare involves battlefield problem solving.

The *operational level* of warfare is the level at which campaigns and major operations are planned and conducted. It provides the linkage between the tactical level, where individual battles and engagements are fought, and strategic-level objectives. The operational level focuses on conducting joint (multiservice) operations through the design, structure, and execution of subordinate campaign plans and major operations. Emphasis here is on operational art, which the *Joint Chiefs of Staff (JCS) define as "the skillful employment of military forces to attain strategic and/or operational objectives within a theater through the design, organization, integration, and conduct of theater strategies, campaigns, major operations and battles." The essence of operational art is to determine when, where, and for what end forces will fight. At this level, warfare is more an art than a science as senior commanders seek to balance the ends sought with the ways to accomplish those ends in light of the resources available.

The study of the *strategic level* of war is the most recent area of development in American military thinking. At this level, there is the closest linkage between military and civilian leaders in defining and articulating national objectives. Military leaders must then translate national objectives into national security objectives attainable by military means. The pursuit of these military objectives is often done as a member of a coalition of nations. The strategic level then determines national or multinational security objectives and guidance, and uses national resources to achieve these aims. According to the JCS, the strategic level of warfare includes activities to "sequence initiatives; define limits and assess risks for the use of military and other instruments of national power; develop global plans or theater war plans to achieve these objectives; and provide

military forces and other capabilities in accordance with strategic plans."

At the strategic level, again, warfare is much more an art than a science. Contemporary analysts are still debating and refining the concept of strategic art. In 1995, the JCS had yet to publish an accepted definition of what constitutes "strategic art." Because of the level at which it is applied, practitioners of the strategic level of warfare must have an appreciation for all the realms of national power—economic, diplomatic, and informational, as well as the purely military dimension. Those who would master the strategic art must embody three complementary roles: leader, practitioner, and theorist.

The strategic leader is one who *exercises* strategic art, or in military parlance, "makes it happen." A strategic leader provides vision and focus of effort; applies leadership and consensus-building skills in ambiguous, often multicultural associations; coordinates ends, ways, and means; and inspires others to think and to act. Recent historic examples include the American generals Dwight D. *Eisenhower and George C. *Marshall, and the British leaders Gen. William J. Slim and Prime Minister Winston S. *Churchill.

The practitioner of strategic art can be defined as one who *translates* political and military guidance into broad, attainable military objectives. A strategic practitioner both develops and executes strategic plans. Such an individual must have a thorough mastery of all the levels of war and must be able to employ force and the other dimensions of military power. A list of recent strategic practitioners might include Erwin *Rommel, Matthew B. *Ridgway, and H. Norman *Schwarzkopf. All were adept at the art of applying ends, ways, and means to solve military problems in a variety of strategic environments.

The strategic theorist, as the name implies, is one who *develops* strategic concepts and theories. Such an individual would be a student of the history of warfare who also might have practical experience in war, although this would not be a *sine qua non*. The theorist's understanding of warfare would permit him to analyze and synthesize concepts of war to develop even finer understanding and distinctions. Examples of strategic theorists would include Thucydides, Sun Tzu, and Carl von Clausewitz.

Contemporary American military thinking views military operations as a continuum. This spectrum extends from general war to large-scale combat operations, possibly including weapons of mass destruction (nuclear, biological, and chemical), down through military operations other than war. Under this last rubric are a number of operations that have become the most prevalent types of warfare conducted in the last decade of the twentieth century. They include noncombatant evacuation operations, strikes and raids, support to insurgency, counterdrug operations, antiterrorism, disaster relief, civil support, peace operations (peace enforcement, *peacekeeping, and peace building), and nation assistance. Each of these operations can be viewed through the prism of the three levels of war: tactical, operational, and strategic. Some involve the destruction of enemy forces; many do not. All represent the use of the military element of power in pursuit of national objectives.

This paradigm of warfare as a tiered and interlocking system will be particularly useful as our understanding of warfare continues to evolve. Military operations other than war have already begun to blur the traditional understand-

ing of the uses of military power. Military observers in the future will have to analyze such disparate acts as electronically crippling a nation's banking system, or the insertion of a virus into the computer-controlled mass transit system of a city, and then decide whether these are acts of war. Their level of analysis—tactical, operational, strategic—will be important for the conclusions they draw about the ever-changing nature of war.

WAR: AMERICAN WAY OF WAR

Like shadows on a parade field, military institutions and war reflect in part the society that creates them. Although many Americans view themselves as a peace-loving people and war as an aberration, war has been a regular part of American history, integral to the way the nation developed.

Despite divisions among Americans, the United States has justified its wars as in defense of American lives, property, or ideals. Policymakers have also taken the nation into war for various strategic, economic, and political reasons. But since the idea of Old World balance-of-power wars or wars of subjugation over other nations has been anathema to Americans' self-image, the United States has usually mobilized for war in highly idealistic crusades—for liberty or democracy.

America views itself as antimilitaristic because for most of its history, the nation relied in wartime on *ad hoc* citizen armies rather than large standing forces, and because civilian control of the military is seen as a fundamental principle. This antimilitarism was reinforced by isolationism. Secure behind vast oceans, the United States did not develop large peacetime standing forces until the "Cold War.

Another paradox is that although Americans generally view themselves as peace-loving, they have been capable of engaging in the most devastating kind of warfare—war aimed at total "victory and complete elimination of the enemy threat, sometimes of the enemy themselves. This view of warfare emerged from European Americans' wars with Native Americans.

Eastern woodland Indians' warfare was originally much less bloody than that of Europeans, who were accustomed to vicious religious crusades and to the savage subjugation of peoples from Ireland to the Indies. Even as the horrors of religious wars were replaced in the Old World by limited warfare using newly organized professional armies, they were repeated in the New World by amateur soldiers of the militia.

Throughout the seventeenth and eighteenth centuries, colonial militiamen were mobilized in terms of crusades against the "heathen savages." Unable to entice Indian warriors, who preferred raiding, sniping, and ambushing, into open-field European-style combat, frustrated militiamen turned to complete destruction of Native Americans' crops and villages, killing men, women, and children, or selling them into slavery. Although the Indians responded with escalating violence, the superior numbers and resources of

the colonists ultimately led to the destruction or removal of entire Indian nations. An American view emerged that military threats to society could indeed be eliminated by the extirpation of the enemy—a result that was impossible among European nations.

This American view of war was reinforced in the eighteenth and nineteenth centuries. In the "French and Indian War (1756-1763), the Americans claimed credit for aiding the British army and navy drive the French out of Canada and the trans-Appalachian West. Later, in the "Revolutionary War, Americans won complete independence from Great Britain. The apparent British threat to American interests and liberties was again defeated in the "War of 1812.

Throughout the nineteenth century, the United States remained free from any external threat (the Civil War was internal and viewed as an aberration). The country was protected by its geographical isolation, the balance of power in Europe, and relatively weak and nonaggressive neighbors. Its formative experiences with war had produced a dichotomy in which the nation was perceived as either wholly secure or wholly insecure. In the latter case, a crusade could be waged that would eliminate the threat and thus restore Americans to total security.

A pattern had emerged in America's wars. War usually began with setbacks, largely because the nation, although willing to go to war, was militarily unprepared. Early defeats were followed by preparation and retaliation, and ultimately decisive redeeming victories—at Quebec, at Saratoga and Yorktown, at New Orleans, and at Gettysburg (at least for the Union). The belief in the inherent righteousness of the cause, in the natural fighting ability of the American "citizen-soldier, and in the nation's ability to mobilize its resources gave Americans an extraordinary optimism about what they could achieve militarily. Wars against Indians, Mexicans, and Spaniards in the nineteenth century reinforced these views, as with relatively small loss of life suffered by U.S. citizens the United States gained enough territory to claim overwhelming, if not always total, victory. In World War I, President Woodrow "Wilson called for a crusade to "end all wars" and to make the world "safe for democracy." The American war effort helped defeat the German empire, create a German republic, and make the United States the financial capital of the world.

The "Civil War had led the United States to adopt the warfighting doctrine of Gen. Ulysses S. "Grant, which emphasized overwhelming and continual military force applied directly against the enemy army and indirectly through deprivation of the enemy's civilian population and resources. In the twentieth century, during two world wars, and limited wars in Korea and Vietnam, the U.S. Army would pursue this strategy against the enemy forces, while the air force and navy pursued the indirect campaign, through bombing and blockade, against the enemy's material resources and political will.

As the United States industrialized, optimism about America's fighting ability focused on superior weaponry. At the turn of the century, Adm. Alfred T. "Mahan's doctrine of Sea Power emphasizing the use of a modern fleet promised swift and total victory. In the 1920s and 1930s, Gen. Billy "Mitchell of the Army Air Service helped develop the doctrine of Strategic Airpower as a technological means to achieve quick and total victory. In World War II, in response to the Japanese attack on 'Pearl Harbor and in

a crusade against fascism, Americans waged war on land, sea, and air, including conventional and ultimately nuclear bombing of urban areas to achieve decisive victory and unconditional surrender of the enemy.

The "Cold War posed a major challenge to American views of war and the military. Containment of the Soviet Union led to large standing military forces, but even these did not produce a sense of military security, for the USSR also developed intercontinental ballistic missiles and thermonuclear weapons. Before it ended in 1991, with the total collapse of the Soviet empire, the forty-year Cold War represented an unprecedented period of U.S. uncertainty over national security.

During the Cold War, the U.S. government refrained from the use of total military force in Korea and Vietnam. But the policy of limited war clashed with the traditional goal of total victory. The "Korean War ended in a frustrating stalemate, the "Vietnam War ultimately in defeat. After the United States had fought for more than seven years to prevent it, the Communist victory in Vietnam was a severe blow to Americans' optimism, sense of righteousness, and sense of military prowess, which did not return until the collapse of the USSR and the American victory in the "Persian Gulf War of 1991.

The U.S.-led coalition assault in Operation Desert Storm seemed quite justified and resulted in a quick, decisive victory that drove the forces of Iraqi dictator Saddam "Hussein out of Kuwait. Although the Baghdad regime continued in power, its threat to the region was dramatically curtailed. More than any other U.S. military engagement since World War II, the Gulf War to liberate Kuwait conformed to the traditional American way of war.

WAR: CAUSES OF WAR

Americans' assumptions about the causes of war have shaped important U.S. foreign and security policies. However, these assumptions were often poorly grounded and sometimes simply wrong.

Ideas on the causes of war held by various American "peace and antiwar movements, for example, often had little basis in reality. Since the early nineteenth century, these movements have, at various times, offered eight main prescriptions that embody their central ideas: (1) arbitration treaties and an international court to arbitrate disputes (popular ideas from the 1840s until 1914); (2) treaties forbidding resort to force (such as the 1920s movement for the "outlawry of war"); (3) disarmament or quantitative

arms reductions; (4) collective security (popular during and after World War I); (5) some form of world government; (6) U.S. "isolationism or strict "neutrality (popular in the late 1930s); (7) pacifist noncooperation with national military programs; (8) dovish U.S. policies toward U.S. adversaries (e.g., Vietnamese Communists or Nicaraguan Sandinistas). Some peace groups have also emphasized the need to cultivate pacific values through public moral education and by emphasizing the horrors of war.

When tried, these prescriptions usually proved infeasible or ineffective. Many arbitration treaties were signed before 1914, but they proved useless: governments freely ignored arbitration rulings that went against them. The Kellogg-Briand Treaty supposedly "outlawed" war in 1928, yet it proved to be an empty stunt that had no political effects. Quantitative disarmament rests on a proposition—that the incidence or intensity of warfare increases with the quantity of modern weapons available—that remains unproven and seems wrong. (Ancient history offers evidence against it, recording many immensely destructive wars fought wholly without modern weapons.) The collective security idea, embodied in the "League of Nations, proved ineffective in the 1930s while distracting Americans from more feasible ways to prevent World War II, such as early U.S. moves to deter or contain Germany and Japan. World government is now among those ideas so discredited they are no longer seriously discussed. U.S. neutrality, codified in the U.S. "Neutrality Acts of 1935-39, helped embolden Adolf "Hitler to start World War II while failing to keep the United States out of that war, and thus must be reckoned as more a cause of war than "peace. "Pacifism also helped embolden Hitler, who saw British and American pacifism as easing his road to European hegemony. Pressure for dovish policies did end one or two wars (e.g., the Indochina and Nicaraguan Contra wars), but only after these wars had burned for years. Overall, peace movements' main prescriptions seem generally unsound in retrospect.

Another misdirected approach to the causes of war has come in the twentieth century from anti-Communist conservatives. Their analysis rested on two main hypotheses: (1) communism causes war because Communist states will seek to expand by force against capitalist states; and (2) appeasement of communism causes war by emboldening Communist states in their "expansionism. Their second hypothesis was arguably valid, at least in some situations, but their first was not. Communist states proved to be only modestly aggressive. The USSR was an opportunistic but cautious aggressor, not a Hitlerian juggernaut. Soviet leaders committed vast crimes against their own people but only modest international aggressions.

After three great victories—in the wake of World War I and World War II, and after the "Cold War, which ended in 1991—the United States has sought to shape a durable peace based on its assumptions about the causes of war. Twice the United States failed, but its third attempt has had some success.

Woodrow "Wilson's post-World War I policies rested on poor theories of war's causes. Wilson offered six main prescriptions, framed in his famous "Fourteen Points: (1) Replace balance-of-power politics and competitive alliance making (which Wilson believed caused war) with a collective security system. But collective security was infeasible, as the League's later failure showed. (2) Reduce armaments to "the lowest level consistent with national safety." Here

Wilson was misled by the myth that quantitative disarmament could reduce violence between states. (3) End secret diplomacy in favor of "open covenants . . . openly arrived at," a change Wilson believed would bolster popular control of foreign policy, promoting peace. This soon-forgotten notion was a false corollary to the stronger hypothesis that democracy promotes peace. (4) Grant self-determination to freedom-seeking peoples. But this was infeasible in a post-1919 Europe of much intermingled ethnicities. (5) Remove trade barriers. This was a sound economic idea but a poor peace program, because free trade can cause war as well as peace, as illustrated by the way U.S. trade with the Allies helped draw the United States into World War I. (6) End colonialism. This was a humane idea that addressed a non-cause of the world war (European colonial rivalries had largely ended by 1914).

In World War II, President Franklin D. *Roosevelt's ideas about the causes of war and peace echoed Wilson's in part and differed in part. Like Wilson, Roosevelt believed that arms reductions, free trade, and national self-determination would promote peace. Unlike Wilson, Roosevelt also believed that aggressor states could best be tamed by completely defeating, disarming, and occupying them. His core belief, however, was that the best cornerstone of peace would be a concert system resembling the 1815 Concert of Europe, run through the cooperation of the "four policemen" (the United States, Britain, Nationalist China, and the Soviet Union). Roosevelt's concert scheme failed because a concert requires an underlying consensus among the great powers—something rare in history and absent after 1945.

In the 1990s, the administrations of George *Bush and Bill *Clinton built their post-Cold War peace on better ideas and got better results. They continued U.S. security guarantees to primary U.S. allies in Europe and Asia, backed by a continued overseas U.S. military presence. They pressed Europe's newly freed states to respect the rights of ethnic minorities. Echoing Wilson, they pressed Europe's dictatorships to democratize, believing that democracies seldom fight each other. Finally, they pushed former Communist states to "marketize" their economies, believing that marketization would promote prosperity, which would bolster democracy and peace. These post-Cold War policies, produced a softer landing than the policies of 1919 and 1945.

Social scientists have developed a large body of theories on the causes of war since World War II, some of them useful and influential. Two major theories have identified military factors as key causes of war and implied military-related prescriptions. What became known as "stability theory" warned that the risk of war increased with the size of the military advantage accruing to the side that struck first. With a large first-strike advantage, a "reciprocal fear of surprise attack" could set in, with each side thinking that "they fear we fear they will attack; so they might attack; so we must." Developed by nuclear strategists of Albert Wohlstetter and Thomas Schelling in the 1950s and 1960s, the theory led some strategists to advise against deploying strategic nuclear forces that were designed for surprise attack on the adversary's nuclear forces. However, the theory had only modest influence on policy, largely because the U.S. *Air Force rejected it.

What became known as "offense-defense theory" warned that the risk of war increased as offensive forces

grew stronger and conquest grew easier. When conquest is easy, this theory holds, aggressors are tempted to attack by prospects of easy gain, and *status quo* powers grow more aggressive because they desire more defensible borders. The theory drew mention before the 1970s but was first developed by the political scientist Robert Jervis in 1978, and then elaborated by others. It is now widely accepted in academe and in many policy circles, although the U.S. military remains skeptical. Its proponents have used it to explain historical events, such as the outbreak of World War I, and as a guide for policy, warning against unduly offensive military doctrines and force postures, and recommending giving security guarantees to others as a way to preserve peace in other regions. It influenced the European peace movement to call for a more defensive *NATO conventional military posture during the mid-1980s; it helped persuade the Soviet reform government of Mikhail Gorbachev to adopt a more defensive military posture in the late 1980s; and it encouraged the decisions of the Bush and Clinton administrations to extend defensive security guarantees in Europe and Asia.

What could be called "misperception theory" has warned that governments are subject to a wide range of war-causing misperceptions. Its dominant version, also developed in the 1970s by Robert Jervis and others, argues that national misperceptions stem from the cognitive errors of policymakers. These psychological errors lead governments to underestimate their own role in provoking others' hostility, to learn slowly, to exaggerate the order and coherence of others' actions, and to fall into spirals of self-reinforcing mutual hostility. Another variant of the theory, elaborated by Geoffrey Blainey in the 1970s, warned that wars of false optimism erupt when states underestimate others' capacity or will to fight.

During the 1970s and 1980s, scholars also explored the hypothesis, asserted in the eighteenth century by the German philosopher Immanuel Kant but never tested, that democracies are more peaceful than other types of government. This led to the growth of "democratic peace theory," and the discovery that while democracies are as war-prone as other states, they almost never fight each other. Democratic peace theory informed official policy in the 1980s and 1990s, fueling a return to Woodrow Wilson's goal of fostering democracy overseas. Most notably, Congress created the National Endowment for Democracy to support democracy abroad, and the Bush and Clinton administrations put priority on supporting democracy in the former Soviet empire.

Other recent scholarly theories of war have had less policy impact. A "structural realist" school argued that a bipolar world of two superpowers is more peaceful than a multipolar world of three or more great powers. A "liberal institutional" school argued that international institutions and regimes ease international cooperation, and, its proponents implied, promote peace. Others offered a "power transition" theory, positing that wars break out during transitions from the leadership of one great power to another. However, these theories are controversial within academe and have had little impact outside it.

Theories of war that drove U.S. policy for much of American history have often proved erroneous. Both the left and the right have frequently treated war's causes as a question to be settled by reference to movement dogma rather than by study. Americans have paid in blood for

mistaken policies that stemmed from these errors. On the other hand, social science has made progress on the problem of war in recent years, and this progress may promise better policies in the future.

WAR: EFFECTS OF WAR ON THE ECONOMY

The most persistent and perhaps most important question relating to the effects of America's wars and their related costs on the U.S. economy is whether military expenditures have been a prop or a burden for economic growth. This question has continued relevance because the United States in the 1990s spent a larger part of its gross domestic product (GDP) on defense (3.8% in 1995) than any other G7 industrial nation, almost four times Japan's expenditure and nearly twice as much as Germany's—America's two most important economic competitors. The fact that Russia in the 1990s spent almost three times more of its GDP on defense—and was in economic chaos—only strengthened this concern.

Historians and economists have waxed and waned with regard to the effect of military expenditures on the U.S. economy. Charles and Mary Beard in *The Rise of American Civilization* (1927) and Louis Hacker in *The Triumph of American Capitalism* (1940) argued that the "Civil War destroyed not only slavery but also the Southern slaveocracy, thus allowing the balance of political power to shift to Northern industrialists and hence spurring American economic growth. Prior to these accounts, the classical economists (Adam Smith, David Ricardo, and Thomas Malthus) were concerned with the effects of war on aggregate demand. The eighteenth and early nineteenth centuries saw very high levels of military expenditures in Britain, for example, which these economists believed had a negative impact on industrial growth. The national debts resulting from war, Smith believed, "enfeebled every state ... enriching in most cases the idle and profuse debtor at the expense of the industrious and frugal creditor."

Critics of the capitalist system in more recent years have argued that capitalist societies are prone to periodic stagnation, and that only wars of the magnitude of World War II are capable of curing massive unemployment. Alternatively, liberal economists argue that war, and particularly World War II, was the strongest influence establishing Keynesian economics as a guideline and a justification for U.S. government fiscal policies for the postwar era—policies that led to widespread employment, high earnings, and a modest measure of income redistribution. Even some strong opponents of the "Vietnam War began to argue in the mid-1990s that full employment was only possible in the late 1960s because of that war.

Paul Kennedy, in his widely read *Rise and Fall of the Great Powers* (1987), is perhaps the best known historian for the view that persistent and high military expenditures have played an important role in the relative economic decline of major nations since 1500. In this and subsequent works, he argues that the United States now runs the risk of "imperial overstretch"; that America's global commitments are greater than its capacity to fund them. For him, war is not only a burden, but continuous high levels of defense spending can and generally have turned major nations into minor ones. Although his is a popular view, he had yet to persuade the experts that the United States was well down the road to relative economic decline.

The most sophisticated studies on the prop v. burden issue—whether defense spending contributes to economic growth and well-being by stimulating the economy, or whether defense spending uses up scarce resources or diverts resources into less productive channels—tend to emphasize that growth in the GDP has been rather constant, with little lasting impact from the nine major wars America has fought since independence. Wars temporarily reduce long-run productive capacity by reducing the growth of population and the inflow of immigrants; but the general burden of any given war falls largely on the current generation, according to Chester Wright in a seminal study on the more enduring economic consequences of American wars to 1940. More recently, Todd Sandler and Keith Hartley demonstrated that defense spending generally inhibits economic growth in developed countries by crowding out public and private investment, and siphoning off of R & D resources. Indeed, since the late 1980s, world military expenditures as a percentage of GDP have decreased dramatically without any evidence of harmful effects on the world economy. In truth, the overall economic burden of America's wars is less significant than the inequitable manner in which so much of that burden has been placed upon the working class and those with modest education, while others largely escape or even profit from such wars.

If the effect of military spending during the war years is the most obvious point of impact on the economy, the most lasting one has to do with veterans' benefits paid after the war to "veterans and their dependents. Veterans' benefits have been paid for every war since the American Revolution. They amounted to about two-thirds of the total dollar cost of the "Revolutionary War; more than half the cost of the "War of 1812; and 3.7 times the cost of mobilizing the Union forces in the "Civil War. Surprisingly, these benefits continued to rise for about forty to sixty years after the end of each of these wars and did not cease until well over a century later. Benefits for Civil War veterans and spouses ceased only in the 1980s; World War II benefits will be paid until sometime after 2070. To date, World War II veteran's benefits have amounted to more than \$300 billion, only somewhat less than the original cost of that war in current dollars. Clearly, veterans' benefits have been a major infusion of funds into the economy, and were the major direct federal subsidy to families prior to the welfare state. Compared to other countries, American soldiers and their dependents received benefits much earlier (since 1783) and in more generous amounts than elsewhere. The average payment to a still-living World War I veteran, for example, was \$6,500 in 1992. Confederate soldiers, of course, received no federal veterans benefits, although some southern states sought to add them.

The most troubling problem concerning the impact of war on the economy has to do with rapidly rising public debt. Large but temporary public debts have occurred in all of America's wars; all were paid off in time until the 1970s, when U.S. public debt rose dramatically owing to large defense increases and major tax cuts under President Ronald "Reagan. In the 1990s, U.S. net public debt (most of which is war-related) was at an unprecedented peacetime level. High public debt levels—a problem in all G7 nations—boost real interest rates, retard the accumulation of private capital, and limit gains in living standards, according to the International Monetary Fund. Reducing this unsustainable public debt, the most significant legacy of recent American wars, will be one of the United States's greatest challenges in the twenty-first century.

WAR CRIMES. Defined largely by international treaties, conventions, and tribunals, war crimes generally fall into one of three categories: crimes against peace; crimes against humanity; and conventional war crimes, which involve egregious violations of the customs and "laws of war. They are based on the assumptions that aggressive war and certain actions by civilian officials or military personnel in war can be limited or at least punished.

War crimes differ from conventional military crimes, criminal violations of codes of military law, or military justice prosecuted by a country's military against violators in its own military service. Few countries have tried their own military personnel for war crimes (although armed services have tried their own members for violations which in other circumstances would be called war crimes).

Enemy soldiers and political leaders have long been punished with or without trial by the victors for heinous acts. However, only in modern times have war crimes been formally defined and made statutory offenses. Murder and maltreatment of "prisoners of war (POWs) was declared a crime in 1792 by the National Assembly in Revolutionary France. In the American "Civil War, the U.S. War Department in 1863 issued General Order No. 100, a code of military conduct toward enemy civilians and POWs (drafted by Professor Francis Lieber of Columbia College). During the war, both sides punished some of their own soldiers for military crimes, but only one person was tried and executed for war crimes—Confederate Capt. Henry Wirz, commander of the infamous POW camp at Andersonville, Georgia, who was held responsible for the deaths of thousands of captured Union soldiers.

In the "Philippine War (1899-1902), the U.S. "Army tried several officers by courts-martial for offenses that were violations of the laws and customs of war. There was a congressional investigation of U.S. Army officers for allegedly mistreating prisoners. (Fighting in the Philippines had devolved into "guerrilla warfare not greatly dissimilar to that of the Plains Indians Wars in the United States a few decades earlier.)

The international community began to codify the laws of war in the nineteenth and early twentieth centuries as weapons grew more destructive, mass armies were created, and industrialized warfare began to blur the lines between combatant and noncombatant. The "Geneva Conventions (1864) adopted agreements to protect wounded soldiers; the "Hague Peace Conferences (1899,1907) prohibited the use of certain weapons; subsequent Geneva Conventions in 1906, 1929, and 1949 expanded the laws of war as they applied to civilians, POWs, and sick and wounded military personnel.

In 1919, following World War I, the victorious Allies created a Commission on the Responsibility of the Authors of the War and on Enforcement of Penalties. Article 227 of the Treaty of "Versailles (1919) arraigned the former German emperor, "Wilhelm II, "for a supreme offense against international morality and the sanctity of treaties," and provided for his trial by a special Allied court. But since Wilhelm had abdicated and fled to the neutral Netherlands, which refused to surrender him, the trial never occurred. In Article 228 of the peace treaty, Germany recognized the Allies' right to try those suspected of war crimes (such as the alleged "atrocities in Belgium). The Allies allowed the new Weimar Republic to try the cases. Although the results in the polarized German republic were farcical, the Allied action of 1919 of deciding to hold individuals accountable to an international body set an important precedent.

During World War II, the barbarities perpetrated by Nazi Germany led the Allies in the Declaration of Moscow (1943) to assert firmly that those responsible for atrocities committed during the war would be tried and punished. In August 1944, the Allies signed the London Agreement establishing an International Military Tribunal to try accused Axis war criminals not only for conventional war crimes, such as brutal treatment of POWs, but also for waging aggressive war and committing crimes against peace and against humanity.

The International Military Tribunal, composed of members from Britain, France, the Soviet Union, and the United States, sat in Nuremberg, a former center of Nazi Party activity, from November 1945 to October 1946. The original twenty-four defendants at the "Nuremberg Trials included many of the surviving leaders of the Nazi regime. (Adolf "Hitler, Propaganda Minister Joseph Goebbels, and Gestapo chief Heinrich Himmler had committed suicide.) Only three defendants were acquitted; of the rest, twelve were sentenced to death and hanged (the most prominent among them, Hermann Goering, a longtime Nazi leader and commander of the German air forces, committed suicide by swallowing cyanide hours before he was to be hanged). Three were sentenced to life imprisonment. And four others, including Albert Speer, the armaments minister, were given sentences of ten to twenty years in Spandau Prison, Berlin. Sentences for the indicted German military commanders included: Gens. Wilhelm Keitel and Alfred

Jodi, death by hanging; Adm. Erich Raeder, life imprisonment; and Adm. Karl Doenitz, ten years in prison. In addition, in 1945-49, separate military tribunals by each of the Allied occupying powers tried others accused of war crimes. The U.S. military tribunal meeting in Nuremberg tried another 185 prominent Nazis in that period.

At the * Potsdam Conference in July 1945, American, British, and Soviet leaders had warned Japan that war criminals would be punished. Consequently, in January 1946, an International Military Tribunal for the Far East was established in Tokyo by the Supreme Commander Allied Powers, Gen. Douglas *MacArthur. With judges from each of the eleven countries at war with Japan, the Far Eastern tribunal tried twenty-eight major Japanese military and civilian leaders between May 1946 and November 1948. The most famous defendant was Gen. Hideki *Tojo, prime minister in 1941-44, who had failed in a suicide attempt in August 1945. The others included thirteen generals, a colonel, three admirals, five diplomats, three government bureaucrats, one politician, and an ultranationalist (later declared insane and unfit for trial). Controversially, Emperor *Hirohito, in whose name the war had been fought, was exempted because MacArthur believed his trial would trigger massive Japanese resistance to the American occupation. The court held all except two of the defendants guilty of conspiracy to wage aggressive war and all were convicted on other charges of responsibility for war crimes. Tojo and six others were hanged in December 1948. Sixteen defendants were sentenced to life in prison, one man to twenty years, and one to seven years in prison.

Unlike the Nuremberg Trials, some elements of the Tokyo War Crimes Trials remain legally controversial. One was the conviction and execution of Gen. Tomoyuki Yamashita, who was held responsible for barbarous acts against civilians in the defense of Manila in 1944, despite the fact that he had ordered Japanese soldiers to leave the city in an orderly manner and had no idea the atrocities occurred, and regardless of the fact that most of these barbarities had been committed by naval ground troops not under his direct command. MacArthur and the U.S. Supreme Court refused his appeal.

Above all, however, the Tokyo trials have remained controversial for a version of history that even some of the judges admitted was based on a seriously flawed interpretation of Japanese * expansionism since the late 1920s, blaming it on a conspiracy of the defendants rather than an essentially incremental, *ad hoc* expansionism, vigorously debated within Japan, up to the decision for war with the West at the end of 1941.

The Nuremberg Trials had a profound impact on the evolution of international law and concepts of responsibility for war and behavior in war. The tribunal rejected the argument that the trials were *ex post facto*, asserting that the acts of which the defendants were accused had been considered crimes long before World War II. Furthermore, the results of the trials clearly held individuals, military or civilian, responsible for conduct leading to or during war. The tribunal rejected the contention that the state, not individuals, was responsible for war and other national policies. The tribunal also rejected the defense that the accused were only following orders issued by others. Instead, individuals were held responsible for their actions, although for those found guilty, the tribunal indicated that a person's place in the hierarchy of authority and the nature of

those orders could be considered as mitigating circumstances in the determination of sentencing. Consequently, no one was convicted of responsibility for the German bombing of Allied cities or for waging unrestricted *submarine warfare.

The Nuremberg principles were upheld by the newly formed *United Nations in 1946. Indeed, the UN Charter of 1945 lapsed resort to war to self-defense and to UN actions to enforce international security. In 1948, the United Nations prepared a Convention on the Prevention and Punishment of the Crime of Genocide. In 1968, it adopted a convention that removed the statute of limitations from war crimes and crimes against humanity.

In the postwar period, the international community sought to define and codify by treaty the nature of war crimes. The Geneva Conventions of 1949 listed among what were considered "grave breaches" of the laws of war torture and other inhumane treatment. The 1977 Protocol to the Geneva Conventions of 1949 added making civilian populations or individual civilians the object of attack or launching an indiscriminate attack affecting the civilian population.

The 1977 Geneva Protocol provided for the establishment of fact-finding commissions to investigate reported grave breaches of international law. Some allegations of war crimes have been made since World War II. In the * Korean War, they concerned "death marches," the torture and killing of American POWs by the North Korean military, and maltreatment by Chinese soldiers. In the *Vietnam War, the allusions were to the torture and execution of captive soldiers by the Communist Viet Cong and North Vietnamese and of suspected Communists by the South Vietnamese. In violation of the Geneva Convention prohibitions against deliberately exposing POWs to insults and public curiosity, Hanoi authorities also marched captured American aviators through the streets of Hanoi to bolster North Vietnamese morale. But there were also accusations of atrocities committed by U.S. forces. In the Iran-Iraq War, atrocities were again claimed, including the use of poison gas by Saddam * Hussein's army.

None of these or other accusations led to an international fact-finding commission under the 1977 Geneva Protocol. Rather, if armed forces responded at all to such allegations, they tended to do so by trying individuals in their organizations by court-martial for breach of their own military or civilian criminal law. In 1971, for example, U.S. Army courts-martial tried 5 soldiers for murder and 2 officers for murder and dereliction of duty for covering up a massacre of 347 civilians during a military operation in the village of My Lai in South Vietnam in 1968. Only one, Lt. William L. Calley, was convicted. For premeditated murder, he was sentenced to life imprisonment in 1971, but in 1974 a federal court overturned the conviction. An investigation by the army confirmed that the *My Lai massacre had occurred and been covered up within the division before being exposed in 1969 by some of the American soldiers who saw it.

With the end of the *Cold War, the United Nations began to establish war crimes tribunals to investigate some of the grave breaches of the rules and customs of war in the ethnic and civil wars that erupted during the 1990s. In 1993, the United Nations set up the first UN War Crimes Tribunal in the Hague to try war crimes cases stemming from the civil wars in areas of the former Yugoslavia. In the

"Bosnian Crisis (1992-95), the tribunal indicted several Bosnian Serbs for war crimes—primarily against Bosnian Muslims—including torture and execution of prisoners of war, the forced relocation ("ethnic cleansing") and murder of large numbers of civilians. Several of the indicted were arrested by "NATO" peacekeeping forces, including U.S. troops; however, as late as 1998, the most important of the indicted war criminals, former Bosnian Serb leader Radovan Karadzic, remained at large.

In Africa, as a result of the 1994 slaughter in Rwanda of perhaps 500,000 Tutsi and moderate Hutu civilians and prisoners of war by an extremist Hutu government and military, a UN tribunal sitting in neighboring Tanzania in 1998 handed down the first guilty verdict by an international court for the crime of genocide, and for the first time defined rape as genocidal. Following four years of proceedings, the three-judge court convicted former Rwandan mayor Jean-Paul Akayesu of responsibility for the death of more than 2,000 persons and the rape of dozens of Tutsi women in his city, Taba, even though the actual attacks had been carried out by police officers, soldiers, and Hutu militiamen. The court sentenced him to life in prison.

The UN tribunal dismissed several charges against Akayesu that he had violated the Geneva Conventions on the treatment of victims of war, stating that the mayor was not a military figure who could be held accountable under those treaties. However, the establishment of war crimes trials in the late 1990s for Bosnia and Rwanda clearly marked a pivotal moment in international law and laid the legal groundwork for future war crimes prosecutions in UN courts.

WAR OF 1812. The War of 1812 is often referred to as the United States's second war of independence because, like the "Revolutionary War, it was fought against Great Britain. The Conflict resulted from the clash between American "nationalism and the war Britain and its allies were waging against the empire of Napoleonic France. Many Americans believed that England sought to humiliate the United States, limit its growth, and perhaps even impose a quasi-colonial status upon its former colonies.

Background. Throughout the wars between Revolutionary and Napoleonic France and Great Britain

(1793-1801 and 1803-15), the belligerent powers of Europe repeatedly violated the maritime rights of neutral nations. The United States, endeavoring to market its own produce while also asserting the right to profit as an important neutral carrier in the Atlantic commercial system, was particularly hard hit. In order to man the Royal Navy, British naval officers impressed seamen from American vessels, claiming that they were either deserters from British service or British subjects, irrespective of whether they had been naturalized by the United States. The United States defended its right to naturalize foreigners and rejected Britain's claim that it could legitimately practice impressment on the high seas. Relations between the two countries reached breaking point on this issue in June 1807, when the frigate HMS *Leopard* fired on the USS *Chesapeake* inside American territorial waters in order to remove, and later execute, four of its crew.

The exact number of Americans affected by impressment is difficult to ascertain—American newspapers on the eve of the war claimed that it was in excess of 6,000—and Great Britain and the United States were never able to resolve the dispute. Over time the issue became the most flagrant example of Great Britain's reluctance to respect the sovereignty of the United States, and this was one of the reasons why President James "Madison cited impressment in his 1 June 1812 message to Congress as the first major grievance that had to be settled by war.

Equally offensive to the United States was the British practice of issuing executive orders in council, particularly those of November 1807 and April 1809, in order to establish "blockades of the European coast. The Royal Navy then seized neutral vessels bound for the Continent that did not first call at a British port to pay duties and unload cargo. By these means, Great Britain could simultaneously wage economic warfare against France and control American trade to its advantage. British ministries justified these tactics as fair retaliation against Napoleon's equally anti-neutral Berlin and Milan decrees, promulgated in December 1806 and December 1807, respectively; but American merchantmen suffered more heavily from British seizures than from French, and the administrations of Thomas "Jefferson and James Madison never accepted British blockading practices as valid under the law of nations. It was the seriousness of this dispute that ultimately raised the question of whether the United States should go to war to defend its neutral rights.

At first, the United States responded with policies of economic coercion rather than war. At the suggestion of President Jefferson, Congress passed a series of embargo laws between December 1807 and January 1809. These laws prohibited virtually all American ships from putting to sea and eventually banned any overland trade with British and Spanish colonial possessions in Canada and Florida. Because the legislation failed to change British policy and seriously harmed the U.S. economy as well, it was replaced by the Non-Intercourse Act in March 1809. This measure forbade trade with European belligerents until it was replaced in May 1810 by Macon's Bill No. 2. This law reopened American trade with all nations subject to the proviso that in the event of either France or Great Britain repealing its antineutral policies, the United States would then enforce nonintercourse against whichever nation failed to follow suit by lifting the remaining restrictions on trade.

In August 1810, Napoleon announced he would repeal the Berlin and Milan decrees on the understanding that the United States would also force Great Britain to respect its neutral rights. President Madison accepted this as proof that French policy had changed, and in November 1810 he imposed nonintercourse against Great Britain. He then demanded the repeal of the orders in council as a condition for the resumption of Anglo-American trade. When Great Britain refused to comply, Madison, in July 1811, summoned the Twelfth Congress into an early session in November to prepare for war. After eight months of debate, Congress responded to the president's initiatives by declaring war on 18 June 1812. The decision was bitterly controversial and was carried by Republican Party majorities alone. In the House of Representatives, the vote was 79 to 49 for war; in the Senate, 19 to 3. The Federalists, whose constituents (especially in New England) depended heavily on trade with Great Britain, believed that France had equally offended against American neutrality; they opposed the declaration of war and, thereafter, its prosecution.

Military and Naval Events. The principal theater of operations in the war was the American-Canadian frontier between Detroit and Lake Champlain. Upper and Lower Canada were the closest British imperial possessions that were vulnerable to U.S. military and naval power. The rapid growth of their economies in the early nineteenth century, particularly in the timber trade, had transformed them into a significant resource for Great Britain during its protracted maritime struggle against France; this reinforced the American desire to seize them, and fostered a strategy of invasion. To the extent that the British were able to carry the war to the Americans, it was by sea; thus, especially after the summer of 1814, the theater of operations expanded to include the mid-Atlantic coast and the American territories around the Gulf of Mexico. For this reason, a war that commenced as an invasion of Canada in 1812 concluded in a defense of the city of New Orleans in the early months of 1815.

Over the summer and fall of 1812, U.S. forces, under the commands of Brigs. Gen. William Hull, Alexander Smyth, and Stephen Van Rensselaer, and Maj. Gen. Henry Dearborn, were directed to invade Canada at Detroit, Niagara, and Montréal; but inadequate preparations, poor leadership, and untrained troops undermined the invasions. The British general Sir Isaac Brock, together with "Tecumseh and the Shawnee, Delaware, and other northwestern Indians who had their own complaints about American territorial expansion, captured Detroit in August 1812. In September and October, Brock and Maj. Gen. Roger Sheaffe defeated two American invading armies on the Niagara peninsula, while Dearborn's invasion of Lower Canada was called off after only one minor engagement in November. American efforts made at the same time by Maj. Gen. William Henry Harrison and Brig. Gen. James Winchester to retake Detroit were also unsuccessful; the latter officer surrendered his army to British and Indian forces on the Raisin River in Michigan Territory in January 1813.

The only American victories in the opening months of the war occurred on the ocean as the heavy frigates of the tiny U.S. Navy took to the seas to protect American trade and to harass the vastly superior naval forces of their enemy. In August 1812, the USS *Constitution*, under Capt. Isaac Hull, destroyed HMS *Guerrière*; in October, Capt.

Stephen "Decatur's" USS *United States* captured HMS *Macedonian*; and in December, the *Constitution*, now under Capt. William Bainbridge, defeated HMS *Java* in an engagement off the coast of Brazil.

Between May and November 1813, the U.S. Army attempted to invade Canada across the Great Lakes and down the St. Lawrence River. American forces were successful inasmuch as they captured Fort George and York (now Toronto) in Upper Canada in May, but subsequent efforts to extend American control in the province were thwarted by British victories at Stony Creek and Beaver Dams in June. A major thrust from Sacketts Harbor down the St. Lawrence toward Montréal under Maj. Gen. James Wilkinson was also aborted, first by British resistance at Crysler's Farm in November 1813, then by Wilkinson's decision to end his offensive after learning that he would be unable to join forces with U.S. troops below Montréal. On the northwest frontier, American naval forces under Commodore Oliver Hazard "Perry" defeated a British squadron at Put-in-Bay on Lake Erie in September. Thereafter, Harrison and his U.S. and Kentucky troops were able first to retake Detroit, and then, in October, to destroy the alliance between the British and the Indians with a victory at the Battle of the Thames.

There were no other major American victories in 1813. The Royal Navy avenged the defeats of 1812 by capturing the USS *Chesapeake* in June 1813, and throughout the year British frigates steadily extended their blockade of U.S. ports, annoying coastal communities and disrupting trade. Yet another setback for the American war effort came in the fall of 1813 when "Redstick" factions in the Creek Nation, who like the Shawnees and Delawares had ample grievances against the United States, attacked forts and settlements on the southwestern frontier. Georgia and Tennessee mobilized troops in response and Tennessee forces under Maj. Gen. Andrew "Jackson" eventually defeated the Creeks at Horseshoe Bend, Mississippi Territory, in March 1814.

By 1814, American land forces had improved in both quality and leadership. Disciplined troops under Maj. Gen. Jacob Brown and Brig. Gen. Winfield "Scott" resumed efforts from the previous year to expel the British from Niagara, and between July and September they fought the enemy on even terms in three major engagements at Chippewa, Lundy's Lane, and Fort Erie. But the defeat of Napoleon in Europe in the spring of 1814 allowed Great Britain to send more troops to North America, and by late summer, the United States had to contend with invasions by combined army and navy forces at Lake Champlain and in Chesapeake Bay. Capt. Thomas Macdonough's victory over a British squadron on Lake Champlain in September compelled one invading army to withdraw to Canada. Meanwhile, another British force had taken and burned the White House, the U.S. capitol, and most other government buildings in Washington, D.C. (in August), and a third had occupied the northeastern section of the District of Maine. Efforts to seize Baltimore failed as Maryland militiamen inflicted heavy losses on the British regulars of Gen. Robert Ross, and the harbor defenses of Baltimore withstood a heavy naval bombardment. It was during the shelling of Fort McHenry on 13-14 September that the poet Francis Scott Key composed the work that became "The Star-Spangled Banner" as a tribute to the American defense.

Conclusion. Efforts to end the war lasted almost as long as the conflict itself. Great Britain, in fact, repealed its orders in council in June 1812 before it had learned of the declaration of war, but President Madison decided to continue the struggle in order to obtain a comprehensive settlement of American grievances. For this purpose, he accepted in March 1813 a Russian offer to mediate the conflict and dispatched a five-man negotiating team to St. Petersburg. Britain rejected mediation in July, but later offered to open separate peace negotiations. Madison accepted this offer in January 1814; the opening of the talks was delayed until July, however, because of changes in venue resulting from the defeat of Napoleon. At Ghent, Belgium, Great Britain initially made unrealistic demands, seeking not only to establish a neutral Indian buffer state in the American Northwest but to revise both the Canadian-American boundary and the terms of the 1783 Treaty of *Paris that had established the United States as an independent nation. The United States, which had originally wanted an end to all objectionable British maritime practices and cessions of Canadian territory as well, forbore to press any claims at this time. Its diplomats parried Great Britain's demands until the British ministry, rebuffed by the duke of Wellington (who refused to take command in Canada) and fearing the expense of a long continuation in hostilities decided to settle for a peace based on the status *quo ante bellum*. Between the signing of the treaty, on 24 December 1814 and the time the news arrived in the United States, the last major battle, the Battle of *New Orleans, had been fought on 7-8 January 1815.

Neither the War of 1812 nor the Treaty of Ghent secured American maritime rights on a firm basis; but a century of peace in Europe after 1815 meant that they were not seriously threatened again until World War I. Nor did Great Britain pursue its future disputes with the United States to the point of risking war. And though the United States failed to obtain any Canadian territory, the campaigns of the war destroyed Indian opposition to U.S. expansion on the northwestern and southwestern frontiers. Both the United States and Canada emerged from the war with a heightened sense of national purpose and awareness, and particularly in the American case, the war consolidated the nation's military and naval establishments on more secure bases than before 1812.

In other respects, though, the war was as much a mixed blessing as an unqualified gain for the United States. The immediate domestic impact of the conflict was to heighten tensions between the northern and the southern states, on the one hand, and the Federalist and Republican parties, on the other. These strains became so serious that in November 1814, New England Federalists met in convention at Hartford, Connecticut, to consider measures to nullify the war effort. The ending of the war shortly afterwards left the Federalists marked with the stigma of disloyalty, and this undoubtedly contributed to the party's rapid demise after 1815.

The economic impact of the war was equally complex. The disruptions it entailed on America's international commerce were, to some extent, offset by greater governmental expenditures, an increased demand for domestic manufacturing, and the deflection of capital from shipping to the first large-scale American industries, especially in New England. Yet not all of the resulting gains survived the unstable economic conditions of the postwar period; and

even the American belief that the war marked a significant stride toward cultural, economic, and political independence would ultimately be overshadowed by the *Civil War, which profoundly altered the meaning of all America's earlier conflicts in the shaping of the nation's identity and purposes.

WAR OF INDEPENDENCE. See Revolutionary War (1775-1783).

WAR PLANS. An effective war plan must reflect the goals of the *state and enable a nation's armed forces to fight on favorable terms. Strategic plans have to deal with numerous factors, including force generation, logistics intelligence, the power and intentions of the enemy, and when necessary the strength and interests of allies. No plan can eliminate the unexpected, described by Carl von *Clausewitz as *friction*, and many commanders believe that no plan can survive the first contact with the enemy—when it must be immediately modified. War plans are nonetheless indispensable, both for *mobilization and for establishing the broad outlines of specific military operations. A war plan must not only meet the general requirements of effectiveness but also respond to particular national and historical contexts. U.S. war plans have been in large part shaped by American history and culture, by American attitudes toward war.

Bordered by oceans and militarily weak neighbors, the United States was traditionally safe from invasion. On the other hand, in the early twentieth century the creation of an overseas empire consisting of distant insular possessions posed serious strategic dilemmas because of an American characteristic—popular suspicion of large standing forces, coupled with a reluctance to assume heavy defense expenditures in time of peace.

During most American wars, mobilization took place after hostilities began. In 1812, 1846, 1861, and 1898, Congress declared war and at the same time called for large numbers of U.S. *volunteers to supplement the small regular army. In 1917, the United States declared war on Germany and then instituted *conscription. The nation did maintain large standing forces during the *Cold War, but force levels fluctuated widely in response to particular local conflicts. Moreover, postwar *demobilization was usually quite rapid. In 1945, for example, the U.S. *Army contained eighty-nine divisions; by 1947, the number had fallen to nine, only one of which was combat-ready. After the *Vietnam War, the government not only reduced conventional force levels but also abolished the draft. The

expansion of the "All-Volunteer Force in the 1980s came to an end with the collapse of the USSR in 1991.

Americans have also become fascinated by technology, seeking technological means that will produce "victory with very low U.S. "casualties. Concepts such as strategic aerial bombardment and the "Strategic Defense Initiative (SDI), indicate that the desire for a painless strategy is pervasive.

These considerations have influenced national war plans. From the "Revolutionary War to the end of World War I, war planning, like mobilization, usually took place after war began. In 1846, President James K. "Polk met with his secretary of war and the commanding general of the army to discuss strategy the day after the declaration of war. Both sides in the "Civil War began to devise strategy after the firing of the first shot. In the "Spanish-American War, the navy did have existing war plans, but the army did not.

By the turn of the century, however, the United States had begun to create a prewar planning system. Staff officers at both the Naval War College and the Army War College had among their missions the preparation of war plans. In 1903, Congress established an Army General Staff, and in the same year the government created the Joint Army and Navy Board. The Joint Board was to discuss and reach common conclusions on matters concerning both services, including war plans. The board did not have its own planning staff but acted as coordinating authority for plans submitted by the individual services.

The board did produce a number of war plans—known as *color plans* since potential adversaries were designated by color. However, failure of the two services to agree on their ability to defend a naval base in the Philippines against the Japanese (Orange) soon undermined the board's influence. Presidents William H. Taft and Woodrow "Wilson made little use of the board, which played a marginal role in World War I.

In 1919, the services decided to strengthen the Joint Board by providing it with its own planning staff. The board resumed writing war plans. Some addressed realistic contingencies that could be handled with existing forces; others dealt with major wars and several as training exercises for staff officers. Before the late 1930s, only one plan dealt with a two-ocean war (Plan Red-Orange, against Britain and Japan). In that case, the board concluded that a European foe posed the greater threat; the United States would have to fight defensively in the Pacific until the European enemy was defeated.

The rise of German, Italian, and Japanese aggression and violence compelled the Joint Board to begin contemplating the prospect of a real war against one or more major enemies. The Rainbow Plans (so-called because of the different colors), written between 1939 and 1941, initially focused on defense of the western hemisphere and a war against either Japan or Germany. After the German victories of 1940, America slowly began to rearm and to supply assistance to Britain.

When Franklin D. "Roosevelt was reelected in 1940, the chief of naval operations submitted a paper to the president. Known as Plan Dog, it recommended secret staff talks with the British and a Germany-first strategy in case of a two-ocean war. Early in 1941, American and British staff officers met secretly in Washington. The ABC-1 Conference accepted the Germany-first approach and agreed

to create a permanent structure for Allied decision making. In November 1941, the Americans revised Rainbow-5 into a two-ocean war plan with a Germany-first strategy and a defensive strategy in the Pacific until the fate of Germany was sealed.

The Joint Board also wrote an estimate of requirements for a global war. The army's Victory Program, prepared by September 1941, called for massive forces (a wartime army and air force of 8.7 million men) that would ensure complete destruction of the Axis powers and avoid the perceived mistakes of 1918. For the first time in the nation's history, the United States had established a grand strategy and had agreed to participate in a coalition prior to the outbreak of hostilities.

American and Allied strategy in World War II did not, however, follow prewar plans. The initial success of Japan's offensive forced Washington to commit major forces to the Pacific and to mount major operations in the region. In Europe, British reluctance to mount an early cross-Channel attack and the overriding need to retain Allied unity led to Anglo-American operations in North Africa, Sicily, and Italy. This imposed a long delay on the Allied invasion of France. By June 1944, the United States was waging major offensives in both Europe and the Pacific. Rome fell on 4 June; the Allies staged the invasion of "Normandy on 6 June; and a few days later U.S. forces stormed Saipan and fought the Battle of the "Philippine Sea.

After Japan's surrender and rapid American demobilization, the Joint Chiefs of Staff (JCS, established in 1942 with the Joint Board as its core) began to devise war plans for a possible conflict with the Soviet Union. The JCS presumed that the USSR possessed overwhelming conventional superiority. Since neither the government nor the public was willing to bear the cost of matching Soviet conventional forces, the military planners sought a technological response in the form of "nuclear weapons, the start of a nuclear arms race that would last for half a century.

The arms race in turn spawned a class of civilian nuclear strategists ranging from those who believed that nuclear war was winnable to advocates of unilateral nuclear disarmament. Military planners, however, always presumed that nuclear weapons were war-fighting instruments and made plans to use them in war. From the Pincher Plans of 1946 to the post-1960 Single Integrated Operational Plans (SIOP), targeting was always strategic. The number of nuclear warheads grew from 13 in 1947 to more than 20,000 by the early 1980s. By this time, many thought the United States had an "overkill" capability—more weapons than could be usefully targeted. Elaborate nuclear war plans notwithstanding, Washington and Moscow understood that a nuclear war involving thousands of nuclear explosions on their home territories would be catastrophic.

Moreover, focus on a total war with the Soviet Union and China left the United States unprepared to wage limited war. The nation was not ready for the "Korean War and equally unready for the type of warfare it had to face in the "Vietnam War. Nevertheless, the conventional expansion of the 1980s, designed to fight the Soviets in Germany, was applicable to the "Persian Gulf War of 1991.

After nearly a century of organized war planning, it is clear that the United States had won most of its major wars and worked effectively with allies. Such victories have rested in part on effective war planning. Whether strategic

planners are prepared to face the problems of the post-Cold War world remains to be seen.

The WAR POWERS RESOLUTION was passed by Congress, vetoed by President Richard M. "Nixon on 23 October 1973, and repassed over his veto on 7 November 1973. Enacted in the aftermath of the "Vietnam War and in the midst of the Watergate crisis, its purposes were to check the "imperial presidency" by ensuring that the collective judgment of both the Congress and the president would apply to the introduction of the military into potential or actual combat.

Section 3 of the resolution requires presidential consultation with Congress before sending U.S. armed forces into hostilities. Section 4 requires the president to report to Congress within forty-eight hours after the introduction of U.S. forces into hostilities or imminent hostilities, and every six months thereafter. Section 5 provides that within sixty days after issuing the initial report, the president must receive either a declaration of war or a specific statutory authorization, or else an extension of the sixty-day period; if Congress refuses, the president has thirty days to remove U.S. forces from hostilities. Section 5 also allowed Congress at any time to direct removal of the forces by concurrent resolution. Since 1983, an amendment has specified that removal of forces is directed by a joint resolution that must be submitted to the president and is subject to presidential veto.

Richard Nixon and all his successors have argued that the law undercuts U.S. credibility with its allies, gives adversaries reason to doubt U.S. determination to use force, and infringes on presidential prerogatives. Presidents have routinely ignored, evaded, or otherwise minimized the reach of the law, and by the end of the Reagan administration, Congress had abandoned it.

Federal courts have indicated their doubts about the constitutionality of many provisions of the law in *Crockett v. Reagan*, *Lowry v. Reagan*, *Dellums v. Bush*, and *Ange v. Bush*. The effect of these cases, and congressional unwillingness to use the procedures in the act, has essentially nullified it, although there appears to be significant public support for the concept behind it.

The WAR RESISTERS LEAGUE, an American pacifist organization, was founded in 1923 by Jessie Wallace Hughan, New York City teacher and socialist. Hughan believed the

League should encourage the growth of "pacifism and provide a home for secular pacifists who could not fit into church-based peace groups.

In literature and street meetings, the War Resisters League spread the message that "wars will cease when men refuse to fight." In the 1930s, increasingly alarmed by the rise of fascism and Nazi brutality, the League demonstrated against anti-Semitism and worked to rescue its victims. During World War II, Evan Thomas, himself a resister in World War I, and the brother of Norman "Thomas, Socialist Party leader, chaired the League when many of its male members were enrolled in alternative civilian service or incarcerated for resisting "conscription. Imprisoned members used work stoppages and hunger strikes to protest prison injustices such as racial segregation.

After World War II, the League led demonstrations against continued conscription and for amnesty for conscientious objectors. It also opposed the militarization of America, especially the nuclear "arms race. In the 1950s and 1960s, its members included the writer Grace Paley, folk singers Joan Baez and Pete Seeger, the former Pentagon scholar Daniel "Ellsberg, and the poet Allen Ginsburg.

The League is affiliated with the War Resisters International (WRI), founded in 1921, with current headquarters in London. The WRI has more than seventy affiliates in at least thirty countries. During the 1960s, the War Resisters League allied with other organizations in the civil rights campaign, and it played an important role in the "Vietnam antiwar movement, organizing demonstrations and training participants in nonviolent activism for "peace and justice.

WARSAW PACT (est. 1955). The Warsaw Pact was created by the Soviet Union on 14 May 1955 as a political-military alliance of European Communist states to counter the North Atlantic Treaty Alliance ("NATO), particularly the entry of West Germany into NATO in 1955. Officially called the Warsaw Treaty Organization, the original eight members were Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the Soviet Union. However, unlike NATO, the Warsaw Pact was a multinational rather than a multilateral military defense organization.

Following Soviet suppression of the Hungarian uprising in October 1956, Moscow reduced the influence of the pact's governing body, the multinational Political Consultative Council (PCC), and tightened its own central control. In the subsequent strains, some southern-tier nations withdrew: Albania, which supported China in the Sino-Soviet split, stopped military cooperation in 1961 and left the pact in 1968 (following the invasion of Czechoslovakia by the pact's forces). Romania excluded Soviet troops and refused to participate in military exercises after 1965.

The Soviet Union controlled the alliance, provided 80 percent of the manpower, and bore more than 90 percent

of the pact's defense expenditures for forces, which in the early 1980s reached 5.4 million troops. The USSR alone had "nuclear weapons and strategic forces, and all nuclear warheads were in Soviet custody.

With declining economies, the shift in Soviet policy under reformer Mikhail Gorbachev, and the increasing independence of the East European nations, the Warsaw Pact lost cohesion in the 1980s. In 1987-88, the pact's doctrine was changed from offensive defense to one that emphasized nonoffensive defense. Following a Soviet proposal in 1987, NATO and the Warsaw Pact agreed in 1990 to substantial reduction of forces.

In 1990, responding to popular demand and the ending of the "Cold War, Poland, Hungary, and Czechoslovakia demanded the removal of Soviet troops and refused to participate in future military exercises. East Germany left the pact that year with German unification. The military structure was officially ended by the PCC in March 1991; the political organization was terminated in July 1991.

— John Whiteclay Chambers II

WASHINGTON, GEORGE (1732-1799), "Revolutionary War commander in chief and first president of the United States. Born into a family on the margins of the Virginia aristocracy, Washington advanced rapidly to local prominence owing to his brother Lawrence's brief career in the British military establishment and to Lawrence's marriage into the powerful Fairfax family. Ambitious and intelligent, though lacking formal education, Washington obtained the office of regional militia adjutant, the assignment of warning the French in the Ohio Valley to depart from lands claimed by Virginia, and afterward the position of special aide to Gen. Edward "Braddock. Washington's heroic performance during "Braddock's defeat on the Monongahela helped earn him the command of Virginia's frontier defenses during the "French and Indian War. Hampered by problems of inadequate manpower and supplies, he performed well, though displaying a lack of respect for higher civil and military authority. His regiment won the praise of crown officers for its training and degree of professionalism, although Washington failed in repeated efforts to have his forces taken into the British army.

Washington's drive and determination, essential qualities for any military commander and revolutionary leader, manifested themselves before 1775 in acquiring still other public posts: county surveyor, vestryman, and legislator. As a planter, he had already shown skill in obtaining land before he inherited Mount Vernon after his brother Lawrence's death. Recognizing the hazards of tobacco growing, he profitably converted much of his acreage to wheat prior to the Revolution, and he continued to accumulate western lands through claims based on his colonial military service.

An early critic of Britain's new colonial policy after 1763, Washington strongly supported boycotting British goods and advocated other forms of nonviolent resistance. Beginning in 1774, he played the leading role in organizing and reforming the Virginia militia, and as a member of the

Continental Congress he wore his Virginia uniform to indicate his willingness to serve after hostilities erupted at Lexington and Concord. Because of his military background and experience in dealing with legislative bodies, the highly visible Washington was the obvious choice, and Congress appointed him commander in chief of the "Continental army in June 1775.

Sensitive to "civil-military relations and to the problems of conducting warfare without the resources of a strong government, Washington had learned much since his earlier wartime service in the 1750s. He communicated regularly with the state governors and with the Congress, aware that he was something of a diplomat in a coalition war involving a weak central authority and thirteen sovereign states. His patience and deference added enormously to his stature and respect, as did certain symbolic acts during the war, such as his refusal to accept military pay and his repeatedly expressed wish to retire quietly to Mount Vernon and eschew subsequent honors and office.

During the first major phase of the Revolutionary War, 1775-78, the conflict was fought largely in the northern and middle states, and Washington's immediate command bore the brunt of the British efforts to crack the rebellion. After Washington's siege of the British in Boston, he moved south to meet the enemy at New York in the summer of 1776. His army fought stubbornly but suffered a succession of defeats before Washington retreated and regrouped on the Pennsylvania side of the Delaware River. Counterattacks that picked off British posts at Trenton and Princeton in New Jersey during the Christmas season reinvigorated the American cause, but the army suffered important defeats the following year at Brandywine and Germantown in Pennsylvania. Yet Washington was a fighter, not a Fabian, as often portrayed, and he learned from his mistakes. He kept coming back, as when he battered the rear guard of the British army at Monmouth when it moved from Philadelphia back toward New York in 1778.

With the war stalemated in the North, Washington capitalized on France's entry into the conflict. Since the British dispersed some regiments to the West Indies and turned increasing attention to the American South, Washington spent the next three years keeping close watch on British forces in New York City and endeavoring to keep his own army up to strength, annual tasks that never eased. His opportunity for a bold stroke did not come again until 1781, when he raced south to cooperate with French military and naval forces in capturing Charles "Cornwallis's army on the Virginia Peninsula at the Battle of "Yorktown, 19 October 1781.

Washington's stature actually increased during the war's final two years. He dramatically upstaged a band of conspiratorial officers at Newburgh, New York, in 1783, shaming them for their threatening behavior toward a weak Congress. He also wrote two of the great, if neglected, state papers of the Revolution: his "Circular to the States" on the need for a firmer union, and his "Sentiments on a Peace Establishment," in which he advocated ideas about regular and militia forces that contributed to the debate on national defense in the Constitutional Convention.

Consistently a nationalist in 1775-76, Washington presided at that convention in 1787, threw his weight behind the Constitution's ratification, and accepted (albeit reluctantly) the presidency in 1789, serving two terms. He worked to build a viable peacetime military structure and

federalized the militia to put down the 'Whiskey Rebellion in 1794, at the same time avoiding a war with Britain over neutral rights, a conflict that he considered the country ill-prepared to fight.

Washington always recognized that governments needed power to perform effectively. As general and president, he employed the power available to him but with moderation and restraint. In both his military and his civilian capacities, he set precedents that successful American generals and presidents still follow.

WASHINGTON NAVAL ARMS LIMITATION TREATY (1922). After World War I, fear that an unrestrained naval race would lead to another world war, the corollary hope that arms limitation would ensure peace, and the demand for domestic economy combined to generate the pressures and incentives that led to the Washington Conference of 1921-22, the most ambitious pre-nuclear effort to limit arms in the history of the United States. The conference produced a series of agreements intended to end naval competition between the United States, Great Britain, and Japan, and to stabilize the political situation in East Asia. The Washington Naval Treaty established tonnage ratios for 'battleships and 'aircraft carriers of the United States, Great Britain, Japan, France, and Italy 5, 5, 3, 1.75, and 1.75, respectively. The United States, Great Britain, and Japan also agreed not to build more fortifications on certain islands in the western Pacific.

The treaty powers linked the naval settlement with political settlements reached at the conference. The Nine Power Treaty pledged to uphold the "open door" policy in China, but contained no enforcement mechanism. The Four Power Treaty replaced the Anglo-Japanese Military Alliance of 1902, anathema to the United States, with a diffuse consultative pact between the United States, Great Britain, Japan, and France. Under the Mandates Treaty, the United States recognized Japan's trusteeship over former German colonies in the western Pacific in exchange for a Japanese pledge not to fortify those islands.

Subsequent efforts at naval arms control achieved only modest and fleeting success. The London Treaty of 1930 extended the ratio system to include 'cruisers, destroyers, and 'submarines, but was limited to the United States, Great Britain, and Japan. A Second London Naval Conference (1935-36) ended in failure when Japan refused to accept anything less than parity with Great Britain and the United States. In 1938, the Japanese declined to give assurances that their new super-battleships were within treaty size limits, and efforts to limit naval arms collapsed entirely; henceforth, the United States and Great Britain slowly resumed their major building programs.

Despite the indisputably positive impact of the Washington Treaties on the overall tenor of Anglo-American relations, events largely confounded lofty expectations. The treaties failed to achieve their goal of "positively ending the

arms race," or freezing the naval balance indefinitely. The Japanese kept building warships even when the United States and Great Britain reduced their building programs significantly. According to some scholars (see Kaufman, 1990), America's restraint in naval building during the interwar years enticed the Imperial Japanese Navy to engage in an unrestrained naval race that ultimately culminated in Japan's decision to undertake the attack on 'Pearl Harbor in December 1941.

The political assumptions underpinning the Washington Treaties also proved transitory. China did not develop peacefully as hoped, but descended into chaos that simultaneously frightened and emboldened Japanese militarists. Japanese constitutionalism did not become more robust, but collapsed under the combined weight of the Great Depression and a badly flawed constitution that put the forces of moderation at a severe disadvantage. The determination of Japanese militarists to dominate China made the failure of the treaties inevitable during the 1930s, just as the ascendancy of Japanese moderates who preferred conciliation to conquest had made the treaties' success possible during the 1920s.

Some scholars, among them Emily Goldman (1994), view the Washington Treaties' accomplishments more positively, primarily because they consider that they were essential in averting Anglo-American enmity. There is agreement, however, that the experiment with naval arms limitation made sense during the 1920s when detente prevailed among the United States, Great Britain, and Japan. But such arms limitation became unrealistic in the 1930s, when the United States and Great Britain persisted in such attempts despite the fact that the world situation had manifestly changed for the worse.

WAVES. President Franklin D. 'Roosevelt signed Public Law 625 establishing a program for women in the U.S. Navy, as an integral part of the naval reserve, on 30 July 1942. The navy's newest members served for the duration of the war plus six months. On 2 August, Mildred McAfee, president of Wellesley College, became the director of the navy's female reserve and the first female naval officer with the rank of lieutenant commander. To avoid nicknames such as "sailorette," Elizabeth Raynard, a member of the Naval Advisory Council that developed the women's program, recommended the official nickname WAVES, an acronym for Women Accepted for Volunteer Emergency Service.

Women were recruited from nearly every state. Officers were trained at Smith College in Northampton, Massachusetts. The navy organized training schools for yeomen, radiomen, and storekeepers, located respectively at Oklahoma A&M College, the University of Wisconsin, and Indiana University in Bloomington. In February 1943, a naval station for enlisted recruits was commissioned at Hunter College in New York. WAVES could apply for more billets and were assigned to more locations than their predecessors, the 11,275 yeomen (female) who served

temporarily during World War I. WAVES worked at naval shore establishments across the United States as chauffeurs, cryptologists, recruiters, and stenographers. They also filled nontraditional billets as air traffic controllers, link trainers, mechanics, and parachute riggers. About one-third of the WAVES served in the communications and aviation communities. By 1944, the need to relieve men stationed in Alaska and Hawaii led the navy to amend the original bill that had limited WAVES to duty within the continental United States.

Nothing in the legislation prevented the recruiting of black women, yet the navy did not admit them into the WAVES until 19 October 1944. The next day, the U.S. "Coast Guard also announced that African Americans could join its female reserve program, but the Women's Marines Corps remained all-white until 1949. Two black women, Frances E. Wills and Harriet Ida Pickens, were sworn into the U.S. Navy on 13 November 1944 and were added to the last class of WAVES officer candidates to be trained. Receiving their commissions on 25 December, they became the first black female officers in the navy. The first black enlisted recruits reported to Hunter in January 1945. By 30 July, the WAVES had reached a peak strength of 86,000.

The performance of the WAVES and the other 150,000 women serving in the military services—"SPAR," "WAC (Women's Army Corps), WASP (Women Air Service Pilots), and the U.S. "Marine Corps Women's Reserve—persuaded officials that women should have a permanent place in the peacetime military. Senator Margaret Chase Smith of Maine achieved that goal with the Women's Armed Services Act of 1948. WAVES continued to serve, particularly during the "Korean War and the "Vietnam War. In 1972, Capt. Robin Quigley, assistant chief of naval personnel for women, wrote a memo discontinuing the navy's official use of the term *WAVES*, recommending the more accurate description *Women in the Navy*. This change reflected the navy's policy of integrating women. By then, the women-in-ships program had begun and the aviation community was opening up more jobs to women.

WAYNE, ANTHONY (1745-1796), Revolutionary War general; commander of the Legion of the United States. An imposing Pennsylvanian, Wayne was a commissioned colonel in the "Continental army in 1776 and took part in the unsuccessful American invasion of Canada. Promoted brigadier general in 1777, he served with George "Washington in Pennsylvania, suffering defeat at Paoli on 20 September. He fought gallantly at the Battle of "Monmouth, 28 June 1778; on 15 July 1779, he seized an important British fortified position on the Hudson River, Stony Point, in a brilliantly executed light infantry assault. He suppressed two mutinies among his soldiers in early 1781 before joining the marquis de "Lafayette's army in Virginia and following Gen. Charles "Cornwallis's withdrawal to Yorktown. After the British surrender there (19 October), he commanded troops in Georgia and South Carolina before resigning from the army in 1782.

Frustrated in civilian pursuits, Wayne gladly accepted Washington's offer in 1792 to command the Legion of the United States, with the rank of major general. His mission was to end the formidable Indian resistance in the Northwest Territory. Over the next two years, he created a tough, disciplined army, and—despite secret attempts by his subordinate James Wilkinson to ruin him—decisively defeated a Delaware, Shawnee, and Canadian force at the Battle of Fallen Timbers, 20 August 1794. After establishing a number of military posts, Wayne concluded the Treaty of Greenville in 1795, pacifying the region. He died on duty at Presque Isle late the following year, at the height of his fame. Known for his vanity, fearlessness, and violent temper, he was popularly called "Mad Anthony" Wayne—a nickname that his troops bestowed in admiration of his audacity in battle.

WEAPONRY, EVOLUTION OF. Weapons are instruments designed to harm, kill, or otherwise disable other human beings, to destroy other military resources, or to deter an enemy's ability to make war through the actual or threatened destruction of crucial components of their society. Broadly conceived, weapons include not only the instruments themselves and their munitions but also their delivery vehicles—so-called weapons platforms: "tanks, ships, aircraft, missile launchers. Today, the combinations are often labeled weapons systems.

Because weapons, like other physical objects, operate under natural laws, discoveries in chemistry, physics, quantum mechanics, and other areas of science and technology have helped propel both the industrial revolution and the dramatic expansion of weaponry in the nineteenth and twentieth centuries. Thus, as shown in the accompanying articles on the development of weaponry in the army, marine corps, navy, and air force, the U.S. armed forces have followed and sometimes originated major developments in science and technology.

Improvements in metallurgy, for example, created stronger gun barrels. These could withstand more powerful explosive charges, themselves the result of chemical discoveries. Stronger rifled barrels in turn provided more accuracy and longer range for standard infantry "side arms, "artillery, and "naval guns. Mechanical improvements eventually produced automatic weapons, including self-loading, magazine rifles and "machine guns. The internal combustion engine led to the development of "submarines, "tanks, and aircraft in the twentieth century. At sea, steam power, iron, and steel transformed naval warships in the nineteenth century. Later, submarines were transformed by new alloys, shapes, and nuclear propulsion. Aircraft made the transition from fabric and wood to aluminum in the 1930s, then more recently in some cases to titanium, carbon-fibre composites and high-strength plastics. Experiments in rocketry combined with developments in guidance mechanisms and gas-turbine engines led to jet aircraft and to ballistic and cruise "missiles. Computer technology and electronic sensing and guidance systems have dramatically improved fire control and accu-

racy, leading eventually to "precision-guided munitions designed to make corrections in flight and on final approach to the target.

Weapons of mass destruction are in a class by themselves. Choking and burning forms of poison gas first developed in World War I were later augmented by nerve agents. Stocks of infectious microbes and other toxins were accumulated for "chemical and biological weapons and warfare, but the controversy over the use of Agent Orange and other defoliants in the Vietnam War led President Richard "Nixon to renounce biological and toxin weapons, to begin destroying the stocks of "toxic agents, and to ratify an international agreement prohibiting them. In 1997, the United States ratified a treaty banning poison gas weapons.

The development of nuclear fission weapons and later thermonuclear fusion weapons represented an incomparable revolution in weaponry. Yet their enormous lethality contributed to a universal refusal to use the weapons after the bombing of "Hiroshima and Nagasaki. Thus nuclear weapons have become predominantly instruments of threat, operating in a nuclear strategy described as "deterrence. The proliferation of such weapons to additional countries and possibly eventually to terrorist groups has long threatened to weaken the tabu against their use. Attempts to curtail weapons of mass destruction have been offset in part by the growing lethality and destructiveness of conventional arms.

But the evolution of weaponry has not been simply a narrow history of scientific invention or technological development. Weapons are artifacts both of the armed forces and of the societies that create them. Essential to the conduct of "war, they can in part be understood through the functions they are expected to perform in warfare on the land, at sea, or in the air. But a fuller understanding of their evolution derives from the recognition that their origins and development derive from particular inventions and also from larger cultural attitudes and ideology and political, military, economic and other institutional structures in society which help to define national security and allocate resources for defense.

Technology—the purposeful, systematic manipulation of the material world—encompasses, of course, inventions for both civilian and military use. Increasingly in the past two centuries, radically new science-based technologies—inventions providing new power sources and means of transportation and communication, for example—have had a transformative effect on society, and on warfare. But despite widespread popular belief in technology as a determinative agent of change, indeed as part of the culture of modernity, a debate continues over the inevitability of the social consequences of particular major inventions. While some see technology as a virtually autonomous agent of change, others contextualize it in larger socio-cultural processes. The latter emphasize that material innovation is initiated and developed, or not developed by human beings with particular abilities and resources (the gun was largely banned from feudal Japan, for example, for more than two centuries; see Noel Perrin, *Giving up the Gun: Japan's Reversion to the Sword, 1543-1879*, 1979). Despite the power of a technological development once it has begun, the beginning and end of every such sequence, as Robert L. O'Connell (*Of Arms and Men*, 1989) has said, is a point when human choice can and does exert itself.

Dedicated to the idea of progress and heirs of the En-

lightenment, Americans have traditionally embraced science and technology as instruments for human and material betterment as well as national security. Ingenuity and invention have been valued attributes, protected legally and rewarded economically. All of this encouraged technological development and change.

The military, however, has traditionally not sought nor often welcomed change. Virtually all the most important military devices invented in nineteenth-century Europe or America—the breech-loading rifle; built-up steel, rifled cannon; effective armored warships; the automatic machine gun; the modern submarine—originated with civilians who brought them uninvited to the military. None of the most important weapons transforming warfare in the twentieth century—the airplane, tank, "radar, jet engine, "helicopter, electronic computer, not even the atomic bomb—owed its initial development to a doctrinal requirement or request of the military.

Despite their desire for *more* weapons, most admirals and generals until World War II had been reluctant to adopt *new and unproven* weapons. The U.S. Army initially rejected development of the revolver, the repeating rifle, and the machine gun in the mid-nineteenth century. It suppressed generations of available improvements in artillery in the nineteenth and twentieth centuries. And until the eve of World War II, it delayed development of the tank, which later became its most favored weapon. The U.S. Navy rejected or resisted pivotal inventions by David Bushnell, Robert "Fulton, Samuel "Colt, and John "Ericsson, and it suppressed and sometimes even persecuted such uniformed technological reformers as John "Dahlgren, William Sims, and Hyman "Rickover. Even in its comparatively short history, the U.S. Air Force, with its dedication to piloted planes, initially resisted liquid fueled missiles, solid fuel missiles, cruise missiles, and unmanned spacecraft.

The armed forces tend to be even less flexible than most other large bureaucratic organizations. In part, this results from their compartmentalization, need for standardization, innate conservatism, and the limitations imposed on them by Congress. Partly it is because military organizations, designed to operate at great risk in a medium of enormous uncertainty—the unpredictability and chaos of war—have emphasized discipline and subordination in a rigidly hierarchical command structure. But the reluctance of the military bureaucracy to innovate has other sources as well. Traditionally, it reflected a dedication to an existing weapon already proven in combat and integrated into doctrine and training (and deployed at great expense) over uncertainties about a projected weapon, which might or might not eventually prove itself in combat. The new weapon's failure, of course, might well mean the deaths of many of those relying on it. High-ranking officers with the power to make such decisions often owe their lives and their careers to particular weapons and doctrines. The officer corps of each branch is a community, and as Elting Morison (*Men, Machines, and Modern Times*, 1967) suggests, communities, particularly to the degree that they are autonomous and isolated from external influence, are often resistant to change. Particularly with radical innovation, resistance may stem from concerns about the costs of purchasing an expensive but unproven technology or fears of potential impact upon the structure, status, and traditions of the organization. Officers of the "sailing ship navy in the mid-nineteenth century were correct in their fears

that the replacement of sails by steam propulsion would mean the end to an entire way of life.

Civilian leaders have often been more receptive to radical new weapons technologies than the military. Consequently, uniformed reformers, civilian inventors, or corporate manufacturers have often circumvented the military bureaucracy through political connections. Frustrated, Samuel Colt sent his proposal for underwater mines directly to Congress; Dahlgren took his ideas about a new naval gun to President Abraham Lincoln; and William Sims relayed his proposals for rapid-firing gunnery directly to President Theodore Roosevelt. Less successfully, Billy Mitchell took his case for air power to the public in an abortive attempt to exert public pressure on Congress and President Calvin Coolidge.

Although traditionally not the initiator of new weapons (since World War II, this has been reversed and the military has become the initiator), the military has often been quite successful in developing those that it became convinced were warranted. In time of war or continuing danger to national security, the government has mobilized enormous financial resources for the military, particularly for weaponry. Before World War II, most of America's wars were too short to be fought with weapons other than those on hand or in development at the beginning of the conflict (the lead time on research and development of modern sophisticated weapons can run 15 years or more). The atomic bomb, developed in a massive effort under the supervision of the Army 'Corps of Engineers' 'Manhattan Project in three years (1943-45), was an exception.

Once invented and adopted, military weapons have been produced in the United States either by government facilities or more commonly in the twentieth century by corporate manufacturers under government contract. The new republic used its own national armories at Springfield, Massachusetts, left from the Revolutionary War, and Harper's Ferry, Virginia, newly constructed by 1801. After decades of producing small arms by hand, by 1842 the armories introduced large-scale assembly of muskets from uniform, interchangeable parts. Together with their private competitors, such as Colt's factory in Hartford, Connecticut, the federal armories became important centers of technological and manufacturing innovation, contributing to what arms makers and others around the world soon called the "American system of manufactures." To make cannon, caissons, gunpowder, and other military supplies, the government possessed five federal arsenals, in or near Boston, upstate New York, Philadelphia, Pittsburgh, and Washington, D.C. (with later additions at Rock Island, Illinois, and Fayetteville, North Carolina).

Thus in the nineteenth century, government manufacturing for the military provided a means to continue technological development, when private manufacturers feared uncertain economic returns in a market environment offering large-scale profits for such items mainly in wartime. During the Civil War, the military-run government facilities ran at full capacity while also providing the specifications and techniques for private subcontractors to mass produce arms for the Union Army. The first ships of the U.S. Navy were built in half a dozen private shipyards along the Atlantic Coast in the 1790s. Later government navy yards were erected to repair the fleet and for some new construction, but the Navy Department always relied more on private contractors than on its own yards

for the construction of new vessels whether in the wooden, iron, or steel navy.

After the Civil War, the spending cutbacks and other factors resulted by 1900 in the U.S. Army being a decade behind European militaries in the development of small arms and artillery. The increasing complexity of weaponry in the twentieth century and the possibilities of sustained high economic profits, first in research and development for the navy, then for the air service, and finally for the ground forces, led corporations to become continuing military contractors and the government to phase out most of its own armories, arsenals, and shipyards for conventional weapons. The U.S. government continued, however, to underwrite 'National Laboratories for research and development of nuclear weapons.

Production of weapons has always been profitable for private entrepreneurs in wartime, but the 'Cold War (1947-1991) produced a market of unprecedented duration and size for weapons. Scholars debate the origins of what President Dwight D. Eisenhower in 1961 called the "Military-Industrial Complex," some seeing its antecedents in the steel and steam naval construction program of the late nineteenth and early twentieth centuries others with the nexus established between the army air service, aircraft manufacturers and Congress in the 1920s and 1930s. Whatever the origins, the scale of industrial development and production of weaponry on a sustained basis has grown extraordinarily in the last sixty years, a period when, as Michael Sherry has written, Americans since 1939 lived *Under the Shadow of War* (1995).

The politically influential, triangular relationship between the military, defense contractors, and Congress, meant that a comparatively few giant corporations that dominated the defense contracting industry were essentially guaranteed a sustained market by the U.S. government. During the Cold War, the arms race between the United States and its 'NATO allies and the Soviet Union and the other 'Warsaw Pact nations encompassed conventional and nuclear weapons. The threat of nuclear war and the concept of deterrence meant a sustained condition of constant readiness for war, which led the U.S. military to modify some of its traditional resistance to declaring proven weapons obsolete or at least obsolescent. Instead, in concert with Congress, the Department of Defense kept research institutes, national laboratories, and defense contractors busy with requests for new and improved generations of weapons.

U.S. defense spending for most of the Cold War averaged about 7 percent of the Gross National Product (GNP), surging briefly during the administration of President John F. Kennedy to 10 per cent. As a result for more than forty years, the armed forces exerted an unprecedented continuing influence on the American economy. Domestically, such massive defense spending beginning in 1950 may have helped prevent a post-war World War II depression as followed the cancellation of war orders after World War I, but such continued "military Keynesianism," skewed the operation of the market system in allocation of human, financial, and material resources, a phenomenon, William H. McNeill (*The Pursuit of Power*, 1982) linked to a "command economy" in which the state drives the economy through the development and production of the technology of war.

Such unprecedented defense spending, particularly the

development and acquisition of weaponry, was eventually challenged. Criticism and protest against certain weapons systems was hardly new. Theodore Roosevelt's battleship building program had been curtailed by public and congressional outcries against its cost. Immediately after World War I, big business joined the peace movement in stopping a second naval arms race. Development of chemical weapons was restrained in the 1920s by public outrage on moral grounds as well as protests from old-line army leaders on the basis of tradition and ineffectiveness. In the 1950s, "nuclear protest movements lobbied for restriction or elimination of nuclear weapons on various grounds: moral, health, ecological, and humanitarian. Such protests helped produce in 1963 an end to the testing of nuclear weapons above ground (with its airborne radioactive fallout). The "SALT Treaties (1972, 1979) and the "START negotiations reversed the nuclear arms race even before the end of the Cold War in 1991 (indeed the end of the Cold War has paradoxically made it difficult to complete START). The general downturn in arms expenditures, both in the United States and the world at large, began in 1987, before the final collapse of the Soviet Union and the official end of the Cold War.

The "Vietnam War (1965-73) divided Americans and raised questions about failure of the U.S. military. Americans' belief in technological progress was also challenged by a series of setbacks including problems with nuclear energy plants and the space program as well as increased concerns about environmental and health damage from new technologies and their products. These contributed to some skepticism about technological progress and inevitability and a belief that politics, markets, and organizational structures could also condition outcomes, implying that some aspects of technological development can be controlled by political and economic decisions.

Militarily in the 1960s and 1970s, rapidly rising prices and the clear numerical superiority in conventional forces in Europe of the Warsaw Pact ignited major debates in the United States over the armed forces, their force structure, strategy, and weaponry. These debates involved issues of military effectiveness and also of civilian contractors' cost-overruns, waste, fraud, and abuse, revealed in congressional and journalistic investigations.

A military reform movement, originating in a controversy over a new fighter plane for the air force, began a debate which spread through Congress and each of the services, prompting a searching examination of the Cold War focus on new, larger, more sophisticated, and more expensive weaponry. It raised the possibility of less expensive yet adequate alternatives, many small "aircraft carriers instead of a few supercarriers, for example, or a single type of "fighter aircraft that could be used with modifications by the air force, navy, and marines. The reformers liked to point out that cutting-edge technology was not always the most appropriate, not always decisive or even victorious in war, as evidenced arguably by the failure of the Germans in Russia in World War II, the French and Americans in Vietnam, and the Russians in Afghanistan.

Beginning in 1979, Soviet actions and resurgent anti-communism in the United States led President Jimmy "Carter reluctantly and President Ronald "Reagan enthusiastically to increase U.S. defense spending dramatically. The Reagan administration achieved the largest peacetime military buildup in U.S. history (approximately \$2.4 tril-

lion spent overall in 1981-89). The focus was on weapons, and each military service obtained long-delayed and often controversial weapons systems, including the B-1 bomber, the MX intercontinental ballistic missile (ICBM), new vehicles and helicopters, the Trident II submarine-launched ballistic missile (SLBM), and many new warships to build toward a goal of a 600 ship navy.

The escalating arms race and the bellicosity of the Reagan administration triggered considerable opposition. The largest protest demonstrations since the Vietnam War failed to prevent the deployment of new, nuclear-tipped, intermediate range ballistic missiles in Europe. But dissent within the scientific community and skepticism in the media limited research on President Reagan's proposed missile defense project, the "Strategic Defense Initiative (SDI), known as "star wars" after a popular science fiction movie of the time. Debate continues over the reasons for the collapse of the Soviet Union in 1989-91. Some link it to economic pressures resulting from the arms race resumed by the United States a decade earlier; others attribute the failure to accumulating systemic problems in Russia and its empire.

In the U.S. armed forces, the reform plans of the 1970s and the buildup of the 1980s produced American forces in Europe which had shifted from a strategy emphasizing overwhelming firepower including nuclear weapons to the "AirLand Battle" focusing on more effective use of conventional air and ground forces to outmaneuver and defeat the greater numbers of the Warsaw Pact. Modified for different conditions, the concept and weapons were used successfully in the "Persian Gulf War in 1991. Its aircraft and precision-guided munitions were employed again in the "Kosovo Crisis of 1999.

The end of the Cold War in 1991 did result in cutbacks in defense spending, even if not as much as many had expected. Although some defense contractors went out of business, merged, or shifted to other production, a military-industrial complex, decidedly smaller, continued to exist. The American market had shrunk. U.S. defense spending in 1995 was down to 4.3 percent of Gross National Product. Defense contracting still remained lucrative to some, however. At beginning of 2000, Lockheed-Martin and Boeing were competing against each other for the largest military contract in history, nearly one-third of a trillion dollars, to design a Joint Strike Fighter plane, capable with modifications of serving the needs of the air force, navy, and marines, and to build 5,000 them, replacing most of the existing fighter planes (not the F-15s or F-18s, however) in the U.S. armed forces.

American defense contractors also turned again to foreign markets. There, limited only by certain legal constraints designed to keep the most sensitive military secrets secure from potential enemies (a continuing challenge), they competed with other arms makers. In the international arms marketplace, the new weaponry was often valued as much for the prestige that such weapons, for example, the latest most sophisticated fighter planes, seem to provide for a nation and its government and armed forces as for their contribution to that nation's security.

In the U.S. experience, as Alex Roland suggested (*Journal of Military History*, 1991), the development of military technology in relationship to strategy and to ground warfare, for example, has been shaped in part by fundamental American views and practices as well as the technology

itself. The value put on the individual human life and labor of U.S. citizens, a concept rooted in early labor scarcity and reinforced by American democracy, has contributed to an emphasis on citizen-soldiers, trying to protect them against usually greater enemy numbers through superior technology, especially weapons of greater firepower and accuracy. Additionally, fear of standing armies and an insistence on civilian control of the military, a reaction to British policies, contributed, directly through the Constitution's two-year limit on military appropriations, to inhibiting long-term development projects for the army. The navy and the air force are by definition technology-dependent services and have required by necessity long-term development of their ships, planes, and missiles.

For most of the nineteenth century and even the early twentieth century, the United States enjoyed freedom from threats of sudden attack by a foreign foe. This allowed the nation to be generally free from the need to prepare massive ground forces or to some extent even major naval forces in advance of war. In concert with foreign policies of "neutrality and "isolationism, the majority of Americans came to view this situation of comparatively free security as a natural condition for the United States. With the exception of certain expansionist-minded industrialists and navalists at the turn of the century, no influential group saw the need or desirability to have large and expensive stocks of the latest weapons on hand. To convince Americans to build one of the largest navies in the world at the turn of the century, navalists like Theodore Roosevelt, had to link the gleaming battleships and armored cruisers of the "Great White Fleet" with the prestige of the world's newest and most powerful industrialized nation.

The era of comparatively free security was suspended with the Japanese attack on "Pearl Harbor and U.S. entry into World War II, and it certainly stopped for nearly half a century during the Cold War. The commitment to containing the threat from the Soviet Union and communism, meant the development of a sustained, enormous market for weaponry, which was supplied by American defense contractors.

American decisions in the Cold War to push for the most advanced technologies and to build big, sophisticated, expensive weapons, however, over more smaller, less complex weapons, even if it meant fewer rather than more weapons, involved many factors: military, economic, political, and also cultural. For such decisions, like those at the turn of the century to build more battleships and fewer smaller warships like submarines and "destroyers, can also reflect images of national identity. As the "Great White Fleet" was said to represent America's emergent status as a "world power," so the giant "bomber aircraft and supercarriers of the Cold War reinforced its image as the leader and protector of the "free world." Even after the end of the Cold War, as economic competition surpassed military conflict as the primary continuing concern of industrialized nations, the image of America's most sophisticated weaponry—the "Stealth aircraft and precision-guided munitions were most prominent at the end of the twentieth century—remained linked in many minds to the prestige of the United States.

Yet for purposes of self-image as well as self-interest, Americans have sometimes sought to limit the development of certain weapons. The United States, for example, curtailed battleship development in the "Washington

Naval Arms Limitation Treaty of 1922. It restricted aspects of the development of nuclear weapons in the "Limited Test Ban Treaty of 1963 and the Comprehensive Test Ban Treaty signed in 1996 (although still not ratified in the summer of 1999). There was also a major international movement to ban the use of land "mines, but because of their use to defend South Korea and the U.S. naval base at Guantanamo, Cuba, the U.S. government had not yet joined the international agreement to prohibit land mines as the century ended. Some attempts were made to limit weaponry in outer space, but such technology has grown dramatically since the late 1950s, particularly the increasing use of military satellites in earth orbit. The development of weapons systems for attacking satellites and proposals for ballistic missile defense systems such as SDI have extended the dangers of warfare to outer space.

At the dawn of the twenty-first century, future directions of weaponry and warfare are unclear in the post-Cold War world and the military missions of preparing for regional and littoral conflict, anti-terrorism, and peacekeeping operations. But requests from the U.S. military for satellite global positioning systems, microcomputers, superconductors, fiber optics, and biotechnical materials suggest that the cyber revolution has led to new forms of vulnerability, for example, the electronic network upon which postmodern societies and their military depend. Such dual-use technology also suggests the degree to which the American economic and technological infrastructure has come to be seen as a backbone of national security. Whatever the weaponry of the future, decisions about its development or nondevelopment will be shaped by technological innovation and by cultural attitudes and political, economic, and military institutions as well as dominant perceptions of the international situation.

WEAPONRY, AIR FORCE. One of the principal tasks of an air force in war is the destruction of selected enemy targets. In the achievement of this aim, air force weapons have evolved from hand-held guns and *bombs into a vast inventory, which includes rapid-firing cannon, guided *missiles for use against air and surface targets, "smart" bombs, weapons dispensers, mines, and cruise and ballistic missiles.

Americans were the first to take weapons into the air in heavier-than-air flying machines. In June 1910, Glenn Curtiss, flying his "Golden Flyer" biplane, aimed tennis ball-sized dummy bombs at a target shaped like a battleship. The following year, Lt. Myron Crissy dropped small high-explosive bombs by hand from a Wright biplane during army exercises near San Francisco. The first shots were fired from an airplane in August 1910, when Lt. Jacob Fickel aimed a rifle from the leading edge of a Curtiss biplane's wing and hit a small ground target. In June 1912, Capt. Charles Chandler successfully air-tested a Lewis machine gun mounted on a Wright B Flyer at College Park, Maryland.

The high command remained generally unimpressed by these unofficial experiments. As a result, American development of the air weapon was neglected before 1917 and the U.S. Army Air Service entered World War I with almost no combat capability. American squadrons in France had to use British or French armament and equipment, even though one of the most effective Allied weapons was the Lewis gun, an American design manufactured in Europe. By the end of the war, an excellent lightweight machine gun, the Browning, was in production in the United States, but too late for combat.

Between the wars, most advances in airborne weapons design were led by Germany and the Soviet Union; elsewhere progress was relatively insignificant. The U.S. Army Air Forces entered World War II using weapons that were mostly updated versions of those available in 1918. The majority of combat aircraft carried *machine guns of 0.3-inch or 0.5-inch caliber, or 20mm cannon. The 0.3-inch gun was found to be generally inadequate, but the higher calibers proved effective against enemy aircraft and soft-skinned surface targets. A 75mm gun was fitted to a few B-25 medium bombers for attacks on shipping, and some *bomber aircraft also carried *torpedoes. (The air force still retains a commitment to support naval operations by minelaying.) During the latter part of the war, tactical aircraft began to attack surface targets with unguided rockets.

The principal American bombs used in World War II were high-explosive, weighing from 100 to 4,000 pounds, and small incendiaries, usually of 2.2 pounds. The devastating effect of these unsophisticated weapons delivered in large numbers was exemplified by the destruction of cities like Hamburg, Dresden, and Tokyo. Some attempts were made to use radio-guided bombs against pinpoint targets, but the experiments were not generally successful. Although the war did see considerable development in aerial

weapons, the only revolutionary change in weapons technology came in 1945, with the B-29 atomic bombings of Hiroshima and Nagasaki, which effectively destroyed both cities and ended the war in the Pacific. The debate over the morality of *nuclear weapons has persisted ever since.

The *Vietnam War highlighted both the folly of attempting close political management of the air campaign and the inefficiency of using massive weights of free-fall ("dumb") bombs, including huge quantities of napalm, against a relatively unsophisticated but well-armed enemy. Such notable successes as were achieved from the air were mostly associated with the advent of the first reliable guided ("smart") weapons. (The Than Hoa Bridge near Hanoi defied over 800 "dumb" attacks, but was destroyed by four F-4 Phantoms on the first sortie with "smart bombs.")

Since the Vietnam War, air force weaponry has increased greatly in variety and power. None of the weapons are entirely new in concept, but technological advances have dramatically improved their accuracy and effectiveness. Large stocks of free-fall nuclear, chemical, and high-explosive bombs are retained. The high-explosive types, including cluster bomb units, can still be used to considerable effect—during the "Persian Gulf War they were deployed by B-52s against Iraqi troop concentrations—but the proportion of guided weapons in the inventory is increasing as guidance systems become smaller and cheaper. As the Gulf War demonstrated, munitions guided by *radar, infrared, or electrooptical (TV and laser) systems greatly enhance the effectiveness of attacking aircraft, one bomb often accomplishing what would have taken hundreds in World War II. The precision of the initial air assault on Iraq in 1991, although not as accurate as was first thought, was still such that the national command and control system was devastated within hours. Guided high-explosive bombs can be extremely effective both tactically, in providing support to surface forces, and strategically, against the fabric of an enemy state.

Short-range air-to-surface missiles, some introduced during the Vietnam War, carry high-explosive warheads and are used by tactical aircraft against pinpoint targets. Similar weapons are available for use against shipping. The next generation of these missiles, with improved "seeker" heads and employing "stealth" technology, should be operational by the end of the century.

Although they represent the ultimate in destructive capacity, in the aftermath of the "Cold War the air force's nuclear weapons occupy a less commanding position than previously in American airpower doctrine. Nevertheless, the air force retains the capability to deliver nuclear warheads of varying yields both as free-fall bombs and in guided vehicles. B-1, B-2, and venerable B-52 bombers carry cruise-guided missiles, which can be launched at ranges of less than 100 to over 1,000 miles from their targets. The air force is also responsible for the intercontinental ballistic missiles deployed in silos in the western United States. During the Cold War, these various nuclear weapons were central to the policy of "deterrence employed in containing the Soviet Union. They still have an important if less well defined role in deterring international aggression at the highest level.

The primary air force weapons in air-to-air combat are guided missiles, typically using infrared or radar homing and achieving in-flight speeds of up to Mach 4. Some are

designed for relatively short ranges, others can be fired at targets more than thirty miles away. The guided missile is now sufficiently reliable to be dominant in air-to-air combat, but guns are still mounted in aircraft like the F-15 and F-16, and will be fitted to the next-generation air superiority fighter, the F-22. They are retained because they are effective at very close range, relatively cheap, and, once fired, "dumb" bullets cannot be fooled by enemy countermeasures. Modern fighter aircraft guns are usually multibarrel weapons of 20-30mm caliber, in which several barrels rotate in "Gatling gun style. Rates of fire can reach over 6,000 rounds per minute, with muzzle velocities of 3,400 feet per second. The combination of these weapons is intended to ensure that air superiority can be achieved by U.S. fighter aircraft wherever required in future conflicts involving American forces.

WEAPONRY, ARMY. The technology of war can best be examined in the light of two interrelated triangular relationships. The first of these is Carl von Clausewitz's curious trinity of reason, chance, and violence, which are respectively manifested by the government, the army, and the people. Although Michael Handel (1986) has argued that twentieth-century warfare demands that technology be added as a fourth pole to the Clausewitzian paradigm, it is far more useful to think of it as an implicit factor in each. This interpretation was suggested, though not specifically addressed, by Alex Roland (1991), who argues that technology is a paradoxical factor in the American military experience. It lurked within each of several enduring issues of that experience before World War II and has tended to obscure them since. In turning from politico-strategic questions on the nature of "war to the operational and tactical issues of combat itself, however, there is no such ambivalence. Here, technology is clearly a major ingredient of a long-standing triad of men, ideas, and weapons. How armies have or have not been able to balance the relations among these three factors and adapt them to particular circumstances of terrain and adversary has almost always been a major determinant of their "combat effectiveness. In short, though weapons themselves are usually not decisive in warfare, they constitute a significant and at times crucial component of a larger framework.

The development of army weapons progressed through three overlapping but fairly distinct periods: the craft era, from the colonial period through the early nineteenth century; the industrial era, from the early nineteenth century through World War II; and the technological era, from World War II to the present.

The Craft Era. The early colonists were armed with weapons made by small groups of craftsmen. The necessity for these weapons was driven by the need to tame a wilderness inhabited by natives not amenable to conversion. The

colonists originally armed themselves with armor and pikes, which soon proved their lack of utility in hostile terrain against bows and arrows. Matchlocks worked somewhat better, but their unreliability, particularly in wet weather, led to the development of flintlocks, the most famous of which was the "Pennsylvania" or "Kentucky" rifle. The serious role of individual armament in colonial society was evident in legislation prescribing the weaponry each militia soldier had to provide and in the establishment of public arsenals to supplement the supply of private arms.

At the beginning of the "Revolutionary War, weapons were a major concern. The scarcity of powder caused Gen. George Washington great anxiety; small arms were often defective; and "artillery was almost nonexistent. Powder was at a premium throughout the Revolution, but the combination of a number of small mills in patriot hands and imports from France kept the supply adequate. Muskets were in short supply in the New York campaign of 1776, but the militia's practice of retaining their personal weapons put a number of British army "Brown Bess" muskets in American hands, which were supplemented as the war progressed by importing French Charlevilles. Thus, throughout most of the war, both the "Continental army and the militia were supplied with adequate individual weapons equal in quality to those of their British adversaries. The one unresolved deficiency, common to almost all revolutionary armies, was that the wide variety of types greatly complicated problems of maintenance and supply.

The lack of artillery was made good by the boldness, initiative, and genius of a single individual: Henry Knox. Knox not only captured Fort Ticonderoga; he transported some sixty liberated guns by sled to Washington's army. He also developed improved carriages that allowed light guns to accompany troops into battle, giving the Continentals a decided tactical advantage at the Battles of "Trenton and Princeton. The American Revolution was not won by superior weaponry, but it would not have been won without a usually reliable supply of adequate weapons—the best that a craft system and human ingenuity could produce.

The Industrial Era. Daniel Shays's "Rebellion of 1786 demonstrated the weakness of the Articles of Confederation and led the new Constitutional government to provide more effectively for the common defense. One of its provisions was the establishment of government arsenals for the manufacture of powder, small arms, and gun carriages. At least equally significant, perhaps more so, was its policy to issue contracts for weapons manufacture. This sponsorship did a great deal to nurture the idea of standard manufacturing processes and the concomitant concept of interchangeable parts, particularly in the case of the most notable weapons contractor, Eli Whitney. Like the Revolutionary War, the "War of 1812 was not won by superior weapons. It did, however, bring to an end an almost two-century period of concern with national survival, ushering in a century of virtual freedom from external aggression and violence. It also demonstrated the utility of standardized weapons manufactured to government specification.

By the "Mexican War of 1846, American troops were supposed to be armed with the 1841 percussion musket, but many still carried flintlock models of 1822 and 1840. Despite their standardization and the increased reliability of the percussion cap over the flintlock, each of these

weapons shared two common characteristics with their Revolutionary War forebears: a smoothbore, and an effective range of about 100 yards. American artillery employment, however, had advanced dramatically. At the Battle of Palo Alto, Maj. Samuel Ringold demonstrated that light artillery maneuvered aggressively in the defense could break up an infantry attack made by superior forces.

On the eve of the "Civil War, many American officers thought Ringold's tactics could be used in the attack as well as the defense. This calculation was upset by a significant advance in small-arms technology: the development for the rifled "musket of a lead projectile—the minie ball—that expanded into the grooves of the rifling and spun out of the barrel with a stability that made it accurate to ranges of up to 500 yards and lethal up to 1,000. This capacity, combined with developments in artillery that allowed it progressively to engage attacking infantry formations with rifled shell, solid shot, and canister, tilted the tactical equation firmly in the favor of the defense.

The weapons issue during the Civil War thus quickly became which side could arm itself with the most rifles and artillery pieces the fastest. The Confederacy was at a decided disadvantage. But the capture of the manufacturing capacity of Harpers Ferry; the expansion of factories in Richmond and Fayetteville, North Carolina; and the limited importation of weapons from Europe allowed it to arm the men available for "mobilization and to develop ratios of artillery pieces to soldiers roughly comparable to those of the Union. The problem, of course, was that in absolute terms the Confederacy was significantly outnumbered. The South produced 600,000 rifles during the course of the war; the North imported about that number and manufactured another 1,700,000. Neither side solved the tactical problem of countering the power of the defense. This led to horrendous "casualties, which, in the long run, the Union could afford to absorb better than could the Confederacy. It would be foolish to argue that the Union prevailed simply because of numerical superiority. Nevertheless, the American Civil War was demonstrably the first war whose outcome was significantly influenced by the relative industrial capacity of the two sides to produce weapons.

This lesson, however, was soon forgotten. After a long period of constabulary duties, a short war with Spain, and a punitive expedition into Mexico, the U.S. Army found itself almost completely bereft of the tools of modern warfare.

In 1917, when the United States entered World War I, American soldiers were armed with the very effective "Springfield Model 1903 rifle; but there were only 890,000 in the arsenals. They also possessed in the 3-inch gun an artillery piece comparable in quality to the French 75mm. Here, too, the problem was one of supply. Of the roughly 2,250 artillery pieces in the hands of the "American Expeditionary Force in 1918, only 100 were made in the United States. The U.S. Army had not neglected the machine gun, and the "Browning Automatic Rifle was among the best in the world. But it was in short supply as well and not issued to divisions departing for France until July 1918. "Tanks were another problem entirely. All U.S. tank units were equipped with French tanks; even so, both British and French tank units were needed to help support the American infantry. In short, though the U.S. Army provided a much needed infusion of manpower to the Allied cause in

World War I, its lack of suitable weapons placed a significant constraint on its "combat effectiveness.

The period between the wars was ambivalent. On one hand, a combination of severe resource deprivation and military conservatism inhibited the army from developing a modern force. Tank development languished and operational concepts of armored warfare were constrained by an infantry-artillery mind-set. On the other hand, the army consciously studied the question of industrial mobilization; further refined its relatively progressive education system, which encouraged its small officer corps to study issues of large-scale war; and developed a sophisticated system for artillery fire control.

Nevertheless, the U.S. Army entered World War II in 1941 unprepared. Troops deploying for the "North Africa Campaign were issued antitank rockets, known as bazookas, with no previous instruction as to their technical or tactical employment. At the Battle of Kasserine Pass in February 1943, the light and medium tanks of the First Armored Division, armed with 37mm and low-velocity 76mm guns, respectively, were devastated by the heavier-gunned, better-protected, and more skillfully employed Panzers and antitank guns of Erwin "Rommel's Afrika Korps. The American 37mm tank destroyer was an equal disappointment. The one bright spot was the Garand "M-1 rifle, which proved to be a superb infantry weapon throughout the war.

By late 1944, things had changed. Although the Sherman tank was still outgunned by the German Tigers and Panthers, the tank destroyer's armament had been enhanced to 90mm and its role changed from offensive to defensive, recognizing the tank as one of the principal "anti-tank weapons. Equally important, through trial and error, American units had significantly enhanced their techniques of combined arms tactics. After the initial surprise wore off in the Battle of the "Bulge, U.S. troops stopped the Germans in their tracks with the sophisticated integration of rifle and machine-gun fire; land "mines; tank destroyers; tanks; and closely coordinated volleys of accurate artillery, augmented by "radar-controlled fuses. Furthermore, all were in adequate quantity. The last observation raises an important point. It is possible to argue that the United States won the war solely through the might of its industrial capacity. However, with the exception of tank development, which never really caught up to the demands of European warfare, the American soldier was well armed; and, of equal significance, by the end of the war his tactics were as good as his weapons.

The Technological Era. World War II marked a watershed in the U.S. Army's approach to weapons. Technological breakthroughs such as high-frequency radio, radar-controlled fuses, and shaped-charge antitank munitions had clearly demonstrated the benefits of scientific advances for ground warfare. Yet the army's initial postwar experiences were disappointing.

In June 1951, Task Force Smith, a battalion-size force commanded by Lt. Col. Charles B. Smith, deployed to the "Korean War with an inadequate number of World War II weapons. Its antitank capacity was nonexistent: it had no mines, no recoilless rifles, no tanks; and the rounds from its 2.36-inch rocket launchers failed to penetrate the North Koreans' Soviet T-34 tanks just as they had failed to penetrate the German's Tigers. The task force's Company K carried two 81mm mortar baseplates and two tubes, but

lacked both bipods and sights. It soon lost radio contact with its supporting artillery and was forced to conduct a hasty withdrawal. After a seesaw battle up and down the peninsula, the lines stabilized. Gen. Matthew B. "Ridgway" refused the Eighth Army with a fighting spirit that employed massive amounts of air and artillery, combined with aggressive infantry tactics to take the high ground. The war ended in a stalemate that was driven primarily by the exigencies of limited war in the nuclear era.

These same constraints shaped the war in Vietnam. But the "Vietnam War was also affected by the army's checkered weapons development and lack of operational acumen. The infantryman's principal weapon was by now the "M-16 rifle. It had the advantage of either semiautomatic or automatic fire, but its fine tolerances made it unsuitable to a jungle environment. "Helicopters provided an initial advantage in tactical mobility, but this advantage dissipated as soon as infantrymen dismounted. The artillery used improved versions of the 105mm and 155mm howitzer of World War II. The "beehive" canister round was devastatingly effective in repulsing enemy attacks, as were large volumes of indirect fire. But the artillery's overall effectiveness was hostage to the willingness of Viet Cong and North Vietnamese units to present suitable targets, which they tended to do only if they could gain the element of surprise. This led to development of sophisticated instruments for locating enemy units in "jungle warfare. Never very effective, the effort caused U.S. Army leaders to become extremely interested in sensor and "heat-seeking technology.

This interest paid off handsomely in the post-Vietnam reform era. After surveying the Arab-Israeli War of 1973, the U.S. Army promulgated a concise and startling epigram: What can be seen can be hit; what can be hit can be killed. It also worked consciously to fashion its doctrine, training, education, and equipment to repulse a Soviet offensive into Western Europe. The equipment manifestations were the Bradley infantry fighting vehicle; the Abrams tank; the multiple launch rocket system; the Blackhawk and Apache helicopters; and a sophisticated sensor and information distribution system, developed in conjunction with the air force. Rather than being employed on the plains of Europe, these weapons were used in the 1991 "Persian Gulf War to liberate Kuwait. And although one must note the ineptitude of the Iraqi High Command, a strong argument can be made that Operation Desert Storm represents a case in which an adequate number of superior weapons in the hands of well-led, well-trained troops indeed helped to turn the tide of battle.

Conclusion. The experience of U.S. Army weapons development has been at best uneven, with World War I representing the nadir and the Gulf War the apogee. The key variables appear to have been the American people's willingness to provide for the nation's security; the government's ability to articulate a convincing rationale for such provision and to channel America's productive capacity; and the army's foresight in war preparation and acumen in war conduct. In other words, with minor adaptation, Clausewitz's trinity retains its explanatory power. The future of army weapons development rests on how well these elements are kept in balance with each other and with the exigencies of a constantly changing world.

WEAPONRY, MARINE CORPS. The Marine Corps from its beginnings was smaller in numbers than other services and was often thrown into action against larger forces. This fact led to a constant search for superior firepower. The result was adoption of more effective weapons ahead of both enemies and sister services.

During the "Revolutionary War, the Continental Marines were armed with British and French muskets of the day. These were variations known as "sea service" models. They were shorter for use in tight spaces aboard ship and aloft, with brass fittings, and the barrel and lock were tin-plated to resist corrosion from salt air and spray. Use of these arms continued well into the nineteenth century, with new developments such as percussion cap locks replacing flint ignition and rifled barrels replacing smoothbores. The Hall breech-loading rifle was used in a 1832 campaign against pirates in Sumatra. Early models of Colt revolving rifles were used in the Seminole Wars of the 1830s.

During the "Civil War, in addition to obsolete Springfield rifled "muskets, Spencer seven-shot repeating rifles (tin-plated for sea service) were used, as well as single-shot Sharps rifles. After the Civil War, many breech-loading and repeating rifles were tried, including the Remington rolling block and the five-shot Remington-Lee bolt action; the army's single-shot "trapdoor" Springfield was finally adopted. The multibarreled, hand-cranked "Gatling gun provided additional firepower during the 1870s to 1890s.

The development in the 1880s of smokeless powder of greater power enabled the firing of smaller (6mm to 8mm or .24- to .31-caliber) bullets at much higher velocities and thus greater ranges. The Marine Corps adopted the Winchester-Lee "straight-pull" five-shot rifle and the Colt-Browning machine gun in 1895, both firing 6mm cartridges. Marines fighting in the "Spanish-American War (1898) were armed with these weapons. In 1900, the accurate .30-caliber Krag-Jorgenson replaced the Winchester-Lee. At this time, the Marine Corps began to stress rifle marksmanship. All Marines were expected to achieve a high order of skill, a policy that has continued to the present.

Marine aviators began training in 1911 on Curtiss pusher biplanes; by 1913, an aircraft unit with Curtiss seaplanes was integrated into the Advance Base Force as the first air-ground team. Every overseas deployment since has been as an integrated ground and aviation team. In 1916, the Marines adopted the King armored car, armed with a light machine gun. The first of the "armored vehicles adopted for regular service, it continued in use until 1921.

Marine rearmament began in the early twentieth century with the army M1903 .30-caliber rifle replacing the Krag in 1912. In the constant search for superior firepower, the Benét-Mercié light machine gun was adopted as the navy Mark II. The Lewis light machine gun, rejected by the army, was adopted by the Marines in 1916. When the Marines joined the U.S. Army's Second Division in France during World War I, they left their Lewis guns behind and were armed like the rest of the division with French Hotchkiss heavy "machine guns and Chauchat light machine guns. After the armistice, these were replaced by the new Browning M1917 heavy machine gun and the M1918 "Browning automatic rifle (BAR). The Brownings continued in use through the "Korean War—one to three BARs in each squad.

Seeking a firepower edge for close quarters fighting, Marines adopted the Thompson submachine gun, firing .45-caliber pistol cartridges, in the early 1920s. They were the first service to adopt the submachine gun as a regular weapon.

The "Springfield Model 1903 rifle continued in use until early in World War II, when it was replaced by the eight-shot Garand "M-1 rifle. The M-1 was replaced by the improved twenty-shot M-14 rifle in the early 1960s. The M-14, which fired the new "NATO standard 7.65mm cartridge, in turn, was replaced during the "Vietnam War by the lightweight "M-16 rifle in 5.56mm or .223 caliber.

By the early 1990s, the Belgian-designed M249 squad automatic rifle (SAW) in 5.56mm was adopted to fulfill the role of the BAR and the automatic M-14. Shortly thereafter, also from Belgium's Fabrique Nationale, the M240 general-purpose machine gun in 7.65mm replaced the M60. The Mark 19 40mm automatic grenade launcher, developed by the U.S. Navy and Marine Corps, added to the firepower.

Sniper rifles included an M1903 equipped with an 8-power Unertl telescope used in World War II and Korea. In Vietnam and the "Persian Gulf War, a bolt action M-40 rifle with telescope was used; in the Gulf War, a Barrett 30-pound M-82 .50-caliber semiautomatic rifle for very long range work was used with great effect.

A weapon unique to the Marine Corps is the amphibian tractor—or landing vehicle tracked—introduced in World War II for ship-to-shore movement and to cross coral barrier reefs in the Pacific Islands. All carried machine guns, with some variants armed with cannon. Modern versions as the LVTP-5 of the Vietnam War and the LVTP-7 of the Gulf War continue in their original purpose and are used as troop carriers inland.

Also unique to the Corps from the late 1980s is the light armored vehicle (LAV), an eight-wheeled armored car carrying an infantry squad and mounting a 25mm automatic gun.

Heavy supporting weapons, "artillery, "mortars, "anti-tank weapons, and "tanks were procured from the army. Here, too, the U.S. "Marine Corps often participated in their development.

WEAPONRY, NAVAL. The history of U.S. naval weaponry embraces not just the weapons themselves and the sensors that point them to their targets. It also includes the so-called platforms—the ships, aircraft, and even unmanned aerial vehicles—that carry the weapons and sensors into battle.

The navy's record of dealing with new weaponry and platform technology is not uniformly bright. There have been periods of hidebound conservatism and willful refusal to understand new developments. But more often the U.S. Navy has sought out technological opportunity and exploited it with vigor, showing itself capable of striking innovations from the early years of American independence to the dawn of the information revolution.

The Fledgling Navy. When the "Revolutionary War began, naval armaments had remained essentially unchanged for over a century. Wooden "sailing warships mounted inaccurate smoothbore cannon along each side and fought each other at close range. The most decisive battles were between massive "ships of the line" with two or three decks of guns.

The colonies had few advantages in weaponry. Their foundries produced guns of uneven quality, and their ships relied heavily on foreign guns. Their fledgling navy had only a few small vessels, whereas the Royal Navy of 1775 possessed more than 131 ships of the line and 139 other warships. Overwhelming power enabled the Royal Navy to blockade any port not occupied by British troops.

But America had abundant oak and softwood for hulls, tall timber for masts and spars—and resins to make critical naval stores like tar to protect standing rigging. It also had a large merchant fleet with fine ships, skilled sailors, and experienced captains. American "privateering scourged British commerce during the Revolution, and some U.S. Navy skippers like John Paul "Jones won famous single-ship victories.

The subsequent "War of 1812 played out along similar lines. By then, however, the U.S. Navy had begun its distinguished history of technological innovation. Not all of it turned out well. The decision to arm the frigate *Essex* exclusively with carronades—a short piece invented in Europe that could deliver as heavy a ball at short range as a much heavier "long gun"—proved disastrous when a British frigate used the greater range of its long guns to batter the helpless American vessel into submission.

But a new class of "big frigates," among them the famous USS *Constitution*, proved more than a match for their Royal Navy counterparts and prompted Britain to build similar vessels. The forty-four-gun frigates were cleverly designed, with the speed to escape from any ship of the line but more firepower than most other frigates and a much stronger hull. In addition, they carried a particularly effective mix of long guns and carronades, the latter greatly increasing the firepower on their upper deck, where minimizing weight was critical.

The Young Republic. The Industrial Revolution that had originated in Britain spread to the United States, bringing with it the potential for great innovations in

ordnance and ships. For several decades, the United States played a leading role in exploiting that potential.

Explosive shells entered service in Europe in the 1830s, and European navies began to experiment with more accurate, rifled guns firing elongated projectiles. In 1844, the U.S. Navy commissioned its first steam warships, the side-wheel frigates *Missouri* and *Mississippi*, which were considered the equal of any European warship then in service. They mounted only two 10-inch and eight 8-inch shell guns, a reduced main battery that illustrates the general trend from a large number of relatively small pre-industrial cannon to a handful of the much larger, longer-range guns made possible by advances in metallurgy, and other related technologies.

The U.S. frigate *Princeton*, which followed in 1844, was the world's first warship with a screw propeller. This eliminated paddle wheels and allowed machinery to be located well within the ship and below the waterline, making it less vulnerable and freeing topside space for guns. The *Princeton* carried twelve 42-pound carronades and two 12-inch wrought-iron guns that fired a 225-pound shot.

However, during a demonstration on the new wrought-iron guns, one of them exploded, killing the secretary of the navy and the secretary of state. The resulting scandal prompted the navy to turn away wrought-iron ordnance. Instead, under the technical leadership of Cmdr. (later Rear Adm.) John "Dahlgren, it subsequently chose to concentrate on safer cast-iron smoothbore guns, in which it became the acknowledged leader.

The Civil War. France and Britain were already pursuing armor and iron hulls for seagoing warships when the "Civil War began. The Confederacy, unable to match the Union fleet, also turned to armor, rebuilding the damaged U.S. steam frigate *Merrimac* as the ironclad ram *Virginia*. Other rams followed, often armed with rifled guns that could fire elongated, steel-cored iron "bolts" for piercing Union ship armor.

The Union countered armor with ever more powerful smoothbores, eventually up to 15 inches in bore diameter, firing solid shot. Many were mounted in revolving turrets in low-freeboard armored coastal ships called Monitors, after the original *Monitor* that confronted the *Virginia* at the Battle of "Hampton Roads in 1862. The only seagoing armored ship of the war, the Union's *New Ironsides*, mounted its guns on the broadside. The Confederacy ordered several seagoing armored rams from European shipyards, but the war ended before any reached the South.

Both sides experimented with the predecessors of today's fast attack craft: steam-powered boats with a "spar torpedo," an explosive charge on a pole, protruding from the bow. Private Confederate citizens built the *Hunley*, a primitive submarine powered by a hand crank. Taken over by the "Confederate army at Charleston, South Carolina, and armed with a spar torpedo, it became the first submarine to sink a warship, the Union sloop *Housatonic*. However, the *Hunley* also sank, drowning its crew.

Both sides used naval "mines, the "torpedoes" famously damned by Adm. David "Farragut at the Battle of "Mobile Bay (1864). These were detonated either by contact or by wires connected to primitive electric batteries ashore.

Postwar Apathy. America turned to its western frontier after the Civil War, scrapping the Union's 700-ship fleet and laying up its ironclads to rust. The seagoing fleet ossified, with wooden ships and antiquated guns. A new fast

cruiser, the *Wampanoag*, became the first ship to use superheated steam, achieving an unprecedented 17.7 knots in 1868 sea trials; but a special board of line admirals, fearing the rise of naval engineers, ordered her boilers removed, and she rotted away at the pier. An 1869 general order required all U.S. naval vessels to have "full sail power" in addition to steam.

In Europe, meanwhile, innovation accelerated. Breech-loading guns entered naval service in the 1870s, rapid-firing guns using cordite charges in the 1880s, and armor-piercing high-explosive shells in the 1890s. In 1866, British engineer Robert Whitehead invented the self-propelled torpedo, which provided the first effective weapon for fast attack craft and, later, for "submarines. Contact and magnetic mines, which did not require remote detonation, also appeared.

American Naval Resurgence. Stimulated in part by the seapower theories of Capt. (later Rear Adm.) Alfred T. "Mahan, the U.S. Navy began to revive. In the 1880s, it built its first all-steel ships, forerunners of the oceangoing steel fleet that emerged in the 1890s. That fleet no longer reflected a vibrant maritime culture, America's merchant marine having declined; rather, it reflected the industrial might of a nation that had become the world's leading steelmaker by the mid-1890s.

Europe continued to lead in naval technology, with the United States playing catch-up. Work carried out at the Washington Naval Shipyard gave the U.S. Navy the ability to cast ever larger rifled guns, and the service encouraged steelmakers to produce first-rate armor and shells. As improved guns, optical rangefinders, mechanical calculators, and electrical distribution systems increased effective gunnery ranges from 6,000 yards in 1898 to more than 20,000 yards in World War I, the United States kept pace.

In 1906, Britain built the *Dreadnought*, the revolutionary "all-big-gun" battleship designed to take advantage of this technology. The first U.S. "dreadnought," was actually funded before the *Dreadnought*, but was not completed until 1909. Like the *Dreadnought*, the *Michigan* had 12-inch guns but its design was much more advanced, with superfiring turrets and all turrets on the centerline. Britain completed the first battleship with 14-inch guns in 1911; America matched it with the "battleships *New York* and *Texas* in 1912. By the end of World War I, Britain had settled on a 15-inch standard for capital ships, while America adopted a 16-inch standard.

American pursuit of newer naval technologies was more uneven. The first true submarine, propelled by a gasoline engine on the surface and an electric battery when submerged, was built in America in 1881 by Irish immigrant John "Holland. In 1893, he built the *Holland*, the first truly practical sub, which the U.S. Navy acquired two years later. But the navy lost its early lead in submarine technology as European navies forged ahead with such innovations as diesel propulsion.

U.S. torpedo development also lagged. In 1907, after decades of depending on foreign suppliers, the navy finally built its first torpedo factory, in Newport, Rhode Island, but the factory continued to produce variants of foreign torpedo designs until the 1920s. During World War I, the service absorbed early British antisubmarine technology, such as the depth charge and hydrophones.

The navy had also shown early interest in aircraft, another American invention. In 1910, it fitted the scout

cruiser *Birmingham* with a temporary wooden flight deck so that civilian aviator Eugene Ely could make the first landing on a ship. In 1911, Ely not only landed on the armored cruiser *Pennsylvania*, but also took off again. Yet, as with the submarine, Europe once more took the lead, and it was Britain that operated the first experimental aircraft carrier (1917) and commissioned the first true carrier, the *Argus* (1918).

The U.S. Navy Comes of Age. By the end of World War I, America's naval building program dwarfed that of any other power, particularly in battleships and battlecruisers. The other powers therefore reluctantly agreed to the 1922 "Washington Naval Arms Limitation Treaty, which left only the Royal Navy equal to the U.S. Navy. Limitations on capital ships were the heart of the treaty, although it limited other ship types as well. Ironically, however, the battleship's supremacy was nearly at an end, and the U.S. Navy was taking a leading role in the aviation technology that would seal its fate.

In 1922, the navy commissioned its first aircraft carrier, the *Langley*, a converted collier. Two half-built "battle cruiser hulls to be scrapped under the new treaty became instead the world's largest "aircraft carriers: the *Lexington* and the *Saratoga*. Aircraft carriers built for the purpose soon followed. The torpedo bomber, developed by the British in World War I, and the dive-bomber, developed in the 1920s by the U.S. "Marine Corps, would become the carriers' great offensive weapons of World War II.

Also from the Royal Navy the United States obtained "Asdic," which it christened "Sonar. The British and the U.S. Naval Weapons Laboratory in Washington, D.C., each developed "radar independently, but the two countries subsequently collaborated on its perfection. One key U.S. Navy radar innovation was the "plan position indicator"—the familiar radar scope.

The shipboard combat information center (CIC), developed during World War II, used radar data to control "fighter aircraft defending the carrier task force. Closer in, the ships defended themselves with anti-aircraft guns and dual-purpose 5-inch guns firing shells equipped with newly invented proximity fuses—miniature radars that detonated the shells as they neared enemy aircraft.

The U.S. fleet "submarines of World War II could not dive as deep as German submarines, but they had long range and good surface speed. They also had radar to help locate and target Japanese ships. Like several other navies, the U.S. Navy had developed a magnetic exploder to detonate its "torpedoes lethally directly beneath the keel of enemy ships. However, while other countries quickly abandoned those unreliable devices, the U.S. Navy's reluctance to do so initially hindered its submarine campaign against Japan.

For "antisubmarine warfare the navy continued to develop sonar, weapons, and tactics. Mortars for projecting charges ahead of the ship supplemented depth charges rolled off the stern and projected over the side of "destroyers and destroyer escorts. Aircraft equipped with radar drove submarines beneath the surface, where they could less readily intercept Allied convoys.

U.S. Preeminence in Naval Weaponry. The United States emerged from World War II with by far the most powerful fleet, but "nuclear weapons delivered by long-range "bomber aircraft seemed destined to render fleets irrelevant. When the Soviet Union obtained nuclear

weapons, the resulting stalemate placed a premium on "deterrence. The navy deployed nuclear-armed *Regulus* I cruise missiles on diesel-electric submarines in the 1950s, but it did not obtain a significant share of the deterrence mission until the 1960s, when the marriage of the long-range ballistic missile and the nuclear-powered submarine enabled it to provide the least vulnerable leg of America's nuclear "triad," which also included land-based "missiles and bombers.

In conventional war, which continued to exist, guided missiles were slower to rival aircraft. The Soviet Navy fielded land attack and antiship missiles from the 1950s, but they tended to be inaccurate or vulnerable to countermeasures. By the 1970s, missile technology had advanced, and the U.S. Navy developed two subsonic cruise missiles: the Harpoon antiship missile, for launch by either aircraft or ships; and the ship- and submarine-launched Tomahawk, which came in nuclear, conventional land attack, and antiship versions.

The missile also became the preeminent defensive weapon, since only a missile had the range and homing capability to intercept supersonic aircraft and cruise missiles. In the 1950s, the navy fielded Tartar, Terrier, and Talos—the so-called 3-T missile systems. However, the unprecedented complexity of these shipboard systems made them unreliable, despite several "get-well" programs. The only solution was to treat the entire ship as a single weapon "platform," with all of its war-fighting equipment integrated into a single system. Such "total system engineering" became the hallmark of the successful "Aegis program, which, starting in the late 1970s, oversaw all development and building of guided-missile cruisers and destroyers.

The same level of integration increasingly characterized submarine programs as well. Nuclear propulsion gave the submarine high underwater speed and unlimited submerged endurance, making it not only an unprecedented threat to surface ships but also the foremost weapon against enemy submarines. The Mk-48 torpedo reflected that new priority, being designed primarily for antisubmarine warfare and secondarily for use against surface ships.

Antisubmarine warfare necessarily became much more sophisticated. Aircraft now dropped sonobuoys for detection and lightweight "torpedoes for attack. Surface ships mounted powerful bow-mounted active sonars and carried antisubmarine rockets and "helicopters. Beginning in the 1970s, the fleet relied increasingly on Tow-ed passive sonar arrays. From early in the "Cold War, extensive arrays of passive receivers were also emplaced on the ocean bottom. However, the post-Cold War threat of diesel submarines in shallow coastal waters has posed a new challenge that may require a return to active sonar, or "bistatic" sonar, which employs a remote sound source.

The U.S. Navy in the Twenty-First-Century. Just as technological developments in the post-World War II period led inexorably to the concept of total system engineering for entire ships, so the increasing complexity of data processing and communications in the new century will lead to "systems of systems" in which many ships and aircraft must be able to act swiftly and reliably as a single entity. Increasingly, all platforms will have access to a common picture of the "battle space," permitting an aircraft to control an air defense missile launched by a distant cruiser, or an unmanned aerial vehicle (UAV) to control a cruise missile launched from a submarine.

This "network-centric warfare," as the navy calls it, will not be easy to master. Like steampower, armor, and long-range guns in the nineteenth century, or aircraft and submarines in the twentieth, it promises revolutionary increases in "combat effectiveness. But to obtain that capability, the U.S. Navy will have to summon up the best attributes of its most progressive eras: the boldness to make mistakes, the discipline to study those mistakes impartially, and the unflinching ambition to seek out solutions.

WEDEMEYER, ALBERT C. (1896-1989), World War II general and diplomat. A native of Omaha, Nebraska, Wedemeyer graduated from West Point in 1919. His service in the regular army included tours in the Philippines and China (1923-25, 1930-34). Two years as an exchange student at the German Kriegsakademie in Berlin (1936-38) gave him insight into the *Blitzkrieg*.

Brought to the War Plans Division of the U.S. Army General Staff by Gen. George C. Marshall in 1941, Wedemeyer became the primary author of the "Victory Plan"—the prophetic prewar document that visualized mobilizing U.S. resources for all-out war with the Axis, and outlined the broad operational "strategy that eventually brought "victory. As a member and then head of the Strategy and Policy Group of the wartime Operations Division of the General Staff, he participated in the joint councils that managed the war.

Upon the recall of Gen. Joseph "Stilwell" in 1944, Wedemeyer assumed the twin posts of U.S. China theater commander and Allied chief of staff to Chiang Kai-shek, the Nationalist president of China. He achieved effective working relations with China; after the war, he recommended continued U.S. support of Chiang's Nationalist government in its struggle with Mao Zedong's Communists. When a postwar effort by the Truman administration to arrange a political coalition of China's warring factions failed, Wedemeyer again was dispatched to East Asia (1947) on a fact-finding mission.

In the wake of the Communist victory in China (1949), Wedemeyer held that, although China had indeed not been "ours to lose," it had been ours to push over the brink. Had China remained friendly to the West, neither the "Korean War nor the "Vietnam War would have occurred.

Wedemeyer retired from the army in 1951. His memoirs (1958) sharply criticized U.S. and British war policies, arguing that better leadership might have altered a costly struggle in which one set of tyrants—the Nazis and Fascists—were thoroughly defeated, only to facilitate the rise of another—the Communists.

WEINBERGER, CASPAR (1917—), lawyer, government official, secretary of defense. President Ronald "Reagan" appointed Weinberger, a former California and federal official, as secretary of defense in 1981. Weinberger worked to implement Reagan's defense program, stressing armed forces modernization, readiness, and sustainability to counter the threats of the Soviet Union, which Reagan labeled the "evil empire." Weinberger pushed for a broad strategic weapons program, including B-1B bombers, a stealth aircraft, the Trident II submarine-launched ballistic missile, and the MX "Peacekeeper" ICBM. He backed development of Reagan's space-based system to defend against missile attack—the "Strategic Defense Initiative or "Star Wars" program.

Weinberger persuaded Congress to approve large increases in the defense budget, which increased from about \$176 billion (total obligational authority) in fiscal year 1981 to over \$276 billion in fiscal year 1985, the largest peacetime defense buildup in U.S. history. After that, he was less successful in getting his budget requests through Congress. Between 1981 and 1985, there was substantial real growth; after 1985, although the dollar amount of the defense budget continued to increase slowly, there was negative real growth.

Weinberger was cautious about committing military forces in trouble spots around the world, but while he was at the "Pentagon, U.S. forces joined an international peace-keeping force in Lebanon (August 1982) and invaded Grenada (October 1983) to oust a Communist-controlled government. Responding to tension in the Persian Gulf, the Department of "Defense created the unified Central Command for Southwest Asia. During Weinberger's term, Congress passed the "Goldwater-Nichols Act (1986), which strengthened the control of the chairman of the "Joint Chiefs of Staff over the JCS organization and increased his influence as adviser to the president on military matters. Weinberger showed little enthusiasm for the U.S.-USSR arms control negotiations ("START and the "INF Treaties), which Reagan accorded high priority during his second term (1985-89). Although within the administration, he opposed the activities leading to the "Iran-Contra Affair (1986). Weinberger was later indicted on a charge that he had not disclosed to an independent counsel the existence of notes he kept on the matter; President George "Bush pardoned him in 1992 shortly before his trial was to begin.

After serving longer than any secretary of defense except Robert S. "McNamara, Weinberger left office in November 1987.

WELLES, GIDEON (1802-1878), secretary of the navy, 1861-69. A prominent political leader from Connecticut, Welles first served in the Navy Department during the Polk administration as chief of the navy's Bureau of Provisions and Clothing.

As Lincoln's secretary, he resisted public demands of ships for the Northern coastline while concentrating on blockading and strangling the Confederacy during the "Civil War. Welles used monitors for Southern harbors and ironclad riverboats for the Mississippi River. In July 1861, he allowed ships to keep contrabands on board. By September, he authorized enlisting contrabands under the same regulations as other enlistments. And in July 1862, he ordered the East Gulf Blockading Squadron actively to recruit contrabands (runaway slaves).

Administratively, through Congress, Welles reorganized the navy. In July 1861, he established the post of assistant secretary and temporary volunteer officers to fill wartime needs. That August, he retired older, infirm officers. Automatic officer retirement for over-age and service limits began in December. In July 1862, line officers received nine ranks, and staff bureaus were raised to eight. The bureau changes reflected the new technologies developing in gunnery and steam engineering. With minor modifications, Welles's administrative changes would remain in place until newer technologies after World War II demanded further reorganization.

WESTMORELAND, WILLIAM C. (1914-), U.S. general. One of the most controversial figures in American military history, William Westmoreland, by his own appraisal, was "the most vilified man in America" during the 1970s. A military leader of the U.S. buildup in the Republic of South Vietnam from 1964 until 1968, the general exuded confidence, only to undergo a devastating Communist attack during the 1968 "Tet Offensive. Critics cited this attack as reason to withdraw U.S. forces and proof that Westmoreland had followed a failed strategy.

Born in Spartanburg County, South Carolina, and graduated from West Point in 1936, Westmoreland held Field Artillery assignments until World War II. Promoted to lieutenant colonel, he participated in the "North Africa Campaign in 1942, landed in Sicily in 1943, and landed on the Normandy coast in 1944. Westmoreland gained a reputation for superb staff work and sound battle leadership during the war.

After the war, Westmoreland joined the infantry, became a paratrooper in 1946, and commanded the only U.S. airborne infantry regiment to participate in the Korean War. After attending an advanced management program at Harvard University, he commanded the 101st Airborne, (1958-60) and served as Superintendent of the U.S. Military Academy (1960-63), after which he took command of the XVIII Airborne Corps. Westmoreland's era of high notoriety began when, as a full general, he was assigned to head the United States Military Assistance Command, Vietnam (MACV) in 1964, an advisory and support effort to the South Vietnamese Army. He saw that the infusion of increasing numbers of North Vietnamese troop units into the small Southeast Asian country was transforming a guerrilla war into a stand-up contest between conventionally organized regulars. Convinced that U.S. forces would have to enter the war as offensive units, Secretary of Defense Robert S. "Mac-

Namara and President Lyndon B. "Johnson received a proposal from Westmoreland that would have the new U.S. Army airmobile force, the 1st Cavalry Division, cut the Communist line of communications by establishing mobile bases in the Laotian Panhandle. Rebuffed and faced with the task of defending all of South Vietnam, Westmoreland devised a scheme of "search and destroy" offensive missions by U.S. forces to locate, engage, and defeat Communist forces in South Vietnam. Following the surprise "Tet Offensive (1968) by the Communists and the erosion of American support, despite its defeat, Westmoreland was succeeded in Vietnam by Gen. Creighton "Abrams.

Returning to the United States in 1968, Westmoreland became chief of staff of the army and retired in 1972. After an unsuccessful run for the governorship of South Carolina in 1974, he became embroiled in a failed 1985 suit against CBS for portraying himself and his staff as falsifying enemy strength and casualty reports during the "Vietnam War.

WESTMORELAND v. CBS (1985). On 22 January 1982, CBS Television broadcast a 90-minute documentary, *CBS Reports: The Uncounted Enemy: A Vietnam Deception*. The program was produced by George Crile and based in large part on reporting by Sam Adams. Crile was the co-author. The narrator—who also conducted some of the interviews—was Mike Wallace of *60 Minutes*.

The program charged that Gen. William C. "Westmoreland, while U.S. military commander during the Vietnam War, had led a conspiracy prior to the surprise "Tet Offensive (1968) to keep down official intelligence estimates of enemy strength, thereby deceiving President Lyndon B. "Johnson, the rest of the military, and the American public. Further, such a "reduction" in enemy strength resulted in the surprise at Tet, with greater troops losses. Most important, public support for the war plummeted.

Three days later, General Westmoreland held a press conference challenging the program and asking for an apology. CBS stood by the broadcast, but an article in *TV Guide* charged the program with at least eight major errors and violations of CBS procedures.

On 13 September 1982, Westmoreland brought suit against CBS for libel, asking \$120 million. The trial—*Westmoreland v. CBS*—lasted from October 1984 to February 1985. On 17 February 1985, just as it was to go to the jury, the two sides settled, each stating that it had proven its major points.

Burton Benjamin, longtime CBS News executive, was also asked to produce an internal evaluation. After an exhaustive investigation, he concluded the program was "seriously flawed": it was out of balance; "conspiracy" had not been proven; friendly witnesses had been coddled and those opposing the thesis treated harshly. Mike Wallace stood by the program, but later said that it took him two years to get his confidence back.

The controversy provided an ironically fitting epilogue to arguments between the press and the military over Vietnam.

WHEELER, EARLE G. (1908-1975), general, U.S. Army; chairman, *Joint Chiefs of Staff (JCS), 1964-79. Gen. Earle Wheeler's tenure as the nation's top military officer spanned the height of America's involvement in the Vietnam War. President Lyndon B. *Johnson appointed Wheeler chairman of the JCS in July 1964 to succeed Gen. Maxwell *Taylor. Wheeler oversaw and supported the expanding U.S. military role in the conflict in the mid-1960s, consistently backing the field commander's requests for additional troops and operating authority. Concerned that the U.S. buildup in Vietnam depleted U.S. military capabilities in other parts of the world, he urged the president to mobilize American reserve forces. In February 1968, after the *Tet Offensive, Wheeler extracted from Gen. William C.

*Westmoreland, the U.S. military commander in Vietnam, a request for some 200,000 additional ground troops to be gained by mobilizing reserve forces. However, Wheeler intended to use most of these troops to reconstitute a general reserve in the United States. His request was not approved and, together with the Tet offensive and shifts in U.S. public opinion, resulted finally in President Johnson's decision to de-escalate the war.

After the election of President Richard M. *Nixon, Wheeler oversaw the implementation of the "Vietnamization" program, whereby South Vietnamese forces assumed increasing responsibility for the war as U.S. forces were withdrawn. He retired from the army in July 1970 and died in 1975.

The WHISKEY REBELLION (1794) originated in a dispute over the role of taxation in the United States. Many citizens of the new republic assumed that the *Revolutionary War meant they would never be made to pay direct taxes to support a distant government. But Washington's secretary of the treasury, Alexander *Hamilton, wanted to tax Americans to help finance the national debt and to support a relatively large national government. Hamilton's plan to override the parochialism of local authorities and to make the United States stable and prosperous prevailed in Congress, which passed an act (3 March 1791) creating an excise tax on spirits distilled in the United States. Opposition to the act was widespread, but centered in western Pennsylvania, where local politicians denounced the tax and citizens attacked it in public meetings. Opponents tarred and feathered tax collectors and their collaborators, including distillers who cooperated with federal officials.

In the summer of 1794, mounting tensions exploded. On 16 July, some 500 men attacked the home of Gen. John Neville, local inspector of the excise in Allegheny County. Neville and his household mounted a defense with the aid of a few regular soldiers, killing two men and wounding six

others. When Neville and his men escaped, the attackers looted and burned his house. Emboldened, the insurgents called a meeting at Braddock's Field, southeast of Pittsburgh, for 1 August. Approximately 6,000 men attended. But after two days of talking about further resistance, they dispersed.

President George *Washington refused to tolerate the escalating defiance of federal authority. On 7 August, he announced that he was calling out the militia to restore order and enforce the law. At the same time, he sent commissioners to western Pennsylvania to offer amnesty to the insurgents in return for oaths of submission to the United States. When that strategy failed, the president, on 25 September, ordered 12,950 militia and volunteers from Pennsylvania, New Jersey, and Maryland to march to Pittsburgh. They arrested a handful of insurgents. Two were convicted of treason, but Washington later pardoned them. Many of the leaders simply fled.

If the Whiskey Rebellion had little military significance, its political importance was tremendous. It demonstrated the willingness of federal officials to use the potentially enormous power of the national government to enforce national law. Coupled with the American victory over the Indians of the Old Northwest in August 1794, the suppression of the Whiskey Rebellion marked the emergence of the national government as a significant presence west of the Appalachians. On the other hand, the rebellion showed the depth of American citizens' hostility to central government intent upon taxing them and regulating their lives. This hostility was part of the more peaceful political rebellion that climaxed in the 1800 election of Thomas *Jefferson as president. Under Jefferson, Congress repealed the Whiskey Tax.

WHITNEY, ELI (1765-1825), inventor and firearms manufacturer. In debt from futile litigation against piracy of his cotton-gin patent, this Massachusetts-born Yale alumnus (class of 1792) obtained a federal contract in 1798 to make 10,000 military muskets. Unhindered by gunsmithing experience, Whitney built a water-powered factory in Hamden, Connecticut, where he devised production methods later adopted into "armory practice." His initially unskilled workers used specialized jigs and fixtures to shape ostensibly uniform gun parts before fitting them together for shipment to the Springfield Armory.

Declining an offer in 1806 to head the Harpers Ferry Armory, Whitney continued to receive contract extensions despite production delays, for his persuasively expressed plan agreed with the desire of French-influenced ordnance officers to standardize weapons. Meeting with Whitney in 1815, they established interchangeability of parts as the goal for military musket production. That required coordination of effort among Springfield, Harpers Ferry, and contractors by a system of inspection and production gauges, which did not operate effectively until the late 1840s. Despite Whitney's fame, his muskets, like others of his era, lacked interchangeable parts.

WILDERNESS, BATTLE OF THE (1864). The Battle of the Wilderness, fought on 5 and 6 May 1864, was the first Civil War confrontation between Lt. Gen. Ulysses S. "Grant and Gen. Robert E. "Lee. Now heading the Union war effort, Grant sought to destroy Lee's Army of Northern Virginia, which numbered about 65,000 soldiers and occupied strong earthworks below the Rapidan River. Grant planned to send Maj. Gen. George Gordon "Meade's Army of the Potomac, supplemented by Maj. Gen. Ambrose "Burnside's 9th Corps, directly against Lee, while Maj. Gen. Benjamin F. "Butler's Army of the James advanced up the James River into Richmond, and another army under Maj. Gen. Franz Sigel threatened Lee's western flank. Hampered by shortages in food, horses, and supplies, Lee decided to bide his time and strike Grant when he crossed the Rapidan.

At midnight on 3-4 May, Grant's main force of 120,000 began moving around Lee's eastern flank, crossing the Rapidan at two fords and camping in the forested Wilderness of Spotsylvania. Lee reacted by dividing his army, already outnumbered two to one, and thrusting Lt. Gen. Richard Stoddert "Ewell's 2nd Corps east toward Grant along Orange Turnpike and Lt. Gen. A. P. "Hill's 3rd Corps east along Orange Plank Road. Lee's purpose was to pin Grant in place with Ewell and Hill, then swing his 1st Corps under Lt. Gen. James "Longstreet into Grant's southern flank. The scheme entailed risk, but Lee counted on the Wilderness's dense underbrush to offset Grant's considerable advantage in troops and weaponry.

Early on 5 May, Ewell deployed along the western edge of a clearing named Saunders' field. Meade ordered Maj. Gen. Gouverneur K. Warren's 5th Corps to attack immediately, but the troops were unable to form in the woods until early afternoon. Well entrenched, Ewell repulsed first Warren's 5th Corps, then Maj. Gen. John Sedgwick's 6th Corps. Hill's Confederates meanwhile advanced along Orange Plank Road, but were stopped at the Brock Road intersection by a detachment under Brig. Gen. George W. Getty. Hill constructed a defensive line a few hundred yards west of Brock Road. Late in the afternoon, Getty and Maj. Gen. Winfield S. Hancock's 2nd Corps attacked. With only two divisions, Hill fought a stubborn defensive action against overwhelming odds and was saved by the arrival of night.

Grant now rearranged his army to concentrate overwhelming numbers against Hill. Hancock, augmented by Getty, was to attack Hill frontally, while four brigades under Brig. Gen. James S. Wadsworth slammed Hill's northern flank. Warren and Sedgwick meanwhile were to keep Ewell occupied, and Burnside was to march between Ewell and Hill and attack Hill's rear. Recognizing Hill's perilous situation, Lee ordered Longstreet to abandon his flanking movement and hurry to relieve Hill. Lee assumed that Longstreet would arrive before daylight and so permitted Hill's tired men to rest without repairing their lines.

Early on 6 May, however, before Longstreet's troops arrived, Hancock and Wadsworth overwhelmed Hill and

poured into Widow Tapp's field, where Lee had his headquarters. At the last moment, Longstreet's Confederates reached the clearing. "Lee to the rear!" they shouted, refusing to advance until Lee retired to safety. Saving the day for the Confederates, Longstreet first repulsed Hancock, then launched a surprise attack against the southern Union flank from an unfinished railroad gradient. Longstreet was accidentally wounded by his soldiers, and the Confederate offensive ground to a halt.

Ever aggressive, Lee once again attacked Hancock, who had entrenched along Brock Road. A portion of Hancock's works ignited, and Southerners poured through the breach, only to be driven back by well-placed Union artillery. Fighting sputtered to a close around 6:00 p.m. Shortly before dark, Confederate Brig. Gen. John B. Gordon assaulted the northern end of Grant's line and overran a portion of Sedgwick's corps. Darkness ended the attack.

Lee had fought Grant to impasse and occupied a strong position along high ground. Instead of renewing his attacks, Grant decided to try to maneuver Lee onto more favorable terrain. After dark, Grant started south toward the crossroads hamlet of Spotsylvania Courthouse, intending to interpose between Lee and Richmond.

During the two-day battle, Grant took approximately 18,000 "casualties, Lee 11,000. Neither could claim victory. Grant had suffered a tactical defeat, but he persisted in his strategic goal of attempting to destroy Lee's army, exhibiting a measure of tenacity previously unknown in the east. For his part, Lee had thwarted a well-provisioned force twice as large as his own, but his grievous loss in men had gutted his offensive capacity. Henceforth, the Army of Northern Virginia would fight defensively. The "Wilderness to Petersburg Campaign, which began with the Battle of the Wilderness, would last five weeks and include the bloody battles of Spotsylvania Courthouse and Cold Harbor.

—Gordon C. Rhea

WILDERNESS TO PETERSBURG CAMPAIGN (1864). On 4 May 1864, Lt. Gen. Ulysses S. "Grant initiated a campaign with the Union's Army of the Potomac to defeat Gen. Robert E. "Lee and the Confederate's Army of Northern Virginia. For forty days, Grant hammered and maneuvered. Lee deftly fended off Grant's force, which was double his own. The series of battles, from the Battle of the "Wilderness to the siege of "Petersburg, was called the "Overland Campaign" to distinguish it from Maj. Gen. George B. "McClellan's Peninsular Campaign ("Seven Days" Battle), in 1862, which had involved an approach by water. The Overland Campaign cost 60,000 Union "casualties and perhaps 35,000 Confederate losses. Strategically, it was a Union success, ending in June with Lee's army backed against Petersburg and Richmond, unable to maneuver.

Grant began by crossing the Rapidan River west of Lee and stopping for the night in the timbered Wilderness near Spotsylvania, Virginia. On 5 May, Lee surprised Grant in the Wilderness and fought him to impasse in a bloody

two-day battle costing 18,000 Federal and 11,000 Confederate casualties. Undeterred, Grant swung southeast, hoping to interpose between Lee and Richmond and draw the Confederates out of the Wilderness. While J. E. B. "Stuart's cavalry delayed Grant's progress, a portion of the "Confederate army beat Grant to Spotsylvania Court House.

The Confederates constructed a formidable line of earthworks above the hamlet. On 8 May, the Battle of Spotsylvania Court House began when Grant battered Lee's left wing at Laurel Hill. On 10 May, he attacked Lee's flank on the Po River and orchestrated a massive assault against the entire entrenched Confederate line. None of these efforts succeeded. On 12 May, Grant assailed a bulge in Lee's formation known as "the Mule Shoe" and broke through, but the Confederates rallied and repulsed the attackers. For twenty-two hours, fearsome combat raged unabated at a bend in the Confederate earthworks called the "Bloody Angle."

Lee constructed a new line across the base of the Mule Shoe. For several days, the Union forces probed for weak points. Following a bloody repulse by Confederate artillery on 18 May, Grant gave up trying to overrun Lee's earthworks and once again swung east and south. Lee countered by deploying his army into an inverted "V" below the North Anna River, its tip resting on the river. Grant crossed the stream in pursuit, only to find that Lee's V had divided his army. Sickness left Lee too debilitated to exploit his ingenious trap.

On 26 May, Grant circled southeast across the Pamunkey River and advanced toward Richmond. Lee parried by drawing a strong line along Totopotomoy Creek. 30 May, Lee attacked part of Grant's army near Bethesda Church, and on 1 June, the armies clashed in the Battle of Cold Harbor. Both sides rushed in reinforcements, and on the morning of 3 June, Grant launched a concerted assault to break Lee's line. The frontal attack across open land against entrenched positions was repulsed with 12,000 Union soldiers killed or wounded. Thwarted in his frontal attacks, Grant again resorted to maneuver. On 12-14 June, he marched to the James River and crossed his army on ferries and a pontoon bridge, heading for Petersburg, the railroad center serving Richmond.

WILHELM II (1859-1941), grandson of Wilhelm I, was the last German kaiser, 1888-1918. He dismissed Bismarck as chancellor and took a dominant role in making Germany a world power, enlarging its army, navy, and empire. His belligerent policy provoked brushes with U.S. naval forces at Samoa (1889) and Manila (1898), and he authorized naval contingency plans for "blockades of the U.S. coast and assaults in the Caribbean.

Wilhelm had little accurate knowledge of the United States when he authorized the German Navy during World War I to begin unrestricted submarine warfare in February 1917. By so doing, this insecure and garrulous narcissist brought America into the war against Germany, tipping the perilous balance against his country.

Although considered one of the dominant players on

the world stage in 1913, from 14 August 1914—when he told the German High Command that it was their job to run the war, not his—until approximately 1967, Wilhelm II's importance in world affairs was downplayed. Recent historiography, however, has reestablished him as a key player in his era. He died in exile in the Netherlands.

WILPF. See Women's International League for Peace and Freedom.

WILSON, CHARLES E. (1890-1961), industrialist and secretary of defense. Wilson received an engineering degree in 1909 at Carnegie Tech University. A distinguished career in industry led to his appointment as vice president of General Motors (GM) in 1928 and president in 1941. During World War II, Wilson directed GM's outstanding performance in producing "tanks, aircraft engines, trucks, and munitions.

President Dwight D. "Eisenhower selected Wilson as his secretary of defense in 1953, and he remained in office for almost five years. Since the president formulated national defense policy, Wilson's principal responsibility was managing the Department of "Defense.

Wilson's years in office were troubled ones. The outspoken secretary of defense made a habit of needlessly offending others. During his Senate confirmation hearings in January 1953, for example, a beleaguered Wilson insisted that his heavy stockholding in GM could constitute *no* conflict of interests "because for years I thought that what was good for our country was good for General Motors and vice versa." More important, he was indecisive and failed to grow in his job. As a result, the services squabbled among themselves, and Wilson expected the White House to provide him with both general guidelines and assistance in resolving technical matters. Finally, while knowing little about foreign affairs or strategic doctrine, Wilson acted as chief spokesman for the administration's "New Look" defense policies, which emphasized airpower and "nuclear weapons over conventional forces. This strategy came under severe attack from within and outside Congress, and from the armed services—particularly the army. Critics charged that the nation was no longer able flexibly to meet its strategic obligations.

Under Wilson, military budgets declined by over 10 percent. These cuts stemmed from Eisenhower's desire to protect the civilian economy and curb the growth of a "military-industrial complex, goals shared by Wilson. However, reduced military spending was complicated by the administration's strident anticommunism, which led to growing commitments abroad—commitments the administration proposed to meet through policies labeled "brinkmanship" and "massive retaliation."

Wilson was in part a victim of circumstances beyond his control. Effectively managing the Defense Department without having a voice in strategic doctrine was nearly impossible. Moreover, justifying military cutbacks would have been easier had the administration seized various op-

portunities to reduce Cold War tensions.

WILSON, WOODROW (1856-1924), scholar, president of Princeton University, governor of New Jersey, twenty-eighth president of the United States. The son of a Presbyterian minister, Wilson was born in Staunton, Virginia, grew up in Georgia and South Carolina, graduated from Princeton University, attended the University of Virginia law school, and earned a Ph.D. in history and political science from the Johns Hopkins University (1885). He was a professor at Bryn Mawr College and Wesleyan and Princeton universities, and in 1902 he became president of Princeton, serving until 1910, when he was elected governor of New Jersey. In 1912, he secured the Democratic nomination for the presidency, was elected, and served two terms.

As president, Wilson was often accused by his political enemies of being cowardly and pacifistic, but he used armed force in support of diplomatic goals seven times between April 1914 and November 1918—more often than any other president. Most historians recognize that he had a sophisticated understanding of the value and limitations of force in international relations, and that he was an effective commander in chief.

Wilson thought that the United States must take an active part in promoting the worldwide spread of democratic ideals, international law, and the cooperation of peaceloving nations. He preferred to achieve these goals through diplomacy and moral persuasion, but he did not shrink from the use of military force. He believed that the president must absolutely control foreign policy, including the decision to use or refrain from using armed force, but he also believed that policymakers should not meddle in military operations once they had begun, just as military commanders should not dictate policy.

Wilson's first uses of force were in Latin America, a region traditionally viewed by the United States as within its sphere of influence. In April 1914, he authorized the occupation of Veracruz, Mexico, to avenge an insult to some American sailors and to pressure the Mexican dictator into resigning. He refused to allow the expansion of intervention beyond this one city, however, and relied mainly on negotiations to achieve his aims. Two years later, he authorized a punitive expedition into Mexico in search of border raiders but again entrusted his main objective—restraining the Mexican Revolution—to negotiators rather than soldiers. Other U.S. military involvement, in Haiti in 1914 and the Dominican Republic in 1915, was limited to the minimum force necessary to establish order while American occupiers tried to develop local support for democratic self-government.

When World War I began in August 1914, Wilson at first shared the feeling of most Americans that 'neutrality was the proper policy for the United States. He also hoped, by keeping America neutral, to have an opportunity to mediate the conflict. He opposed expansion of the army and navy and employed his diplomatic skills to maximize American trade. In 1915 and 1916, he sent his friend Edward M. House to Europe to promote peace talks.

The beginning of German submarine warfare early in 1915 undermined the president's optimism, and that autumn he came out for enlarging the army and navy. In May 1916, he suggested that the United States might join a post-war association of nations dedicated to collective security. That autumn, after his reelection, he launched a new peace effort in Europe, and upon its failure, proposed his own peace terms in the "Peace Without Victory" speech on 22 January 1917. This initiative also failed when the Germans announced unrestricted submarine warfare.

Wilson severed diplomatic relations with Germany on 3 February 1917, but before seeking a declaration of war he first explored armed neutrality. On 2 April, he at last asked Congress for a declaration of war on Germany, justifying the request as a defense of neutral rights and, more important, as an opportunity for the United States to defeat autocracy and mold a peace based on democracy and collective security.

After Congress declared war on 6 April, Wilson named Gen. John J. Pershing commander of the 'American Expeditionary Force to be sent to France, and gave him full authority to decide when, where, and how American troops were to be used. Likewise, the president gave his full backing to the plans of Adm. William S. 'Sims to concentrate virtually the whole naval effort on developing a convoy system to defeat the German submarine threat. To coordinate U.S. military policy with that of the British and French, he appointed Edward House and the retiring chief of staff of the army, Gen. Tasker H. Bliss, to sit on a permanent inter-Allied conference. House and Bliss understood that their role was to smooth differences with the Allies and to give U.S. military commanders maximum freedom within the coalition.

In April 1917, German leaders were confident that American armies would arrive too late to affect the outcome of the conflict. They were wrong. Within a year the United States had mobilized and transported a large army of fresh troops to Europe in time to help deal the decisive blow. That achievement was partly a testimony to Wilson's decision to let his commanders do their jobs without political interference, but even more it was proof of the enormous productivity of the American economy.

Wilson was keenly aware that 'victory in the war depended upon the maintenance of solidarity among the Allies. To promote unity, he agreed to the creation of an Inter-Allied Supreme War Council to coordinate military policy, and to the appointment of French Gen. Ferdinand Foch as supreme military commander over all Allied forces. He also agreed to allow expeditions of American soldiers to take part in Allied forces that landed at Murmansk, Archangel, and Vladivostok. At first, they were intended to help keep Russia in the war, then to protect Allied military supplies from German seizure after the Bolsheviks made a separate peace with Germany, and to support the withdrawal of Czech prisoners of war for assignment to the western front. Although hostile to the Bolsheviks, Wilson was skeptical of this intervention because he believed it would arouse Russian hostility. He eventually yielded to maintain Allied solidarity and to restrain the ambitions of the other Allies, who seemed interested in territory (Japan) or counterrevolution (Britain and France).

By October 1918, German leaders realized that they had catastrophically underestimated the importance of American intervention. Faced with imminent defeat, they

suggested to President Wilson an armistice on the basis of his "Fourteen Points" speech of 8 January 1918. Wilson used the German overture to force the Allies and General Pershing to agree that the Fourteen Points would be the basis for a cease-fire and the starting point for negotiation of the peace treaty. Thus by November 1918, when the armistice was signed, it appeared that Wilson had been remarkably successful in using American military power not only to force his peace program on the enemy but to impose it on the Allies as well. Only later, after the guns fell silent, would many of his hard-won gains slip away.

Wilson led the American delegation to the peace talks in Paris in the spring of 1919 and submitted the resulting Treaty of "Versailles to the U.S. Senate in July. But the Senate rejected it, and the president, crippled by a stroke that October, served out the last years of his term an embittered invalid isolated in the White House.

WOMEN IN THE MILITARY. The role of women in the U.S. military has changed significantly over the last 200 years, but the greatest change has come since the initiation of the "All-Volunteer Force in 1973. Throughout American history, the expansion of women's roles has come about when the military faced a shortage of male recruits, usually in times of war. Historically, women's participation has occurred mainly in medical and administrative support positions, thus releasing male soldiers from desk jobs to fight in combat. However, the excellent performance of women in support roles in combat zones during the 1980s and 1990s spurred extensive public debates about opening combat positions to women and about women's duties and rights as citizens. This debate focused attention specifically on the contribution women soldiers have made to military readiness and efficiency, rather than simply on the older notion that a woman's military role was to free up men to fight.

From the "Revolutionary War to the present day, women have served in the armed forces. Until World War I, however, their roles—as laundresses or nurses, for example—were generally informal and seldom institutionalized. A handful of women disguised themselves as men and fought alongside male soldiers in the eighteenth and nineteenth centuries. In World War I, 21,000 women served in the U.S. Army and Navy "Nurse Corps, and another 13,000 volunteered for clerical positions in the U.S. Navy and Marine Corps. All except the nurses held a quasi-military status and were discharged from active duty immediately after the war ended. At the outbreak of World War II, the shortage of military personnel led to the first large-scale recruitment of women and the formation of

the women's auxiliary military branches. During that war, more than 350,000 women served primarily in the medical and administrative fields, although the services also employed women as pilots, mechanics, truck drivers, gunnery instructors, and electricians. Women were not used in combat roles, but rather to fill support positions and thus release male soldiers for combat.

The end of World War II brought the "demobilization of large numbers of servicemen and -women and a corresponding diminution in women's roles. In 1948, Congress passed the Women's Armed Services Integration Act, which provided the first ever legal basis for and legal limits to a permanent role for women in the military. Allowing for women to hold full military rank and privilege, the 1948 act also placed caps on women's enlistment and promotion, and excluded them from combat service. Women were not to exceed 2 percent of active duty personnel in each service and could not be promoted beyond lieutenant-colonel or commander. The combat exclusion requirement remained more or less in effect into the late 1990s (aside from exceptions in the early 1990s for female pilots), but the enlistment and promotion ceilings were repealed in 1967, when the Department of "Defense again needed to ease a recruitment deficit at the height of the unpopular "Vietnam War. Coinciding with the expanding role of women in the labor force and calls for equal rights more broadly, women's participation in the services grew gradually over the next few years (in 1971, 1.6% of active duty personnel were women; in 1976, 5%), and the first women were promoted to general officers in 1970.

When the end of U.S. involvement in Southeast Asia resulted in the elimination of the draft in 1973 and the initiation of the All-Volunteer Force, the military began planning how to recruit more women to compensate for expected shortages of qualified male volunteers. Congressional passage of the Equal Rights Amendment (1972), as well as a number of court rulings in favor of equal treatment across gender lines in the services, led to changes in personnel policies that allowed women to command units composed of both men and women; eliminated rules that required the automatic discharge of pregnant women soldiers; ended segregated training of male and female recruits; and equalized dependents' entitlements for married servicewomen and servicemen. In 1973, the first women naval aviators earned their wings (followed by women pilots in the army in 1974 and air force in 1977). In 1976, the first women cadets were admitted to service academies; in 1978, President Jimmy "Carter signed a new law allowing navy women to be assigned to sea duty aboard noncombat ships.

During the 1990s, women participated in all major military deployments of U.S. forces, and some combat specialties opened up to them. In 1989, 800 women soldiers served among the 18,400 U.S. troops sent to Panama for Operation Just Cause. From August 1990 to February 1991, 41,000 military women were deployed to the Persian Gulf for Operations Desert Shield and Desert Storm. In the "Persian Gulf War, women constituted 7 percent of all U.S. military personnel deployed; 13 U.S. women were among the 375 U.S. soldiers who died, and 2 women were captured and held as prisoners of war. In April 1993, Air Force 1st Lt. Jeannie Flynn was the first woman to complete a combat training course to fly advanced "fighter aircraft.

By 1996, 197,693 women were serving in the armed forces, constituting 13.4 percent of all active duty personnel. At the junior officer levels, women were represented relatively proportional to their numbers in the services. However, there remained a "glass ceiling" inhibiting promotion at the senior levels. In 1996, no women held three- or four-star rank, and only 2 of the 277 two-star officers and 14 of the 430 one-star officers were women.

Media coverage in the 1990s led to increased public debate about the role of women in the armed forces. In arguing for equal treatment of all individuals in the military, some senior women military officers and liberal feminists, including Congresswoman Pat "Schroeder of the Armed Services Committee, have pressed for opening combat roles to women as part of a larger program to give women full citizenship rights and responsibilities. Furthermore, women's advocates note that combat exclusion reinforces the glass ceiling that blocks promotion to the most senior ranks in a system that favors combat experience over support roles as a condition for advancement. Those opposing women's assignment to combat roles argue that "combat effectiveness will be compromised because men will be more likely to defend their female colleagues than to destroy the enemy; that unit cohesion might be undercut by tensions between the sexes; and that the problem of pregnancy makes women soldiers not deployable in times of emergency. Some observers have suggested that the line between combat and noncombat roles will become increasingly arbitrary as support functions put women in the line of fire (as in the Persian Gulf) and as the armed forces prepare to fight noninfantry, high-technology wars.

The issue of "sexual harassment has caught public attention in recent years. Starting with the 1991 Tailhook Conference, at which at least 83 women were assaulted by drunken male navy fighter pilots, harassment scandals have rocked the services. In 1997, a number of female soldiers at the Aberdeen Proving Ground in Maryland alleged that their army drill instructors harassed them during their training. Subsequently, a sexual harassment hotline set up to field anonymous calls from women in the armed forces yielded hundreds of reports of abuse of rank and privilege by senior male noncommissioned officers and commissioned officers. The sexual harassment issue remains controversial as the armed forces attempt to establish fair procedures to adjudicate complaints in organizational environments hostile to change.

The WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM (WILPF) was founded in Geneva, Switzerland, in 1919, an outgrowth of the International Committee of Women for Permanent Peace, formed

at the Hague during World War I. Composed primarily of white, educated, middle-class women, the U.S. Section began as the Woman's Peace Party, organized by the social worker Jane "Addams in 1915. Still functioning with international headquarters in Geneva, the WILPF has branches in countries across the globe.

With a peak membership of approximately 16,000 in the mid-1930s, the U.S. Section was an active and influential organization in the American peace movement between the two world wars. This was due largely to the astute leadership of first president Addams, as well as that of the former Wellesley economics professor Emily Greene "Balch and the Quaker activist Hannah Clothier Hull, and the administrative talents of executive secretary Dorothy Detzer and organization secretary Mildred Scott Olmsted. Addams and Balch were awarded the Nobel Peace Prize (1931 and 1946, respectively), the only American women so far to be so honored.

Only a minority of WILPF antiwar activists were absolute pacifists, but all were committed to a world that repudiated "aggression and violence as a way of resolving disputes among nations. Erroneously accused by critics of "isolationism, the interwar WILPF endorsed all cooperative endeavors internationally that did not involve war or preparation for war. It supported disarmament, consultative pacts, arbitration, and the World Court, and advocated aid to Jewish and other victims of Nazi persecution, but opposed U.S. involvement in World War II.

After 1945, the U.S. Section became alarmed by the "Cold War, with its escalating "arms race and "nuclear weapons proliferation. Now led by Olmsted, the WILPF opposed American involvement in the "Korean War and the "Vietnam War; continued its longtime support of equal rights for women as well as for ethnic and racial minorities; and protested American low-intensity warfare in Asia, Africa, and Latin America.

WOOD, LEONARD (1860-1927), army officer and colonial administrator. Educated at Harvard and Harvard Medical School, Wood joined the army as a contract surgeon in 1885. Although he entered the line in 1898 as the colonel in command of his friend Theodore "Roosevelt's First U.S. Volunteer Cavalry (the "Rough Riders"), Wood was considered an outsider by most career officers. Remaining in Cuba after the "Spanish-American War, Wood, as a brigadier general, was appointed military governor and implemented a program of wide-ranging progressive reforms. Later, in the Philippines, as governor of the Moro province, he directed the bloody campaign to pacify the Moros. In 1910, President William H. Taft appointed Major General Wood army chief of staff.

Wood sought to modernize the U.S. Army. As chief of staff (1910-14), he worked to break the authority of the War Department bureau system, to reform the General Staff, and to reorganize the field army. He also encouraged the formation of the Army League, a supportive group of

business, foreign policy, and education elites. After war broke out in Europe in 1914, Wood became, with former President Theodore Roosevelt, one of the chief architects of the "Preparedness" movement, advocating compulsory, short-term military training for all able-bodied young men, as well as reserve officer training to prepare a mass reserve army. Wood's highly visible role in the controversial Republican-led campaign to drum up popular support for military preparedness did little to endear him to Democratic president Woodrow "Wilson. Established as a partisan figure, the army's senior general spent the period of U.S. involvement training recruits in Kansas.

Resentment at having been denied command in France during World War I pushed Wood further into politics. Afterward, he claimed Roosevelt's mantle as leader of the Republican Party's progressive wing, yet also ran a "law and order" campaign for the presidential nomination in 1920 while on active duty. The convention chose Senator Warren Harding, who after election sent Wood to the Philippines as governor general, a position that he held until his death from a brain tumor.

Wood's restless energy and monumental ambition made him an innovator who adapted the progressive spirit of the age to military affairs. He was also a maverick, ruthlessly attacking anything that thwarted his ambitions, and exempting himself from traditional strictures excluding professional soldiers from politics.

WOOLMAN, JOHN (1720-1772), American Quaker and reformer. Born near Mt. Holly, New Jersey, Woolman traveled as a minister through the colonies and England. Best known for his *Journal* and for his antislavery efforts, he became involved in peace issues during the "French and Indian War, becoming a war tax refuser, and joining others in 1755 in signing "An Epistle of Tender Love and Caution." In 1759, he wrote a second letter, sometimes called the "Pacifist Epistle." In response to the draft, Woolman emphasized principled objection, decrying objectors who merely "pretend scruple of conscience." He did not refuse to quarter soldiers, but would not accept pay, explaining that he acted "in passive obedience to authority." During the frontier violence after the war, he visited the Indians at Wyalusing, Pennsylvania, "to feel and understand the spirit they live in" and to promote peaceful relations. His essay "A Plea for the Poor" shows unusual insights into the causes of war, urging people to look at their possessions and "try whether the seeds of war have any nourishment in them."

WORLD BANK (est. 1944). At the July 1944 Bretton Woods Conference in Bretton Woods, New Hampshire, forty-four nations, including the United States, Great Britain, and the Soviet Union, agreed to establish the International Monetary Fund (IMF) and the International

Bank for Reconstruction and Development (IBRD, but called the-World Bank) to provide loans to governments for postwar economic reconstruction. The IBRD officially came into existence on 27 December 1945, when states holding 65 percent of the bank's shares approved the agreement. The bank's headquarters are in Washington, D.C. Each of the 179 member states has one representative on the board of governors. Each state's voting power, however, depends on the number of bank shares held by the state. The United States as the single largest investor currently holds 16.53 percent of the shares.

The World Bank's membership and objectives were affected by the "Cold War. The Soviet Union never joined the bank; post-Soviet Russia, however, became a member on 1 June 1992. In 1948-52, the European Recovery Program—the "Marshall Plan—superseded the IBRD as the primary reconstruction aid provider for Western Europe. The bank's main objective became making or guaranteeing loans to developing states. Since the early 1990s, aid to Eastern European countries, including member states of the former Soviet Union, has become an increasingly important aspect of the bank's work. In January 1996, the IBRD granted Bosnia a \$150 million loan to aid rebuilding after the end of its civil war.

From its inception to 30 June 1998, the World Bank has granted 7,112 loans to 168 recipients, totaling \$425 billion. African states received 18 percent of that amount, Asian and Pacific countries 42 percent, Near Eastern states 3 percent, European countries (including Russia) 12 percent, and Latin American and Caribbean states 25 percent.

WORLD WAR I (1914-18)

Causes

Causes of U.S. Entry

Military and Diplomatic Course

Domestic Course

Postwar Impact

Changing Interpretations

WORLD WAR I (1914-18): CAUSES

Although the United States did not enter World War I until 1917, the outbreak of that war in 1914, and its underlying causes and consequences, deeply and immediately affected America's position both at home and abroad. In the debate on "neutrality and later on peace aims, much was made of European secret diplomacy, which was rejected on the U.S. side of the Atlantic, of militarism and the escalating arms race before 1914, and of the impact of colonialism. Undoubtedly, all these factors contributed to the origins of the European catastrophe, but they do not explain why the war broke out when it did. This question can only be answered more precisely by looking at the political and military decision-making processes in the last months, weeks, and days of peace in 1914.

After decades of debate about whether Europe "slithered over the brink" (David Lloyd George's phrase) owing

to general crisis mismanagement among all participant nations or because of the actions of a clearly identifiable group of people, the overwhelming majority consensus has emerged among historians that the primary responsibility rests in Berlin and Vienna, and secondarily perhaps on St. Petersburg. Judging from the documents, it has become clear that the German kaiser and his advisers encouraged Vienna to settle accounts with Serbia following the assassinations of the heir to the Austro-Hungarian throne, Archduke Ferdinand, and his wife at Sarajevo in Bosnia-Herzegovina on 28 June 1914.

By issuing a "blank check" to Austria-Hungary on 5 July 1914, the German government took the first step in escalating a crisis that involved the risk of a world war among the great powers. This risk was high not only because these powers had been arming over the previous years, but also because they had regrouped into two large camps: the Triple Alliance (Germany, Austria-Hungary, Italy) and the Triple Entente (Britain, France, Russia). And when, after various diplomatic maneuvers, it became clear toward the end of July that such a world war might indeed be imminent, Berlin refused to deescalate although the decision makers there were in the best position to do so.

The Czarist government, as Serbia's protector, also had a role in this development; but it was primarily a reactive one after Vienna had delivered a stiff ultimatum in Belgrade and subsequently began to invade its smaller Balkan neighbor. So, while the main responsibility for the outbreak of war is therefore to be laid at the kaiser's door, the question of why he and his advisers pushed Europe over the brink continues to be a matter of debate. The German historian Fritz Fischer has argued that the kaiser's government saw the Sarajevo crisis as the opportunity for aggressively achieving a *Griff nach der Weltmacht* (*Breakthrough to World Power Status*), as the 1961 German version of Fischer's first, and highly controversial, book on the subject was entitled. The American historian Konrad Jarausch and others, by contrast, have asserted that Berlin's and Vienna's initial strategy was more limited. By supporting Austria-Hungary against the Serbs, the two powers hoped to weaken Slav nationalism and Serb expansionism in the Balkans and thus to restabilize the increasingly precarious position of the ramshackle Austro-Hungarian empire with its many restive nationalities. According to this interpretation, the assumption was that Russia and its ally, France, would not support Serbia, and that, after a quick localized victory by the central powers in the Balkans, any larger international repercussions could be contained through negotiation following the fait accompli.

It was only when this strategy failed owing to St. Petersburg's resistance that the German military got its way to launch an all-out offensive, the first target of which would be Russia's ally, France. This was the sole military operations plan, the "Schlieffen Plan," first developed by Gen. Alfred von Schlieffen, that the kaiser still had available in 1914. The alternative of an eastern attack on Russia had been dropped several years before. Worse, since the German Army was not strong enough to invade France directly through Alsace-Lorraine, Helmut von Moltke, chief of the General Staff, had further reinforced the right flank of the invasion force with the aim of reaching Paris swiftly from the north. However, this could only be achieved by

marching through Belgium, and it was this violation of Belgian neutrality that brought Britain into the conflict, definitely turning it into a world war.

In a further radicalization of his argument, Fischer asserted in his second book, *War of Illusions* (1973), that the German decision to start a world war had been made at a "War Council" on 8 December 1912, and that Berlin used the next eighteen months to prepare it. However, this view has not been generally accepted by the international community of scholars. Unless new documents supporting Fischer emerge, possibly from the Russian archives, the most plausible argument seems to be the one developed by Jarausch and others of a miscalculated "limited war" that grew out of control.

While diplomatic historians and political scientists have dominated the debate on the outbreak of World War I, social historians have more recently begun to examine the attitude of the "masses" in that summer of 1914. The older view has been that there was great enthusiasm all-round and that millions in all participant countries flocked to the colors expecting to achieve victory no later than Christmas 1914. No doubt there was strong popular support, reinforced by initial serious misconceptions about the nature of modern industrialized warfare. But there have been recent challenges to this view, and it appears that divisions of contemporary opinion were deeper and more widespread than previously believed. French social historians have shown that news of the * mobilization was received in some parts of the country with tears and consternation rather than joy and parades. In Germany, too, feeling was more polarized than had been assumed. Thus, there were peace demonstrations in major cities to warn Austria-Hungary against starting a war with Serbia. And when the German mobilization was finally proclaimed, the reaction of large sections of the population was decidedly lukewarm. As one young trade unionist wrote after watching cheerful crowds around him near Hamburg's main railroad station on 1 August 1914: "Am I mad or is it the others?"

Considering the unprecedented slaughter that began shortly thereafter in the trenches of the western front as well as in the east, this was certainly a good question, and further research may well open up new perspectives on the mentalities of the men and women in 1914 and on the socioeconomic and political upheavals that followed, which ultimately also involved the United States as a participant.

WORLD WAR I (1914-18): CAUSES OF U.S. ENTRY

Like the origins of World War I itself, the causes of U.S. entry on 6 April 1917 have been much debated. The 1930s emphasis on economic motivations—the desire of American munitions makers and financiers to protect their stake in Allied victory—has been superseded by two new interpretations. One, a broad view enunciated first by historians William Appleman Williams and N. Gordon Levin, emphasizes the desire of President Woodrow *Wilson and

many among America's economic and foreign policy elites to ensure a liberal, capitalist world order in contrast to reactionary militarism and colonialism or widespread revolution and communism. The other reflects a greater focus on Wilson's decision making and is put forward by Arthur S. Link, Ernest May, Robert H. Ferrell, and Thomas J. Knock. They emphasize variously the strategic situation of the United States as the leading neutral industrial and financial power; and the influence upon Wilson of the German "submarine warfare, the predominantly pro-British attitude of American elites, and the president's own appropriation of the leadership of the liberal movement toward a just and lasting peace based upon a league of nations.

In 1914, Wilson proclaimed U.S. "neutrality in keeping with American tradition. He was also aware of the great divisions over the war: although perhaps a bare majority of Americans favored Britain, nearly as many were hostile to the Allies because of ethnic loyalties or suspicions of Britain, the world's most powerful empire and financial center, or hostility toward czarist Russia with its autocracy and pogroms.

Both Germany and Britain violated U.S. neutral maritime rights, as Wilson strictly defined them, but German submarine warfare seemed more ruthless, particularly with the sinking of the *Lusitania*, a British passenger liner, in 1915. American trade with the Allies tripled to \$3 billion a year between 1914 and 1916 and helped economic recovery in the United States. Pro-British elites and the urban press increasingly emphasized German immorality—the invasion of neutral Belgium and alleged "atrocities there and later the barbarity of submarine warfare. Seeking to avoid being drawn into the war but also insisting on Americans' right to aid the Allies, Wilson held Germany to "strict accountability" for its submarine warfare, and for a while caused Berlin to restrict its U-boats.

After his reelection in 1916, Wilson offered to mediate a peace; but both sides refused. Berlin then decided on unrestricted submarine warfare, beginning 1 February 1917, to starve Britain into terms. Wilson severed diplomatic relations on 3 February. American public opinion was also inflamed by the Zimmermann note, in which Germany sought a military alliance with Mexico against the United States. When submarines sank three American merchant ships, Wilson abandoned temporary armed neutrality and decided to take the United States into the war, in part because his strict accountability policy had failed and in part because he wanted the United States to help shape a treaty for peace.

In his powerful war message of 2 April 1917, Wilson condemned the German submarine campaign as "warfare against mankind," and urged Americans to fight, in his famous phrase, to make the world "safe for democracy." By a vote of 82-6 in the Senate (4 April) and 373-50 in the House (6 April), Congress adopted a resolution declaring that a state of war existed between the United States and Germany.

WORLD WAR I (1914-18): MILITARY AND DIPLOMATIC COURSE

"The situation is extraordinary. It is militarism run stark mad." Col. Edward House, President Woodrow "Wilson's closest adviser, did not exaggerate when he wrote these words. The Europe he described in the spring of 1914 was divided into two armed camps: the Triple Entente (Russia, France, and Great Britain) and the Triple Alliance (Germany, Austria-Hungary, and Italy). An unprecedented arms race was underway that coincided with revolutionary advances in the technology of warfare. Magazine-loading rifles, belt-fed "machine guns, and improved "artillery dramatically increased the firepower of armies. Relying on an expanding network of railways, the general staffs of the major European powers devised elaborate "mobilization and offensive schemes. The smallest details were covered, including the preparation of exact railway timetables and even the registration of farmers' horses for possible use. Universal "conscription fostered militarism. Governments identified and registered able-bodied males of military age. Approximately 4 million men were in uniform when the war started in August 1914; that number had risen to a staggering 20 million by the end of the month.

Europe's military elite, accepting Carl von "Clausewitz's military principles of "the decisive force, at the decisive place, at the decisive time," were committed to an offensive strategy designed to climax in one or two great decisive battles. Clausewitz's ideas on war may also have influenced society. The historian John Keegan argues that Europe had been transformed into a warrior society by the acceptance of Clausewitz's maxims that "war was a continuation of political activity and that "war is an act of violence pushed to its utmost bounds."

A month after House's letter, the assassination on 28 June 1914 of Archduke Franz Ferdinand, the heir to the Austro-Hungarian throne, precipitated a general European crisis that quickly became unmanageable. The Austrians, given unequivocal support by their ally, Germany, blamed Serbia for the archduke's death and decided to crush Serbia's challenge to the fragile Austro-Hungarian empire. Vienna's determination to go to war triggered a general conflict. The illusion that modern industrialized wars would be short made this decision easier. Few believed the Polish banker and economist, Ivan S. Bloch, the author of *The Future of War in Its Economic and Political Relations: Is War Now Impossible?* (1898), who argued that modern military technology had made unlimited war mutually destructive for the participants.

Germany's "Schlieffen Plan," designed to achieve victory over France within six weeks by a gigantic flanking movement through neutral Belgium, came to grief during the First Battle of the Marne (5-9 September). An ominous portent was that the French, Germans, and British had suffered over half a million "casualties in three weeks of fighting. Meanwhile, the Russian offensive in East Prussia was checked and thrown back, with an entire Russian army destroyed at Tannenberg (26-30 August).

Following the opening battles, the armies in the west

dug in. An almost continuous line of parallel defensive systems was constructed from the North Sea to Switzerland. Protected by barbed wire, usually 50 or more feet deep, these earthworks were frequently built in depth. The front resembled a spiderweb, consisting of thousands of miles of connecting and parallel trenches. "Trench warfare also existed to some extent of other fronts—in some areas of Russia, Italy, the Balkans, and Palestine—though nowhere did it become as prominent as in France and Flanders.

Europe's military leaders sought to return to a war of maneuver by rupturing the enemy's front. To restore the offensive, new weapons such as "tanks and chemical warfare were eventually introduced. High-explosive shells, recoilless carriages, optical sights, improved communications, and cannon ranges of 20 or more miles made indirect artillery bombardment the dominant force of the battlefield. The application of massive and increasingly sophisticated artillery fire proved to be the most effective means of reducing fortifications. But the western defenses, bolstered by dramatic advances in firepower, were so strong and thickly defended that it was possible to break into them but not through them prior to 1918. When breakthroughs were successful, there remained limitations to the advance. The 1916-18 version of the tank lacked the speed and reliability to maintain the momentum of an attack over battle-torn ground before defenders dug in again. Nor could the heavy guns be moved forward rapidly to support a continued advance of the infantry.

The 1930s view, which lingers still among many, is that the generals of the western front were inept and their approaches to winning the war futile. "A war of attrition was substituted for a war of intelligence," is the way that Lloyd George, British prime minister and a leading critic of attempts to win the war on the western front, put it. The historian Tim Travers has emphasized that many commanders had difficulty abandoning their nineteenth-century vision of warfare, which emphasized the *élan* of the individual soldier over the new weapons technology. But recent studies of the evolution of tactics by Paddy Griffith and Robin Prior and Trevor Wilson have demonstrated that the western front during the last half of the war was not tactically stagnant. The Germans are often considered the most innovative with their elastic defense-in-depth and stormtrooper tactics of infiltration. But the British, with more offensive experience than the enemy in 1916-17, also perfected all-arms assaults and advanced techniques of trench raiding prior to the tactical successes of the Germans in the spring of 1918.

Germany, relying on strong support from Austria-Hungary, concentrated its resources on the eastern front in 1915. The vastness of that front, and the clear superiority of German artillery and leadership, made possible an advance of some 300 miles. Although Italy joined the Allies in 1915, by the end of the year, Berlin dominated Central and southeastern Europe, had a bridge to Asia and Africa through its Turkish ally, and retained Belgium and the most industrial part of France. Serbia had been defeated and Bulgaria enlisted as an ally. British efforts to find a "way around" the western front ended in dismal failure in the Dardanelles and Gallipoli campaigns. The central powers, with a more unified command because of Germany's dominant position, interior lines, and a good system of railways, held a formidable position despite their inferiority in warships, manpower, and industrial capacity.

In 1916, Germany sought to break the stalemate in the west in the ten-month Battle of Verdun, deliberately seeking a decisive battle of attrition and will. To relieve Verdun, a massive Anglo-French offensive was launched on the Somme in July. When winter brought the fighting to a close, the western front had little changed: Verdun remained in French hands, and the Allies had captured no position of strategic importance on the Somme. Combined German-Allied casualties exceeded 2 million. Despite the carnage, the warring coalitions faced a bleak future of continued stalemate and exhaustion.

Compared to the great powers of Europe, the United States was a profoundly peaceful and unmilitaristic nation. Prior to America's entry into the war in April 1917, Wilson's secretary of the navy, Josephus Daniels, was decidedly antiwar if not pacifistic, and Newton Baker, secretary of war since 1916, was an ardent antimilitarist. The U.S. Navy had expanded to defend American shores and trade routes, but the U.S. Army ranked seventeenth in the world. The United States was the world's number one industrial power, but the army lacked modern weaponry, including tanks, poison gas, aircraft, heavy artillery, and trench mortars. War "mobilization, 1917-18, failed to remedy this deficiency: the American Expeditionary Forces (AEF) largely fought with foreign weapons.

Although legally neutral, the United States had become a vital factor for the Allies with their growing dependence on American credit and material. Caught between the effective Allied naval blockade and Germany's "submarine warfare campaign, America's right to trade overseas was jeopardized. To keep the United States from being drawn into the global conflict, Wilson attempted mediation. With the European belligerents unable to take the U.S. military seriously, he had little diplomatic leverage except for American economic might. The European nations wanted a peace to reflect their immense sacrifices in blood and treasure. But an acceptable peace to one side represented defeat to the other.

Wilson's mediation efforts implied that he was prepared to accept a global role for the United States to obtain a compromise peace, but he certainly never imagined any circumstances that would involve American forces in what he referred to as the "mechanical game of slaughter" in France. Nor apparently could he identify any strategic interest for the United States in the total defeat of Germany, which he believed would result in an unbalanced peace of victors. His formula for a satisfactory end to the fighting as he announced in January 1917 was "peace without victory."

Pressed into the war in April 1917 by Germany's gamble for quick victory through unrestricted submarine warfare, Wilson initially believed that American belligerency would largely be economic and psychological and that the central powers could be forced to the peace table without U.S. troops becoming involved on European battlefields. Pressure from London and Paris and the realization that his voice in any peace conference would be small without an American military presence in Europe changed his mind.

Only once before, during the American Revolution, had the United States fought as part of a military alliance. The General Staff in the War Department, however, quickly concluded that the only way that the United States could fight in Europe was through a collective military enterprise with the British and French on the western

front. Nonetheless, America's leadership was determined to maintain a distinct military and political position. Wilson immediately disassociated himself from the entente's controversial war objectives by insisting that the United States was an "associate power," with freedom to conduct independent goals.

The commander in chief of the AEF, John J. *Pershing, proved an excellent choice to defend a separate and distinct U.S. military role in the war. The AEF commander tenaciously adhered to his goal of an independent U.S. force with its own front, supply lines, and strategic goals. His preparations for a win-the-war American breakthrough to occur in 1919 in Lorraine to the east and west of Metz profoundly influenced America's military participation. The United States supported unity of command and the selection of Gen. Ferdinand Foch as generalissimo; but Pershing resisted anything but the temporary amalgamation of American units into French and British divisions, even during the grave military crisis confronting the Allies in the spring of 1918. The German High Command, with Russia knocked out of the war in the winter of 1917-18, attempted to destroy the French Army and drive the British from the Continent through a series of offensives. Pershing resisted the only means of immediately assisting the depleted Allied forces: the inclusion of American units in British and French divisions. Small numbers of American soldiers, however, began to enter combat under the American flag in May and June. On 28 May, 14 months after the United States entered the war, a reinforced U.S. regiment (about 4,000 men) captured the village of Cantigny. Several days later, the Second Division (which included a Marine brigade) took up a defensive position west of Château-Thierry and engaged the advancing Germans.

Pershing rebuffed efforts by Allied soldiers to share their increasingly sophisticated tactical techniques with his forces. Revisionists have been critical of his emphasis on riflemen, the American frontier spirit, and open field tactics, arguing that he did not comprehend how science and the machine age had revolutionized warfare.

After gaining reluctant approval from Foch for the formation of an independent American force, the U.S. First Army, Pershing went forward with plans to eliminate the threatening salient of St. Mihiel, as a prelude to his Metz offensive. The Battle of *St. Mihiel (12-16 September 1918) proved to be an impressive but misleading U.S. victory because German forces were in the process of withdrawing to a new and shorter defensive line when the Americans attacked and cut off the salient.

The pressing demands of coalition warfare, however, forced Pershing to delay preparations for his 1919 Metz campaign. Complying with Foch's strategy, he reluctantly shifted most of his troops some sixty miles northward to the Meuse-Argonne sector, where he was expected to participate in simultaneous and converging Allied attacks against the large German salient. Logistical chaos, flawed tactics, and inexperienced men and officers contributed to a disastrous start to the *Meuse-Argonne offensive (26 September-11 November 1918). Pershing hoped to advance ten miles on the first day; his front, however, had moved just thirty-four miles by the armistice six weeks later, much of the ground gained only during the last phase of the offensive when Germany had exhausted its reserves.

Although only involved in heavy fighting for 110 days,

the AEF made vital contributions to Germany's defeat. With tens of thousands of "doughboys" crossing the Atlantic to reinforce the Allies, and with the AEF emerging as a superior fighting force, the exhausted and depleted Germans had no hope of avoiding total defeat if the war continued into 1919.

Before Berlin's appeal in early October for a peace based on Wilson's * Fourteen Points, the United States was on the verge of brilliantly coordinating its participation in the land war in Europe with its political plans to reshape the postwar world. If the war had continued into the spring of 1919, Pershing's plan to deliver a knockout blow to the German Army probably would have been achieved. Gen. Jan C. Smuts, the South African statesman who served in the British War Cabinet, warned the British government in October: if the war continued another year, the United States would become the "diplomatic dictator of the world."

In contrast to Pershing's wishes for total * victory, Wilson hoped to avoid placing Germany at the mercy of the Allies. American participation had not been designed to further the British empire, strengthen French security, or even maintain the European balance of power. Wilson stood not with the interests of the nation-states, but with the rights of humankind. He thus attempted with mixed results to use separate negotiations with Berlin over an armistice to impose his Fourteen Points on the Allies as well as Germany.

As the Great War concluded with the armistice on 11 November 1918, American policy was directed toward the repudiation of power politics and the erection of a "permanent" peace. Wilsonianism promised an end to war primarily through democratic institutions, the end of secret diplomacy, the self-determination for ethnic minorities, and most especially through a *League of Nations. It has been argued that this visionary approach raised expectations that were impossible to meet. The war had destroyed the old balance of power in Europe, and the peace settlement made revisionist nations out of the two states that would soon dominate the Continent, Germany and the Soviet Union. The United States, the greatest economic beneficiary of the war, helped make the peace, but with its rejection of the Treaty of "Versailles refused responsibility for maintaining it.

A war in which over 65 million troops had been mobilized by the belligerents ended in a twenty-year truce instead of "permanent peace." The failure to achieve Wilson's unrealistic though desirable goal was hardly surprising. But another general war was not inevitable. World War II was caused by many factors, including the flawed peace settlement of 1919, the Great Depression of the 1930s, and the psychological scars of World War I, which enfeebled the democracies. But the inability of the victorious powers, especially Great Britain and the United States, to work together to prevent the resurgence of German military power, was certainly one of the most important reasons for the resumption of war in 1939.

WORLD WAR I (1914-18): DOMESTIC COURSE

With its dynamic economy, its large population, and its stable government, the United States was well suited to the kind of total conflict that was raging overseas in World War I. But to realize its potential as a belligerent, it had to overcome several obstacles. Unity was vital in a war that pitted whole nations against one another; yet in the months that followed the country's entry into the war in April 1917, the country remained divided. Faults ran through American society along lines of race, ethnicity, and economic class. The declaration of war had not eliminated "isolationism apathy, pockets of "pacifism and antimilitarism, and even sympathy in some quarters for the people America was fighting. Although American factories, farms, and mines had been producing materials for the Allies for many months, the task of converting the economy to war production promised to be complex and difficult. The method for raising and supporting an army of the size that would have to fight had barely been sketched out.

President Woodrow "Wilson's administration improvised a series of solutions to these problems. It exhorted Americans to work and sacrifice for the war and to submerge their differences. It isolated and punished the war's opponents and rewarded people and organizations whose cooperation it needed. The result of its efforts was what has been called a wartime welfare state, in which government and interest groups sought to manage one another; in which "patriotism and idealism and sacrifice existed alongside the determined pursuit of self-interest; in which those with the greatest power, the strongest organization, or the most badly needed resources tended to secure the largest benefits from Congress and the Wilson administration.

To control domestic public opinion, the administration established a Committee on Public Information, which supplied American media with overwhelming quantities of facts and propaganda. Together with the Department of Justice and the Post Office, the Committee on Public Information defined what Americans were permitted to say in wartime. Notable dissenters, including the Socialist leader Eugene V. "Debs and hundreds of others whom government officials felt had opposed government policies or interfered with war production, were sent to prison. The government's portrayal of a monstrous enemy and its attacks on dissenters, together with the reports of "casualties suffered in battle at enemy hands, helped promote a frenzy of anti-German and anti-German American feelings in parts of the nation.

Appealing to liberals, at that time a very large faction, the administration made the war, in some respects, a continuation of the prewar Progressive movement. It depicted the struggle against the central powers as a campaign for worldwide reform. It endorsed a federal women's suffrage amendment as a reward for women's war work. It extended disability benefits to members of the armed forces, provided financial support to their dependents, and created occupational health and safety standards for war workers. It tried to limit alcohol consumption and abolish prostitution, goals of many reformers. To assure the cooperation of pro-war labor unions, the administration approved collective bargaining for the duration of the conflict, provided federal mediation of labor disputes, and gave union officials an opportunity to sit on boards that managed the economy—but not to determine the policies of those boards. To the small and weak contingent of racial equality reformers, however, it offered only modest concessions, including positions in government as intelligence workers so that civil rights leaders could inform the government of possible disaffection among African Americans.

American corporations made large gains in wartime. The government enabled business groups to regulate themselves. Executives of leading companies dominated agencies, such as the Council of National Defense and the War Industries Board, that coordinated war production and distribution and arranged prices. It could hardly have been otherwise. Without a large, experienced regulatory bureaucracy of its own, the U.S. government needed not only the products of factories run by these businessmen but also their expert knowledge of how their industries operated. The president and Congress provided some checks on abuses by businesses. They declined for several months to give precise authority to the Council of National Defense and the War Industries Board; for a long time they failed to stop the War Department from resisting control over procurement by the business-dominated agencies. Congress passed legislation that in principle outlawed conflicts of interest. In some cases, the administration even used federal agencies to run important segments of the war economy, such as the railroad system. Yet the bureaucracy that managed railroads for the Railroad Administration was recruited from executives who had managed the railroads before the government took them over, so even that organization—a supposed example of "war socialism"—continued the practice of self-regulation.

The economic war agencies operated largely through a system of incentives, often using indirect methods rather than overt commands to achieve their objectives. They established a priority system in which companies that volunteered to manufacture war goods were given greater access to raw materials, workers, fuel, and "transportation than those whose activities were deemed less essential. (To put it another way, companies that chose not to cooperate might receive barely enough of what they needed to keep them going). These agencies offered cooperating businesses the chance to earn very large profits, partly because prices for whole industries were set at a level that could make the most inefficient producers profitable. Because the people who awarded contracts and negotiated their terms came from the industries that received the awards, executives who sought those contracts could feel confident that they were dealing with knowledgeable persons, not insensitive government officials. Businesses could engage in collusion

without fear of being prosecuted. Although producers in the lumber, steel, automobile, and other industries drove very hard bargains with the war agencies, and in some cases threatened to refuse contracts for vital war products, American capitalists used publicity about their war work to restore an image of private enterprise that had been seriously tarnished in the prewar years. Certain large business leaders also appreciated the wartime opportunity to substitute cooperation for competition—a change some of them hoped would be permanent.

Incentives and publicity played significant parts in other areas of war "mobilization. To induce farmers to expand production, the federal government set a minimum price for wheat. It ran massive propaganda campaigns encouraging citizens to conserve food and fuel and to help pay for the war by purchasing government Liberty bonds. The Committee on Public Information and the Treasury Department staged Liberty bond rallies at which movie stars, war heroes, politicians, and other celebrities appeared to promote bond sales. Government publicity encouraged men of military age to join the armed forces and promoted a public climate in which able-bodied "slackers" felt extremely uncomfortable. Though thousands held back out of "conscientious objection or for other reasons, plenty of Americans wanted to enlist. Still, the government decided not to rely on volunteers alone. It instituted "conscription, administered by a Selective Service System, which sent sent two and three-quarter million men to the armed forces. The Selective Service System also promoted economic mobilization, inducing essential civilian workers to stay where they were by exempting them from the draft, but warning them that they must work or fight.

From women suffragists to civil rights leaders, from union officials to corporate executives, American civilians sought to turn the war to their advantage or to the advantage of the groups to which they belonged. Their political leaders and representatives did the same. After announcing that "politics is adjourned," President Wilson asked the voters to elect candidates from the Democratic Party in 1918 as a referendum on his war leadership. (They responded by giving Republicans control of both houses of Congress.) Several of the state councils of defense, which had been established to foster mobilization, became political organizations, usually dominated by Republicans. Many wartime measures were intensely political—for example, the decisions to fix minimum prices for certain products and not others, and to pay part of the cost of the war by progressive taxation and by taxes on "excess" profits.

The wartime welfare state, created for temporary purposes and staffed largely by volunteers rather than by a standing bureaucracy, dissolved at the end of the war. But the memory of the wartime system remained in the minds of those who had run it, and some of its components persisted in the 1920s—such as a federal system of medical benefits to "veterans and government-sponsored cooperation among businesses. During the Great Depression, several wartime agencies were resurrected with new names and altered purposes, including the War Finance Corporation, restored in Herbert C. "Hoover's administration as the Reconstruction Finance Corporation, and a host of New Deal organizations such as the National Recovery Administration, which traced its origins to the War Industries Board. Short-lived though it may have been, the wartime

system for managing America's home front in 1917 and 1918 contained some of the germs of the late twentieth-century welfare state, and was a progenitor of modern big government.

WORLD WAR I (1914-18): POSTWAR IMPACT

World War I marked a turning point in world history. It reduced the global influence of Europe, destroying some of its monarchies and empires and diminishing the strength of others. It enabled new nations to emerge. Shifting economic resources and cultural influences away from Europe, the war encouraged nations in other areas of the world, notably the United States, to challenge Europe's international leadership.

Essentially a civil war in Europe with global implications, World War I destroyed some empires and weakened others. The 1917 Revolution in Russia, following the czarist regime's collapse, culminated in the Bolshevik seizure of power. With military defeat in 1918, the Ottoman and Austro-Hungarian Empires disintegrated, while Germany replaced the kaiser's government with the Weimar Republic. New nations such as Poland, Czechoslovakia, and Yugoslavia emerged from former empires. Victory for the European Allies came at a high price. They owed over \$11 billion to the United States, which was transformed from a net debtor to a net creditor. New York replaced London as the world's financial center. The European Allies also faced increasing demands for self-rule from their colonies. They no longer controlled sufficient military and economic resources to shape world affairs as before.

By war's end, the United States and Japan were among the victorious powers at the Paris Peace Conference of 1919, along with the United Kingdom, France, and Italy, with U.S. president Woodrow "Wilson playing a leading role. He made the "League of Nations an essential part of the Treaty of "Versailles with Germany. The United States and the Allies, refusing to recognize the Bolshevik government in Russia, excluded the Soviet Union from Paris. Still, the specter of Bolshevism loomed over the conference.

Wilson sought a peace settlement that would protect democratic and capitalist nations. Affirming the principle of national self-determination, he called for a postwar League of Nations to provide collective security for its members. He expected the League, under American leadership, to protect its members' territorial integrity and political independence against external aggression, and thereby preserve the peace.

Within the belligerent countries, the war had enhanced the "state's role in the economy and society, but it also generated a backlash. Democratic governments in Western Europe retained civilian control, while autocratic governments in Central and Eastern Europe had succumbed to both military rule and revolution. Western democratic

governments lost authority after the war. British elections in 1918 that kept Prime Minister David Lloyd George in office also registered Irish demands for self-rule. France experienced political instability after Premier Georges Clemenceau's resignation following his defeat in the presidential election.

Americans likewise reacted against Wilson's strong wartime leadership. The 1918 elections reduced the Democrats to the minority in Congress. After the war, as wartime agencies removed regulations, the United States experienced rapid inflation, labor strikes, and economic recession. The American Expeditionary Forces returned from France and quickly demobilized. Congress reorganized the armed forces with the *National Defense Act of 1920, reducing the regular army to nearly its prewar level.

Rapid readjustment and "demobilization produced social unrest in the United States in 1919-20. Regardless of their wartime "patriotism, African Americans were primary victims of urban race riots and rural lynchings, while socialists and other radicals, whether immigrants or native-born, were targets of the Red Scare. Wilson was partly responsible for this postwar impact, given his negative attitudes toward black people, new immigrants, and labor strikes, and his international focus, resulting in a neglect of postwar reconstruction at home. He contributed to the Red Scare, too, by advocating the League of Nations as a barrier against Bolshevism. Nevertheless, under Henry Cabot * Lodge's leadership, the Republican Senate kept the United States out of Wilson's League by rejecting the Treaty of Versailles.

Americans reacted against the wartime regulatory state and international involvement. Voters in 1920, including women who had just gained the suffrage under the Nineteenth Amendment, elected Republican senator Warren G. Harding to the presidency. Promising less government at home and less entanglement abroad, he epitomized one postwar alternative to Wilsonianism.

The postwar legacy of World War I was very different from Wilson's hopes. The League of Nations failed to maintain peace when aggressive nations—notably Communist Russia, Fascist Italy, Nazi Germany, and Imperial Japan—later challenged the Versailles peace. These revisionist powers rejected democracy and capitalism and challenged the status quo. They exploited the Anglo-American revisionism of the treaty's critics, such as John Maynard Keynes in *The Economic Consequences of the Peace* (1920), to justify their aggression. During the Great Depression of the 1930s, which resulted in part from the postwar failure to create a sustainable world economy, they turned modern "nationalism into a hostile force that culminated in World War II.

Yet the long-term impact of World War I also included the enduring legacy of Wilsonianism. Wilson had emphasized the principle of national self-determination in the peacemaking. To curb nationalist excesses and aggression, he had advocated collective security through the League of Nations, hoping to enable free nations to participate in a new world order of peace and prosperity. He had endeavored to shape public opinion in favor of democracy and capitalism as well as internationalism. Despite his failure after World War I, Wilson's ideals deeply influenced the statecraft of future generations. Wilsonianism would continue to shape the international history of the twentieth century.

WORLD WAR I (1914-18): CHANGING INTERPRETATIONS

Historical opinion about the causes of World War I, American entry, and the making of peace has changed sharply over the years, with the publication of documentary collections, the opening of archives, and the appearance of memoirs and collections of personal papers, as well as changing theories and international circumstances. There is now general agreement on the causes of the war and of American entry; but disagreement remains over the American role in the peace.

During the years between the two world wars, contentions abounded between the adherents of Sidney B. Fay of Harvard University and Bernadotte Schmitt of the University of Chicago, who took respectively the sides of the central powers and the Allies, and based their books and articles on the national documentary collections and memoirs. At the end of World War II, the American and British governments took control of the German Foreign Office files and opened them, which revealed the bias of the earlier German documentary collection, *Die Grosse Politik der Europaeischen Kabinette: 1871-1914*. Opinion now is that German "nationalism bears primary responsibility for starting the war.

American entrance into the great European conflict, which made it a true world war, produced an argument in the 1930s between Charles Seymour of Yale University and the popular historian Charles A. Beard, in which Seymour singled out German "submarine warfare, especially the resort to unrestricted use of submarines beginning 1 February 1917, contrary to historical American neutral rights, as the cause of President Woodrow *Wilson's decision to move from "neutrality to intervention. Beard belittled such a monocausal contention, writing that the cause of any large event is necessarily complex, akin to a chemist pouring reagents into a test tube and obtaining a precipitate—but the latter is not the cause. Historical opinion now favors multicausality within a larger cultural and economic context provided by U.S. ties with the Allies.

In the making of the peace it is possible to say that the Wilsonian internationalists, the champions of the American president, such as historians Arthur Link and Arthur Walworth, have held the field. But questions remain, notably about whether the American people were prepared in 1919 for, if not a world government, then a world organization. Historians have agreed that Wilson himself was not his own best advocate. Thomas J. Knock has argued that Wilson undermined the progressive internationalist coalition by wartime repression. There is particular concern about the Wilson design of the Covenant of the "Teague of Nations, which was neither fish nor fowl—neither a general scheme to promote international law and arbitration,

which was in the American diplomatic tradition, nor a design for a postwar alliance of the victorious powers, which such conservative senators as Henry Cabot "Lodge of Massachusetts might have approved on a short-term basis. Historians have remarked on the extraordinary nationalism of post-1918 America, the inchoate but ardent desire to promote peace, and the victory of "isolationism. They are unsure that any American president, seeking an acceptable peace, could have done anything other than what President Warren G. Harding did, which was to declare agreement with the nonpolitical provisions of the Treaty of "Versailles.

—Robert H. Ferrell

WORLD WAR I, U.S. AIR OPERATIONS IN. The U.S. declaration of war on April 6, 1917, found American aviation in an embryonic and woefully unprepared state. The army air service had some 1,400 officers and men; naval aviation, 300.

America's first operational unit in Europe, a naval air detachment, began flying seaplane escort for French coastal convoys in September. The first army flight candidate landed in France in June 1917, while those arriving in Italy in the fall included New York congressman Fiorello La Guardia.

In France the command of the embryonic U.S. Air Service remained in flux into 1918, as frontline commander Col. William "Billy" Mitchell emerged as the key leader. Mitchell determined to undertake a tactical aerial offensive on the Western Front with an air arm of new recruits from America and a nucleus of veterans from the Lafayette Escadrille and Lafayette Flying Corps, who had flown with the French since the battle of Verdun in 1916.

U.S. units entered action in the quiet sector around Toul in the spring, and in early June thirteen squadrons joined the struggle over Chateau-Thierry during the Aisne-Marne offensive.

When the First Army AEF attacked the "St. Mihiel salient on September 12 to 16, Billy Mitchell commanded 1,481 airplanes, the largest wartime concentration of Allied air forces, nearly half of which were American. Despite poor weather conditions, this overwhelming mass seized aerial control as fighters penetrated over German airfields and day bombers struck targets on the battlefield and in the rear. St. Mihiel also marked the meteoric ascent of balloon-busting ace Frank Luke, who shot down 18 Germans in 17 days before meeting his death. The impetuous Luke won the Medal of Honor, as would American ace of aces Eddie "Rickenbacker, who ultimately gained 26 victories and survived the war.

In the climactic "Meuse-Argonne Offensive from September 26 to the end of October, Mitchell successfully continued his massed offensive tactics. By the Armistice the intensive fighting combined with supply problems to reduce the air service to 45 squadrons with 457 serviceable airplanes, nearly two hundred fewer aircraft than in September. Yet the air service had grown to 195,024 officers and men by war's end. More than 2,000 American flight personnel had reached the front. 681 aviators died, 75 percent of them in accidents and 25 percent in combat.

By October 1918 the navy had some 900 seaplanes for convoy duties, 400 of which were stationed abroad at 27 U.S. naval air stations from Ireland to Italy. A few naval avi-

ators flew bombers from Calais-Dunkirk, while army aviators in Italy, manned bomber units there.

American industry delivered Curtiss flying boats, the standardized Liberty engine, and copies of the British DH4 bomber to American combat units. Yet inadequate overall aviation production necessitated American reliance primarily on allied aerial equipment. The U.S. Air Service's significance lay in its support of the army through reconnaissance and attacks on enemy troops and supplies at and behind the front, while fighter aviation protected observation and bomber craft, engaged in ground attack, and provided the public with heroic aces.

WORLD WAR I, U.S. NAVAL OPERATIONS IN. As a direct response to the war in Europe, the Naval Act of 1916 required the United States to construct a battle fleet equal to that of Britain and able to gain command of the sea. President Woodrow "Wilson hoped that this radical change in naval policy would strengthen his hand in efforts to arrange a negotiated peace. The United States entered the war in 1917 before this ambitious program was very far advanced. Thereafter, the peculiar exigencies of naval operations caused its abandonment. Germany's resumption of unrestricted "submarine warfare against neutral and noncombatant merchant shipping on the high seas (attack without warning) led to the U.S. intervention. German leaders expected this response, but believed that a maritime strategy, interrupting the flow of supplies to the Allies, would force a decision on the western front within six months, long before U.S. assistance could affect the outcome. This challenge led the United States to concentrate on naval construction to thwart the submarine offensive—building antisubmarine craft to engage the German U-boats and merchant ships to replace those destroyed at sea. This program forced postponement in constructing "battleships and "cruisers, the most important elements of a battle fleet.

Adm. William S. Benson, the chief of naval operations, and others wished to continue the 1916 building program, seeking to gain postwar political leverage, but Adm. William S. "Sims, sent to London to establish liaison with the British Admiralty, offered counsel that helped fix naval policy for the remainder of the war. Soon grasping the severity of the submarine depredations, Sims urged immediate support of the antisubmarine war. Following British strategy, he became a strong advocate of the convoy, that is, forming groups of merchant ships and escorting them with naval vessels through submarine-infested waters. This recommendation was accepted in Washington, forcing suspension of the 1916 building program in favor of antisubmarine craft and merchant vessels.

The first move of the Navy Department was to send available reinforcements to European waters. Six "destroyers were sent to Queenstown, Ireland, to join the British antisubmarine force there. Others soon followed, helping to escort merchantmen to British ports. U.S. destroyers were later dispatched to the Mediterranean Sea, assisting

the Allied fleet there to protect communications with Asia. Beside destroyers, the United States built small submarine chasers, of which 235 reached European waters. In all cases, ships under Sims's control operated under Allied commanders. Thus, American vessels were effectively integrated into the Allied navies, especially the Royal Navy. This approach meant that the U.S. Navy, unlike the army, which resisted integration into European commands, was able to make an early, sustained, and significant contribution to the Allied cause.

In 1918, Admiral Benson pushed for the development of a strong escort service based at the French port of Brest to cover the arrival of the American Expeditionary Force. This force soon became larger than the one at Queenstown that protected commerce. The British continued to stress escort of merchant shipping, but the U.S. Navy Department concerned itself primarily with American army troop transports. Sims supported the Admiralty view, which strengthened the impression that his was unduly pro-British. Fortunately, conflicts over this questions were kept within reasonable bounds; sufficient resources were found to maintain both types of escort duty. No loaded American troop transports were sunk en route to Europe, although several empty vessels were torpedoed while returning to the United States.

The inter-Allied antisubmarine campaign eventually contained the German undersea offensive, although the U-boats were never defeated decisively. Allied tonnage losses were cut from 875,000 tons in April 1917 to about 260,000 tons in April 1918. Effective management techniques and merchant ship construction were sufficient to preserve maritime communications.

During 1918, Admiral Sims devoted considerable attention to the Allied Naval Council, founded to coordinate inter-Allied naval campaigns. Allied shipping losses in the Mediterranean, especially to Austrian submarines operating from the Adriatic ports of Pola and Cattaro, led Sims to urge offensive naval operations in that theater, particularly raids on enemy bases and barrages to interdict the passage of submarines through choke points such as the Strait of Otranto at the southern end of the Adriatic. This endeavor led to nothing because the Italian Navy effectively opposed operations that might endanger its ships. The Italian government wished to preserve its fleet as leverage in support of postwar territorial claims. Nevertheless, U.S. naval vessels, including thirty-six submarine chasers, supported the barrage between Otranto and Corfu.

During 1918, the U.S. Navy made two other contributions to the naval war. U.S. super-battleships (Dreadnoughts) were sent to the North Sea, becoming the Sixth Battle Squadron of the British Grand Fleet. These vessels helped to continue to contain the German High Sea Fleet in its bases. A more ambitious enterprise was the construction of the huge North Sea Mine Barrage, which the Navy Department sponsored despite initial British resistance. The Anglo-American Mining Squadron laid a belt of 75,000 naval "mines between the Orkney Islands and the coast of Norway. About 240 miles long and 15 to 35 miles wide, it was intended to force U-boats to proceed to the Atlantic Ocean through the English Channel, a dangerous passage. The barrage was not completed until just before the armistice of November 11, too late for a thorough test. Four U-boats were confirmed lost, and perhaps an equal number more were also destroyed.

Although the U.S. Navy did not conduct independent operations and maneuvered few vessels other than those on antisubmarine duty, it lent notable support to the victory at sea in World War I. Admiral Sims, critical of his superiors' skepticism about his recommendations, precipitated a postwar congressional investigation of the Navy Department, complaining that it had moved slowly and inefficiently during the crises of 1917. Nevertheless, because of its effective antisubmarine work and the protection of the troopships, the U.S. Navy emerged from the war with enhanced prestige and valuable experience that would prove useful during World War II despite the naval disarmament treaties of the interwar years.

WORLD WAR II (1939-45): CAUSES

The entry of the United States into World War II came formally as a consequence of the Japanese naval air attack on "Pearl Harbor on 7 December 1941. But although overtly committed to "neutrality, the U.S. government had been involved in the conflict, both morally and effectively, for over a year before that fateful date.

World War II was a conjunction of two geographically separated armed conflicts. The one that began with the German attack on Poland on 1 September 1939, and the British and French declarations of war on 3 September, was provoked by Adolf "Hitler's commitment of the state of Germany, whose machinery he had completely captured for himself and his Nazi Party, to a drive for world hegemony. In this drive, Hitler saw, after the destruction of the Soviet Union and the annexation of its agricultural and energy resources, the United States as the ultimate enemy. Britain and France (up to the latter's defeat in 1940) recognized Hitler's drive to be incompatible with and inimical to their conception of a peaceable world based on consensus and mutual respect between the major, especially the European, powers. This conception they called "civilization," seeing the alternative as chaos or "barbarism." The attack on Poland was thus the occasion, not the cause, of the outbreak of armed conflict in Europe.

The second conflict arose from Japanese militarism and Japan's ambition to establish exclusive domination over greater East Asia, including Southeast Asia and the western Pacific, an ambition with strong racialist overtones. The first target of Japanese military "expansionism was China, with whom conflict broke out in 1937. Britain and the

United States became the second targets, since Japanese military opinion saw Western support for Nationalist China as the cause of the Chinese failure to acknowledge defeat. Britain, followed by the United States, attempted to contain Japan by diplomacy, backed by increasing economic pressure on the nation's need for imported metals and petroleum. Japan exploited German success against Britain and France to expand into Southeast Asia. U.S. economic pressure led the extreme nationalist elements in Japan to support war against the United States, accompanied by an all-out assault on and capture of the French-, Dutch-, and British-controlled areas in Southeast Asia and on the U.S.-protected Philippines.

The two aggressor states had common enemies, including Britain and the United States—the latter, under the leadership of President Franklin D. *Roosevelt, unwilling to see universalism destroyed by two cultures so antagonistic to consensual “world order” as those of Nazi Germany and militaristic-nationalist Japan. In practice, Japan's relative weakness in the face of possible joint Anglo-American resistance led successive Japanese governments to act only when events in Europe—the German defeat of France and occupation of the Netherlands in 1940, and the German occupation of southeastern Europe and invasion of the Soviet Union in 1941—seemed to open the way for a progressive takeover of French Indochina as an open threat to the oil, tin, rubber, and other mineral resources of Malaysia and the East Indies. President Roosevelt's decision in the winter of 1938-39 to strengthen Britain and France as the first barrier to the threat to the United States he recognized Hitler's Germany as constituting—a decision reiterated in the autumn of 1940, when British determination to continue the war against Germany was underlined by their victory in the Air Battle of Britain—made the progressive application of economic pressure on Japan inevitable. The United States was largely unprepared for war. Furthermore, the loss of British Malaysia to Japan might well prove fatal to Britain's ability to continue the war against Hitler in Europe.

Roosevelt had already shown his judgment that Germany constituted a greater threat to U.S. security than did Japan as early as 1936. To this he added a confidence in British and French military strength, suitably backed by American industry, which events were to prove quite inadequate. But apart from a moment of doubt in the summer of 1940, he never changed his policy of perceiving Germany as the main threat. The *destroyers-for-bases agreement (1940), the *Lend-Lease Act and Agreements (1941), the denial of the western Atlantic by U.S. naval patrols to German U-boat warfare in 1941, and the takeover of the occupation of Iceland from the British that year were all backed by a secret decision made in late 1940 that if America were to find itself at war with both Germany and Japan (wrongly believed to be coordinating their actions), priority would be given to the defeat of Germany in Europe.

American public opinion was divided, with Roosevelt somewhat restricted by isolationists, particularly in Congress. The belief that American entry into World War I had been secured by a combination of unscrupulous British propaganda, U.S. arms manufacturers, and New York bankers, bound by the scale of British purchases and borrowings to the defeat of Germany, reinforced traditional “isolationism. War in Europe was a spectator sport. Most Americans supported Britain; but intervention necessitat-

ing the “conscription of American youth to fight overseas was something else. Opinion on the West Coast was vigorously hostile to Japan. Yet for the bulk of Americans, war in China was likewise a spectator sport with Nationalist China the hero and militarist Japan the villain. A Japanese attack on the United States seemed inconceivable. Japan's ability to project its power across the Pacific and defeat American forces on their own territory was underestimated by both American military and civilian opinion, just as the ability of Japanese spiritual *élan* to overcome American technological superiority and productivity was overestimated in Japan.

By the beginning of 1941, the Japanese expansionists had already taken their moderate colleagues well on the way to war. The year 1940, believed to be the 2,600th anniversary of the founding of the Japanese empire, filled them with a millennialist, now-or-never spirit. In June 1940, with France defeated and invasion threatening Britain, Tokyo decided on Japanese expansion southward, rather than in China or against the Soviet Union, irrespective of any Western resistance. In August, the establishment of the “Greater East-Asian Co-Prosperity Sphere” was announced. In September, with American opposition hardening, Japan signed the Tripartite Pact with Fascist Italy and Nazi Germany. Direct military action forced the French to accept Japanese occupation of northern Indochina.

America stood largely aside from all this, offering little aid to the French or British, forced that summer to agree to close the route by which Nationalist China received Western arms supplies. But once Roosevelt had been reelected president in November, American economic pressure on Japan resumed. With most of its forces involved in containing Fascist Italy in the Mediterranean, Britain welcomed American leadership in the Far East, as a realization of something sought since the mid-1930s. Staff talks between American, British, Chinese, and Dutch commanders in Southeast Asia were followed by close coordination of British and American economic pressure on Japan. The culmination was reached at the end of July 1941. The German attack on the Soviet Union on 22 June 1941 led the Japanese, freed from fears of the USSR, to occupy southern Indochina, outflanking the American-protected Philippines and directly threatening Malaya. In response, the United States froze all Japanese assets in America and embargoed all oil and petroleum exports to Japan. Without American (or East Indian) oil, Japan's air forces and navy would be paralyzed.

There followed a dual-track set of events for Japan. Internally, a series of imperial and ministerial/military liaison conferences drove the nation toward the decision for war. Externally, those opposed were driven to a succession of increasingly desperate attempts to negotiate an end to the embargo on terms that would not provoke a military coup in Tokyo. Had the United States leadership been willing to accept a *modus vivendi* by which Japan withdrew from southern Indochina in return for an end to the embargo and a free hand in China, the decision for war would have been abandoned. But neither President Roosevelt nor his secretary of state, Cordell Hull, let alone their British and Chinese allies, were ready for such a compromise, which could at best have been seen as only a postponement of conflict.

The actual Japanese decision to open hostilities by at-

tacking Pearl Harbor only emerged as a plan in the summer of 1941 and was only adopted reluctantly in October. But it followed logically from the strategic position of the American forces in the Philippines across the flank of Japanese expansion into Malaya and the East Indies. By a narrow margin, the problem of supply was taken to rule out an actual invasion of Hawaii. U.S. strategic myopia, separate service commands, and failures in intelligence, analysis, and "communications gave the Japanese total strategic and tactical surprise in their attack on Pearl Harbor; only the absent "aircraft carriers, vital to America's naval victories later in 1942, escaped destruction.

President Roosevelt declared 7 December a "day of infamy," and Congress declared war on Japan on 8 December 1941. On 11 December, under the Tripartite Pact, Hitler's Germany and Mussolini's Italy declared war on the United States. The two separate conflicts had become one global war.

— Donald Cameron Watt

WORLD WAR II (1939-45):

MILITARY AND DIPLOMATIC COURSE

Officially, the United States remained neutral during the first two years of World War II and did not enter the conflict until December 1941, when it was forced to do so in response to both the Japanese attack on "Pearl Harbor and a German declaration of war. In reality, however, it became an unofficial belligerent and ally of England in mid-1940, and by the fall of 1941 it was engaged in an undeclared naval war with Germany.

The fundamental reason for this shift in U.S. policy was the series of dramatic German military victories in the spring of 1940, culminating in the June conquest of France. The speed and totality of these victories, largely the result of a very effective use of mechanized forces and airpower commonly referred to as *Blitzkrieg*, or "lightning war," led many Americans to question their traditional belief that the Atlantic Ocean constituted a defensive moat that freed them from concern with the European balance of power and provided extensive time to prepare for any threat. German power now appeared to pose such a threat, one capable of crossing the Atlantic at will and easily defeating the meager U.S. military forces then in existence.

President Franklin D. "Roosevelt proposed a twofold response to this perceived menace: national rearmament and sufficient aid to maintain British resistance and thereby keep the Germans preoccupied in Europe. Congress quickly agreed to rearmament with the first peacetime "conscription and billion-dollar defense bills in U.S. history, but aid to England aroused much more controversy. Consequently, Roosevelt used his executive powers in September to transfer fifty overage destroyers to Britain in return for ninety-nine-year leases on British bases in the western hemisphere, and justified the agreement as a net strategic gain.

British prime minister Winston S. "Churchill soon made clear that such aid was insufficient, however, and that Britain was running out of money to purchase American supplies. Roosevelt responded in December 1940 by proposing that Congress agree to lend or lease London extensive war material on the grounds that England constituted the first line of American defense and that its continued survival could preclude U.S. entry into the war. His critics maintained that such unneutral activities would bring about U.S. entry, but in March 1941 they

were outvoted as Congress passed the "Lend-Lease Act and Agreements.

Determined to force a favorable end to the Sino-Japanese War that had been raging since 1937 and achieve hegemony in the Far East, Japan during this time period decided to take advantage of the German victories by extending its influence into the European colonies of Southeast Asia. The British, French, and Dutch authorities were powerless to act against Tokyo due to the military events in Europe, but the United States responded with economic sanctions and the movement of its fleet to Hawaii. Japan in turn responded with the Tripartite Pact with Germany and Italy, a defensive military alliance asserting that an attack by a present neutral on one of them would be considered an attack on all. In actuality, this pact was a diplomatic bluff, never supported by actual military collaboration, to scare the United States out of assistance to England or China via the threat of a two-front war. It failed to do even that, however, and in effect only hardened the American opposition to all three nations while convincing U.S. strategists of the need to plan for a two-front, global war against all three Axis powers.

This thought had actually begun to dominate U.S. strategic planning as early as 1939 with the inception of the RAINBOW "war plans. Yet throughout that year and most of 1940, attention had centered on continental and hemispheric defense. Then in late 1940, Chief of Naval Operations Adm. Harold E. Stark proposed in his "Plan Dog" memorandum that the United States focus instead on a scenario in which it would be allied with England and would concentrate its forces in the Atlantic/European theater to defeat Germany first, while assuming the strategic defensive against Japan. Secret Anglo-American staff conversations in Washington during early 1941 led to agreement in the so-called ABC-1 accord, and then the revised U.S. RAINBOW 5 plan, that this would constitute Anglo-American global strategy should the two powers find themselves at war with the Axis.

The German attack on the Soviet Union in June 1941 only reinforced the validity of this strategic approach while providing Britain and the United States with another ally, albeit one perceived as weak and not to be trusted. Nevertheless, Churchill and Roosevelt quickly welcomed Soviet leader Josef "Stalin and promised him material assistance. In July, Moscow and London signed an accord pledging mutual assistance and no separate peace. Then, in August, Churchill and Roosevelt met off the coast of Newfoundland in their first wartime summit conference and issued the Atlantic Charter, a statement of lofty war aims focusing on national self-determination and eschewing any territorial desires.

Roosevelt still refused to commit the United States to entering the conflict, however, or even to convoying Lend-Lease material to England. Yet he did create a de facto convoy system via the gradual extension of his definition of the western hemisphere "security zone," including the occupation of Greenland in April and Iceland in July, and naval cooperation with the British fleet. By September this had resulted in a German U-boat attack upon the U.S. destroyer *Greer* and a subsequent presidential "shoot on sight" order against German "submarines. By late November, Congress had agreed to requested revisions of the U.S. "Neutrality Acts that enabled Roosevelt to send Lend-Lease supplies on armed and escorted U.S. merchant ves-

sels, and the United States found itself engaged in a full-scale if undeclared naval war with German submarines in the Atlantic.

War officially came in the Pacific when Japan responded to increasing U.S. economic sanctions, including a total freeze in the summer on Japanese assets, with a decision to go to war against Britain and the United States in an effort to obtain economic self-sufficiency before the sanctions crippled its warmaking potential. The 7 December surprise naval air attack on Pearl Harbor was designed to remove the naval threat to the flank of the Japanese invasion forces moving into the resource-rich Southeast Asia, thereby assuring military "victory. It did so, but at the cost of infuriating the American people and guaranteeing Japan the unlimited war it could not win instead of the limited, colonial war it desired.

Adolf "Hitler's decision to declare war on the United States three days later formally globalized the conflict. It also enabled Roosevelt and Churchill to reaffirm their "Germany First" strategy during the ensuing Arcadia summit conference in Washington. At that conference, they further agreed to the creation of a Combined Chiefs of Staff organization to run the global war and report directly to them; additional combined boards to meld their war efforts; full unity of command of all British and American land, naval, and air forces in all theaters; specific priorities for those theaters; and a combined Anglo-American invasion of French North Africa (Gymnast) in 1942. In March 1942, they further agreed to a global division of responsibility whereby the U.S. "Joint Chiefs of Staff (JCS) assumed primary responsibility for the Pacific and the British chiefs for the Middle East, while the European theater remained a combined responsibility.

The Arcadia decisions would create a very special and unparalleled wartime relationship between Britain and the United States within the framework of a larger coalition. That so-called Grand Alliance officially came into existence on 1 January 1942, when all the nations at war with any of the Axis powers signed the Declaration of the United Nations, pledging themselves to military victory and the creation of a postwar world based on the principles of the Atlantic Charter. The Soviet Union insisted upon retaining the Baltic States and portions of Poland and Romania that it had obtained as a result of the 1939 Ribbentrop-Molotov Pact, however, and in meetings with British foreign secretary Anthony Eden in December, Stalin pressed for recognition of this frontier shift as well as other postwar territorial agreements. Eden was ready to consider such accords as a means of strengthening the alliance, but Roosevelt disagreed vehemently. Remembering the disastrous impact of the World War I secret treaties, he feared that territorial discussions would lead to acrimony within the alliance and endanger public support for the war effort; consequently, postponement of all such discussions would remain a fundamental U.S. policy until 1945.

The Arcadia decisions were accompanied and followed by a series of Allied military defeats, which called into question the very survival of the coalition and some of its members. In the Pacific, Japanese forces quickly destroyed all Allied resistance and conquered the Dutch East Indies, Singapore, Malaya, the Philippines, and Burma. They also appeared capable of conquering India as well as Australia and New Zealand, and of forcing a Chinese withdrawal from the war. In Libya and Egypt, German forces under

Gen. Erwin "Rommel advanced to within sixty miles of Alexandria and striking distance of the Suez Canal by June 1942. Simultaneously, German forces in Russia, checked in December for the first time in front of Moscow, now launched an offensive in the south that brought them to the Caucasus oil fields and Stalingrad on the Volga River. A complete Soviet collapse was widely predicted.

The American military response to these defeats was to propose the strategic defensive in all theaters except Europe and the immediate concentration of all available Anglo-American forces in England for a cross-Channel invasion in late 1942 or early 1943 in order to relieve the hard-pressed Red Army and prevent its collapse, as well as to force the Germans into a two-front war. Roosevelt concurred in March and Churchill in April, but in June the prime minister came to Washington once again and argued that the Channel could not be successfully crossed in 1942; rather than remain idle, Anglo-American forces should invade French North Africa, as originally planned during the Arcadia Conference, and in conjunction with a British offensive in Egypt trap Rommel's forces. The JCS objected vehemently to such a strategic shift, and the conference ended inconclusively. A few weeks later, however, London vetoed cross-Channel operations in 1942 and pressed for a North African substitute. Intent upon some 1942 offensive to bolster both public opinion and Soviet morale, Roosevelt concurred, and in mid-July sent his dissenting military advisers to London for a second time to reach accord. The result was an Anglo-American agreement to invade North Africa instead of northern France in the fall of 1942 (Torch).

Stalin, however, had been promised a cross-Channel operation. Indeed, Roosevelt had used this operation as a means of obtaining Soviet agreement not to press for any territorial agreements during the negotiations that led to the Anglo-Soviet Alliance of May 1942. Churchill therefore flew to Moscow in August to inform Stalin personally of the shift in Anglo-American plans for 1942. Simultaneously, he promised a large cross-Channel operation in 1943. With German forces at the gates of Stalingrad, the Soviet leader's response was frosty at best.

So, too, was the response of the JCS. From their perspective, Torch was a dangerous diversion and part of a badly flawed, politically inspired, peripheral strategy. Roosevelt had forced them to agree to it, but they now fought to limit its scope and free resources for Asia and the Pacific, where Japanese successes had created political as well as military crises. Most notable in this regard were continued Japanese movements into the South Pacific to cut Allied lines of communication to Australia and New Zealand, leading to pleas for assistance from those two governments and threats to remove their forces from the Middle East. Equally if not more ominous were warnings from Nationalist Chinese leader Chiang Kai-shek that collapse was imminent unless additional U.S. aid was forthcoming. Such aid was quickly sent and temporarily quieted the crisis on the mainland. The Pacific crisis, however, would lead to a series of major battles.

In the spring of 1942, U.S. forces had first succeeded in blunting the Japanese Pacific threat in two pivotal naval air engagements. The Battle of the "Coral Sea on 7-8 May, the first naval battle in which the opposing fleets did not even see each other, was tactically a draw but strategically a U.S. victory since the Japanese Navy halted its southern ad-

vance. The Battle of *Midway on 4 June was a much more decisive victory, one of the most decisive of the war and of naval history in general. Rather than surprising and destroying the remnants of the U.S. Fleet as planned, the Japanese were themselves surprised as U.S. forces broke their naval code and destroyed 4 of their aircraft carriers as well as 253 planes. Tokyo was never able to recover from this loss of capital ships, aircraft, and trained pilots. Nevertheless, Japanese forces continued their advance southward by launching a land offensive along the northeastern coast of New Guinea and by seizing Tulagi and Guadalcanal in the Solomons astride the U.S.-Australian lines of communication. Finding this intolerable, the JCS ordered the retaking of these islands at the same time the British were vetoing cross-Channel operations and proposing the North African substitute.

The fall of 1942 witnessed the end result of all these decisions—a series of major battles and campaigns that, taken together, constitute what is usually referred to as the “turning point” of the war. In October, British Gen. Bernard Law *Montgomery defeated Rommel at El Alamein and forced the latter to retreat westward. A few weeks later, on 8 November, combined Anglo-American forces under the command of Gen. Dwight D. *Eisenhower invaded Casablanca, Oran, and Algiers in French North Africa, secured French surrender, and drove eastward toward Tunisia, effectively trapping Rommel. Simultaneously, Australian, New Zealand, and U.S. forces halted the Japanese offensive on New Guinea and counterattacked while U.S. forces took Guadalcanal and in a six-month campaign of attrition succeeded in holding it against numerous Japanese counterattacks. In November, the Red Army counterattacked and succeeded in first isolating and then forcing the January surrender of the entire German Sixth Army in Stalingrad. Taken together, these victories ended all Axis hopes of total victory and gave the strategic initiative to the Allies. The Axis still controlled enormous populations, resources, and territory, however, and their defeat was far from secured or predetermined. Indeed, Allied forces were badly dispersed in numerous theaters, and future military stalemate remained a distinct possibility.

In January 1943, Roosevelt, Churchill, and their advisers met once again to plan future strategy, this time in the recently captured Casablanca. Once again the British were able to win American acquiescence in their strategy, now in the form of an invasion of Sicily (Husky) after Rommel had been cleared from Tunisia and the probable postponement of cross-Channel operations until 1944. In return, the Americans under the prodding of naval chief Adm. Ernest J. *King insisted that more attention be given to the war against Japan, both in the Pacific and via operations in Burma to reopen supply lines to China. Both nations further agreed that first priority had to be given to the war against German submarines in the Atlantic, and that a combined bomber offensive should be launched against Germany from the United Kingdom.

The Casablanca Conference is best known not for these strategic decisions, but for Roosevelt’s announcement at a press conference of the Allied policy of “Unconditional Surrender.” Actually, this had long been the unstated policy of and lowest common denominator within the Grand Alliance. Roosevelt verbalized it on this occasion for multiple political reasons: to reassure Stalin in the continued ab-

sence of a second front; to reassure Chiang in the continued absence of a major military effort in the China theater; and to reassure British and American public opinion in the aftermath of controversial compromises that Eisenhower had made with the Vichy French official, Adm. Jean Darlan, in North Africa. In doing so, however, Roosevelt made Unconditional Surrender the official Allied policy and thereby indirectly reinforced his own policy of postponing territorial issues until war’s end.

Anglo-American forces in 1943 obtained most of the objectives outlined at Casablanca, albeit not as rapidly as anticipated nor with the decisive results desired. Simultaneously, and to an extent consequently, serious military and political disputes arose once again within the Grand Alliance and threatened to disrupt the coalition. These disputes were successfully resolved in a series of high-level conferences at year’s end, thereby establishing both an agreed-upon strategy for the duration of the war and a framework for establishing a postwar peace.

The greatest Allied successes in 1943 were on the eastern front and in the Atlantic. In July, Soviet intelligence enabled the Red Army to prepare for and halt, in the largest tank battle of the war, Hitler’s thrust at the Kursk salient; German forces never recovered from the ensuing destruction of their armor. Simultaneously, Anglo-American forces made effective use of their own intelligence breakthroughs, most notably cryptographic intercepts from the Enigma Machine (*ULTRA), as well as new naval and air tactics to turn the tide against German submarines in the Battle of the Atlantic. In other areas, however, Anglo-American successes were far more limited.

Unable to reconcile U.S. precision daylight bombing with British nighttime area bombing, the Combined Chiefs of Staff in effect allowed each nation to pursue its favored approach simultaneously under the umbrella of the Combined Bomber Offensive. While German cities were devastated and civilian * casualties mounted, this controversial campaign also resulted in very high Allied casualties and destroyed neither German industrial capacity nor the civilian will to resist. In that sense it was a failure and revealed serious shortcomings in the strategic bombing concept. It did force the German Luftwaffe into an extensive war of attrition, however, one it could not win due to the enormous U.S. productive capacity. The result would be complete Anglo-American control of the air by the time their forces invaded France in June 1944.

In Tunisia, Rommel in February 1943 was able to inflict a stinging defeat on the still green U.S. forces at Kasserine Pass. The Germans were soon overwhelmed by British forces under Montgomery coming from the south and the revived American forces under Gen. George S. *Patton and Gen. Omar N. *Bradley coming from the west, however, and on 13 May they surrendered in Tunis. Then, on 10 July, Anglo-American forces under Eisenhower’s overall command successfully invaded Sicily. Consequently, the Italians deposed Benito Mussolini and began secret peace negotiations that culminated in a 3 September surrender. Simultaneously, Eisenhower’s forces invaded the toe and heel of the Italian “boot” and Salerno just below Naples.

In the Pacific, U.S. naval forces completed their victory at Guadalcanal and moved up the chain of Solomon Islands, while Gen. Douglas *MacArthur’s forces stopped the Japanese advance in New Guinea and in a series of “leapfrogging” moves along the northern coast dealt

Japanese forces a series of stinging defeats. By year's end these dual lines of advance had isolated the major Japanese base at Rabaul and precluded the necessity of a costly invasion. Where to go next aroused heated controversy. Reverting to their prewar ORANGE war plan, naval planners called for a major thrust across the central Pacific toward Formosa. MacArthur disagreed and argued instead for a major offensive in his Southwest Pacific theater aimed at liberation of the Philippines. The JCS temporarily resolved this dispute by sanctioning both offensives, a resolution made possible by U.S. productive capacity and the subsequent availability of resources, with the final territorial objectives remaining undetermined. While MacArthur's forces continued their leapfrogging along the New Guinea coast, U.S. naval and Marine forces under Adm. Chester "Nimitz" began their central Pacific advance in November with bloody but successful assaults on Tarawa and Makin in the Gilbert Islands. The availability of resources did not extend to Southeast Asia, however, and the Burma invasion had to be canceled.

While American preoccupation with the Pacific deeply disturbed the British, their own preoccupation with the Mediterranean at the expense of cross-Channel operations deeply upset the Americans. This strategic disagreement was heatedly debated and compromised during the May Trident and August Quadrant summit conferences in Washington and Quebec. At these meetings, the Americans agreed to the Italian campaign but only within limits that would allow for a May 1944 cross-Channel assault (Overlord) under an American commander. In September and October, Churchill requested additional delays in the movement of landing craft and troops from the Mediterranean to England so as to take advantage in the Aegean of the Italian surrender, reinforce Eisenhower's forces in the wake of Hitler's rescue of Mussolini and decision to hold the Italian peninsula, and break the resulting military stalemate south of Rome.

Along with this Anglo-American conflict came continuing problems with the Chinese due to the cancellation of the Burma operation and a very serious split with the Soviets over both Poland and cross-Channel operations. In April 1943, Stalin broke diplomatic relations with the Polish government-in-exile, supposedly over Polish demands for investigation of the recently revealed Katyn Forest massacre of Polish officers, but actually due to Polish refusal to cede eastern Poland to Russia. Less than two months later, Stalin angrily denounced the further postponement of cross-Channel operations until 1944. Secret low-level German-Soviet contacts took place during the spring, but without any concrete results. By the summer, separate peace rumors were filling the air.

All of these conflicts were resolved in a series of high-level Allied conferences held between October and December 1943. The first of these was the Tripartite Foreign Ministers' Conference in Moscow, during which the British and Americans reaffirmed their intention to cross the Channel in the spring of 1944 and the Soviets responded with formal agreement to the Unconditional Surrender policy, Allied occupation of Germany, and a postwar collective security organization. Then, in November, Roosevelt met with Chiang as well as Churchill in Cairo and mollified the former with promises of an amphibious operation in the Bay of Bengal as well as postwar return of territory and equality as a great power. Immediately thereafter, Roosevelt

and Churchill flew to Teheran for the first "Big Three" meeting, during which Roosevelt and Stalin finally forced Churchill to abandon additional Mediterranean campaigns and agree to launch Overlord across the Channel in May 1944, with forces in Italy shifted to a supporting invasion of southern France (Anvil). Stalin in turn promised a simultaneous Soviet offensive in the east and entry into the war against Japan once Germany had been defeated. Informal political talks also took place, most notably over a possible shift in Polish boundaries westward and the future status of Germany. Churchill and Roosevelt then returned to Cairo for yet another conference, during which the Burma operation was once again postponed so as to provide Overlord with sufficient landing craft and Roosevelt appointed Eisenhower to command the operation.

This series of conferences would prove critical, both militarily and politically. It by no means ended Allied conflicts and differences, but it did result in an agreed-upon "strategy that would preserve the alliance and lead to total military victory. It also established the essential prerequisites for a new postwar order based on Allied dominance and cooperation, verbalized by Roosevelt as the "Four Policemen," within a global collective security framework. Additionally, it marked both a decline in British power and the rise of the Soviet Union and the United States. Henceforth, these two emerging superpowers would exercise more and more control over both the war effort and postwar plans.

The year 1944 witnessed the results of these 1943 accords in an extraordinary series of Allied military victories. The most notable of these involving U.S. forces was Operation Overlord, the largest amphibious invasion in history. After meticulous preparation, including an extensive deception plan, it was successfully launched on 6 June 1944 against the Normandy coast under Eisenhower's overall command. Progress was extremely slow, however, even after the launching a few weeks later of the promised and massive Soviet offensive in Byelorussia, and only in late July did Allied forces break out of the bridgehead. Their progress after that date was extremely rapid, however, partially because Hitler's simultaneous decision to counterattack at Avranches enabled them to form a pincer that almost destroyed his entire army in the west. In the ensuing debacle, Anglo-American forces were able to sweep through France very rapidly, liberating Paris on 25 August and moving into the Low Countries. But large numbers of German forces managed to escape before the pincers closed around the so-called Falaise pocket, and they would effectively regroup in the fall to fight again.

The Anglo-American sweep through France was aided not only by the Soviet offensive in the east, but also by a breakthrough in Italy that culminated in the capture of Rome on 4 June and the subsequent invasion of southern France in August. These took place long after they were supposed to, however, and were subjects of great controversy. Seeking to break the Italian deadlock in late 1943, Churchill had pressed for an amphibious landing at Anzio. Although successfully launched in January 1944, it remained an isolated and endangered bridgehead until May-June, when Allied forces under Gen. Mark "Clark" finally broke through the main German lines. Clark's decision to take Rome enabled the main body of German troops to escape northward and thus to fight on until the spring of 1945.

The Anzio fiasco delayed preparations for Anvil and reinforced Churchill's desire to cancel that operation in favor of a movement eastward into Yugoslavia. Fed up with the prime minister's continued interest in the Balkans, and aware of Eisenhower's desperate need for additional port facilities, the Americans bluntly refused such a shift and insisted that a delayed Anvil be launched, even after Overlord. Churchill was forced to accede to the renamed Operation Dragoon, and on 15 August, Allied forces landed in southern France and quickly advanced up the Rhone Valley, where they joined Eisenhower's forces moving eastward. Those forces now included nine armies organized into three army groups: the British-Canadian 21st under Montgomery, the American 12th under Bradley, and the Franco-American 6th under Gen. Jacob Devers.

A similar string of military successes took place in the Pacific during 1944 as the "dual advance" picked up momentum. While MacArthur's forces continued to leapfrog along the northern coast of New Guinea and nearby islands, Nimitz took Kwajalein in the Marshall Islands. During the summer his forces conquered Saipan, Tinian, and Guam in the Marianas, and destroyed what remained of the Japanese naval air forces in the Battle of the Philippine Sea. In October, the joint chiefs finally decided to invade the Philippines rather than Formosa, and MacArthur's forces landed at Leyte Gulf. In the ensuing naval Battle of "Leyte Gulf, the largest naval engagement in history, the Japanese surface fleet was virtually destroyed. Simultaneously, U.S. submarines sank much of the Japanese merchant fleet.

The first nine months of 1944 were also marked by substantial progress in postwar planning. In July, representatives of forty-four nations meeting in Bretton Woods, New Hampshire, established the basis of a new postwar economic order, including a "World Bank and an International Monetary Fund. Then from August to October, British, Chinese, Soviet, and U.S. diplomats meeting at the Dumbarton Oaks estate in Washington, D.C., reached agreement on the essentials of a postwar collective security organization. In September, Churchill, Roosevelt, and their advisers met for a second time in Quebec (Octagon), both to plan their next military moves and to consider numerous postwar issues. As Churchill noted at the beginning of this conference, virtually everything the Allies had touched in the last nine months had turned to gold.

The luster was quickly tarnished, however. Throughout 1944, the China theater and Burma had remained notable exceptions to the string of Allied victories, with the Japanese repelling Allied ground and air offensives and launching major counteroffensives of their own. By May, the Allies had successfully halted an invasion of India; but in China, the Japanese overran the U.S. air bases that had recently been established by Gen. Claire "Chennault and precipitated a near collapse of Chinese forces. U.S. Gen. Joseph "Stilwell, who had been sent to China in 1942 to serve as Chiang's chief of staff, blamed the Chinese leader for the fiasco. So did his superiors in Washington, who now demanded that control of Chinese forces be ceded to Stilwell. Chiang, however, insisted that Stilwell was the problem and in the fall demanded his recall. Roosevelt complied and replaced him with Gen. Albert C. "Wedemeyer, but the combination of success in the Pacific and failure on the Asian mainland led the JCS to downgrade the future importance of the China theater, put increased

emphasis on obtaining Soviet entry into the Far Eastern war, and focus even more intently on the naval advance in the Pacific. By October that advance was running into problems of its own, largely as a result of new Japanese suicidal tactics (most notably but far from exclusively the kamikaze air attacks) that increased both the length of battles and the number of U.S. casualties.

The situation in the European theater during the fall was not much better. In August, German forces had appeared to be on the brink of collapse, but they were able to rally in the fall and postpone total defeat—most significantly when they checked Montgomery's September attempt to use airborne forces to cross the Rhine River defenses in the Netherlands (Market-Garden). Thereafter, Eisenhower's controversial "broad-front" approach, involving a series of slower, methodical offensive operations to bring his entire front to the Rhine defenses, dominated Anglo-American strategy despite heated protests by his subordinates, each of whom insisted he could end the war if given all the supplies. Then, in December, Hitler launched a counteroffensive against the thin U.S. forces in the Ardennes in an effort to reach Antwerp and thereby split the British and American armies. The resulting "bulge" in the American lines gave this largest U.S. engagement of the war its name, and led Eisenhower to temporarily transfer control of two U.S. armies north of the German advance to Montgomery. The bulge never developed into an open break, largely because of fierce resistance by the outnumbered Americans, combined with reinforcements and counterattacks by Patton in the south and Montgomery in the north, the return to good weather and with it Allied airpower, and a massive Soviet offensive that brought the Red Army to within thirty-five miles of Berlin. In the end, Hitler wasted the last of his reserves on this operation. Its only accomplishment was to delay further Anglo-American advances until the spring and thereby guarantee that the Red Army would reach Berlin before the British or the Americans.

By early 1945 this probability, along with the extent of Soviet conquests in Eastern and Central Europe, had begun to worry numerous American as well as British officials. Stalin's August-September halting of the Red Army on the east bank of the Vistula River and abject refusal to assist the Polish Home Army in its uprising against the Germans in Warsaw appalled these individuals and led to deep worries over the extent of Soviet territorial conquests and postwar goals. With American vetoes foreclosing his proposed military operations to secure some postwar influence in the Balkans, Churchill in October flew to Moscow for a second time and arranged with Stalin for British and Soviet spheres of influence in the Balkans; two months later, he made use of this agreement to suppress forcibly a Communist uprising in Greece.

Given this fait accompli as well as military events and the deterioration in Allied relations, Roosevelt realized that he could no longer avoid discussion of postwar issues. Such issues, as well as strategy for termination of the war, would dominate the second Big Three conference, held in February 1945 at Yalta in the Crimea. There the Big Three were able to reach agreement on operations for the final defeat of Germany, military occupation zones in Germany and Berlin, a shift of Polish boundaries westward and a Communist-dominated Polish provisional government, free postwar elections for all of Europe, the

outline of a charter for what would become the *United Nations, and Soviet entry into the war against Japan within three months of German defeat in return for territorial concessions focusing on reacquisition of Russian losses from the Russo-Japanese War of 1904-05. The advent of the *Cold War after 1945 led to severe condemnation of Roosevelt for many of these agreements, most notably those concerning Poland and the Far East. At the time, however, he and his advisers believed that they had guaranteed both total victory in the war and a stable postwar peace, and in the ensuing years his supporters defended the accords as both understandable and unavoidable in light of the power, position, and continued importance of the Red Army to the war effort.

The post-*Yalta Conference euphoria proved to be totally justified militarily but largely unjustified diplomatically. In March, U.S. First Army forces captured an intact Rhine River bridge at Remagen, leading Eisenhower to alter his plans and allow these forces rather than Montgomery's to seize the initiative. When Montgomery did cross a few weeks later, the two forces linked up and trapped 350,000 German troops in the Ruhr. After another heated Anglo-American debate, Eisenhower then ordered a limited U.S. movement southeastward to the Elbe River rather than a move by Montgomery against Berlin, on the grounds that he needed to prevent a collision with the Red Army and a Nazi movement into the Bavarian Alps for protracted *guerrilla warfare, and that the German capital was no longer a military objective or worth U.S. casualties—especially in light of the fact that by the Yalta accords the city would be divided into zones of occupation anyway. Meanwhile, Soviet behavior in Poland and Romania led Churchill and Roosevelt to accuse Stalin of breaking the Yalta accords, while the Soviet leader in turn accused them of trying to negotiate a separate peace on the Italian front. Amidst bitter recriminations, Roosevelt died unexpectedly on 12 April, leaving a host of unresolved military and diplomatic issues to his unprepared successor, Harry S. *Truman. A few weeks later, Soviet and American forces met along the Elbe at Torgau, splitting Germany in half. On 30 April, Hitler committed suicide in his Berlin bunker as Red Army forces took the city, and on 7-8 May his successor, Adm. Karl Doenitz, surrendered unconditionally.

With the common enemy totally defeated, Soviet-American relations continued to deteriorate throughout the spring. Some differences were resolved by Harry Hopkins's June visit to Moscow and the July Big Three summit conference in the Berlin suburb of Potsdam, but only partially and temporarily as the two nations' definitions of a secure postwar world began to collide and mutual suspicions increased. The method by which the war against Japan came to an end both reflected and reinforced *hose collisions and suspicions.

American forces made substantial progress in the Pacific War during the first half of 1945, liberating the Philippines, destroying what remained of the Japanese merchant fleet, conquering the islands of Iwo Jima and Okinawa, and launching a devastating strategic bombing campaign against Japanese cities from their bases in the Mariana?*. Nevertheless, the Japanese used their new suicide tactics to exact a heavy toll on American troops and naval forces in the Philippine, Iwo Jima, and Okinawa campaigns. Although Japan's position was clearly hopeless, its armed forces fought on fanatically in the hope of forcing a negoti-

ated peace with the Americans. Simultaneously, American scientists*successfully developed and in July successfully tested the first nuclear weapon. Seeing this weapon as a means of shocking the Japanese into a quick surrender and obtaining the "diplomatic bonus" of impressing the Soviets with this new, awesome power, Truman and his advisers ordered the use of atomic weapons against Japanese cities. On 6 August, Hiroshima was destroyed, and on 9 August, Nagasaki. In between, on 8 August, the Soviet Union entered the war, thereby fulfilling its Yalta pledge and depriving Japan of all hopes for a mediated end to the war. On 14 August, Japanese leaders agreed to surrender, albeit with the proviso that the emperor be retained, and on 2 September, they signed the official surrender documents.

World War II thus ended militarily. Diplomatically, however, continued friction within the Grand Alliance would preclude the possibility of any general peace treaty and would lead instead to the forty-five-year Cold War between the Soviet Union and the United States.

WORLD WAR II (1939-45): DOMESTIC COURSE

The early stages of American *mobilization before its entry into World War II in December 1941 were halting and gave little indication of the prodigious efforts to come. A critical step was massively to expand the U.S. *Army. After France fell in June 1940, this could no longer be delayed. But President Franklin D. *Roosevelt, who was soon to run for an unprecedented third term, did not wish to offend antiwar voters—often called isolationists—so, in the end both sponsors of the *conscription program known as Selective

Service were Republicans, Senator Edward R. Burke of Nebraska and Congressman James W. Wadsworth of New York. Among the other Republicans who provided essential support were two Wall Street lawyers with a longtime interest in the military, Grenville Clarke and Henry L. Stimson, the latter a distinguished statesman who soon became secretary of war.

On 2 August, Roosevelt finally endorsed Selective Service, and so did Wendell Willkie, the Republican candidate for president. Burke-Wadsworth's Selective Training and Service Act received majority votes of 58-31 in the Senate and 263-149 in the House, and was signed into law 16 September 1940. America's first peacetime draft provided for the registration of men aged twenty-one to thirty-five who might be called up for twelve months of training and service within the United States. The first call inducted 1.2 million men, while 800,000 reservists were mobilized as well. Owing to the high degree of public support, there was no wholesale refusal to register for the draft, unlike during World War I, although there was some "conscientious objection by pacifists and others. The main difficulty was that a U.S. Army numbering only 270,000 officers and men could not more than triple in size during one year without having serious problems.

In the end, these problems were solved, however. Even the extension in 1941 of the term of enlistment from one year to two and a half provoked little more than angry protests from the men—although it was almost derailed in the House, which extended service by a margin of one vote. If late in coming, the draft—later stretched to include men aged eighteen to forty-four and service for the duration—worked well. A total of more than 16 million men and women served in the military during the war, approximately 11 million in the army and Army Air Force, 4 million in the navy, 670,000 in the Marines, and 330,000 in women's military units. Most were draftees, although 5 million volunteered for service, primarily in the navy and Army Air Force. The army, stretched thin around the world, could have used even more people. But women were not drafted for noncombat assignments, as in Britain. The military also lost large numbers of men who were declared "4-F," that is, mentally or physically unfit for service. Others were given occupational deferments to keep them on critical jobs in defense plants.

Mobilizing the civilian economy proved to be more difficult than raising an army. Even after his reelection in 1940, President Roosevelt was reluctant to make demands on the public, and refused also to hand over the direction of mobilization to a single head, or "czar." Thus, he created a series of agencies with limited mandates, commonly referred to as "monstrosities" at the time, while shortages of commodities and disputes over priorities made a farce of prewar mobilization.

After the Japanese attack on "Pearl Harbor and the U.S. formal entry into the war, Roosevelt established the War Production Board. He also created an Office of Economic Stabilization under James Byrnes, an ex-senator, which began to bring order out of chaos. A Controlled Materials Plan finally established an effective method of allocating critical commodities. The rubber shortage, caused by Japan's seizure of most of the world's rubber trees, was solved by building synthetic rubber plants and rationing gasoline. The rationing, which politicians feared people would reject, won popular acceptance after a distinguished

panel led by the financier Bernard "Baruch issued a report proving beyond doubt that there was no way to conserve rubber except by limiting automobile use. Consequently, in 1942 a national speed limit of 35 miles per hour was established, and most drivers were given a weekly limit of 3 gallons of gas.

War financing was an outstanding success, thanks in important part to the work of Beardsley Ruml, the treasurer of Macy's Department stores. He led a group of businessmen who argued that the income tax should be extended to all workers, instead of the affluent few, and that taxes should be collected "at the source," in the form of payroll deductions. This effort resulted in the Revenue Act of 1942, which raised the number of taxpayers from 7 to 42 million. It cost the United States \$318 billion to wage World War II, 45 percent of which came from current revenues—a much higher percentage than in any previous war. The balance was paid for by borrowing from banks, bond sales to financial institutions, and also to the general public—which bought \$49 billion worth of Liberty bonds.

The manufacture of automobiles, home appliances, and many other products was suspended for the duration. Meanwhile, industrial wages rose by 22 percent and net farm income doubled. With more money chasing fewer goods, inflation would have soared had not the government imposed wage and price controls, which were resented but largely effective. So, too, was the elaborate system of rationing food, clothing, and other consumer goods, in which stamps or coupons worth various "points" were required in addition to cash to make a purchase. As availability and the number of points required for any given item changed constantly, shopping could be a nightmare. Still, despite some black marketeering, rationing did the job, aided by backyard "Victory Gardens," which in 1943 produced 8 million tons of produce—more than half the nation's total.

The United States never fully mobilized, despite achieving full employment. There was no labor draft, for example, though Roosevelt suggested one in 1944—much later than he should have. Congress refused to act even then, so industry was forced to rely on incentives that varied greatly from firm to firm, resulting in local labor deficits. Often these were caused by housing shortages, which neither government nor private enterprise did much to ease. With so many men in uniform, industry was forced, against its will at first, to hire women, including married women with children. Yet it was rare for government at any level, or for industry itself, to provide the child-care and support services that mothers required. Despite all obstacles, women flocked to defense plants. Their symbol, "Rosie the Riveter," was based on fact. America could not have produced what it did without the millions of women who took the hardest jobs in shipyards, steel mills, aircraft plants, and every heavy industry except mining.

Yet, even without going flat out, America stunned the world by arming and equipping not only its own armed forces but, to a considerable extent, those of its Allies as well. Before Pearl Harbor, Roosevelt had said that the United States would become the "arsenal of democracy," and so it did. Some \$50 billion in Lend-Lease aid flowed to all corners of the world. Britain and its Commonwealth received about half of this; the Soviet Union \$10 billion. At war's end, the Soviet Union possessed 655,000 motor vehicles, of which 400,000 were made by Americans; the

United States also supplied the USSR with 2,000 locomotives, 11,000 freight cars, and 540,000 tons of rail. In addition, the Soviets received from their allies, chiefly the United States, over 20,000 combat aircraft and 11,500 "tanks and self-propelled guns.

Predictably, national elections were determined by military events. In the 1942 congressional elections, after a string of American defeats in the Pacific War, and before the successful invasion of North Africa, voters elected so many Republicans that, together with conservative Democrats, they gained effective control of Congress. Although it gave Roosevelt great discretion over military and diplomatic affairs, the conservative coalition in Congress did all it could to destroy the New Deal—ending many useful social agencies, such as the Civilian Conservation Corps and the National Youth Administration. In the 1944 presidential election, with the war going well, Republicans took a beating at the polls. FDR, and his new vice president, Harry S. "Truman, defeated Governor Thomas E. Dewey of New York, winning 25 million votes to his 22 million. The New Deal, however, remained curtailed.

Although the mass media were filled with war news and exhortations of every kind, government did not establish a ministry of propaganda, despite considerable pressure to do so. Instead, when Roosevelt established the Office of War Information, he gave it a limited mandate, and did not react strongly in 1943 when Congress abolished all of its domestic functions except for the Bureau of Motion Pictures—which attempted, with little success, to make films more progressive. Hollywood did crank out an enormous number of war-related movies, a few of which, such as *Casablanca*, live on still. For the most part they were ephemeral; many of the most successful films of the period, such as *Going My Way* and *National Velvet*, had nothing to do with the war.

There was no ministry of science either, yet weapons development was one of the great successes of the war. In 1941, FDR created an Office of Scientific Research and Development (OSRD) to coordinate, rather than direct, advancements in "weaponry. Headed by Dr. Vannevar "Bush, the OSRD brought cooperation between military, industrial, and educational experts to a level never before seen in the United States. Under OSRD direction, "radar was improved, the radio proximity fuse was developed, and many other innovations created for military use. And it was OSRD that persuaded Roosevelt to back what became the atomic bomb—which entailed not only building an entire industry from scratch, but persuading Congress to finance a secret effort, the "Manhattan Project, without being told what it was paying for.

Popular entertainments of every kind flourished, partly because of the need for diversion, partly because there was little to buy at a time when workers were earning more money than ever. Ball parks, racetracks, and similar facilities prospered, as did the music industry. Perhaps more than films, the popularity of certain types of songs says much about the national mood in wartime. The biggest hits were not about the war itself, but spoke to the emotions that "war inspired. The most popular song of 1944 was the touching "I'll Be Seeing You." Another hit was "I'll Be Home for Christmas," with its melancholy epilogue—"if only in my dreams." The biggest seller of the war years was Irving Berlin's nostalgic "White Christmas."

Although civil rights and liberties were not suspended

entirely, as during World War I, they took the usual beating. A great miscarriage of justice occurred in 1942 when the entire Japanese and Japanese American population of the West Coast was transported to internment camps. Despite receiving a clean bill of health from the FBI following a roundup of suspected aliens, more than 100,000 of them would spend much of the war behind barbed wire in so-called "relocation" camps, an action upheld by the Supreme Court in the "Japanese American internment cases. Racism further disfigured the national effort when minorities sought work in the booming war industries. Attacks against Mexican Americans took place in Southern California, and against blacks in many places. The worst race riot broke out in Detroit on 20 June 1943, leaving 35 dead and 700 wounded—most of them African Americans.

Yet, despite all the difficulties and heartbreaks, and the ugly outbursts of racism, war made life seem more precious, which is probably why the suicide rate fell by a third. Similarly, the birth and marriage rates, which had reached new lows in the thirties, started their fateful rise—early signs of the baby boom that would transform the nation.

Although America suffered less than any other major warring nation, "victory did not come without sacrifice. In addition to the 400,000 uniformed personnel who died, hundreds of thousands more were disabled. All who served lost, as most felt at the time, on average three years of their lives—as did their wives, sweethearts, and children. Americans did everything that was asked of them, and would have done more if more had been wanted, as polls repeatedly showed. At war's end they were right to feel proud: in saving their country from defeat, they also helped to save democracy, putting all free peoples in their debt.

WORLD WAR II (1939-45): POSTWAR IMPACT

Insulated from the war's destructiveness, most Americans foresaw that World War II would shape their future, but not how it would. Alone among major combatants, the United States was physically undamaged and economically vitalized by the war. Even its loss of 400,000 uniformed personnel in combat was censored in visual culture and small compared to other countries' losses. Just as most Americans had to imagine the war itself, they had to imagine its consequences.

To do so, they projected the past into the future. Above all, they felt stung by World War I's tragic aftermath, traumatized by the Great Depression, and transfixed by mighty enemies in World War II. Uncertain, secretive, exhausted by the war, President Franklin D. * Roosevelt gave them only a few signals about what to expect, but did voice their broad desire for a better life and for "security"—a word inscribed in the names of countless postwar agencies and acts of Congress. Thus, most Americans saw the war's impact as rising steeply during hostilities, then receding sharply until some ill-defined, worrisome normality resumed. Enormous focus on returning 16 million "veterans to civilian life exhibited that expectation—almost magically, the veterans' readjustment would be the nation's—even as the tool for achieving readjustment, the "G.I. Bill" (1944), broke sharply from the past. The postwar economy attracted fear and hope, nourished by the depression and by propaganda promising an economic reward for wartime sacrifices. Thanks partly to the G.I. Bill, the hope was largely met.

In contrast, few foresaw the war's consequences for social relations. In fact, the war undermined the existing racial system by extending federal power into the Jim Crow South, inspiring the aspirations and tactics of African Americans, and reshaping national priorities. Pushed by black spokesmen like A. Philip Randolph, leaders increasingly saw racial discrimination as an anachronism that squandered resources needed to wield power abroad and mocked the claim of defending freedom against Fascist and Communist oppression. Though cautious on racial matters, FDR sounded this theme: a nation facing "totalitarianism" should strengthen its "unity and morale by refuting at home the very theories which we are fighting abroad."

President Harry S. Truman's 1948 order banning segregation and discrimination in the military flowed from forces set in motion by the war, which also eroded religious and ethnic barriers. The war reworked systems of gender and sexuality in more complex ways. Prizing both male virtue and women's contributions, wartime culture set the stage for a virtual invention of the "traditional family," to the detriment of many women and homosexuals. However varied their fortunes, social groups nonetheless had something in common: their fate was now shaped by America's global power and the national government's resultant additional authority. As world war faded into cold war, this temporary change turned into a lasting one that few anticipated.

Expectations were nearer the mark regarding international relations: Americans knew their nation was a superpower; most expected it to act like one, and few yearned for the "isolationism that purportedly had led to World War II. Axis aggression, the Depression, and the war's startling technological advances, all seemed to forecast a seamless postwar world presenting new threats to America's economic and military security. Against those threats, most leaders argued, the United States would have to mobilize power even in peacetime, just as wartime "victory gave many Americans confidence that they could do so, alone or through the new "United Nations. As Gen. George C. Marshall warned in 1945, the vast "ocean distances" that once protected America had evaporated; reliance on such outdated factors would put "the treasure and freedom of this great Nation in a paper bag."

Initially, many Americans feared renascent German and Japanese power, but Americans' brittle mix of anxiety and arrogance, stoked by their possession and use of atomic weapons, shaped perceptions of the Soviet Union. Many soon regarded Stalinist Russia as the old Axis wolf in bear's clothing—"Red fascism" was a common term eliding the two. Likewise, for decades, leaders defending their "Cold War policies cited failure to foresee Axis aggression and violence, symbolized by the 1938 Munich Conference and the 1941 attack on "Pearl Harbor. While scholars dispute the Cold War's causes, World War II certainly created an institutional and imaginative apparatus in America that at least initially exaggerated—with help from a ruthless Stalinist regime—the Soviet menace to the United States. The war's greatest legacy was Americans' newfound sense of permanent peril and the Cold War it helped to nourish.

Thus, too, postwar developments extended the impact of World II into an indeterminate future. The Cold War gave permanence to temporary wartime improvisations in national governance—secrecy, "conscription, repression, industrial and scientific mobilization, and high levels of defense spending. Because of the Cold War, or under its guise, America exercised awesome military, economic, and political power in the postwar world. World War II alone did not make that happen, but it set the stage for it to happen, as did many of America's war-weakened European allies, who nervously encouraged its postwar role and joined it in "NATO (the North Atlantic Treaty Organization, 1949). Since victory impresses leaders and institutions, American technological and logistical supremacy in World War II also shaped how Americans would wage later wars—including, disastrously, the "Vietnam War. Seen that way, World War II accelerated America's militarization—pervasive military and defense influence—in a historical process as defining as industrialization and urbanization earlier had been.

Its handmaiden was a more powerful national government, a development often erroneously attributed solely to the New Deal. Indeed, national security imparted to the federal government a size, reach, and legitimacy never decisively achieved under the New Deal. Its broad mandate embraced social programs—the G.I. Bill, initiatives in civil rights, and federal aid to education, for example—seen variously as rewards for Americans' sacrifices in war, expressions of national vitality, and necessities for tapping all available resources. Rather than imposing sharp choices between "welfare" and "warfare," the Cold War "militarized" national security and blurred the two, at least as long as national abundance and credible threats abroad allowed. The war taught a related lesson that few leaders would forget: massive government spending promoted prosperity. Only in the 1980s and 1990s did the system dissolve and with it much of national government's legitimacy.

Until then, it helped to sustain Americans' impressive prosperity and economic power. And since the system served "national security," it largely escaped the stigma of "welfare" or "social engineering" attached to the New Deal. Because it prized military and technological strength, it sent prosperity flowing above all to men, institutions, and corporations in the "gunbelt," particularly to the south, southwest, and the West Coast—to the long-run detriment of trade unions, women, minorities, older industrial regions, and the nation's economic competitiveness. But with defense spending so huge, and economic competitors

so damaged by the world war, a majority of Americans initially shared in midcentury prosperity.

World War II also forged a new sense of "patriotism and nationhood that lingered into the Cold War era. To be sure, unity was defined as well by exclusion—of conscientious objectors, right-wing zealots, and Japanese Americans during the war, and pacifists, leftists, gay people, racial militants, and others after it. Ethnic, racial, and religious tensions remained. Yet crusades against enemies abroad prized inclusiveness at home, if only to mobilize all the nation's resources. Catholics and Jews (especially those of Southern and Eastern European background), refugees fleeing fascism and communism, African and Asian Americans, and others generally, though unequally, tapped into and benefited from the assimilationist mood.

World War II also shaped postwar culture. Again, national pride—a conviction that America was now the world's cultural capital—swelled. But a darker sensibility—skeptical, tragic, or apocalyptic—characterized fiction, religious writing, and movie genres like film noir. Pearl Harbor, the Nazi Holocaust, and the atomic bomb generated a pervasive iconography of the horrors of modern warfare. Their symbols first served to dramatize not what the United States did to others—as in the atomic bombings of Hiroshima and Nagasaki—but what others—a nuclear Soviet Union—could do to the United States, and thus to undergird Washington's Cold War policies. But it measured the war's staying power that these symbols were recycled decades later to different purposes—by the antinuclear, anti-Vietnam War, anti-abortion, and AIDS action movements, among others.

The war's most lasting impact was as benchmark of national greatness. As Dwight D. Eisenhower demonstrated, military service in World War II became a virtual requirement for the presidency during the Cold War, just as most leaders invoked World War II when framing Washington's great postwar initiatives at home and abroad. During the war's fiftieth anniversary celebrations in the United States, only a celebratory stance seemed possible—as indicated by the outcome of a bitter debate over the 1990s Smithsonian Institution exhibit of the B-29 bomber, *Enola Gay*, that attacked Hiroshima—one that honored the real virtue and unity while dismissing the complexities and conflicts in America's conduct of the war.

Both reassuring and disquieting, the celebratory stance registered national pride, but also the gnawing sense that World War II was the nation's finest hour, its moment of greatest unity and purposefulness, with everything after it more dubious, complex, or tragic. Placing it at the center of their modern history, Americans were left to wonder how, outside the arena of war, they might restore past unity and glory.

WORLD WAR II (1939-45): CHANGING INTERPRETATIONS

For over half a century, a general consensus has existed on the fundamental cause of World War II in Europe: on 1 September 1939, Adolf Hitler attacked Poland without provocation in order to obtain *Lebensraum* (expanded territory for Germany), his stated goal from the time he wrote *Mein Kampf* (1925). Often corollary was the claim that Hitler not only preached aggressive war against France and the Soviet Union but followed a carefully timed blueprint of "expansionism. As revealed in the Hossbach Memorandum of 5 November 1937, the Führer had made Austria and Czechoslovakia his immediate targets. Winston S. Churchill said in the House of Commons on 14 March 1938, well over a year before war broke out, "Europe is confronted with a program of aggression, nicely calculated and timed, unfolding stage by stage." From the "war crimes prosecutors at Nuremberg to Walter Hofer's book *War Premeditated, 1939* (1955), few disagreed.

By the sixties, the matter of a timetable was being challenged. Only a minute group of people, often rooted in neo-Nazism, took seriously David Hoggan's *The Forced War: When Peaceful Revisionism Failed* (1961; English translation, 1989), an attempt to absolve Hitler of all aggressive designs. Far more formidable was *Origins of the Second World War* (1961), written by the provocative British historian A. J. P. Taylor. Hitler—claimed Taylor—was governed primarily by opportunism and improvisation, a position challenged in the many works of Gerhard L. Weinberg, for example, *The Foreign Policy of Hitler's Germany* (2 vols., 1970, 1980). Many historians—such as Alan Bullock in his *Hitler: A Study in Tyranny* (1952) and Gordon Brook-Shepherd in *The Anschluss* (1963)—long held that Hitler kept his options open until the last minute.

Even prominent German historians, however, share in the consensus that any ad hoc method to Hitler's diplomacy operated within such long-standing goals as Germany's control of Europe, mastery of the seas, internal warfare against the Jews, and external warfare against the Slavs—see, for example, Eberhard Jackel, *Hitlers Weltanschauung* (1969; English translation, 1972); Andreas Hillgruber, *Hitlers Strategie: Politik und Kriegführung, 1940-1941* (1975); Klaus Hildebrand, *The Foreign Policy of the Third Reich* (1970; English translation, 1973); and Karl Dietrich Bracher, *The German Dictatorship* (1969; English translation, 1970). Some German historians, participating in the *Historikerkstreit* (historians' debate) of the 1980s, sought to "relativize" Hitler's "genocide by pointing to other global "atrocities and stressing the anti-Bolshevik nature of Nazism; see for example, Ernst Nolte, *Der europäische Bürgerkrieg, 1917-1945: Nationalsozialismus und Bolschewismus* (1987), a position strongly criticized in Richard J. Evans, *In Hitler's Shadow: West German Historians and the Attempt to Escape from the Nazi Past* (1989). Nonetheless, few historians took seriously Hitler's claim that the attack on Russia of 21 June 1941 was a mere preventive strike before Josef "Stalin attacked; and a major 1995 study confirmed the traditional picture: James Barros

and Richard Gregor, *Double Deception: Stalin, Hitler, and the Invasion of Russia* (1995).

As to Asia, rarely did historians ever see a Japanese master plan at work. If David Bergamini's *Japans Imperial Conspiracy* (1971) asserted that Emperor "Hirohito masterminded Japan's aggression of the 1930s, no serious historian today finds any specific blueprint in that decade to conquer all East Asia. Even the famous Marco Polo Bridge incident of 7 July 1937, an event near Peking (Beijing) that triggered the Sino-Japanese War of 1937-45, did not result from any planned Japanese campaign.

If, however, Japan had blundered into the bridge incident, Japan's leaders increasingly perceived that their nation's security and prosperity, indeed very survival, depended upon domination of East Asia. To Japan's leaders, such mastery increasingly relied upon the ability ultimately to fight the Soviets and the Americans and to destroy Nationalist China. Michael A. Barnhart's *Japan Prepares for Total War: The Search for Economic Security, 1919-1941* (1987) stresses the Imperial Japanese Army's desire for resources in Manchuria, northern China, and possibly the Southwest Pacific. By the 1970s, some Japanese historians were acknowledging their country's aggressive policies; see, for example, (Japanese contributors to Dorothy Borg and Shumei Okamoto, eds., *Pearl Harbor as History: Japanese-American Relations, 1931-1941* (1973), and James W. Morley, ed., *Japan's Road to the Pacific War, 4 vols.* (1976-84, translated from *Taiheiyō senso e no michi*, a multivolume work by Japanese scholars).

The historiographical debate over U.S. entry into World War II was in many ways a replay of the isolationist-interventionist debate of 1939-41. During the pre-Pearl Harbor debate over such Roosevelt policies as Lend-Lease and armed convoys in the Atlantic and embargoes against Japan in the Pacific, isolationist historians called the president's measures warlike and provocative, and their postwar histories were efforts to support their case—Charles A. Beard, *President Roosevelt and the Coming of the War, 1941* (1948), and Harry Elmer Barnes, ed., *Perpetual War for Perpetual Peace: A Critical Examination of the Foreign Policy of Franklin D. Roosevelt and Its Aftermath* (1953).

The most extreme writers, a mere handful, argued without credible evidence that the Roosevelt administration possessed specific foreknowledge of the Japanese attack on "Pearl Harbor, but—seeking a "back door" to full-scale U.S. participation in the European War—permitted the deliberate loss of American lives and ships: Charles Callan Tansill, *Back Door to War: Roosevelt Foreign Policy, 1933-1941* (1952), and John Toland, *Infamy: Pearl Harbor and Its Aftermath* (1982). A British and an Australian writer recently levied a similar unsubstantiated accusation against the British prime minister, Winston Churchill: James Rusbridger and Eric Nave, *Betrayal at Pearl Harbor: How Churchill Lured Roosevelt into World War II* (1991). A less extreme argument by a respected scholar, Paul W. Schroeder, *The Axis Alliance and Japanese-American Relations, 1941* (1958), claimed that U.S. intransigence over China led to the conflict; this still finds adherents, but most scholars believe American leaders were less committed to liberating China than Schroeder suggests.

Interventionist historians were quick to supply rejoinders to the isolationist polemics, the standard work for many years being William L. Langer and S. Everett Gleason's two-volume *The World Crisis and American Foreign*

Policy (1952-53). Waldo Heinrichs's *Threshold of War: Franklin D. Roosevelt and American Entry into World War II* (1988) in many ways updates their findings. Accusations of conspiracy and deceit concerning Pearl Harbor have long been rejected by all major scholars. Gordon W. Prange, *At Dawn We Slept: The Untold Story of Pearl Harbor* (1981), and Roberta Wohlstetter, *Pearl Harbor: Warning and Decision* (1962), emphasize "communications and intelligence analysis failures. Currently debated are such matters as the wisdom of America's Far Eastern diplomacy, in particular, the levying of economic sanctions on Japan on 25 July 1941—Jonathan G. Utley, *Going to War with Japan, 1937-1941* (1985); the responsibility of the American commanders in Hawaii—Edward L. Beach, *Scapegoats: A Defense of Kimmel and Short at Pearl Harbor* (1995); blundering diplomats—R. J. C. Butow, *The John Doe Associates: Back Door Diplomacy for Peace, 1941* (1974), and Hilary Conroy and Harry Wray, eds., *Pearl Harbor Reexamined: Prologue to the Pacific War* (1990); and multinational oil companies—Irvine Anderson, *The Standard-Vacuum Oil Company and United States East Asian Policy, 1933-1941* (1975).

By the 1960s, the interventionist interpretation had so strongly swept the historical profession that not a single major professional historian defended the isolationists' conspiratorial view. Revisionism itself, however, did not die; rather, it took a different form. In 1959, William Appleman Williams's *Tragedy of American Diplomacy* (rev. ed. 1962) presented World War II as "the war for the American frontier," an effort to preserve the U.S. democratic and capitalistic system by eliminating the closed economic blocs of Germany and Japan. A few economically oriented writers asserted that overproduction led the United States into the war in order to keep open foreign markets—Patrick J. Hearden, *Roosevelt Confronts Hitler: America's Entry into World War II* (1987)—or to secure the wealth of Southeast Asia—Jonathan Marshall, *To Have and Have Not: Southeast Asian Raw Materials and the Origins of the Pacific War* (1995).

The "Cold War led to more bitter controversy about World War II, this time centering on wartime diplomacy. Over the years, four schools have emerged. Defenders of Franklin D. "Roosevelt, if they differed with the president on particulars, saw the president's wartime diplomacy as usually pragmatic and realistic; he was a man much attuned to the realities of power. Examples include Robert A. Divine, *Roosevelt and World War II* (1969); James MacGregor Burns, *Roosevelt: Soldier of Freedom, 1940-1945* (1970); and Robert Dallek, *Franklin D. Roosevelt and American Foreign Policy, 1932-1945* (1979). Conversely, a "realist" school portrayed the president understandably, if unfortunately, as too attached to universalistic and unattainable Wilsonian goals; see, for example, Gaddis Smith's *American Diplomacy During the Second World War, 1941-1945* (1965; 2nd ed. 1985). A few right-wing isolationist critics, such as William Henry Chamberlain, *America's Second Crusade* (1950), opposed unconditional surrender of Germany, saw Japan as a bastion against the USSR, and found FDR needlessly solicitous of Stalin, going so far as to betray Poland and China. Although such an isolationist critique never attained scholarly standing, it was long prevalent in right-wing political circles. A left-wing "revisionist" school, represented by Gabriel Kolko—*The Politics of War: The World and United States Foreign*

Policy, 1943-1945 (1968)—described the Roosevelt administration as relentlessly pursuing open capitalistic markets and sources of raw materials at the expense of Britain, the Soviet Union, and even the Third World. Although Kolko enjoyed some popularity in the 1960s, the pragmatic and idealist schools retained the most adherents. An important subdebate, prompted by the Cold War revisionist Gar Alperovitz, centered on the claim that the Truman administration undertook the atomic bombings of *Hiroshima and Nagasaki primarily to intimidate the Soviets—*Atomic Diplomacy: Hiroshima and Potsdam* (1965; 2nd, expanded ed. 1994)—a motive most historians see as decidedly secondary to winning the war as rapidly as possible.

The terms of debate over the war, however, are currently being altered by new forms of investigation, including comparative cultures—Akira Iriye, *Power and Culture: The Japanese-American War, 1941-1945* (1981); bureaucratic politics—Theodore A. Wilson, *The First Summit: Roosevelt and Churchill at Placentia Bay, 1941* (1969; rev. ed. 1991), and Mark M. Lowenthal, *Leadership and Indecision: American War Planning and Policy Process, 1937-1942* (1988); public opinion—Michael Leigh, *Mobilizing Consent: Public Opinion and American Foreign Policy, 1937-1947* (1976); and definitions of American national security—Lloyd C. Gardner, *Spheres of Influence: The Great Powers Partition Europe, From Munich to Yalta* (1993).

WORLD WAR II, U.S. AIR OPERATIONS IN: THE AIR WAR IN EUROPE. U.S. air operations in the Mediterranean and Europe evolved into two distinct fields of effort: the strategic air campaign against the German war economy and the tactical air support of American ground forces. In both arenas the U.S. Army Air Forces (AAF) began hostilities with untested doctrine. In the strategic sphere, the AAF believed that it could attack and destroy German war industries, with accuracy and in daylight, without the benefit of friendly fighter escort, while suffering acceptable losses. In the tactical sphere, using methods based on British combat experience in 1940-41, Field Manual 35-31 laid out a scheme for the command and control of tactical air power that usually placed airmen in control of their own forces.

U.S. Tactical Air Operations in Europe. Tactical air power requires the cooperation and understanding of two combat arms, each with a unique perspective on ground operations. The United States' initial ground campaign in Tunisia demonstrated the difficulties inherent in orchestrating ground and air efforts. At the outset neither ground nor air understood the U.S. *Army's air support doctrine, but both were forced, unprepared, into combat. As a result,

"teething" problems, such as lack of *radar for early warning and excessive fear by ground units of air attack, hampered cooperation. In mid-February 1943, the placement of all Anglo-American tactical air power under the command of an experienced air officer, Air Marshal Arthur T. Connigham of the British Royal Air Force (RAF), coincided with air reinforcements and the solution of air logistics problems. By the campaign's end, tactical air power had contributed greatly to the Axis defeat on the ground. Likewise, tactical air power assisted in repelling Axis counterattacks on the beachheads of Sicily and Salerno in Italy. In the winter of 1943-44, tactical air aided the fruitless Allied assaults on the Cassino Line and the defense of the Anzio Beachhead. In the spring of 1944, the U.S. Twelfth Air Force and British First Tactical Air Force began Operation STRANGLE, a campaign designed to interdict German supplies, and in the winter of 1944-45, tactical air operations in Italy followed much the same pattern.

In the European theater, the AAF established the Ninth (Tactical) Air Force in October 1943 in Great Britain under the command of Lieut. Gen. Lewis H. Brereton. By June 1944, it had become the most powerful tactical air force in World War II. Initially, Ninth Air Force fighters flew escort for strategic *bomber aircraft attacking into Germany. As the needs of the Anglo-American invasion forces increased the Ninth gradually switched its emphasis to air/ground training and to an attritional air attack on the Belgian and French transportation systems. The Allied high command expected the transportation plan to hinder the post-invasion movement of German reinforcements and logistics to oppose the beachhead. On the day of the landings in *Normandy on 6 June 1944, the Ninths' medium bombers struck invasion beaches, its fighters supplied air cover, and its troop transports delivered the bulk of the Allied parachute forces. Allied fighter bombers made daylight movement by German ground forces almost impossible and entirely thwarted German air force tactical operations. After assisting in the breakout at *St. Lô on 25 June 1944, the Ninth worked closely with the U.S. Twelfth Army Group assigning a Tactical Air Command to each of its armies; AAF pilots literally rode in the turrets of the most advanced American armored spearheads in order to call upon tactical air power when needed. With the invasion of southern France on 25 August 1944, the AAF established the First Provisional Air Force to assist the Sixth Army Group. In the winter of 1944-45, Germany purposely launched their Ardennes counteroffensive in poor flying weather in hopes of negating Allied air power. This ploy ultimately failed and tactical air pushed back the Germans and then assisted the Allied drive into Germany in the spring.

U.S. Strategic Air Operations in Europe. On and increasing scale from mid-1942 through May 1945, U.S. strategic air contributed to the defeat of Germany. Along with the British strategic effort, U.S. bombing constituted a second or third front against the enemy. In a significant diversion of strength and resources, Germany was forced to disperse its aircraft and ball bearing industries, devote two million troops to air defenses, skew aircraft production toward interceptors, and divert high velocity artillery and vital communications equipment to home defense. This drain increased throughout the conflict, constituting a significant, if somewhat intangible, achievement of strategic bombing.

Responding to a promise to British prime Minister Winston *Churchill, U.S. strategic air operations began on

4 July 1942, with a raid of six U.S. Eighth Air Force light bombers on Dutch airfields. The Eighth's first heavy bomber raid of twelve B-17s hit marshalling yards at Rouen, France on 17 August 1942. The raid came after pressure from AAF headquarters in Washington and criticism of American methods in the British press. On 27 January 1943, fifty-five aircraft made the first American air attack on Germany—the naval base at Wilhelmshaven. Once again, the attack followed promises made to Churchill and the Combined Chiefs of Staff. Throughout the war, U.S. strategic air power would be the focus of intense political, diplomatic, military, and bureaucratic pressures.

Pre-war plans specified that the U.S. air force in Britain would be the AAF's largest overseas contingent and gave it the task of conducting an offensive against the German war economy. However, shifting priorities (such as the invasion of "North Africa") slowed the rate of the Eighth's growth. By the second Schweinfurt Raid of 14 October 1943, the Eighth had failed to gain air superiority over Germany. Its short-ranged fighters could not accompany the bombers deep into Germany, where the bombers suffered crushing losses, while the European weather allowed only a slow rate of operations. Wartime crew training could not produce sufficient personnel capable of duplicating pre-war bombing accuracies. The Eighth had inflicted no permanent damage to the German war effort.

By the end of February 1944, however, the Eighth's fortunes reversed. In November 1943, the Eighth introduced the H2X radar bombing device, which permitted the bombing of large targets through clouds and, consequently, allowed an increase in attacks. Long-range escort fighters, P-51s, P-38s, and P-47s with drop tanks arrived in large numbers, while a change in tactics, instigated by the Eighth's new commander, Lieut. Gen. James H. "Doolittle," required American fighters to attack German aircraft rather than passively protect bombers. Constant combat increased the attrition of German pilots to catastrophic levels. In addition, an influx of new bomb groups almost doubled the Eighth's bombflit, and the creation in Italy of a new U.S. strategic air force, the Fifteenth, opened new areas to attack and spread German air defenses.

Just as the Eighth gained air superiority over Germany, a dispute arose in London as to how strategic air could best aid the coming invasion of France. Lieut. Gen. Carl A. "Spaatz," commander of the Eighth and Fifteenth Air Forces, wished to attack the German synthetic oil industry, while Gen. Dwight D. "Eisenhower's" air commanders favored an attritional attack on the French and Belgian rail systems. Eisenhower chose transportation bombing, but allowed two oil attacks in May 1944. The success of those attacks, confirmed by Allied code breakers, made oil the first priority air target in the month before the invasion. Both tactical and strategic air power mangled the French railways, but strategic air power's chief contribution to the Normandy landings was the elimination of the German day fighter force. From landing to breakout, the invasion never encountered significant air opposition.

For the remainder of the war, synthetic oil was the primary U.S. strategic target. By September 1944, bombing temporarily halted production entirely. The oil campaign, which deprived the German air force of flight and training time, severely hampered the mobility of ground forces, and even limited fuel to the U-boats, was the finest achievement of U.S. strategic bombardment. It destroyed a vital,

compact, target system with minimal damage to the civilian population. However, the harsh weather of the winter of 1944-45 rendered the refineries safe even to the H2X. Consequently, the Eighth devoted the majority of its effort to hitting the German rail system, especially after the German Ardennes counteroffensive. The key components of the rail system, marshalling yards, were physically located in the midst of German urban areas. Given the inaccuracy of bombing in severely overcast conditions, rail yard bombing meant that many bombs would fall among the civilian population. The Eighth further increased destruction by employing large numbers of incendiary bombs in rail yard raids. At the end of January 1945, at Churchill's urging, the Allied strategic bombing effort began an offensive against eastern Germany to aid Soviet ground forces and demonstrate Allied solidarity. Strategic raids on Berlin and other cities followed, including the RAF's controversial attack on Dresden on 13 and 14 February. The Eighth bombed the center of the city on 15 February. Ironically, the transportation bombing achieved its aim. By the end of February 1945, it had ruined the rail system, shattering Germany's ability to sustain its war economy.

WORLD WAR II, U.S. AIR OPERATIONS IN: THE AIR WAR IN JAPAN. On 18 April 1942, sixteen B-25 bombers under the command of Army Lt. Col. James "Doolittle" took off from U.S. "Navy" aircraft carriers 650 miles off the coast of Japan. Their raid on Tokyo and other Japanese cities caused little material effect but a significant psychological one, boosting American morale while embarrassing Japanese leaders into accelerating operations that would lead to the Battle of the "Coral Sea and the Battle of "Midway" later that year. But it would be more than two years before new American bomber aircraft returned to hit the Japanese home islands again.

In 1944-45, long-range B-29 Superfortresses were used to carry out the strategic air campaign against Japan. Eventually, over 1,000 were deployed in the 20th Air Force, subdivided into the XXth and XXIst Bomber Commands. The Army Air Forces (AAF) commanding general, H. H. "Hap" Arnold, retained direct command of the 20th Air Force, to prevent diversion of its resources to theater commanders. Feeling pressure to get results from his expensive Very Heavy Bomber (VHB) project, he fielded the new B-29s even before testing had been completed, gambling that they could achieve decisive results while correcting any technical deficiencies.

In June 1944, B-29s from Maj. Gen. Kenneth Wolfe's XXth Bomber Command staged from India to China, and began bombing Japan as part of Operation Matterhorn. Wolfe was plagued by "logistics and mechanical problems, however, which grew worse when Japanese ground troops in Operation Ichigo overran advanced U.S. airfields in China. Arnold relieved Wolfe and brought in Maj. Gen. Curtis E. "LeMay," the AAF's premier problem solver and

the most innovative air commander of World War II. However, except for a successful incendiary raid on Hankow, even LeMay achieved poor results with Matterhorn.

Arnold's greatest hopes for "victory through airpower over Japan rested with the XXIst Bomber Command, under the command of Brig. Gen. Haywood "Possum" Hansell, which began operations from the Marianas in November 1944. Hansell was one of the architects of precision-bombing doctrine, but his operations also had little success. Poor facilities, faulty training, aircraft engine failures, cloud cover, and jet stream winds at bombing altitudes made precision methods impossible. Hansell seemed unwilling to change his tactics, and Arnold feared that he would lose control of the heavy bombers to Asian theater commanders Douglas "MacArthur, Chester "Nimitz, or Louis Mountbatten without better results. Arnold decided to consolidate both Bomber Commands in the Marianas under LeMay and relieved Hansell.

LeMay instituted new training and maintenance procedures but still failed to achieve useful results with daylight high-altitude precision attacks. So he resorted to low-level incendiary raids at night. Although area firebombing went against dominant American Army Air Forces doctrine, flying at low altitude reduced engine strain, required less fuel, improved bombing concentration, avoided high winds, and took advantage of weaknesses in Japanese defenses. LeMay's systems analysts predicted that he could set large enough fires to leap firebreaks around important industrial objectives. His first application of the new tactics, Operation Meetinghouse on the night of 9 March 1945, resulted in extraordinary destruction: 334 B-29s incinerated 16 square miles of Tokyo, destroying 22 key targets and killing 80,000-90,000 civilians in the deadliest air raid of the war.

Once enough incendiaries were stockpiled, the fire raids began in earnest. Warning leaflets were also dropped; their primary purpose was to terrorize Japanese civilians into fleeing from cities. Eight million did so. When Gen. Carl A. Spaatz arrived in July 1945 to take command of Army Strategic Air Forces in the Pacific (including the 20th Air Force and Doolittle's 8th Air Force redeploying from Europe) and to coordinate air operations supporting the invasion of Japan, he was directed to shift the air campaign from cities to "transportation. But there was too much momentum behind the fire raids—sustained by operational tempo, training programs, and bomb stocks—for strategy to change.

By the time Spaatz arrived, naval carrier strikes were also hitting key industrial objectives in Japan. More important, the navy's submarine blockade had crippled the Japanese economy, and the Russians were about to attack Manchuria. Spaatz maintained direct command over the 509th Composite Group of B-29s specially modified to carry atomic bombs. Directed by Washington to deliver these weapons as soon as possible after 3 August, Spaatz ordered the bombings of "Hiroshima and Nagasaki. Along with the incendiary campaign, these different elements composed the series of blows that produced immediate Japanese surrender.

As with the atomic bomb, there is still debate over the effects and morality of the fire raids. LeMay's bombers burned out 180 square miles of 67 cities, killed at least 300,000 people, and injured over 400,000 more. His 313th Bomb Wing also sowed 12,000 naval "mines in ports and waterways, sinking almost 1 million tons of shipping in about four months. LeMay remained convinced that

his conventional bombing could have achieved victory by itself, without need for a ground invasion of the Japanese or the atomic bombs. He even briefed Arnold and the "Joint Chiefs of Staff in July 1945 that the war would have to end by 1 October, when the 20th Air Force would run out of targets.

WORLD WAR II, U.S. NAVAL OPERATIONS IN: THE NORTH ATLANTIC. During World War II (1939-1945), Germany attempted to isolate Great Britain by severing the North Atlantic sealanes by "submarine warfare. Initially, the *Kriegsmarine Untersee-Waffe* commander, Adm. Karl Doenitz deployed submarines into England's southwestern approaches, where they nearly crippled Allied shipping. The effectiveness of this operation increased substantially when France and the Low Countries capitulated in spring 1940, giving the Germans U-boat bases on the Atlantic. During the war's first two years, German submarines sank more than 1,200 Allied ships and severely hampered England's supply systems.

In the fall of 1941, with U.S. Lend-Lease supplies to Britain in jeopardy, President Franklin D. "Roosevelt ordered U.S. naval warships to begin escorting Allied convoys. On 4 September, after evading a torpedo from a German submarine, the destroyer USS *Greer* launched a depth charge attack against the U-boat. Roosevelt then ordered the navy not to wait until attacked but to shoot German submarines on sight. Eight weeks later, after several other confrontations, a German submarine sank the USS *Reuben James*. Before the attack on "Pearl Harbor, U.S. naval forces were fighting in a major if undeclared naval war with Germany in the North Atlantic.

After the United States entered the war in December 1941, U-boats began patrolling off the American East Coast and in the Gulf of Mexico, where they unleashed Operation *Paukenschlag* (Drumbeat) to destroy American shipping. In four months the Germans sank more than 360 ships, including the destroyer USS *Jacob Jones*. Caught off guard, the U.S. Navy had failed adequately to protect commercial coastal vessels, which were often gunned down by surfaced U-boats using East Coast city lights to silhouette their targets.

Because U.S. naval forces were spread thin across the Atlantic and Pacific, the chief of naval operations, Adm. Ernest J. "King, decided against using a coastal convoy system. Instead, in what was later called the "Bucket Brigade," merchant captains were advised to sail close to America's shorelines by day and to dash into the nearest harbor at night.

The British criticized King for not providing proper antisubmarine warfare (ASW) defenses. After carefully convoying ships across the Atlantic and into American waters,

the U.S. Navy was allowing too many merchant ships to fall prey to the enemy along the coast. Upon transferring several British ASW escort ships to the U.S. Navy, Prime Minister Winston S. Churchill suggested that America inaugurate a coastal convoy system.

In May 1942, after continued losses, King did institute such a system, and assigned land-based airplanes and blimps to patrol along the Atlantic seaboard. As these pressures increased, the U-boats withdrew from East Coast waters and reconcentrated in the Gulf of Mexico and Caribbean Sea, where they sank another 160 ships.

During the fall of 1942, Doenitz ordered his submarines into the mid-Atlantic, which was free of Allied air cover. Here, in an area called the "Black Pit," the Germans in their continuing assault against convoys instituted *Rudel-taktik* (wolf pack tactics). Initially, these attacks on convoys by groups of submarines were quite successful. However, by the summer of 1943, improved ASW tactics, better training, and new technology began extracting a toll on the U-boats.

The Battle of the Atlantic was ultimately a conflict of attrition: numbers of vessels sunk versus new ships constructed, and numbers of U-boats sunk versus new submarines constructed. As time passed, the Allies amassed great quantities of merchant ships, war vessels, ASW weapons, and sophisticated equipment. Improved radar, sonar, and radio direction-finding systems, coupled with extensive use of airpower, slowly turned the tide of war against the U-boats.

Intelligence gathered from ULTRA and the decoding of U-boat and other German radio transmissions allowed the rerouting of convoys around the wolf packs. Destroyers equipped with radio direction finders located U-boats, drove them underwater, and dropped depth charges on them. Airborne and shipborne radar was significant in spotting surfaced submarines. U.S. patrol planes flying over the Bay of Biscay used radar to find and attack surfaced U-boats transiting in and out of French ports.

In addition to these technical advances, organizational reforms aided the U.S. Navy's effort. During the spring of 1943, Admiral King consolidated all ASW research, training, weapons procurement, and strategy under one command, the Tenth Fleet. Under his authority, the Tenth Fleet coordinated and streamlined all Atlantic operations.

A turning point in the Battle of the Atlantic occurred in the spring of 1943, when the U.S. Navy began using long-range, land-based aircraft and escort carriers to patrol the mid-Atlantic. Planes such as PBV Catalinas and B-24 Liberators provided extensive convoy coverage across the "Black Pit." Flying from Iceland, a B-24 Liberator (with depth charges aboard) could enter the mid-Atlantic and patrol above Allied vessels for nearly four hours. Many of these planes successfully attacked and destroyed U-boats. On occasion, patrolling aircraft forced U-boats into deep water dives, where for extended periods they were unable to threaten the convoys. In May 1943 alone, the Germans lost more than forty submarines.

American hunter-killer groups, typically composed of one escort carrier and three destroyers, substantially enhanced the U.S. Navy's ability to defend the convoys. Often, in the mid-Atlantic, after forcing U-boats to crash-dive, carrier planes dropped homing torpedoes on the submarines. One particular success occurred on 4 June 1944, when the crew of the escort carrier *Guadalcanal* cap-

tured U-boat 505 on the surface, along with all of its codebooks and sophisticated equipment.

In part because of these successes, Germany was unable to block the men and material necessary for the invasion of Normandy and the D-Day landing. By war's end, Doenitz's *U-Waffe* was depleted. While his submarines sank more than 2,700 Allied ships, they also lost nearly 800 U-boats and 28,000 sailors. Yet there were no spectacular, Midway-style decisive battles for the U.S. Navy in the Atlantic as there were in the Pacific. Instead, for U.S. naval forces, the battle consisted of endless days of searching for elusive U-boats and once one was found, of launching a prolonged attack upon the submerged enemy.

After the war, because most documents remained long classified, a myth of the highly successful U-boat campaign developed. However, newly declassified documents have indicated that because of torpedo and other technical problems, U-boats were much more vulnerable to ASW attacks than previously thought. The evidence also reveals that the submarines destroyed only a very small percentage of the ships crossing the Atlantic. This new evidence, however, has not distracted from the difficulties and the bitterness of one of history's longest and most complex naval campaigns.

WORLD WAR II, U.S. NAVAL OPERATIONS IN: THE PACIFIC. In *The Armed Forces of the Pacific: A Comparison of the Military and Naval Power of the United States and Japan*, published early in 1941, retired Capt. William D. Puleston, former Director of Naval Intelligence, concluded that a war between the two countries would end with an American victory in a climactic naval battle somewhere in the western Pacific. Carrier-based aircraft would be important, but the decisive element would be the battle line of heavy surface ships. Such thinking was widespread in the pre-World War II navy.

The circumstances and aftermath of the Japanese attack on Pearl Harbor, 7 December 1941, radically altered the character and course of World War II in the Pacific. Since the three carriers of the U.S. Pacific Fleet were out of the harbor and the eight battleships were heavily damaged, air power would dominate naval action for the first six months of 1942 and would heavily influence strategic planning for the entire war. When surface combat began in August 1942, American heavy cruisers had to do the work of battleships against Japanese capital ships. The battleships damaged at Pearl Harbor would slowly return, along with their newer, faster sisterships, but their chief functions would be gunfire support for landings and escort of carrier task forces. Only twice, at Guadalcanal in November 1942 and at Surigao Strait in the Battle for Leyte Gulf two years later, would there be classic gun duels with Japanese battleships in the manner anticipated by every fresh young ensign of the late 1930s.

Following Pearl Harbor, destruction of small British and Dutch naval forces (along with the inadequate United States Asiatic Fleet) meant that the Allied effort in the

Pacific war would become almost exclusively American. President Franklin D. "Roosevelt and his advisors, reacting more to public pressure and political considerations than to geographical realities, the need for unity of command, and clear administration, assigned to Army Gen. Douglas "MacArthur the Southwest Pacific Area, comprising Australia, the Solomons, New Guinea, and the Philippines, while Adm. Chester W. "Nimitz commanded all the remaining Pacific Ocean Area. Interservice "rivalry and bickering, especially by the more image-conscious MacArthur, flared repeatedly during the war.

The first, or defensive, phase of the Pacific war lasted from Pearl Harbor until August 1942. "Submarines harassed Japanese military and commercial shipping. The celebrated carrier raid on Tokyo (18 April) by James "Doolittle's B-25s proved that Japan was vulnerable and buoyed American spirits. A defensive line, protecting vital communications with Australia, stretched from the Aleutians to Midway to Samoa to New Guinea. Above all, Japanese expansion to the east and southeast had to be stopped. The major engagements of this phase came as Americans blunted each prong of a three-part Japanese expansion plan for the spring and summer of 1942.

A Japanese effort at a seaborne invasion of Port Moresby in southeastern New Guinea as a base from which to attack Australia led to the Battle of the "Coral Sea (4-8 May). Fought entirely between carrier fleets 95 miles apart and tactically unfortunate, the battle accomplished its strategic purpose of preventing the invasion. A month later the Japanese sought to spread the northern end of the defensive perimeter by attacking the Aleutians and to draw the American fleet into a destructive battle by threatening Midway with a large invasion fleet. Once again, air-to-air and air-to-surface action replaced ship-to-ship combat. The Battle of "Midway (4-6 June), one of the war's most decisive victories, cost the Japanese four carriers, plus 250 planes and experienced pilots. The United States lost one carrier.

The third part of the overall Japanese plan, a move through the southern Solomons against New Caledonia, Fiji, and Samoa to cut the communication line to Australia, ended the purely defensive phase of the war. On 7 August 1942 United States Marines invaded Guadalcanal in the southern Solomons to prevent completion of a vital Japanese airfield. The invasion marked the beginning of the second or offensive phase of the Pacific War by the Americans. The centerpiece of this offensive phase was the recapture of the Philippines, preceded by an island-hopping campaign to get there, and followed by another one to position American forces for the expected seaborne invasion of Japan.

The Solomons campaign lasted from August 1942 until January 1943. It included three major land battles on Guadalcanal and six naval engagements in the southern and eastern Solomons, most of them extremely fierce night surface actions, fought at close range. The Japanese prided themselves on night fighting with searchlights; the Americans had "radar, a new weapon not always available and not always well used in combat. Most Japanese cruisers, unlike American cruisers, carried "torpedoes. Lingering controversies over tactics and command arose from several engagements, most notably the loss of three American and one Australian heavy cruiser at Savo Island in August 1942. More effective torpedoes increased the efficiency of U.S. submarine raids on Japanese shipping during 1943.

The securing of "Guadalcanal on 9 February 1943 focused full attention on Rabaul, a major Japanese base on New Britain, which stood in the way of any approach to the Philippines via the islands to the southeast. Six more naval engagements occurred in the central and northern Solomons and the Bismarck Sea before Rabaul, neutralized and bypassed, ceased to be a threat in January 1944.

The encirclement of Rabaul had clearly required a joint army-navy strategic effort, although MacArthur had pressed for army dominance in a hopscotch campaign along island chains and the north coast of New Guinea. The assault on the Philippines, whose personal significance to MacArthur matched its strategic significance, also required joint effort to avoid a dangerously unprotected eastern flank. The navy and marine corps, with some army troops as well, swept westward across the central Pacific, beginning with Tarawa in the Gilberts in November 1943, continuing with Kwajalein in the Marshalls, and ending with Saipan, Guam, and Tinian in the Marianas in mid-1944. The Japanese attempted to destroy the American fleet with air attacks in the Battle of the "Philippine Sea (19-20 June) but lost three carriers and nearly 500 planes. From this defeat the Japanese naval air arm never recovered.

October 1944 brought the long-awaited invasion of the Philippines. The Battle for Leyte Gulf (23-26 October), the world's last great naval battle, secured and protected the congested landing beaches. A multi-phase response to a complex Japanese plan, the battle included the destruction in Surigao Strait of one battleship formation by the gunfire of several repaired Pearl Harbor battleships, heavy air attacks on other Japanese ships in several locations, and the luring away of Adm. William F. "Halsey's Third Fleet by a decoy Japanese carrier force. In light of a near disaster, Halsey's judgment has been controversial ever since. The Japanese lost four carriers, three battleships, ten cruisers, and eleven destroyers, permanently ending their ability to challenge the U.S. Navy for control of the seas.

Only the kamikaze or suicide plane remained a major weapon. First used in the Philippines, this desperate sacrifice of both plane and pilot was a terror weapon designed to maximize loss of life among sailors stationed topside on the destroyers and cruisers that screened the carriers, and most importantly to cause as many fires as possible on the carrier. Kamikazes sank 34 ships, none larger than a destroyer, and damaged 368 others, including some carriers, in a failed attempt to prevent the capture of "Okinawa (April-June, 1945). But the failure was bloody: nearly 5000 sailors died, more than double the number killed at Pearl Harbor and comprising nearly 15 percent of the navy's total World War II battle deaths in all theaters. Following American use of the atomic bomb against "Hiroshima and Nagasaki, Japan agreed to surrender on 14 August, executing the final documents on board the battleship USS *Misouri* in Tokyo Bay on 2 September 1945.

The greatest naval war in history had ended with victory for a naval force of unprecedented size and power. The Marianas campaign alone, for example, required 800 ships manned by 250,000 sailors, transporting 150,000 Marines and soldiers. From Pearl Harbor to Tokyo Bay, the U.S. Navy lost 128 combatant vessels in the Pacific and only 29 in the Atlantic. To a much greater degree than the Atlantic phase, the Pacific phase of World War II evolved into the world's first three-dimensional format of the traditional

navy war, with large formations of ships engaged in surface, submarine, and air combat. Only superior American human and industrial resources made such an effort possible.

WOUNDED KNEE, BATTLE OF (1890). The final major encounter between Indians and the U.S. Army, Wounded Knee grew out of the revitalization movement known as the Ghost Dance that swept western Indian reservations in 1889-90. On the Sioux reservations of North and South Dakota, people embraced the new religion with fervor. Fearful of violence, agents called for military assistance, and strong forces were dispatched. The overall commander, Maj. Gen. Nelson A. Miles, pressed for the imprisonment of such "troublemakers" as "Sitting Bull and Big Foot.

On 15 December 1890, Sitting Bull was killed while resisting arrest by Indian policemen. Big Foot eluded arrest when he led his band of Lakota Sioux in a trek toward Pine Ridge Agency; his intent was not hostile, as assumed, but peaceful. Intercepted, the band was escorted to Wounded Knee Creek to be disarmed. Col. James W. Forsyth and the Seventh Cavalry, about 500 strong and bolstered by four small-caliber cannon, surrounded the Indian village of about 350 people. Neither side intended a fight, but the disarming process built tension and suspicion. A rifle accidentally discharged touched off battle.

After a brief exchange of close range fire and hand-to-hand fighting, the Indians scattered and the artillery opened fire. The village was flattened, and Indians fleeing in all directions were cut down. About 200 of Big Foot's people, including women and children, were killed or wounded, while the troops lost 25 killed and 39 wounded. After Wounded Knee, General Miles maneuvered his forces in such fashion as to bring about the surrender of the Ghost Dancers. The Indians, and even General Miles, accused the troops of indiscriminate massacre. Although few such incidents can be documented, the tragedy at Wounded Knee poisoned relations between whites and Indians; today, it still symbolizes the wrongs inflicted by one race on the other.

WRIGHT, ORVILLE and WILBUR, inventors of the airplane and pioneer aviators. Wilbur and Orville Wright went to local schools in Ohio, Indiana, and Iowa; neither attended college. In 1889, the brothers established a printing shop in their home town of Dayton, Ohio. In addition to providing normal printing services, they launched two unsuccessful newspapers and built presses for other local printers. They expanded in 1892, establishing a bicycle sales and repair facility. By 1896, they were manufacturing bicycles of their own design.

The Wrights first became interested in heavier-than-air flight between 1896 and 1899. They built and flew one kite (1899); three gliders (1900, 1901, 1902); and three powered machines (1903, 1904, 1905). The disappointing performance of the first two gliders led them to undertake a series of key experiments with a wind tunnel (1901). Their clarity of vision, capacity to solve the most difficult problems (particularly with regard to roll controls), and their determination to design their machine through solid experimentation set them apart from their contemporaries.

The Wright brothers made the world's first powered, sustained, and controlled flights with a heavier-than-air machine near Kitty Hawk, North Carolina, on the morning of 17 December, 1903. They returned to Dayton, where they continued their experiments quietly in a local cow pasture for two more years. By fall 1905, they had built the world's first practical airplane. In the summer and fall of 1908, they won world fame with their first demonstration flights in Europe and America.

The Wrights never doubted that world governments would be their primary customers. They signed their first contract for the sale of a military airplane to the U.S. Army in 1908. In 1909, in cooperation with a group of financiers, they founded the Wright Company to build and sell airplanes in the United States, and licensed various manufacturers to produce their machines in Europe. That same year, they trained the first group of U.S. military airmen. The Wrights taught many officers to fly, including Lt. Kenneth Whiting, the U.S. Navy aviator who commanded the first U.S. military unit to arrive in France during World War I, and "Hap" Arnold, who would command U.S. Army Air Forces in World War II.

Wilbur and Orville Wright achieved an extraordinarily difficult technical goal that had eluded engineers for over a century. The airplane, a product of their combined inventive genius, would reshape the history of the twentieth century, redefine the notion of battle, and open the way to total war.

Y

YALTA CONFERENCE (1945). In 1945, the "Big Three" of World War II—Franklin D. *Roosevelt, Winston S. *Churchill, and Josef *Stalin—had not met since December 1943. Because of Allied landings in France and the Soviet thrust across Poland and into Germany, by the summer of 1944 a second meeting of the three men was deemed necessary. But arguments over the time and place of their meeting delayed the conference until 4-11 February 1945, when they met at Yalta in the Crimea because Stalin refused to leave the Soviet Union.

Each man traveled to Yalta for different reasons. Roosevelt came because of his desire to create a *United Nations before World War II ended. Churchill feared the growing power of the Soviet Union in a devastated Europe. Stalin was intent on protecting the Soviet Union against another German invasion. The major problems facing the three leaders included Poland, Germany, Soviet entry into the war against Japan, and the United Nations.

At Yalta, Roosevelt attained his goal in an agreement for a conference on the United Nations to convene in San Francisco, 25 April 1945. In addition, Stalin accepted the American proposal on the use of the veto in the Security Council and the number of Soviet states represented in the General Assembly.

Much time was spent on Poland because Stalin insisted on a "friendly" Poland. The three men agreed to move the Polish eastern boundary westward to the 1919 Curzon Line and to restore western Byelorussia and the western Ukraine to the Soviet Union. At Stalin's insistence, a Communist Polish provisional government would be reorganized to include primarily Polish leaders from within Poland, but he agreed to some from abroad to placate Roosevelt. Stalin promised free elections there within a month on the basis of universal suffrage and the secret ballot.

Stalin demanded \$20 billion in reparations from Germany, half of this sum to be destined for the Soviet Union. Churchill rejected this amount while Roosevelt accepted the sum as a basis for future discussion. Germany would be temporarily divided into three zones of occupation, with France invited to become a fourth occupying power.

Stalin promised that the Soviet Union would enter the war against Japan after the fighting ended in Europe. Stalin's terms for this were accepted: the southern Sakhalin and adjacent islands to be returned to the Soviet Union; Dairen to be internationalized; Port Arthur to be leased as a naval base to the Soviet Union; Chinese-Soviet companies to operate the Chinese-Eastern and the South Manchurian railroads; Outer Mongolia to remain independent of China; and the Kurile Islands to be handed over to the Soviet Union. China would be sovereign in Manchuria.

In a Declaration on Liberated Europe, proposed by Roosevelt, the three governments pledged jointly to assist liberated people in forming temporary governments representing all democratic elements and pledged to free, early elections. When the three governments thought action necessary, they would consult together on measures to fulfill their responsibilities. There could be no action without the agreement of all three governments.

Roosevelt probably hoped that in the United States, the Declaration would project an acceptable image of the Yalta Conference as the protector of the rights of liberated peoples. It could also be a standard against which Stalin's policies in Eastern Europe could be judged. However, when put to the test, Declaration proved ineffective. After the Yalta Conference, the Western powers accepted a Polish government in which two-thirds of the members were Communists. When elections finally came in 1947, they were not democratic.

In the Far East, Soviet armies went to war against Japan two days after the atomic bomb was dropped on Hiroshima. The Soviet entry into the war accelerated the Japanese surrender. However, in February 1945, American military planners had expected the war against Japan to drag on into 1946 or even 1947.

As the *Cold War heated up, anti-Communist American critics, particularly in the Republican Party, condemned Yalta as a symbol of appeasement and a diplomatic defeat for the United States. Poland and Eastern Europe had been betrayed. The United States should avoid negotiating with the Soviet Union. Some critics later insisted that China had gone Communist because of the Yalta Conference. The severest claimed that Roosevelt was either too sick to deal with Stalin or was duped by him.

The reality of Yalta was that the location of armies determined the final outcome. Soviet armed forces decided the politics of Eastern Europe; Allied forces influenced politics in Western Europe. China became Communist because the armies of Chiang Kai-shek were defeated, not because Roosevelt had abandoned Chiang.

Yalta was an attempt to transform a temporary wartime coalition into a permanent agency for peace. Roosevelt apparently hoped to modify Stalin's behavior through the United Nations and postwar U.S. policies. Agreements had been negotiated while war was in progress when unity was vital. After the enemies were vanquished, however, the victors quarreled and their fundamental disagreements emerged.

YAMAMOTO, ISOROKU (1884-1943), Japanese admiral and champion of naval aviation; as Combined Fleet commander in chief (1941), carried out the air attack on "Pearl Harbor. No Imperial Japanese Navy officer of his age knew more about the United States than Yamamoto. He had served as a language officer and special student at Harvard (1919-21) and as naval attaché in Washington (1926-28). When navy vice minister (1936-39), Yamamoto opposed Japan's alignment with Germany and Italy, warning that the United States was not the weak-willed nation pictured by Tokyo's hard-liners. He also warned fellow officers that the industrial might of America posed a great threat. But when he was ordered to fight the United States, he took bold action.

The orthodox strategy of the Japanese naval General Staff was to wait for the U.S. Fleet to steam into the western Pacific and destroy it there in a battleship contest. To Yamamoto, a pioneer of naval aviation and a long-standing lover of games of chance, this was a weak-hearted approach. He insisted on a preemptive carrier strike on Pearl Harbor to destroy the U.S. Fleet at the outset. The navy staff opposed him, and only his immense moral stature allowed him to prevail.

The attack on 7 December 1941 proved a brilliant tactical success, and strategically it achieved its objective of protecting Japan's Southeast Asian offensives. But the wave of American public anger that it aroused made impossible a limited settlement of the war. Yamamoto continued to command the fleet in 1942 and 1943, but less successfully. The disastrous Japanese defeat at the Battle of "Midway was his responsibility, and his air offensives in the Solomons wore down Japanese naval airpower relentlessly. On 18 April 1943, Yamamoto was on his way to visit forward units in the Solomon Islands when his plane was shot down by U.S. P-38s, alerted to his route by reading the Japanese naval codes.

YAMASEE WAR. *See* Native American Wars: Wars among Native Americans.

YORK, ALVIN (1887-1964), American soldier and World War I hero known as "Sergeant York." A semieducated Tennessee mountaineer and sharpshooter, York in his late twenties joined a fundamentalist pacifist sect. In 1917, when his draft board rejected his claim for deferment as a conscientious objector, York went off to war, convinced, after a second conversion experience, that God wanted him to fight for his country.

During the "Meuse-Argonne offensive in France in an engagement on 8 October 1918, York's small detachment from the 82nd Division was pinned down by German fire. He personally shot and killed 25 German soldiers, captured 132 more, and put 35 enemy "machine guns out of action. Promoted from corporal to sergeant, he was awarded the highest decorations of the American and French governments, and became, as "Sergeant York," the most renowned doughboy of the war.

York rejected offers of commercial ventures and returned to Pall Mall, Tennessee, to a farm partially funded by public subscription. He founded a vocational school for the undereducated mountain children.

In 1940-41, York became an ardent interventionist, endorsing U.S. defense measures and aid to the Allies. He approved a Warner Bros. film, *Sergeant York* (1941), starring Gary Cooper.

A plain-talking mountaineer combining religious piety and deep-rooted "patriotism, York was a latter-day descendant of the American frontier and perfect hero for the new popular press and for a United States fighting its first war in Europe.

YORKTOWN, BATTLE OF (1781). The entry of France into the Revolutionary War in May 1778 gave Americans hope that they might achieve "victory rather than just stave off defeat, for French naval power could impede the flow of British resources across the Atlantic and help to trap British forces in the seaports from which they operated. Yet it was not until the autumn of 1781 that four factors combined to produce a decisive victory.

First, Gen. George "Washington kept the "Continental army in the field despite shortages of money, clothing, food, and ammunition. Second, the leaders of the French army (Rochambeau) and fleet (de Grasse) were competent commanders, willing to cooperate with one another and with Washington. Third, the British had concentrated their resources in home waters to forestall invasion. Ships sent across the Atlantic were responsible for protecting both the West Indies and British coastal enclaves in North America. Fourth, Britain's efforts to use loyalists to reestablish royal control in the South failed to eliminate rebel activity in South Carolina. Charles Lord "Cornwallis, commander of the last British mobile force in America, invaded North Carolina and then Virginia, to eliminate support for the rebels further south.

Cornwallis's operations in Virginia during the summer of 1781 put his 10,000-man army within range of Franco-American forces based in southern New England and New York. Washington saw the opportunity Cornwallis had presented, and Rochambeau and de Grasse agreed to attempt a joint operation. Leaving half the American army to pin Sir Henry "Clinton's forces at New York City, Washington with 2,300 Continentals and Rochambeau with 4,000 Frenchmen began moving south on 20 August. They reached Williamsburg on the 26th, having traveled down Chesapeake Bay by ship. There they joined 3,400 Continentals and 3,200 Virginia state and militia troops already

operating against Cornwallis, who had withdrawn to Yorktown, on the York River, to await resupply.

The plan's key element was de Grasse's fleet, which arrived on 26 August from the West Indies, established control of the coastal waters inside the Capes of Virginia, and contributed 4,800 more men to the besieging force. Ten days later, de Grasse fought a strategically decisive engagement with a British squadron sent by Clinton to evacuate Cornwallis's force. The British failure to penetrate past de Grasse, plus Cornwallis's inertia, allowed Washington and Rochambeau to spring their trap.

The allies closed in on Yorktown on 28 September, and on 6 October began formal siege operations, which would have been impossible without French heavy "artillery. By 14 October, the cannonade had weakened British positions sufficiently to allow the allies to capture key outposts: 400 American light infantry, led by Alexander "Hamilton, took the smaller Redoubt No. 10 sooner and with fewer "casualties than the French at Redoubt No. 9. Cornwallis and 8,000 men surrendered on 17 October.

Yorktown's most decisive effect was on political opinion in Britain. The British still had substantial forces in North America, but all were tied down defending coastal enclaves; Cornwallis's army was the last force surplus to garrison requirements they had been able to scrape together. Britain could have continued the war, but its political leaders had lost the will to fight.

YOUNG, CHARLES (1864-1919), U.S. Army colonel, military attache. The son of slaves, Young was born in Kentucky and educated in Ohio. He became the ninth African American appointed to West Point, and only the third to graduate (1889). Young's military career was consistently marked by his achievement in mixing combat, command, and intelligence assignments with teaching, administrative, and diplomatic duties at home and abroad. He served for nearly three decades (1889-1917), experiencing combat in the "Spanish-American War, the "Philippine War, Haiti, Liberia, and Mexico. On the eve of World War I, he was sixth in line for promotion to brigadier general.

Although genuine physical ailments (high blood pressure and kidney inflammation) constituted the official reasons for his removal from active duty, Colonel Young was also the victim of the 1890s and early twentieth-century white redefinitions of manhood, gender, and race. The African American successes as combatants during the Spanish-American War helped spark debate within the military on the suitability of using blacks for combat. The cultural attempt by African Americans to define their independence as citizens came into play in the enforced retirement of Colonel Young as the nation prepared for entry into World War I.

ZUMWALT, ELMO R., JR. (1920-), U.S. Navy admiral and chief of naval operations, 1970-74. Born in San Francisco, Zumwalt was valedictorian of his high school class and graduated with distinction from the U.S. Naval Academy (1942). He attended the Naval War College in 1952-53 and the National War College in 1961-62.

During World War II, he served in the Pacific on destroyers and fought in the Battle of "Leyte Gulf. His subsequent service at sea included commands of USS *Tills*, USS *Isbell*, and USS *Dewey*. Zumwalt served tours, as a captain, in the Department of "Defense (International Security Affairs), and as executive assistant and senior aide to the secretary of the navy (Paul "Nitze). Selected for rear admiral in 1964, he was ordered to command of Cruiser-Destroyer Flotilla Seven. In 1966, he returned to Washington to become director of the chief of naval operations Systems Analysis Group.

In 1968, Vice Adm. Zumwalt reported for duty in the Vietnam War as commander, Naval Forces, Vietnam. Promoted to three-star rank, at age forty-seven he was the navy's youngest vice admiral. His employment of the "Brown-Water Navy" in the rivers and canals of South Vietnam was imaginative and daring. Under President Richard M. "Nixon's program of "Vietnamization," Zumwalt's accelerated transfer of U.S. Navy ships, craft, bases, and operational responsibilities to the Vietnamese

Navy only increased his standing. In 1970, leapfrogging many more senior officers, he was promoted to four-star rank and named chief of naval operations (CNO).

Admiral Zumwalt's tour as CNO was marred by serious disciplinary problems and related racial disturbances in the navy. He issued a series of "Z-Grams" to the fleet, dealing with personnel matters (haircuts, liberty, "uniforms, etc.) traditionally the province of local commands. His popularity with the junior enlisted community soared, but the "mod navy" he ushered in did not meet with general approval in the officer corps or with many conservatives in Congress.

After retirement, Zumwalt published two books: *On Watch* (1976) and *My Father, My Son* (1986).

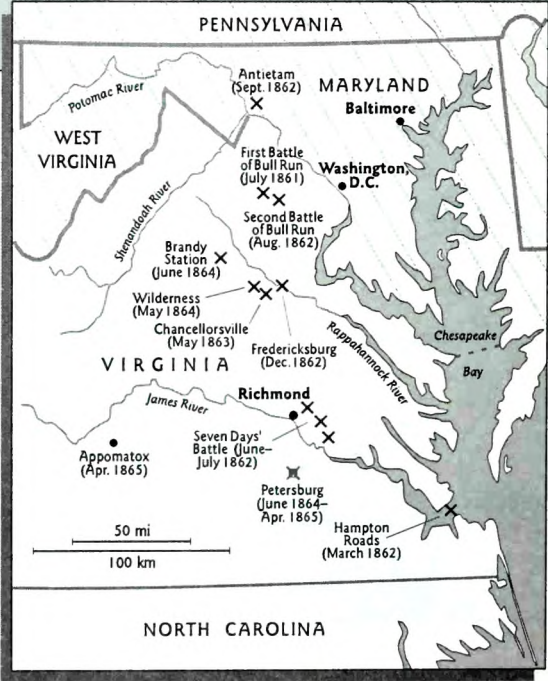

Admiral Zumwalt's son, LTJG Elmo R. Zumwalt III, served as officer in charge of a "swift; boat in the Vietnam War. He later contracted and perished from cancer, which he and his father believed was caused by exposure to chemical defoliants used extensively in the war.

literature, music, and photography; and on war viewed through the disciplinary lenses of anthropology, economics, gender studies, and psychology. The result is the widest ranging account compiled in one volume of war, peace, and the U.S. military.

Boasting authoritative and vividly written entries, maps of several major wars, extensive cross-referencing, lists of further readings, and an index, this volume is the first place to turn for information on our nation's military history.

John Whiteclay Chambers II is Professor of History and former chair of the History Department at Rutgers University, New Brunswick, New Jersey. A distinguished scholar in American history and in war and peace studies, he is the author or editor of nearly a dozen books, including *To Raise an Army: The Draft Comes to Modern America*, which won the Distinguished Book Award from the Society for Military History, and most recently, *World War II, Film, and History* and *Major Problems in American Military History*.

OXFORD
UNIVERSITY PRESS
www.oup.com

“Belongs on the bookshelf of all serious military historians. Thorough, fair, and readable, it is a treasure house of information [that] can also be read for entertainment.”

—John S. D. Eisenhower

- Written by some 500 distinguished contributors, including such eminent figures as John Keegan, Stephen E. Ambrose, James M. McPherson, and Robert M. Utley
- A thousand entries cover virtually every aspect of United States military history:
- Major Wars: ranging from the Revolution to the Persian Gulf War
- Important Battles: from Bunker Hill to the Alamo, Gettysburg, Little Bighorn, Normandy, and Khe Sanh
- Military Leaders: from George Washington to Grant, Lee, Eisenhower, MacArthur, Westmoreland, and Schwarzkopf
- Branches of the service: Army, Navy, Air Force, Marines, Coast Guard
- Weapons: from the Gatling gun to the M-16, including flame-throwers, land mines, tanks, and artillery
- Types of naval vessels: from river craft and sailing ships to battleships, cruisers, air craft carriers, and submarines
- Types of aircraft: from blimps and dirigibles to bombers, fighters, and helicopters
- Types of warfare: from privateering and trench warfare to guerrilla warfare, terrorism, and counterinsurgency
- Military life: from awards, insignias, and uniforms to troop morale, leaves and furloughs, and the changing experience of combat
- Acts of Congress: from the Alien and Sedition Acts to the War Powers Resolution
- Peace Groups: from the Quakers and the War Resisters League to the Carnegie Endowment for International Peace and SANE
- Cultural Influence: the impact of war and the military on literature, music, photography, and film
