

THE OXFORD COMPANION TO

AMERICAN MILITARY HISTORY

EDITED BY

JOHN WHITECLAY CHAMBERS II

THE OXFORD COMPANION TO
**AMERICAN
MILITARY
HISTORY**

Here is a gold mine of information on American military history, exploring battles and soldiers, ships and weapons, services and doctrines—as well as the social and cultural impact of the U.S. military at home and around the world.

The Oxford Companion to American Military History boasts over 1,000 entries written by some 500 distinguished contributors. Readers will find Stephen E. Ambrose writing on the D-Day landing, James M. McPherson on the battle of Antietam, John Keegan on the changing experience of combat, Jean Bethke Elshtain on Jane Addams, Mark A. Noll on religion and war, and Robert M. Utley on Sitting Bull. Ranging from brief pieces to extensive essays, the entries examine every major war from the Revolution to the Persian Gulf; important battles from Bunker Hill, to the Alamo, Gettysburg, Little Bighorn, Normandy, and Khe Sanh; and military leaders from Washington to Grant, Lee, Eisenhower, MacArthur, Westmoreland, and Schwarzkopf. Moreover, the *Companion* goes well beyond the usual “drum and trumpet” coverage to examine a wide range of subjects you might not expect to find. There are entries on relevant acts of Congress and on diplomatic policies such as the Monroe Doctrine and the Marshall Plan; on peace and antiwar movements; on war in film,

INTRODUCTION

“It is well that war is so terrible, or we would grow too fond of it.” As Gen. Robert E. Lee observed at Fredericksburg in 1862, battle can produce spectacular pageantry, bravery, and exhilaration, but it also yields mangled bodies and bloated corpses. That is war’s eternal paradox. In it, brutality, cynicism, tragedy, and absurdity are accompanied by courage, comradeship, self-sacrifice, and noble purpose. The continuing popularity of books and films from *All Quiet on the Western Front* (1930) to *Saving Private Ryan* (1998) demonstrates that, for all its contradictions, war has its fascinations.

War is central to the way the United States has developed as a nation and a society. The use of military force attended the conquest of the Indians, the expulsion of French and then British power, the birth of the republic, western expansion, the preservation of the Union, the creation of an island empire, and the triumph of the United States in two world wars. The use and the threat of using military force accompanied the emergence of the United States as a global superpower.

Warlike images form part of the national memory: the Minutemen with farmers’ muskets and tricornered hats standing up to the king’s red-coated soldiers at Lexington and Concord, Andrew Jackson and his buck-skinned frontiersmen blasting the British regulars at New Orleans, the masses of blue- and gray-clad citizen-soldiers firing volley after volley at each other in the Civil War, Theodore Roosevelt and his Rough Riders charging up San Juan Hill (and the oft-forgotten black regulars alongside them), khaki-clad doughboys slashing through the Argonne Forest in World War I.

Who can forget the iconography of World War II, from the burning ships in Pearl Harbor to the Japanese surrender on the deck of the USS *Missouri* in Tokyo Bay? Photographers immortalized Douglas MacArthur wading ashore returning to the Philippines, the Marines raising the flag on Iwo Jima, the B-17s dropping sticks of bombs over Germany, and the deadly mushroom cloud spiraling above Hiroshima. The American memory of that war also contains pictures of Gen. George Patton and his ivory-handled pistols, Dwight D. Eisenhower meeting paratroopers bound for Normandy, Robert Capa’s blurred photos of G.I.s struggling ashore at Omaha Beach, and the haunting images of skeletal survivors as the Allies liberated German death camps.

War certainly has its dark side—one emphasized since World War II. The cold, bone-weary faces of American G.I.s haunt David Duncan’s photos of the Korean War. Following them are the fiery images of burning villages and screaming civilians in the Vietnam War, and the emotive pictures of American body bags and amputees coming home from Southeast Asia, Eddie Adams’s picture of a summary execution in the streets of Saigon in 1968. Some twenty years later, fear of massive American casualties accompanied the deployment of U.S. troops in the Persian Gulf War—a fear only alleviated by the success of America’s high-technology weaponry and combat-ready forces, which destroyed many of Saddam Hussein’s military units and installations in Iraq and occupied Kuwait.

With the end of the Cold War, international conflict and the military are once again in transition. Gone are the minuscule standing forces in peacetime and the old mass armies of wartime draftees and volunteers. Replacing them are highly mobile, professional, all-volunteer forces now increasingly combining active duty and reserve troops. War too has changed. The world wars and threat of global conflict that characterized much of the twentieth century seem to be a thing of the

past. The Persian Gulf War of 1991 showed that intensive regional wars may certainly continue. Retaining the ability to project massive power overseas, American armed forces at the beginning of the twenty-first century have been assigned new missions, such as acting against regional threats involving the use of weapons of mass destruction. But the U.S. military has also returned to an old mission involving constabulary duties. Now, however, these include border security, counter-terrorism, and, in a world increasingly torn by internal and sectarian strife, peacekeeping.

As U.S. experiences in Somalia and Bosnia show, the multinational use of outside armed forces in dangerous areas to separate previously warring groups and encourage the development of stable peaceful conditions is a complex and difficult mission. Yet this role is rooted in historic American relationships among war, peace, and the military. For Americans often seek to use the military for idealistic purposes—from “the war to end all wars” in 1917-18 to the rescue mission of the Berlin Airlift in 1948-49—and in recent years, the United States has been a major supporter of the idea of collective security and peacekeeping through the United Nations and NATO.

Of course, peace and peace movements are also important in U.S. history. Traditionally, Americans see themselves as a peace-loving people and war as an aberration. As a people, they are committed not to Old World conquest or balance-of-power politics, but to the expansion of their political and economic ideals expressed in terms of life, liberty, justice, and democracy. Only a few Americans have been absolute pacifists, like the Quakers, but many have led in struggles for non-violence and social justice, among them, William Lloyd Garrison, Jane Addams, and Martin Luther King, Jr. They also believed in an internationalism without violence. Other internationalists championed collective security for a world of peace and justice, such as Presidents Woodrow Wilson and Franklin Roosevelt. Both kinds of internationalists reacted against traditional American isolationism; indeed, isolationists usually opposed the deployment or use of U.S. troops overseas.

Increased popular interest in the role of war, peace, and the military in U.S. history is evident in films, books, commemorations, reenactments, and other aspects of popular culture. This coincides with a transformation in scholarship in the field. In the last two generations, a variety of new scholarly approaches has augmented the old “drum and trumpet” school of refighting battles. The new military history first shifted attention to the evolution of military institutions, engaging not simply historians but sociologists, economists, anthropologists, and political scientists. Some scholars then began to explore the wider relationship between war, the military, and society. Others probe the nexus with science and technology. Scholars in cultural history as well as in psychology, literary criticism, film studies, and gender studies explore cultural dimensions of war, peace, and the military. The comparatively new field of peace history is producing works on peace and antiwar movements and their relationship to politics and culture. Building on a broad conception of national defense, some historians, political scientists, sociologists, and economists examine relationships among the military, the economy, and governmental policy either in the short run or in long-term interpretations of the rise and decline of particular nations. In a different direction, but equally as influential, is a renewed attention on battle. This new combat history, however, shifts the focus away from the perspective of top commanders to the battle experiences of the common soldiers, airmen, sailors, or Marines.

Drawing on the most current scholarship in the field and in a number of cases advancing that scholarship, *The Oxford Companion to American Military History* provides a comprehensive, one-volume guide to the study of war, peace, and the military throughout American history. Through more than 1,000 alphabetically arranged entries, each written and signed by a specialist in the field, this work examines America’s military past from the colonial era to the present. It focuses not only on wars, battles, and military institutions but also on their relationship to the social, economic, political, and cultural milieu. In recognition of this broader understanding of military history and the history of war and peace in America, the volume also examines peace and antiwar movements, efforts at arms reduction, and limitations on the size and use of the armed forces.

In entries ranging from brief essays to extensive analyses, the *Companion* covers the various armed conflicts, institutions, policies, weapons, organizations, individuals, and issues that have together made up the American experience with war, peace, and the military. Although its primary focus is historical—particularly military history, war and society studies, peace history, and the history of international relations—the work uses an interdisciplinary approach. It includes concepts and research from such other fields as art history, cultural anthropology, economics, film studies, gender studies, literary criticism, minority studies, political science, and sociology.

Like the shadows on a parade field, the military reflects the larger society that creates it. The primary goal of this reference work is to explore the *changing* nature of war and the military and, in the process, to explain how and why the United States developed its military institutions, weapons, and national security policies. It seeks to understand the impact of war on American society and the state, and the influence of American politics, culture, and society on the nature of war and military organization. Taken as a whole, the *Companion* seeks to answer several key thematic questions: How has the military evolved in American history? How has it prepared for and carried out its missions? What have been the role and impact of war and the military? What has been the relationship of war, weaponry, and the military to U.S. foreign policy and to American society, including various social and economic groups, the political system, and the national culture and pluralistic subcultures? How have these groups, institutions, policies, and values helped to shape one another? What has caused and characterized the evolution of movements for arms limitation, peace, and reduction of the armed forces?

Included in the *Companion* are broad, interpretive entries designed to further several goals. One aim is to provide historical insight into particular wars and military organizations. “Composite” pieces composed of integrated essays separate these large topics into manageable areas. For example, articles on each major war are divided into essays that deal with the war’s causes, military and diplomatic events, domestic course, postwar impact, and changing interpretations. Other composite articles break into chronological periods the history of each major service—U.S. Army, Navy, Air Force, and Marine Corps. Another aim is to provide theoretical as well as historical understanding of the military’s structure and missions, and of the social, political, economic, technological, cultural, and strategic context in which these have evolved.

Within the space available, this book provides a comprehensive guide to the history and current circumstances of the U.S. armed services, as well as American ideas about war, peace, and national security. It does so through an alphabetical organization that comprises several broad categories of entries. These categories were designed to reveal the connections and relationships among the topics under consideration. In planning articles, the criteria for inclusion always began with the question: What is the overall significance of this subject within the context of war, peace, and the military in American history?

Conceptual categories include:

Historical Actions and Events. More than 300 articles examine historical actions and events. Varying in length from a few hundred to several thousand words, these entries deal with wars (from King Philip’s War of 1675-1677 to the Persian Gulf War of 1991), battles and sieges (such as Bunker Hill, Gettysburg, Normandy, Inchon, and the Tet Offensive), overviews of air and naval operations in specific wars or campaigns (such as U.S. Naval Operations in the Pacific in World War II and U.S. Air Operations in the Korean War), armed insurrections (like the Whiskey Rebellion of 1794 or the New York City Antidraft Riots of 1863), and international incidents and crises (from the Samoan Crisis of 1888-89 to the Kosovo Crisis of 1999). They include acts of Congress (like the G.I. Bill and the War Powers Resolution) and executive orders, court cases and decisions, international conferences and agreements, and overviews of U.S. military involvement in other countries or regions (from Canada to the United Kingdom, the Caribbean to the Middle East).

Concepts. War, peace, and the military cannot be adequately understood without the concepts

that underlie them. Thus, the *Companion* provides extensive articles on such major relevant concepts as Foreign Policy, War, Peace, National Security, Military Doctrine, and the State. More than two dozen middle-length entries on related concepts, among them Collective Security, Command and Control, Deterrence, Operational Art, the Order of Battle, Principles of War, the Rules of Engagement, Victory, and Defeat, as well as Pacifism, Peacekeeping, Nonviolence, Just War Theory, and the Laws of War. There are also composite articles, combining a cluster of connected entries. The composite entry on Strategy, for example, is divided among articles on the Fundamentals of Strategy and Historical Development, and then three separate articles on the application of Strategy to Land, Sea, and Air warfare. Due to the differences they entail, there are also entries on nearly two dozen different kinds of warfare (such as Airborne Warfare, Amphibious Warfare, Napoleonic Warfare, Privateering, and Trench Warfare).

The Armed Services. A special emphasis of the work is on explaining the nature and historical evolution of the armed services as institutions and their relationship to American society, polity, culture, and international relations. Each has, of course, influenced the other. Institutional entries provide historical perspective on such topics as the individual U.S. armed services, plus each of their combat branches. A composite entry on the U.S. Army, for example, contains an overview article, accompanied by five chronological articles covering the Colonial and Revolutionary Eras, and the periods 1783-1865, 1866-1899, 1900-1941, and since 1941. Another composite article explores the Army Combat Branches, with entries on Infantry, Artillery, Cavalry, Armor, and Aviation. For more information about the weapons of these branches, the reader can consult generic articles on, for example, Artillery, Machine Guns, Standard Infantry Side Arms, Tanks. There are similar composite chronological and combat branch articles on the navy, air force, and Marine Corps, as well as a general article on the Coast Guard. Other entries explain the development of the militia and the National Guard and of the other reserves. The myriad aspects of military life in war and peace are explored in scores of different articles: these include overviews of the nature of Gender and Identity in the Military, Mobilization, Rank and Hierarchy in the Military, Recruitment, and Training and Indoctrination, as well as Concepts of Military Leadership. There are also articles on Careers in the Military, Casualties, the Changing Experience of Combat, Combat Effectiveness, Combat Support, Prisoners of War, and Troop Morale.

Weaponry and Material Weapons systems, and instruments of detection, observation, communication, and supply essential components of the armed forces. The *Companion* encompasses a wide variety of articles here, ranging from specific weapons and other instruments to generic categories. The aim is not simply to describe and explain their function but to give their historical military significance and, when pertinent, to situate them within a larger political and economic context. Interpretive overview articles place developments in multidimensional perspective (there are long entries, for example, on the Evolution of Weapons, on Nuclear Weapons, and on the Arms Race, as well as separate overviews on the Weaponry of the U.S. Air Force, the army, the navy, the U.S. Air Force, and the Marine Corps). Other articles of varying length explain the evolving forms and usage of such support functions as Intelligence (with separate articles on the roles of MAGIC and ULTRA in World War II), Coding and Decoding, Covert Operations, Engineering, Logistics, Maintenance, and Transportation, as well as such detection systems as Radar, Sonar, AWACS aircraft, AEGIS ships, U-2 Spy Planes, Reconnaissance Satellites, and Heat-Seeking Technology.

State and Society. The armed forces are, of course, instruments of the state, but they—and war itself—reflect and affect the larger society. Responding to new scholarship on war and society, as well as producing new scholarship itself, the *Companion* includes substantial articles on social perspectives, economic perspectives (from the economy and war to procurement in various defense industries), and political perspectives (Congress, War, and the Military; the News Media,

War, and the Military; the President as Commander in Chief; Public Opinion, War, and the Military; and the Supreme Court, War, and the Military). There are also articles about rebellions against state power: an extensive one on Colonial Rebellions and Armed Civil Unrest (1607-1775), and specific articles on Bacon's Rebellion (1676), Shays's Rebellion (1786-87), and the Whiskey Rebellion (1794), as well as the internal strife known as Bleeding Kansas (1854-58).

Law and Ethics. Because of the purpose of the armed forces and the nature of war, the military's system of law and its professional ethics have often differed from those of the larger civilian society. Particularly in twentieth-century America, however, with the increased sense of individual rights, egalitarianism, and civil liberty, more confluence has evolved between military and civilian systems of law and ethics. In this work, the nature and evolution of military law, which has focused more on maintaining discipline than achieving justice, and of military ethics, increasingly delineated, are treated in a number of entries. Among these is a large composite article on Military Justice, plus shorter articles on the Right to Bear Arms, Civil Liberties and War, and the Constitutional and Political Basis of War and the Military. There are also individual articles on such topics as Atrocities, Ethical Issues Involving Nuclear Weapons, Genocide, the U.S. War Effort and the Holocaust, and War Crimes.

Dissent. War and the military have sometimes provoked vigorous dissent in American history. Responding to broadening scholarship on peace, arms reduction movements, and alternative views of national security, the *Companion* includes articles on such groups and movements. Sizeable interpretive entries examine Conscientious Objection, Draft Resistance and Evasion, Nuclear Protest Movements, Peace and Antiwar Movements, and the Vietnam Antiwar Movement. Individual groups, ranging from Quakers to the War Resisters League, merit smaller entries.

Popular Culture and the Military. Cultural perspectives are important in understanding the relationship of war and the military to society. Consequently, a number of pioneering articles explore various interrelationships between war and the military and American culture, including historically oriented entries dealing with such diverse topics as Commemoration and Public Ritual, Military Reenactments, and Paramilitary Groups. Separate articles appear on War and the Military in Film; Illustration, and Photography; Literature; Music; Sermons and Orations; and Textbooks. There is even an article on Military Influences on Fashion.

Biographies. Some 300 biographical entries explore the lives of individuals of particular importance to war, peace, and the military in American history. These include 25 U.S. presidents and many other civilian public officials, more than 100 generals and admirals (from Nathanael Greene to Colin Powell), plus other military figures (from Molly Pitcher to Sergeant Alvin York). You will find biographies of military theorists, inventors, scientists (such as Carl von Clausewitz, Alfred T. Mahan, Giulio Douhet, Robert Fulton, Samuel Colt, John Dahlgren, John Holland, Orville and Wilbur Wright, John von Neumann); pacifists and social activists (William Penn, Henry David Thoreau, and Emily Greene Balch); and other nonmilitary public figures (among them Clara Barton, Frederick Douglass, W. E. B. Du Bois, Charles Lindbergh, Bill Mauldin, Ernie Pyle, and Norman Thomas). There are Native American warrior chiefs, and several foreign leaders, friend or foe (from George III to Saddam Hussein).

Combining clear, lively prose with the latest scholarship, *The Oxford Companion to American Military History* is a reference source that students, teachers, journalists, military history buffs, and general readers will find indispensable.

HOW TO USE THIS COMPANION

As you begin the intellectual adventure of exploring and using this work, you will rapidly discover that it is designed for both specific reference and sustained browsing. Wide exploration of related topics is encouraged by several features:

• *Alphabetical arrangement* of entries provides the quickest way to locate a significant person or topic. You can plunge right into the book by selecting something that interests you and go from there. Perhaps it is an individual—King Philip (Metacomet), Molly Pitcher (Mary Hays Ludwig), George Washington, Tecumseh, Winfield Scott, Robert E. Lee, Ulysses S. Grant, Abraham Lincoln, or maybe George Custer, Emory Upton, George Patton, Hyman Rickover, Robert McNamara, or Bill Clinton. It could be an adversary: Charles Cornwallis, Antonio Lopez de Santa Anna, Isoroku Yamamoto, Erwin Rommel, Adolf Hitler, or Vo "Nguyen Giap. Maybe it is a specific battle or war or a particular type of weapon (Sailing Warships, Battleships, Stealth Aircraft, or Rifled Musket, Gatling Gun, the M-16 Rifle). It might be a particular branch of the service such as Special Operations Forces: U.S. Navy SEALs, or historical organizations like the Continental Army and Navy, the Union Army and Navy, the U.S. Colored Troops, or the Confederate Army and Navy. It could be the Militia and National Guard. There are midlength historical articles on various aspects of military life, from Uniforms, Insignia, Interservice Rivalry to Medical Practice, Military Families, and Sexual Harassment. Longer thematic essays probe such topics as Native Americans in the Military; War: Nature of War; Nuclear Weapons and War, Popular Images of; Pacifism; and Terrorism and Counterterrorism. There are historical overviews of U.S. Military Involvement in the Caribbean and Latin America as well as the Middle East—or any one of nearly two dozen other regions or specific countries.

• The *index* is a good place to start a more systematic search, for it offers the most effective way to discover a wide variety of persons, events, organizations, institutions, doctrines, and weapons, whether they have their own entries or are embedded in a larger article. For example, the index references to Gen. Billy Mitchell will not only guide the reader to his alphabetically listed biographical entry; they will also indicate references to this controversial advocate of airpower in articles on the predecessors of the U.S. Air Force, 1907-46; on Strategy: Air Warfare Strategy; and, because of his court-martial, to the entry on Civil-Military Relations. Or, since there is no alphabetical entry for the Pequot War (1636-37), a description of this conflict can be found via the index in the article on Native American Wars: Wars Between Native Americans and Europeans.

• *Blind entries* appear within the alphabetical range of headwords. For synonyms, related subjects, and inverted terms, they refer the reader to the entry under which the topic is discussed. For example, the blind entry on "Manassas, Battles of" refers the reader to entries listed as "Bull Run, First Battle of (1861)" and "Bull Run, Second Battle of (1862)." In some cases, the blind entry will refer to another entry that discusses the topic as part of a broader category. The blind entry "Atomic Bomb," for example, directs the reader to "Atomic Scientists," "Hiroshima and Nagasaki, Bombings of (1945)," "Manhattan Project," and "Nuclear Weapons."

• *Asterisks* in the body of an article denote cross-references. Topics marked can be found elsewhere in the volume as separate entries. Asterisks can direct the reader to more detailed treatments of specific battles, weapons, commanders, laws, or court cases. For example, the article on "Civil-Military Relations: Civilian Control of the Military" is cross-referenced to more than half a dozen acts or events, from the "Newburgh 'Conspiracy' (1783)" to the "Goldwater-Nichols Act (1986)." Or, the cross-references can place a more limited topic within a larger context. For example, the entries on the "D-Day Landing (1944)" and "St. Lô, Breakout at (1944)," both refer the reader to the larger campaign of which they were a part: the article on "Normandy, Invasion of (1944)."

• *Cross-references* also appear in the section entitled "See also" that follows many entries. For example, in the article on "Bacon's Rebellion (1676)," there are such cross-references to larger entries on "Colonial Rebellions and Armed Civil Unrest," as well as "Native American Wars: Wars Between Native Americans and Europeans." In the entry on "Benedict Arnold," the reader is also directed to such larger topics as the "Revolutionary War: Military and Diplomatic Course" and

“Treason.” From the “War of 1812,” cross-references lead to conceptual entries on “Neutrality” and on “Trade, Foreign,” which were major causes of the war. Similarly, the entry on the “Emancipation Proclamation” also directs the reader to related broader topics such as “African Americans in the Military” and “Civil War: Domestic Course.”

Suggestions for further reading at the end of most articles are useful to learn more about the topic. The length of these reading lists varies, with the longest included with the most comprehensive essays. While every effort has been made to include the most recent, nontechnical, and widely available books, inevitably some topics require more specialized reading, and their bibliographies reflect this fact. Finally, the name of the contributor of the entry appears either at the end of the text or after the bibliography. A section in the front of the book lists individual contributors and their institutional affiliations.

The history of America’s wars and the military can be made more understandable by graphics. Consequently, the *Companion* includes tables on wartime mobilization and casualties, charts indicating the ranks and accompanying insignia in the armed forces, and maps of the Revolutionary War, Civil War, World War II, and the Vietnam War. These are located in an appendix at the end of the book for the reader’s reference.

ACKNOWLEDGMENTS

Initially conceived in conjunction with Linda J. Halvorson of Oxford University Press in 1990, this *Companion* has been an extensive project. Nearly a decade in the making, it involved the work of hundreds of scholars and other professionals, whose efforts I greatly appreciate. First, for their invaluable assistance, I want to thank my fellow section editors—Fred Anderson, Lynn Eden, Joseph T. Glatthaar, and Ronald H. Spector. In addition, members of the Advisory Board offered extraordinarily helpful advice as we sought to bring to a broad audience the latest scholarship from a wide range of fields.

Planning and implementing such an undertaking benefited not simply from the knowledge of those on the *Companion’s* Editorial and Advisory Boards and from Oxford University Press, but also from numerous other scholars. We often drew upon those in the Army’s Center of Military History, the Inter-University Seminar on the Armed Forces and Society, the Marine Corps Historical Center, the Navy Historical Center, the Office of Air Force History, the Organization of American Historians, the Peace History Society, the Society for Historians of American Foreign Relations, and the Society for Military History. We called upon independent scholars, members of the armed forces, and faculty at college and universities around the world. A number of individuals interrupted their own work to provide invaluable advice on the project whenever needed. Among these stalwarts were Dean C. Allard, Harriet Hyman Alonso, Stephen E. Ambrose, Edward M. Coffman, Graham A. Cosmas, Richard H. Kohn, Allan R. Millett, Charles C. Moskos, Carol M. Petillo, Alex Roland, and Edwin Howard Simmons. At a crucial period, G. Kurt Piehler helped out by serving as consulting editor.

Hundreds of authors contributed the over 1,000 articles in this volume. A separate list of contributors provides the names and institutional affiliations of these authors, whose scholarship, learning, and erudition made this volume possible. This book is a tribute to the strong support that colleagues in many different branches, fields, and disciplines gave to the project.

Coordinating such an enterprise and shepherding it through to production required a sustained effort by the Trade Reference Department of Oxford University Press (USA). After the initial exploration of the concept and systematic entry development with Linda Halvorson, then executive editor, and Marion Osmun, the first development editor assigned to the project, progress over the next nine years was guided sequentially by developmental editors Mark Cummings, John Drexel, and Liz Sonneborn, and then by a series of project editors: Anita Vanca, Hannah Borgeson,

and, in 1998-99, Catherine E. Carter, who completed the monumental task of bringing the manuscript into production. Anne Adelman did the copyediting; Suzanne Gilad and Maine Proofreading Services read the proofs; Mary Neal Meador designed and typeset the interior of the book; Sonny Mui designed the cover; Gary S. Tong created the maps; Adam B. Bohannon, Elizabeth Szaluta, and Kelly Trezza guided it through the final stages of production. I would also like to thank Marjorie Mueller, Director of Subsidiary Rights at Oxford. In 1998, Nancy Toff succeeded Linda Halvorson as head of Oxfords Trade Reference Department and provided overall supervision for the final publication of the book in November 1999. Sincerest thanks to all who worked on making this volume an important contribution to the understanding of war, peace, and the military in American history.

John Whiteclay Chambers II
Editor in Chief
May 1999

ABOUT THE EDITORS

EDITOR IN CHIEF

John Whiteciay Chambers II is Professor of History and former Chair of the History Department at Rutgers University, New Brunswick, New Jersey. He received his Ph.D. in History from Columbia University (1973), where he then taught for ten years. He has written *To Raise an Army: The Draft Comes to Modern America* (1987), which won the Distinguished Book Award from the Society for Military History, and *The Tyranny of Change: America in the Progressive Era, 1890-1920* (1992); he is completing a book titled *All Quiet on the Western Front: The 1930 Motion Picture and the Image of World War I* (forthcoming, 2000). He is the editor or co-editor of *Three Generals on War* (1973); *Draftees or Volunteers* (1975); *American History* (1983); *The Eagle and the Dove* (1991); *The New Conscientious Objection* (1993); *World War II, Film, and History* (1996); and *Major Problems in American Military History* (1998).

EDITORS

Fred Anderson is Associate Professor of History at the University of Colorado, Boulder. He served in the U.S. Army from 1973 to 1975 and in 1981 received his Ph.D. from Harvard University. He is the author of several scholarly articles and two books—*A People's Army: Massachusetts Soldiers and Society in the Seven Years War* (1984) and *The Crucible of War: The Seven Years' War and the Fate of Empire in British North America, 1754-1766* (forthcoming, 2000).

Lynn Eden is Senior Research Scholar at the Center for International Security and Cooperation, Stanford University. She received her Ph.D. in Sociology from the University of Michigan (1985), was a Social Science Research Council-MacArthur Foundation Fellow in International Peace and Security (1986-87), and taught in the Department of History at Carnegie Mellon University. Eden has written *Crisis in Watertown: The Polarization of an American Community* (1972; nominated for the 1973 National Book Award); co-authored *Witness in Philadelphia* (1977; Book-of-the-Month-Club alternate selection); and co-edited *Nuclear Arguments: Understanding the Strategic Nuclear Arms and Arms Controls Debates* (1989). She is completing a book entitled *Constructing Deconstruction: Organizations, Knowledge, and the Effects of Nuclear Weapons* (forthcoming).

Joseph T. Glatthaar is Professor of History at the University of Houston. He received his Ph.D. in History from the University of Wisconsin-Madison and is the author of numerous articles and three books—*Forged in Battle* (1991), *Partners in Command* (1993), and *The March to the Sea and Beyond* (1995). He has also taught at the U.S. Army Command and General Staff College and the U.S. Army War College.

Ronald H. Spector is Professor of History and International Relations at George Washington University. He has been a senior Fulbright Lecturer in India and Israel. During 1995-96 he was Distinguished Visiting Professor of Strategy at the National War College. He is the author of five books, the most recent of which are *Eagle Against the Sun: The American War With Japan* (1985) and *After Tet: The Bloodiest Year in Vietnam* (1994). Professor Spector is a retired Lieutenant Colonel in the U.S. Marine Corps Reserve.

CONSULTING EDITOR

G. Kurt Piehler is Assistant Professor of History and Director of the Center for the study of War and Society at the University of Tennessee, Knoxville. He is author of *Remembering War the American Way* (1995) and co-editor of *Major Problems in American Military History* (1999). His articles have appeared in *History of Education Quarterly*, *Journal of the Rutgers University Libraries*, and the anthology *Commemorations: The Politics of National Identity* (1994). As director (1994-98) of the Rutgers Oral History Archives of World War II, he conducted over 200 interviews with veterans of this conflict. His televised lecture "The War That Transformed a Generation," which drew on the Oral History Archives, appeared on the History Channel in 1997. A Phi Beta Kappa graduate of Drew University (1982), he received his Ph.D. from Rutgers in 1990.

THE OXFORD COMPANION TO
AMERICAN MILITARY HISTORY

ABM TREATY (1972). See Salt Treaties (1972; 1979).

ABRAMS, CREIGHTON W. (1914-1974), one of the leading American generals of the twentieth century.

From a humble background, in Springfield, Massachusetts, he earned an appointment to West Point in 1932 and graduated in the famous class in 1936 that produced 60 wartime generals. "Abe" Abrams commanded an armored battalion in World War II, and, astride his tank "Thunderbolt," led the column that relieved American forces in Bastogne during the Battle of the * Bulge.

Considered the best tactical leader in the army, he was placed in charge of armored forces in Germany during the Berlin Crisis of 1961. He also earned the respect of President John F. * Kennedy for his sensitive handling of federal troops in racial disturbances in Alabama. Sent to Vietnam as deputy to General William C. * Westmoreland, he succeeded Westmoreland in 1968. Under President Richard M. *Nixon's strategy of "Vietnamization," Abrams sought to train and equip South Vietnamese troops to fight on their own.

In the last two years of his life, as Army Chief of Staff (1972-74), he was determined to rebuild the army in a way that would ensure its decisive use in future engagements. His vision is widely credited with creating the foundation for the 1991 Desert Storm victory over Iraq during the *Persian Gulf War. His insistence on joining superbly trained soldiers to multiple and synergistically devastating equipment led to the development of the Air Land Battle, the strategy that produced the most lopsided military victory in history in 1991.

ACADEMIES, SERVICE

Overview

- U.S. Military Academy
- U.S. Naval Academy
- U.S. Air Force Academy
- U.S. Coast Guard Academy

ACADEMIES, SERVICE: OVERVIEW

The primary function of the military service academies is to educate and train professional officers for the nation's standing armed forces.

With the development of modern standing armies and more complex military technology, the modern military academy originated in Western Europe in the eighteenth century, established by royal governments to train younger

sons of the nobility or veterans as line officers. Other academies trained middle-class officers for the technical services: *artillery, military *engineering, and *logistics. In the nineteenth century, preparation of naval officers shifted to shore-based naval academies, and in the twentieth century, air force academies were established.

Unlike those in some other nations, U.S. service academies are not narrowly vocational, but offer a broad education in the liberal arts and sciences, as well as engineering, management, and the military sciences, while emphasizing, of course, leadership, duty, responsibility, and loyalty. The requirements for admission are similar to those of other undergraduate schools, although the academies stress physical ability, character, and leadership potential.

Appointments to the service academies (except for the Coast Guard Academy) are made by members of Congress, a requirement designed to ensure a representative geographical distribution of the officer corps. In return for the government-provided college education, the newly commissioned graduates are required to serve five years of active duty.

From the early republic, some Americans partly viewed national military academies and the regular officer corps as potential aristocratic threats to democracy. Consequently, Congress has periodically adopted measures to ensure the representativeness of the academies and the officer corps. For example, blacks were admitted to West Point beginning in the 1870s (although only in token numbers at first); women were admitted to all the service academies beginning in the 1970s.

The officer corps in the United States is prepared at public and private military academies (the latter including such state-supported institutions as Virginia Military Institute and The Citadel in South Carolina) as well as at Officer Candidate School and in the campus-based Reserve Officer Training Corps (*ROTC). However, although only a minority of U.S. military officers graduate from service academies, their connections, training in military technology, and leadership qualities have promoted their careers, including selection for positions of high command.

ACADEMIES, SERVICE: U.S. MILITARY ACADEMY

The U.S. Military Academy (USMA) at West Point, New York, located fifty miles north of New York City on the west bank of the Hudson River, originated as a * Revolutionary War fortress. After the war it became a military stores depot. George *Washington, however, advocated a military academy to train professional officers, and

Thomas *Jefferson saw an academy as a way to create a “republican” officer corps. On 16 March 1802, Jefferson signed the act establishing a military academy at West Point, the first American school of engineering.

West Point’s existence remained tenuous until Sylvanus *Thayer arrived as superintendent in 1817. Thayer studied European military academies after the *War of 1812 and modeled USMA on the French Ecole Polytechnique. Under Thayer, the “Father of the Military Academy,” West Point became the nation’s premier school for civil engineering. Thayer established a four-year curriculum and annual examinations. The books he secured in Europe became America’s first technical library. His insistence upon strict discipline, integrity, small classes, and daily recitations placed the burden for learning upon cadets. Thayer’s “system,” copied throughout the United States, survives at West Point today.

West Point was criticized by many during its early years as being wasteful and aristocratic. Alden Partridge, an 1807 graduate and later superintendent, became an unrelenting critic of both USMA and Thayer, who had replaced him. Instead, Partridge advocated regional military schools like Norwich, which he founded after leaving the army. Other critics included Congressman Davy Crockett of Tennessee, who claimed that West Point taught undemocratic values and was too expensive. Fortunately, West Point enjoyed support from other influential Americans, including President Andrew *Jackson, who declared it to be “the best school in the world.”

The critics were mostly silenced by the performance of the academy’s graduates. When American expansion demanded engineers for internal improvements, West Point provided them. Most railroad lines built before the * Civil War involved academy graduates. Others mapped new territory, and supervised roadbuilding, canal construction, and harbor improvements. However, West Pointers mainly achieved fame in battle, beginning with the * Mexican War, where junior officers like Robert E. *Lee, Ulysses S. *Grant, and Thomas “Stonewall” *Jackson practiced what they had studied under Professor Dennis Hart Mahan, a disciple of the Swiss war philosopher, Antoine Henri *Jomini.

Despite its superintendents’ efforts, including those of Lee, the growing rift between North and South disrupted West Point life. When the Civil War began, most Southern cadets resigned and most Southern alumni sided with their native region. West Point graduates dominated in the Civil War, commanding both sides in fifty-five of the sixty major battles and one side or the other in the other five. West Pointer Jefferson * Davis served as president of the Confederacy; the contesting armies were commanded by the likes of Lee, “Stonewall” Jackson, Joseph E. *Johnston, Grant, William Tecumseh *Sherman, Philip H. *Sheridan, George B. *McClellan, and George Gordon *Meade.

West Point stagnated after the Civil War, as the army was reduced to frontier constabulary duties. But America’s colonial expansion after the *Spanish-American War and entry in World War I returned USMA graduates to prominence. Col. George W. *Goethals supervised the building of the Panama Canal. John J. *Pershing led the American Expeditionary Force in France and Chief of Staff Peyton C. *March mobilized and trained the army. March also revitalized the academy by appointing Douglas * MacArthur superintendent in 1919. MacArthur introduced curricular and other reforms, liberalizing USMA’s course of study for

the first time in a century and insisting upon every cadet being an athlete.

The Reserve Officer Training Corps and Officer Candidate Schools bolstered the army’s officer corps in World War II, but West Point continued to furnish many of the highest ranking officers for the army and air force. Four of the five men promoted to five-star General of the Army rank—MacArthur, Dwight D. *Eisenhower, “Hap” * Arnold, and Omar *Bradley—were West Pointers. Over 85 percent of living West Point graduates served in the armed forces during World War II, 10 percent as general officers, including George S. * Patton, Joseph * Stilwell, and Mark *Clark.

The advent of *nuclear weapons and the *Cold War limited warfare in scope and resources. Difficult conflicts tested West Pointers MacArthur, Matthew B. *Ridgway, and Maxwell * Taylor in Korea, and William C. * Westmoreland and Creighton *Abrams in Vietnam. These experiences also changed the academy’s curriculum, broadening cadets’ education in humanities. Reform superintendents, like Taylor and Garrison Davidson, pointed to military governors such as Lucius *Clay in Germany and Douglas MacArthur in Japan to justify requiring more history, languages, economics, political science, and international relations. A 1960s building program supported doubling the Corps of Cadets, to over 4,000.

Although Henry O. Flipper, the first black graduate of West Point, graduated in 1877, black cadets were not treated well generally and only three African Americans graduated from West Point before 1941. These attitudes began to change following the integration of the armed forces after World War II, and minority recruitment increased significantly in the 1960s. After much controversy, USMA also admitted its first women cadets in 1976. Since the end of the Cold War, graduates have participated in expeditionary warfare, as in the *Persian Gulf War, where Gen. H. Norman *Schwarzkopf commanded Coalition Forces against Iraq.

The U.S. Military Academy’s mission remains essentially as in 1802: to provide leaders of character, imbued with the academy’s motto, “Duty, Honor, Country,” to serve the common defense. In 1994, the academy produced its 50,000th graduate.

ACADEMIES, SERVICE: U.S. NAVAL ACADEMY

The U.S. Naval Academy is a four-year undergraduate institution whose mission is to educate and train officers for the U.S. *Navy and U.S. * Marine Corps. The academy was founded in 1845 by Secretary of the Navy George * Bancroft. He overcame years of congressional opposition to a naval school by transferring Fort Severn, an old army post on the banks of the Severn River in Annapolis, Maryland, to the navy for a naval school. Earlier, American naval

officers were trained on shipboard by schoolmasters or chaplains, but the inefficiency of this system led to appeals for a naval school ashore. The Naval School opened 10 October 1845 with fifty-six midshipmen and seven faculty members under the direction of the first superintendent, Franklin Buchanan. Five years later, with a new four-year curriculum, summer cruises, and major improvements to the physical plant, the school became known as the U.S. Naval Academy.

Over its 152-year history, the U.S. Naval Academy has expanded from the original 10 acres and antiquated buildings of Fort Severn to a modern, 338-acre campus designed by Ernest Flagg in 1894. His French Renaissance buildings, including Bancroft Hall and the Naval Academy Chapel, were completed early in the century, but complemented in the 1960s by the addition of three classroom buildings, the Nimitz Library, Halsey Auditorium, and recently a Brigade Activity Center.

The Naval Academy program is supervised by a board of visitors and administered by an academic board composed of the superintendent, commandant, academic dean, and division directors. Once called "naval cadets," since 1902 students have been referred to as "midshipmen," a name originating in the days of sail. A need for more junior officers just prior to World War I prompted expansion of the student body to a regiment of 1,240 men. Today, the Brigade of Midshipmen numbers about 4,600, including women, who were first admitted in 1976 and now comprise about 10 percent of each class. Three African Americans entered the academy in the 1870s, but the first to graduate was Wesley A. Brown, Class of 1949. The number of minorities was increased from 9 midshipmen in 1965 to 178 by 1974; today, minority midshipmen compose about a fifth of each entering class.

Applicants to the academy must qualify scholastically, physically, and medically, and obtain an executive nomination. Once admitted, midshipmen are educated at government expense in a four-year program taught by a civilian-military faculty. In the 1960s, Superintendents Charles C. Kirkpatrick and James F. Calvert expanded the core curriculum with the Trident Scholar independent study program, elective majors, and more professional courses. Midshipmen are under military discipline and are bound by the honor concept, which states: "A Midshipman may not lie, cheat, or steal."

Athletics, first encouraged as intramurals by Adm. David Dixon *Porter, superintendent after the * Civil War, remain important to the academy program, and all midshipmen are required to participate in year-round sports. A navy football team was organized in 1882 and played the first Army-Navy football game at West Point on 29 November 1890. Blue and gold colors were chosen in 1893 and a navy team mascot, Bill the Goat, was first adopted by Commandant of Cadets Cmdr. Colby M. Chester (Class of 1864) in 1890.

U.S. Naval Academy graduates are awarded a bachelor of science degree, first given in 1933, and commissioned as ensigns in the U.S. Navy or as second lieutenants in the U.S. Marine Corps. Because their education is paid for by the government, they are required to serve five years on active duty following graduation. Although the academy provides only a fraction of the navy's officers, many senior naval officers have been or are Annapolis graduates. Distinguished graduates include Admirals George * Dewey

and William *Sampson; Fleet Admirals Ernest J. *King, Chester *Nimitz, and William F. * Halsey; Nobel Prize winner Albert Michelson; historian Alfred T. *Mahan; inventor Bradley Fiske; Adm. Arleigh * Burke; and President Jimmy *Carter.

ACADEMIES, SERVICE: U.S. AIR FORCE ACADEMY

In 1947, when the *Air Force was established as a separate service, the question of how to educate potential career Air Force officers was one which followed immediately. It seemed to Air Force leaders that since there was a clear distinction between the challenges of an Army career and an Air Force career, it was also important to create a distinct education process for an Air Force officer. In 1948 the Stearns-Eisenhower Board, studying military education, recommended the creation of a separate Air Force Academy, but not until the * Korean War was over was legislation for an Academy presented in Congress. On April 1, 1954, President Dwight D. * Eisenhower, who had been an early supporter of the idea, signed the bill that created the academy.

Colorado Springs, Colorado, was chosen as the academy's home. Availability of land and water, a supportive community, an aesthetic environment, weather, flying conditions and real estate value were important factors considered. While the new institution was being constructed, the Class of 1959 began their Academy education at Lowry Air Force Base in Denver, moving to the permanent site for their final year.

Much planning went into the curriculum of the institution, and many of the principles behind a West Point education were adapted at the Air Force Academy. A military faculty was deemed important, as well as a core curriculum providing a strong concentration in the sciences. An introduction to flying was considered crucial. Development of character, intellectual and physical development, and professional military development form the basis of an Air Force Academy education; the second lieutenant graduated by the Academy is expected to meet demanding standards in each of these areas.

In 1965 Congressional action increased the size of the cadet wing to 4400, almost doubling it. In 1976 the first women entered the cadet wing; their numbers have steadily increased in the succeeding decades.

ACADEMIES, SERVICE: U.S. COAST GUARD ACADEMY

The U.S. Coast Guard Academy located in New London, Connecticut, was founded in 1876. It educates young men and women for a career as Coast Guard officers. Admission is based upon academic competition without congressional appointment. In the 1995-96 school year 862 cadets were enrolled. The student body included 24 percent women, 21 percent minorities.

The curriculum is designed to meet the needs of the service. In addition to teaching professional skills, providing practical seagoing experience, and ensuring that cadets learn integrity, maritime law, and the importance of public service, the curriculum provides humanistic, scientific, and technical knowledge. An emphasis on interactive learning assures that tomorrow's graduates will have the analytical skills needed to cope with a changing international maritime world.

The faculty consists of a mix of permanently assigned commissioned officers, rotating officers, and civilians. They provide a stable base of academic excellence and continuous interaction with the operational Coast Guard.

Cadets concentrate in one of eight majors (civil, electrical, mechanical, or marine engineering; government; management; operations research; or marine science) and graduate with a bachelor of science degree and a commission as an ensign in the U.S. Coast Guard.

ACHESON, DEAN (1893-1971), lawyer, statesman, secretary of state. After holding lower State Department posts from 1941 to 1947, Acheson became secretary of state under President Harry S. Truman in January 1949, serving until January 1953. As a diplomatic official, Acheson held strong views about how, when, and why to use armed force in international affairs.

Acheson was a hawkish interventionist before U.S. entry into World War II. After the war, in 1945-46, he advocated an agreement with the USSR on control of nuclear arms (embodied in the Acheson-Lilienthal Plan). In 1949, when the Soviets first exploded an atomic bomb, Acheson feared it would neutralize the West's nuclear weapons. In response, he consistently advocated building strong conventional U.S. and NATO military forces. Acheson thought an East-West war unlikely, but should it occur, he wanted a military that could stop aggression before the Soviets could conquer Western Europe. With some ambivalence, he always favored keeping a powerful American nuclear arsenal, and in 1950 as an adviser he recommended to President Truman that the United States build the hydrogen bomb. He worked to keep the Korean War from becoming a general war, but used the sense of resulting urgency to push for greater NATO forces, including the rearmament of West Germany.

Advising Presidents Kennedy, Johnson, and Nixon after 1953, he consistently took hard-line defense positions, especially in the Berlin Crisis of 1961, the Cuban Missile Crisis of 1962, and the early stages of the Vietnam War. However, by 1968 he became an influential advocate of ending the war in Vietnam.

Acheson's key strategic concepts focused on the efficacy of various forms of power, the importance of "strategic reach" to project the first line of U.S. defense far from American shores, and developing "positions of strength" before engaging in negotiations with potential adversaries.

ADAMS, JOHN (1735-1826), member of the Continental Congress, diplomat, vice president, and second president of the United States. John Adams never soldiered, but throughout his public life he repeatedly faced issues of war and peace.

In June 1775, at the beginning of the Revolutionary War, Adams nominated George Washington to command the Continental army, and in October and November 1775, as a member of the Continental Congress's Naval Committee, he was instrumental in creating the U.S. Navy and Marines. From June 1776 until November 1777, Adams chaired the Board of War and Ordnance, Congress's committee to oversee the Continental army and the conduct of the war. As a U.S. diplomat in Europe after 1778, Adams repeatedly implored France to make a greater military commitment. He emphasized the need for concerted action by Washington's army and the French Navy, a formula that eventually led to victory at the Battle of Yorktown.

Later, faced by the Undeclared Naval War with France (1798-1800) during his presidency, Adams sought to avoid hostilities, fearful that the fragile new nation might not endure another war. He took steps to strengthen the Union's defenses, but also dispatched to Paris the envoys who ultimately negotiated the accord that prevented war. His action split the Federalist Party and contributed to his defeat in the 1800 election. Reflecting on his public career in 1815, Adams said that his greatest achievement had been the preservation of peace during his presidency.

ADAMS-ONÍS TREATY (1819) This agreement, also called the Transcontinental Treaty, was made during the administration of President James Monroe and settled long-standing disputes between the United States and Spain. Madrid ceded East Florida to the Americans, while Washington surrendered its claims to Texas and agreed to assume payment of American financial claims against the Spanish up to \$5 million. The treaty established definitive western boundaries for the Louisiana Purchase, following the Sabine, Red, and Arkansas Rivers to the 42nd parallel, and running along that line to the Pacific. The United States also secured Spanish claims to Oregon.

Historians have variously interpreted the treaty's significance. Samuel F. Bemis stressed the establishment of the first American claims to territory bordering the Pacific. More recently, William E. Weeks emphasized that the treaty consummated the first phase of the United States's aggressive, nineteenth-century territorial expansion. Strategically speaking, the Florida cession closed a vulnerable point in American coastal defenses. European powers welcomed the treaty because it ended the possibility of war between the United States and Spain. Some westerners protested the loss of Texas, but otherwise, there was little domestic opposition. The agreement was named for its principal negotiators—Secretary of State John Quincy Adams and Spain's minister to the United States, Don Luis de Onís.

ADDAMS, JANE (1860-1935), American social reformer, settlement house founder, pacifist, and writer. Addams was born 6 September 1860 in Cedarville, Illinois. Heir to her fathers political sensibilities, Jane Addams's early heroes were Abraham *Lincoln and Giuseppe Mazzini. A member of the first generation of college women, she found a way to put her social gospel and piety directly to work with the founding (with Ellen Gates Starr) of Hull House, a settlement house in Chicago's immigrant ghetto. In 1889, Addams claimed that democratic political governance was, in fact, a form of civic housekeeping: she became a leading social reformer of the era and a founder of modern social work.

Jane Addams's world was turned upside down with the outbreak of World War I. Her defense of radicals and anarchists, her brave and often lonely devotion to *pacifism and opposition to "the idea of war" as well as its terrible reality, placed her outside the American mainstream and brought down derision and abuse. In 1915, Addams, Emily Greene *Balch, and others helped to create the Woman's Peace Party, which called for "continuous mediation." This was the forerunner to the *Women's International League for Peace and Freedom, founded in 1919, of which Jane Addams was a founding mother and president from its inception in 1915 to her death. An advocate of women's suffrage, Addams in her articles, speeches, and books traced the powerful role women must play in promoting peace as an imperative to preserve human life. Her understanding of feminism set it in "unalterable" opposition to militarism.

Unfairly and inaccurately called a traitor and a Bolshevik, Addams never reneged on her commitments to civil liberties or to pacifism. Her joint recognition (with Nicholas Murray Butler) for the Nobel Peace Prize in 1931 and her embodiment of the notion of service helped restore her stature as one of America's foremost humanitarians.

AEGIS. The AEGIS Combat System is a sophisticated shipborne target detection and tracking system developed by the U.S. *Navy and currently installed in twenty-eight *Ticonderoga*-class guided missile cruisers and eighteen *Arleigh Burke*-class fleet escorts.

The U.S. Navy developed AEGIS in the 1970s in response to the Soviet threat of saturation missile attacks against American carrier forces. Conventional rotating radars cannot rapidly track and process multiple targets, but AEGIS planar arrays are able to track an unlimited number of targets and relay the data instantaneously to a main computer in the ship's combat information center. The system then rapidly prioritizes the target data received from its SPY-1 phased array radars and assigns targets to the ship's weapons systems. Superior to more conventional radar systems and highly resistant to electronic counter-

measures, AEGIS has also enhanced the target collection and processing capability of *Ticonderoga*-class cruisers serving as flagships for battle groups.

Budget limitations prompted the navy, which originally intended AEGIS for nuclear-powered escorts, to substitute the less expensive, but proven, oil-fired *Spruance*-class design for its new guided missile cruisers. In 1988, the first of an AEGIS-equipped class of fleet escorts, USS *Arleigh Burke* (DDG 51), was launched, and to date twenty-eight have been completed.

To support joint and coalition operations against adversaries in littoral areas, the U.S. Navy has offered the AEGIS system to allied navies. Japan already has a significant AEGIS capability and Spain plans to install the lighter, more compact SPY-IF arrays in its new F-100 class frigates.

AFRICAN AMERICANS IN THE MILITARY. Americans of African descent have participated in all the wars of the United States, serving their country and themselves, for military service has offered African Americans a means of economic, social, and political as well as military advancement. Black participation thus must be understood in the context of the importance of racial issues that developed as early as the colonial era, issues that have shaped the unique expansion of African Americans in the American military.

During the colonial period, the largest numbers of free blacks were in the northern colonies. These colonies were much more willing to include Americans of African descent in their militia than were the southern colonies, which held the majority of slaves, although some colonies used blacks in labor units for militia expeditions. But in cases of dire need, even colonies like South Carolina, where slaves greatly outnumbered whites, would arm slaves to fight in exchange for their freedom, as in the victorious campaign against the Yamasee Indians in 1715.

Following the 1739 slave revolt in Stono, South Carolina, however, most of the colonies excluded all blacks from military service. Laws for black exclusion were repealed in the North for freed blacks and often overlooked in the South, where despite the official policy of exclusion, free Americans of African descent were still armed during conflicts with the Indians and the French, and even slaves served as scouts, wagoners, laborers, and servants.

In the American Revolution, African Americans served with the New England "Minute Men" at Lexington and Concord and helped fire the "shot heard 'round the world." Although blacks had served in the colonial wars before the revolution and still served in northern militias, when the

* Revolutionary War began in 1775, they were not at first welcomed into the *Continental army because of the influence of the slave states in the new national government. It was not until after November 1775, when the British started to recruit blacks into their forces, that African Americans were officially allowed to join the Continental army. By 1776, faced with increasing shortages of volunteers, Gen.

George Washington disagreed with the Continental Congress and declared that he could depart from the resolution that barred participation by blacks. Because Congress did not challenge Washington's action, more than 5,000 Americans of African descent served in integrated units in the Continental forces. Most of the southern states officially refused to use blacks in the military except as laborers, but in practice, some Southern black slaves were sent as substitutes. African Americans participated in many battles, including those of Bunker Hill, New York, Trenton and Princeton, Savannah, Monmouth, and Yorktown.

Following the Revolutionary War, the new United States virtually eliminated its army and navy. The U.S. Army was soon established and accepted blacks; the U.S. Navy was created in 1798, accepting black sailors as it had during the revolution and continuing to do so throughout the nineteenth century. The smaller U.S. Marine Corps excluded blacks from its inception in 1798 until 1942. Black soldiers served in the War of 1812, but in 1820, Secretary of War John C. Calhoun of South Carolina, responding to Southern slaveowners, banned any further enlistment by African Americans. As black veterans left, the U.S. Army became exclusively white until the Civil War.

The Civil War, a conflict over slavery as well as the nature of the Union, also raised the issue of black military service. The Confederacy, which used the black slaves as the basic agricultural labor force and which feared slave rebellion, refused to recruit blacks until 1865, when it was too late. In the North, the U.S. War Department in 1861 continued its policy of rejecting black enlistment, but in 1862 as slaves flocked to the Northern armies invading the South, some abolitionist Union generals began training them to fight. Official policy did not change until after the Emancipation Proclamation took effect, 1 January 1863; then, when volunteering had slackened in the North and it had become a war to free the slaves, the Northern states and the federal government began recruiting the eager freedmen into black regiments with black noncommissioned officers (NCOs) and mostly white commissioned officers.

Eventually, 186,000 Americans of African descent fought for their freedom in the Union army (and another 30,000 in the Union navy), winning fourteen Congressional Medals of Honor in the process. Units of the U.S. Colored Troops fought in a number of major battles, including the 54th Massachusetts Regiment's assault during the siege of Fort Wagner at Charleston and the attack of the black Fourth Division of the Ninth Corps at the Battle of the Crater in the siege of Petersburg, Virginia. Confederates often refused to take black prisoners, and they killed a number of them at the Fort Pillow massacre in Tennessee. Although the black soldiers were paid less than the whites, their wartime service and heroism were cited as one reason for giving black men the vote in Reconstruction.

After the Civil War, there were black militia units in the southern states until the end of Reconstruction, and in some northern cities well into the twentieth century. Congress added four black regiments to the regular army (the 9th and 10th Cavalry and the 24th and 25th Infantry). These "Buffalo" Soldiers, as they were called by the Indians, served mainly in the West, but they also saw combat in the Spanish-American War and Philippine insurrection, as well as in the Mexican Punitive Expedition of 1916. Most of their officers were white, like John J. Pershing.

Only three African Americans graduated from West Point, 1865-98; one of them, Charles Young (Class of 1884), remained the army's sole black officer until he was joined by Benjamin O. Davis, Sr.

With the increased segregation, disfranchisement, and lynching of black Americans at the turn of the century, race became an issue in the U.S. mobilization for World War I. NAACP leader W. E. B. Du Bois urged black men to join the military in order to regain the rights of citizenship and he obtained commissions for a few black junior officers (Col. Charles Young was forced into retirement). The southern-dominated Wilson administration supported the army's insistence on continuation of racially segregated units, and, after a race riot in Houston in August 1917, limited these to eight black combat regiments. Conscription and voluntarism brought 380,000 Americans of African descent into the wartime army, but 89 percent were assigned to labor units and only 11 percent to the two combat divisions. Although the 93rd Division, which included the black National Guard units like the 369th New York (the "Harlem Hell Fighters"), distinguished itself fighting alongside French troops, after the armistice, the War Department concluded that in future wars, black soldiers should mainly serve as laborers. It cut back the one black regular regiment (the 25th Infantry) and excluded blacks from new specialties like aviation. By 1940, there were only 5,000 black soldiers (2 percent of the force) and five black officers in the army. The navy had been accepting fewer blacks since its changeover from sail to steam power in the later nineteenth century (there were only 441 black sailors in 1934); the Marines continued their all-white policy.

At the outbreak of World War II, America reverted to its practice of turning to African Americans when it needed more troops. In 1940, President Franklin D. Roosevelt appointed Col. Benjamin O. Davis, Sr., to be the army's first black brigadier general, and opened the Army Air Corps to black pilots. These "Black Eagles," including Davis's son, Benjamin O. Davis, Jr., who trained at Tuskegee, Alabama, served in all-black units. In 1941, black labor leader A. Philip Randolph threatened a protest march on Washington for equal opportunity in the defense workforce and the military. Civil rights activist Bayard Rustin and Black Muslim leader Elijah Muhammad dramatized such concerns by going to prison.

Most of the 900,000 blacks who served in the armed forces in World War II were in segregated units, chiefly in the army (and including black women, who served in segregated units of the WACs and the Army and Navy Nurse Corps). However, wartime demands for increased numbers of service people as well as the ideology of a war against Nazi racism contributed to some integration. The Coast Guard began racial integration on shipboard, and the navy followed on some fleet auxiliary ships. Army units were segregated for most of the war, but beginning with the Battle of the Bulge, when the army suffered shortages of white infantrymen, some 4,500 men from black service units volunteered and formed black platoons in formerly all-white combat companies. Although the Marine Corps accepted a few black recruits, it largely maintained its racial segregation. Black service people, like other veterans, benefited after the war from the G.I. Bill.

In the postwar era, the armed forces initially sought to avoid integration, delaying even in the face of President Harry S. Truman's 1948 election-year order (Executive

Order 9981) for an end to segregation in the military—the armed forces were directed to provide equal treatment and opportunity regardless of race. The U.S. Air Force, however, had moved toward integration in 1949 after achieving independent status in 1947. Beginning in 1951, the reverses of the *Korean War led to the end of all-black units in the army and Marines, and moved all the services toward racial integration in the enlisted ranks for greater efficiency. Black and white service people now fought side by side, dined in the same mess hall, and slept in the same barracks. Nevertheless, the officer corps remained white, with black officers representing only 3 percent of the army's officers and 1 percent of the air force, navy, and Marine officer corps.

The * Vietnam War saw the highest proportion of blacks ever to serve in an American war. During the height of the U.S. involvement, 1965-69, blacks, who formed 11 percent of the American population, made up 12.6 percent of the soldiers in Vietnam. The majority of these were in the infantry, and although authorities differ on the figures, the percentage of black combat fatalities in that period was a staggering 14.9 percent, a proportion that subsequently declined. Volunteers and draftees included many frustrated blacks whose impatience with the war and the delays in racial progress in America led to race riots on a number of ships and military bases, beginning in 1968, and the services' response in creating interracial councils and racial sensitivity training.

The Nixon administration ended the Vietnam War and the draft in 1973, and the * All-Volunteer Force (AVF) soon included a disproportionate number of African Americans. By 1983, blacks represented 33 percent of the army, 22 percent of the Marine Corps, 14 percent of the air force, and 12 percent of the navy. Black senior NCOs in the army increased from 14 percent in 1970 to 26 percent in 1980, and 31 percent in 1990. Blacks also increased in the officer corps; by 1983, the army had almost 10 percent, the air force 5 percent, the Marine Corps 4 percent, and the navy 3 percent. Black women were an important component of the influx of women into the AVF, beginning in the 1970s; by 1983, they comprised 17 percent of the army's officers and 20 percent of its enlisted women. For the air force, the figures were 11 and 20; the Marine Corps, 5 and 23; and the navy, 5 and 18 percent.

In 1977, Clifford Alexander was appointed the first black secretary of the army, and in 1989, Army Gen. Colin *Powell was appointed the first black chairman of the

* Joint Chiefs of Staff, the head of the uniformed services. Powell oversaw the * Persian Gulf War of 1991, in which 24 percent of the 500,000 U.S. service people deployed to the Middle East (30 percent of the soldiers) were Americans of African descent. Significant percentages of African American troops also participated in peacekeeping operations in Somalia, Haiti, and Bosnia and Kosovo in the 1990s.

The participation of Americans of African descent in the U.S. military has a long and distinguished history. But although African Americans have participated in all American wars, they have sometimes faced almost as bitter a hostility from their fellow Americans as from the enemy. Nevertheless, particularly since the 1970s, the U.S. military has made a serious effort at racial integration, and while much remains to be done, the military has achieved a degree of success in this area that surpasses most civilian institutions.

AGGRESSION AND VIOLENCE. To understand the nature of aggression and violence on the battlefield, it must first be recognized that most participants in close combat are literally "frightened out of their wits." Once the bullets start flying, most combatants stop thinking with the forebrain (that portion of the brain that makes us human) and start thinking with the midbrain (the primitive portion of our brain, which is indistinguishable from that of an animal).

In conflict situations, this primitive, midbrain processing can be observed in the existence of a powerful resistance to killing one's own kind. Animals with antlers and horns slam together in a relatively harmless head-to-head fashion, and piranha fish fight their own kind with flicks of the tail, but against any other species these creatures unleash their horns and teeth without restraint. This is an essential survival mechanism that prevents a species from destroying itself during territorial and mating rituals.

One major modern revelation in the field of military psychology is the observation that such resistance to killing one's own species is also a key factor in human combat. Brig. Gen. S. L. A. *Marshall first observed this during his work as an official U.S. Army historian in the Pacific and European theaters of operations in World War II. Based on his postcombat interviews, Marshall concluded in his book *Men Against Fire* (1946, 1978) that only 15 to 20 percent of the individual riflemen in World War II fired their own weapons at an exposed enemy soldier. Key weapons, such as * flamethrowers, were usually fired. Crew-served weapons, such as "machine guns, almost always were fired. And action would increase greatly if a nearby leader demanded that the soldier fire. But when left on their own, the great majority of individual combatants appear to have been unable or unwilling to kill.

Marshall's findings were and have remained controversial. Faced with scholarly concern about a researcher's methodology and conclusions, the scientific method involves replicating the research. In Marshall's case, every available parallel, scholarly study validates his basic findings. Ardant du Picq's surveys of French officers in the

1860s and his observations about ancient battles (*Battle Studies*, 1946), John Keegan and Richard Holmes's numerous accounts of ineffectual firing throughout history (*Soldiers*, 1985), Holmes's assessment of Argentine firing rates in the Falklands War (*Acts of War*, 1985), Paddy Griffith's data on the extraordinarily low firing rate among Napoleonic and American * Civil War regiments (*Battle Tactics of the American Civil War*, 1989), the British army's laser reenactments of historical battles, the FBI's studies of nonfiring rates among law enforcement officers in the 1950s and 1960s, and countless other individual and anecdotal observations, all confirm Marshall's fundamental conclusion that human beings are not, by nature, killers. Indeed, from a psychological perspective, the history of warfare can be viewed as a series of successively more effective tactical and mechanical mechanisms to enable or force combatants to overcome their resistance to killing other human beings, even when defined as the enemy.

By 1946, the U.S. Army had accepted Marshall's conclusions, and the Human Resources Research Office of the U.S. Army subsequently pioneered a revolution in combat training, which eventually replaced firing at targets with deeply ingrained "conditioning," using realistic, man-shaped pop-up targets that fall when hit. Psychologists assert that this kind of powerful "operant conditioning" is the only technique that will reliably influence the primitive, midbrain processing of a frightened human being. Fire drills condition schoolchildren to respond properly even when terrified during a fire. Conditioning in flight simulators enables pilots to respond reflexively to emergency situations even when frightened. And similar application and perfection of basic conditioning techniques increased the rate of fire to approximately 55 percent in Korea and around 95 percent in Vietnam.

Equally high rates of fire resulting from modern conditioning techniques can be seen in Holmes's observation of British firing rates in the Falklands, and FBI data on law enforcement firing rates since the nationwide introduction of modern conditioning techniques in the late 1960s.

The extraordinarily high firing rate resulting from these processes was a key factor in the American ability to claim that the United States never lost a major engagement in Vietnam. But conditioning that overrides such a powerful, innate resistance has enormous potential for psychological backlash. Every warrior society has a "purification ritual" to help the returning warrior deal with his "blood guilt" and to reassure him that what he did in combat was "good." In primitive tribes, this generally involves ritual bathing, ritual separation (which serves as a cooling-off and "group therapy" session), and a ceremony embracing the veteran back into the tribe. Modern Western rituals traditionally involve long separation while marching or sailing home, parades, monuments, and the unconditional acceptance of society and family.

In the * Vietnam War, this purification ritual was turned on its head. The returning American veteran was attacked and condemned in an unprecedented manner. The traditional horrors of combat were magnified by modern conditioning techniques, and this combined with societal condemnation to create a circumstance that resulted in .5 to 1.5 million cases of Post-Traumatic Stress Disorder (PTSD) in Vietnam veterans. The mass incidence of psychiatric disorders among Vietnam veterans resulted in the "discov-

ery" of PTSD, a condition that we now know traditionally occurred as a result of warfare, but never in such quantity.

PTSD seldom results in violent criminal acts, and upon returning to society, the recipient of modern military conditioning is statistically no more likely to engage in violent crime than a nonveteran of the same age. The key safeguard in this process appears to be the deeply ingrained discipline that the combat soldier internalizes with his military training. However, with the advent of interactive "point-and-shoot" arcade and video games, there is significant concern that society is aping military conditioning, but without the vital safeguard of discipline. There is strong evidence to indicate that the indiscriminate civilian application of combat conditioning techniques as entertainment may be a factor in worldwide, skyrocketing violent crime rates, including a sevenfold increase in per capita aggravated assaults in America since 1956. Thus, the latest chapter in American military history may be occurring in the city streets.

AGRICULTURE AND WAR. War and agriculture have often been intertwined during the nation's history. Although this usually involved arable land and farm production, there were times when agricultural trade was at issue.

The American Revolution, for example, stemmed in part from British mercantilist regulations, including the requirements that the colonies ship certain commodities, such as tobacco, only to England, and that the English have a monopoly of the American market on certain foodstuffs such as tea. During the * Revolutionary War, agriculture helped to feed the American forces, and in the Continental Congress it saw U.S. commodity exports as a major lever in building alliances with other nations, creating the model Commercial Treaty of 1777 (Jefferson later sought to use the curtailment of American agriculture exports, the embargo, to force Britain and France to change their maritime policies toward the United States). Land was the major resource of the new government, which often offered it as enlistment bounty to soldiers during the revolution. The peace treaty of 1783 provided the new United States with land as far west as the Mississippi River.

Westward expansion of agriculture intensified the pressures on American Indian nations and fueled intermittent wars with them. The westward expansion of American agriculture was founded on military conquest and the displacement of Native Americans. The *Mexican War of 1846-48 also involved westward expansion, this time at the expense of Mexicans as well as Indians.

The * Civil War was partly caused by the expansion into those new lands and the debate over whether the agricultural workforce there would be slave or free. Secessionists dedicated to slavery believed that demand for southern

cotton would force Great Britain and other countries to support the Confederacy. Southern agriculture continued during much of the war, maintained by slave labor; the main change was diversification from large cotton crops to corn and other foodstuffs as the South was cut off from Northern wheat supplies. In the North, many rural young men went into the * Union army, creating a great shortage on the farms when foodstuffs were bringing high prices because of inflation and increased demands at home and abroad. Immigration and use of farm machines was expanded—to horse-powered cultivators, mowers, and reapers—to resolve the dilemma.

In 1862, the Republican Congress enacted a number of the party's programs for agriculture. Among these were the Homestead Act, promoting western agricultural expansion by granting family-sized farms free to settlers; the Morrill Act, offering states public lands to sell for endowing land-grant agricultural colleges; and the establishment of the U.S. Department of Agriculture (USDA). Congress also adopted high protective tariffs for industry, which meant rural consumers would pay higher prices for manufactured goods.

American agriculture boomed in World War I when the United States in essence fed the Allied nations as well as its own wartime armed forces. In 1914-18, American wheat production rose to an average of about 870 million bushels and cotton exports also increased, although corn production remained relatively stable. Farmers and much farm labor received draft deferments; encouraged by soaring commodity prices, they increased their production through purchase of gasoline-powered machinery and the cultivation of additional land. In 1918, grain production reached into the most arid section of the Great Plains. The wholesale price index of farm products more than doubled, from 100 to 208 between 1914 and 1918. When the wartime foreign and military demands declined after the war, export markets collapsed, and American agriculture, already heavily in debt from the wartime expansion, plunged into a severe economic depression in 1921, which lasted for more than a decade.

During the 1930s, the Roosevelt administration responded to the depression in agriculture with commodity support programs that provided benefits to the more affluent commercial farmers, especially midwestern corn growers and southern cotton producers. At the same time, the New Deal in agriculture included a land-use planning effort in which USDA officials worked with less affluent farmers at the local level in pursuit of a reformist program. New Deal reform initiatives for agriculture, as in many other areas, were overwhelmed by the World War II economic mobilization. President Franklin D. *Roosevelt's wartime administration relied on the commodity support programs—not the land-use planning infrastructure—to guide wartime production. By guaranteeing high prices, the wartime program generated high output of crops that were not needed, overproduction of important crops, and a sharp rise in food prices. In pushing land-use planning to the margins of the mobilization, these wartime decisions determined the outlines of the agricultural policies that would dominate the postwar period. The postwar U.S. Department of Agriculture distributed commodity support payments according to the total output and landholdings of farmers; marginal producers received less and were

thereby encouraged (in many cases forced) to leave farming. Whereas the mobilization for the Civil War gave birth to the Department of Agriculture, the mobilization for World War II ensured the demise of reformist planning efforts that had characterized the Department of Agriculture during the New Deal of the 1930s.

During the war, farmers received draft deferments as well as loans for increasing production through mechanization, land acquisition, and increased use of fertilizers. The index of gross farm production (with 1939 at 100) rose from 108 in 1940 to 126 in 1946. Cash receipts from farm products doubled, from \$9 billion in 1940 to \$22 billion in 1945.

The federal government sought to limit domestic civilian demand by rationing certain products, including sugar, coffee, meat, fats and cooking oils, butter, cheese, and processed foods. Wheat and cotton both tripled in price; wheat from 90 cents a bushel in 1940 to \$2.88 in 1948; cotton from 9 cents per pound in 1940 to 32 cents in 1947. Beef cattle prices also increased dramatically. During World War II, the American Farm Bureau Federation, created in 1920 among affluent, commercial farmers, worked actively to protect those farmers' interests under price controls and in directing programs necessary in the war effort.

In the post-World War II period, the changing technologies and logistics of war sharply reduced the strategic importance of agriculture. During the 1940s and 1950s, the national security doctrine asserted the need for the United States to maintain a preponderance of power—power that was not based solely upon strategic *nuclear weapons. National security required the United States to maintain a lead in industrial production and access to raw materials. Even with this expansive definition of national security, agricultural goods were at the margins of U.S. military planning.

Yet while diminishing in its direct relevance to the military, agriculture played an important role in the *Cold War. The damage to European agriculture in World War II and extensive aid given through the *Marshall Plan to deter the expansion of communism led Washington to fund the marketing of American agricultural surpluses in Europe in the late 1940s and early 1950s. With American agriculture continuing to produce more than was consumed by the domestic market, the Agricultural Trade Development Act of 1954 authorized the secretary of agriculture to accept up to \$700 million in foreign currency as repayment for commodities shipped overseas to nations deemed friendly to the United States.

In the 1960s, the Food for Peace program administered by George McGovern was one of the Kennedy administration's efforts to counter communism in Third World countries while assisting American farmers in finding foreign markets. The 1960s and 1970s saw a shift away from price supports and instead an expanded role for American farmers and agribusiness in producing foodstuffs under government subsidies for export to Third World nations.

In the hegemonic role the United States played during the Cold War, a major strategy was to liberalize world trade in manufactured goods, especially through the General Agreement on Tariffs and Trade (GATT) system. But under pressure from the farm interests, Washington in the 1950s obtained an exclusion of agricultural products from GATT, allowing the U.S. government to use import quotas

to protect commercial farmers. Not until the late 1980s, when the more heavily subsidized farmers of Japan and the European Community would bear more of the cost of trade liberalization, did Washington include agriculture within the GATT.

Agricultural goods were necessary to sustain the mass industrial armies of the twentieth century, but these supplies represented a shrinking portion of all munitions. In the Franco-Prussian War of 1870, for example, foodstuffs constituted the largest portion of military supplies (for soldiers and for horses), while ammunition constituted only 1 percent of the total. During World War II, food and clothing comprised approximately 10 percent of military supplies, while petroleum and ammunition constituted the largest share of military supplies.

Even during the Korean and Vietnam Wars, procuring agricultural goods to feed and clothe the armed forces did not require specialized agencies and governmental controls. In the 1990s, as the nation entered the post-Cold War era, the separation of the military and agriculture seemed likely to widen further. Military planners project a significantly smaller force structure and procuring the necessary agricultural goods is increasingly taken for granted. If this projected diminution of agriculture's strategic importance does occur, it should not obscure the intimate ties between the U.S. military and agriculture in the foundation and early development of the nation.

AGUINALDO, EMILIO (1869-1964), revolutionary and statesman of the Philippines. During the Spanish-American War, Emilio Aguinaldo y Famy consolidated a strong nationalist movement against Spain only to face a stronger opponent of Filipino independence, the U.S. government. Though initially aided by U.S. Navy and consular agents, Aguinaldo's provisional government became the primary obstacle to the annexation policy of President William McKinley after Spain capitulated in August 1898. Six months later, U.S. troops drove Filipino militias from Manila and pursued them into the countryside. With his political council divided between accommodationists and die-hard nationalists, and his regiments poorly trained and ill-equipped, Aguinaldo's was perhaps a doomed effort. Nevertheless, he used guerrilla tactics and clandestine political organization to resist, retreating from redoubt to redoubt until his capture by Brig. Gen. Frederick Funston on 31 March, 1901. Accepting defeat, he swore allegiance to the United States and retired to his plantation. In 1935, he lost a bid for the presidency of the Philippine Commonwealth. After supporting Japanese occupation during World War II, Aguinaldo was imprisoned in 1945, but re-

ceived amnesty. He died in 1964, a tragic but beloved Philippine national hero.

AIDS. Shortly after the first cases of acquired immunodeficiency syndrome (AIDS) were recognized among civilians in 1981, early forms of the disease (AIDS-related complex and lymphadenopathy syndrome) were detected among active duty personnel. The causative virus (now called the human immunodeficiency virus, HIV) was first isolated from ill soldiers and their asymptomatic but nonetheless infected wives in 1984. These military studies provided the first proof that HIV could be transmitted through heterosexual intercourse. Nationwide blood bank testing for HIV began in June 1985. Shortly thereafter, in October 1985, the Department of Defense (DoD) began screening all civilian applicants for military service; those who tested positive for the virus were medically disqualified from service. Overall, 1 in 650 applicants was found to be infected, but prevalence rates in various geographic and demographic subpopulations varied from as low as 1 in 20,000 in the upper Midwest to 1 in 50 in northeastern urban centers. The HIV screening program was the first population-based screening program in the United States, and provided the first hard data that the epidemic had already spread silently throughout the country by the mid-1980s.

HIV screening of active duty military personnel began in 1986. Based largely on the recommendations of the Armed Forces Epidemiological Board, policies for HIV infection were established to be comparable to those for any other chronic medical condition. Infected military personnel were to remain on active duty, to lodge in military quarters, and to continue work in their duty assignment. Implemented at a time when fear of HIV contagion was widespread in the United States, these policies were far-sighted and courageous. All DoD HIV-positive personnel were to be medically evaluated periodically, and those with advanced disease were honorably discharged with medical disability and benefits. HIV-infected personnel were restricted from overseas deployment, from health care jobs where potentially risky procedures were performed, and from sensitive Personal Reliability Program (e.g., nuclear missile) positions. In an effort to decrease HIV transmission, HIV-infected active duty personnel were counseled by their commanders that if they knowingly put others at risk of infection through sexual intercourse, they could be prosecuted through the military justice system. Overall, DoD policies were designed to reflect fair and rational public health principles.

Screening was originally undertaken annually for all active duty personnel, but this interval has gradually lengthened with a number of new service-specific regulations. For example, testing takes place every five years for all air force personnel, or for the following clinically indicated reasons: during pregnancy; on entry into a drug/alcohol rehabilitation program; on presenting at a STD (sexually-transmitted disease) clinic; on deployment overseas; on PCS (Permanent Change of Station) overseas. However, all personnel must be proven negative within six months of any overseas deployment.

The U.S. military HIV research program began in 1986, when Congress provided \$40 million for this purpose. The U.S. Army Medical Research and Development Command, as the lead agency for infectious disease research, managed the tri-service program. Major accomplishments include the following firsts: definition of antibody test criteria for a diagnosis of HIV (criteria used worldwide today); evidence that HIV was becoming a serious problem among minorities; detection of transmission of drug-resistant HIV strains; tracking the global spread of genetic variants; vaccine therapy trials; and international preventive vaccine trials.

At the heart of the controversy over HIV/AIDS research is the question of its relevance to the military. HIV/AIDS has little or no direct impact on readiness or combat operations for U.S. forces. However, recent studies have shown very high HIV prevalences among some African (one in four) and Asian (one in ten) military populations. From a broader national security point of view, the global pandemic is a threat requiring maximal efforts by all capable U.S. agencies.

Rates for new infections have decreased; in 1995, the DoD's total of infections among active duty personnel was approximately 300. In 1996, an amendment to the department's authorization bill ruled that all HIV-infected personnel on active duty must be involuntarily separated, regardless of their fitness for duty or years of service; however, as of 1999, the policy was not to separate HIV-infected personnel who were physically fit. The impact of this legislation on the effectiveness of public health control of HIV within the military remains to be determined.

AIR AND SPACE DEFENSE. Recognizing that the two great oceans that had protected the United States from invasion for more than a century could now, at least in theory, be overcome through aerial assault, the administration of President Franklin D. *Roosevelt after the outbreak of World War II in September 1939 began to rearm the nation. A sizable investment in this effort went to the Army Air Corps, which was woefully inadequate to meet the needs of national defense. In April 1939, when Congress passed the National Defense Act of 1940, it authorized the Army Air Corps to develop and procure 6,000 new airplanes, to increase personnel to 3,203 officers and 45,000 enlisted, and to spend \$300 million, much of it directly earmarked for defense of U.S. territory. As a result, the aviation forces received \$70.6 million, 15.7 percent of the army's direct appropriations. This number and the percentage continued to climb during the early 1940s.

After the attack on * Pearl Harbor of 7 December 1941, the ability of the Japanese Navy to strike American forces on the West Coast could not be dismissed. On 9 December, Gen. "Hap" * Arnold, commanding the U.S. Army Air Corps, directed that all aircraft on the West Coast be dispersed so that a single attack could not destroy significant military capability. He also placed air squadrons along the borders on alert, relocated most support infrastructure to the interior, and set into motion the modern approach to defense of the nation's perimeter.

During World War II, coastal aerial attacks on the United States were limited to a few Japanese balloons

carrying bombs over the West Coast in 1944 and 1945. However, the effect of World War II on thinking about U.S. national defense proved crucial. Two major technological developments rendered the nation particularly vulnerable to outside attack: the long-range strategic bomber (especially if carrying atomic bombs), and the ballistic missile, which had enormous potential for intercontinental attack (also with atomic warheads). During World War II, the strategic bombing campaigns in Europe and Asia represented for many the "creation of Armageddon"; estimates well in excess of 100,000 deaths took place in the two atomic bombings of *Hiroshima and Nagasaki, Japan. Likewise, the German V-2 rocket demonstrated the potential of missiles for long-range attack. As the first true ballistic missile, the V-2 flew at speeds of over 3,500 miles per hour and delivered a 2,200-pound warhead 500 miles away. First flown in October 1942, it was employed against targets in Britain beginning in September 1944. By the end of the war, 1,155 had been fired against England and another 1,675 had been launched against Antwerp and other Continental targets. The guidance system for these missiles was imperfect and many did not reach their targets, but they struck without warning and there was no defense against them. As a result, the V-2 had a terror factor far beyond its capabilities.

Following World War II, despite postwar *demobilization, the *Cold War precipitated a continuation of the expansion of military aerospace activities and fostered the search for a truly effective air and space defense for the United States. In the process, the air arm became an independent service, the U.S. *Air Force, in 1947. The military air and space component during the Cold War involved a broad range of activities: training, equipping, and employment of aerospace power extended from aircraft to missiles to satellites to other systems, both passive and active. Much of this, such as satellite reconnaissance, was carried out in a highly classified environment, with neither details nor records of government available for ready inspection. All has been justified as a means of maintaining integrity against an aggressive threat from Russia and other global rivals.

In this context, U.S. air and space defense strategy developed in two distinct ways. First was the development of offensive strategic nuclear forces capable of deterring any attack on the United States—either by striking an enemy before it had a chance to inflict significant damage, or by being able to retaliate massively in response to a strike.

To execute this deterrent mission, the *Department of Defense (DoD) created such organizations as the Strategic Air Command (SAC) in the late 1940s, and placed in command Gen. Curtis E. *LeMay, as rough and irascible an officer as the air force had, but he got results. LeMay fully understood that the nation's first line of defense—indeed, in many respects its only line of defense—was the nuclear deterrent that SAC was charged with maintaining. The command, he knew, had to be prepared to carry out its nuclear mission at any time for the deterrent to have viability. He therefore refined the procedures for strategic bombardment, both with intercontinental ballistic missiles (ICBMs) and strategic bombers, and he made them increasingly more effective. The preparedness of SAC to execute its mission became legendary and set standards of excellence still sought after within the air force, as SAC

maintained a state of extreme readiness from the late 1940s through the early 1980s.

More broadly, this strategy ensured the development of what was known as the *nuclear triad*: U.S. continental-based, long-range strategic bombers; U.S. continental-based intercontinental ballistic missiles (ICBMs); and sea-launched intercontinental ballistic missiles (SLBMs) carried on submarines and therefore mobile. All of these could strike the Soviet Union—or anywhere else on the globe—with nuclear weapons and therefore ensure an enemy's destruction despite a United States in ruins. Sometimes referred to as mutual assured destruction, this doctrine was known by the most appropriate acronym ever coined by the military: MAD.

Second, perhaps more critical to air and space defense, was the development of early warning and interception systems by the United States. The first successful one was the DEW (distant early warning) Line, approved by President Harry S. Truman in 1952, across Alaska, Canada, and Greenland. Its purpose was to provide radar and other electronic surveillance of the Soviet Union to monitor technological progress and, more important, any possible hostile actions against the United States and its allies. The capability of this string of listening posts across the arctic was to be 100 percent detection for all weapons up to 100,000 feet in altitude, which would therefore handle ballistic missiles and bombers. A joint project, the United States provided the funding and supervision of the construction. The Canadians, with a similar system already in place in certain parts of their nation, would link with the DEW Line for an unbroken surveillance sequence in the arctic. This system was constructed quickly in the next two years, coming on line in 1957, and served its purpose throughout the Cold War. It was still operational, although its capabilities had been upgraded, at the close of the century.

To manage the DEW Line, and to respond to any threat detected, the United States and Canada created the North American Air Defense Command (NORAD) in 1957 ("Aerospace" was substituted for "Air" in the title in 1981). Based at Cheyenne Mountain a few miles outside Colorado Springs, for more than three decades NORAD provided integrated command of air and space defense forces of the two nations. It directed dedicated interceptors, other fighters, surface-to-air missiles, air and space detection and control centers, and other facilities to defend the continent against attack.

A U.S. service-backed antiballistic missile (ABM) program was accelerated in 1967. But by the early 1970s, Russian work on an ABM system of ultra-high-speed missiles and phased array radars threatened to destabilize deterrence. In 1972, one of President Richard M. Nixon's arms control agreements was an ABM treaty limiting deployment to two ABM sites.

Another major component in the U.S. air and space defense system was the strategic reconnaissance efforts of space satellites. Under development in the late 1950s, Project CORONA was the first successful reconnaissance satellite program. Essentially, the objective was to obtain high-quality satellite photographs of the Soviet Union and thereby ensure that the United States would never suffer another Pearl Harbor-like surprise attack. As part of this effort, the first satellite, launched 18 August 1960, reached orbit and then correctly returned its reentry vehicle containing photographs of the Soviet ICBM base at Plesetsk

and the bomber base at Mys Schmidta. The satellite was plucked from the Pacific Ocean by U.S. Navy frogmen. After this flight, CORONA became an operational mission and functioned through 1973, when it was succeeded by later generation reconnaissance satellite projects.

But strategic deterrence, satellite reconnaissance, and NORAD's warning and response capability were insufficient to guarantee safety against a determined enemy, and this prompted national security officials to seek an ultimate shield. The result was the Strategic Defense Initiative (SDI), unveiled by President Ronald Reagan in March 1983. An expansive, technologically complex, and exceptionally expensive research and development (R&D) program, SDI's aim was to create an array of space-based technologies that could track and destroy incoming missiles. The project immediately became controversial because of its technical complexity, its high price tag, and because it would upset the strategic nuclear balance of power between the United States and the USSR that had succeeded in avoiding superpower war. With the collapse of the Soviet Union in 1989 and the end of the Cold War, SDI declined in importance and survived only as a modest R&D effort within the DoD in the mid-1990s.

Indeed, with the end of the Cold War in the early 1990s, the U.S. air and space defense system underwent substantial changes. NORAD continues to exist, but as a component of U.S. Space Command and its mandate has been narrowed since there is no major strategic threat. Some of its response component has been transferred from the active military force to the Air National Guard. Some nuclear forces of the DoD have been taken off alert, some nuclear weapons destroyed, and SAC inactivated, and targeting of Russia has been deemphasized. The DoD component managing SDI has been reduced in size and funding and renamed the Ballistic Missile Defense Organization. Finally, public conceptions of air and space defense, such as civil defense in its various capacities, have been minimized.

AIRBORNE WARFARE. The first concept for the use of American airborne troops occurred during World War I in 1918, when Gen. Billy Mitchell proposed a mass drop of paratroopers against German trenches on the western

front. The following year, Gen. John J. *Pershing endorsed Mitchell's plan, but the armistice of November 1918 made the airborne assault unnecessary. *Isolationism and small budgets between the world wars prevented the development of an airborne force, but the U.S. *Army kept a close eye on developments in the Soviet Union and Germany where paratrooper and glider units participated in large training exercises. The dramatic, successful assault in May 1940 on Fort Eben Emael in Belgium by German parachute and glider troops, followed by a successful German mass airborne assault against Crete in 1941, convinced military planners that America needed an airborne capability for the coming war.

On 16 August 1940, a test platoon of U.S. paratroopers made their first jump at Fort Benning, Georgia, and by April 1942, four months after U.S. entry into World War II, a parachute school was in full operation. In August 1942, the army formed its first two airborne divisions, the 82nd and the 101st. Their mission was vertical envelopment: to land behind enemy lines in order to disrupt command, control, and communications and to impede the enemy's ability to fight. From the beginning, U.S. paratroopers exhibited characteristics that remain central to the airborne fighting spirit. All were volunteers, physically and mentally tough, filled with esprit de corps, and capable of acting alone in a crisis.

The U.S. Army formed six airborne divisions of parachute and glider regiments during World War II, and the most famous exploits of these elite units under commanders such as Maxwell D. *Taylor, James M. Gavin, and Matthew B. *Ridgway occurred in Europe. The first combat action took place in November 1942, during the

* North Africa campaign, followed by a larger airborne assault during the invasion of *Sicily in July 1943. Early airborne operations had significant problems; but in September 1943, paratroopers proved their worth when the 82nd Airborne made an emergency jump into the beachhead at Salerno, Italy, and helped prevent a potential Allied debacle. The 82nd and 101st Airborne Divisions were among the best in the war and fought valiantly in June 1944 as the airborne vanguard of the *D-Day landing. Despite some units being dropped in the wrong place, they captured key bridges and road junctures and impeded the German Army's ability to react to the amphibious assault. In August, a provisional division of airborne and glider troops supported Operation Dragoon, the invasion of southern France. The 82nd and 101st Airborne jumped again that September and fought at Eindhoven and Nijmegen in Holland as part of Field Marshal Bernard Law *Montgomery's abortive British Operation Market-Garden to seize the Arnhem Bridge on the Rhine. During the Battle of the *Bulge, the 82nd Airborne helped to defend the northern shoulder of the German salient near St. Vith. Meanwhile, the 101st rushed to Bastogne by truck and fought a dogged defense of the village, denying the Germans control of an important road junction even while surrounded. In March 1945, the 17th Airborne Division participated in Operation Varsity, the airborne assault supporting the British crossing of the Rhine River in northern Germany. The 11th Airborne Division fought in several campaigns in the Pacific and distinguished itself in 1945 during the liberation of the *Philippines.

The *Cold War saw a dramatic transformation in airborne forces. Significant reductions in airborne units

occurred after World War II. During the *Korean War, the 187th Airborne Regimental Combat Team made two jumps in an effort to cut off retreating North Korean forces at Sukchon in October 1950 and at Musan-ni in March 1951. The Korean War saw a greater use of *helicopters, and in 1952 the army formed its first helicopter battalions for vertical envelopment and soon eliminated all glider units.

The unconventional nature of the *Vietnam War precluded normal airborne operations and led to air-mobile warfare in which helicopters transported soldiers to the battlefield. The army's first air-mobile division, the 1st Cavalry Division, deployed to Vietnam in August 1965 and fought the war's initial, major air-mobile Battle of the *Ia Drang Valley in November 1965. Later, the 101st Airborne Division converted from parachutes to helicopters, and air-mobile "search and destroy" missions came to dominate U.S. operations. The 173rd Airborne Brigade conducted the only major parachute drop of the Vietnam War near Tay Ninh City in February 1967.

In the post-Vietnam War era, airborne and air-mobile forces remain vital to the U.S. military. The 82nd Airborne and the 101st Airborne (Air Assault) Divisions deployed to Saudi Arabia in 1990 and saw action during the *Persian Gulf War. In 1994, the 82nd Airborne was en route from North Carolina to a parachute drop to help overthrow the military junta in Haiti, but was recalled in the air due to successful political negotiations. Today, the 82nd Airborne and the 101st Airborne (Air Assault) Divisions retain their elite status, maintain a high level of readiness, and possess the strategic mobility to respond rapidly to crises across the globe.

AIRCRAFT CARRIERS. Invented by the British during World War I, the aircraft carrier was adopted by the United States and Japan as an experimental weapon to augment the battle line. In contrast to the Japanese, whose fleet and carriers were designed for defensive operations in the western Pacific, the U.S. Navy planned for an offensive, transpacific war all the way to Japan and created the long-legged "fast" (33-knot) carrier to operate over those great distances. The navy first converted a collier (coaling ship) into the 11,050-ton carrier *Langley* (CV-1 "V" being the symbol for heavier-than-air craft), commissioned in 1922. Then it converted two battle-cruiser hulls, as allowed by the *Washington Naval Arms Limitation Treaty, into 36,000-ton fast carriers of the *Lexington* class. While the 542-foot *Langley* experimented with fighter and scout planes in fleet maneuvers during the 1920s, the navy developed *dive-bombers and *torpedo planes for the new 888-

foot-long carriers. As soon as the *Lexington* and the *Saratoga* joined the fleet, Adm. Joseph Mason Reeves placed squadrons of all four plane types aboard them, a total of eighty planes per carrier. With the *Saratoga*, he launched a successful surprise mock attack on the Panama Canal during Fleet Problem IX in 1929. This demonstration of offensive carrier air power established the foundation of U.S. carrier aviation for the rest of the century.

During the war games of the 1930s, similar aggressive attacks struck the Hawaiian Islands, including Pearl Harbor; West Coast seaports; and defending fleets and land-based air forces. Traditional battleship admirals often minimized these achievements and argued for using the carriers with the battle line, but this only inhibited their mobility and made them vulnerable to air, ship, and submarine attacks. The *Lexington*-class carriers mounted a defensive battery of eight 8-inch and twelve 5-inch guns. In fact, their own fighter planes and escorting gunships provided the surest defense. So newer carriers, built from the keel up as carriers, mounted only eight 5-inch guns. Flight decks were made of wood so that bombs would not explode until they struck the hangar deck, enabling planes to keep operating during battle.

The stunning Japanese attack on * Pearl Harbor by planes from six Japanese carriers on 7 December 1941 proved decisively the offensive power of fast carriers. It was, however, uncharacteristic of Japanese warships to operate so far from home waters. Adm. Ernest J. *King, commander in chief of the U.S. Fleet, therefore instituted wide-ranging offensive hit-and-run raids with the six available carriers to keep the Japanese off balance. Their most aggressive leader was Adm. William F. *Halsey, who even launched James *Doolittle's army bombers from the *Hornet* to strike Tokyo in April 1942. U.S. carriers won naval victories at the Battle of the *Coral Sea in May, the Battle of *Midway in June, and the battles around *Guadalcanal between August and November, sinking several Japanese carriers—four at Midway alone. But one by one all U.S. carriers were sunk except for the *Saratoga* and the *Enterprise*, and even these two were heavily damaged. The reasons included imperfect tactics and damage control, inferior aircraft, inadequate numbers of fighter planes, ships, and anti-aircraft guns, and insufficient reconnaissance.

These lessons were applied to the construction of two dozen new fast carriers of the *Essex* class, which entered the fleet in 1943. At 27,100 tons, the 872-foot *Essexes* each embarked an air group of three squadrons: thirty-six fighters, the superior F6F Hellcat; thirty-six dive-bombers, first the SBD Dauntless and later the SB2C Helldiver; and eighteen torpedo bombers, the TBF/TBM Avenger. All three types performed scouting functions too, but the greatest innovation for detecting enemy planes was the installation of shipboard search * radar, enabling fighter director officers to coordinate their fighters out to 100 miles from the carrier. In addition, anti-aircraft defenses included twelve 5-inch/.38-caliber guns and numerous 40mm and 20mm batteries on each carrier. Nine 11,000-ton light carriers (CVL) of the 31-knot Independence class, converted from cruiser hulls between 1941 and 1943, added additional offensive punch; each operated twenty-four fighters and nine torpedo bombers. Circular screens of new escorting fast *battleships, *cruisers, and *destroyers, all bristling with anti-aircraft guns, surrounded the carriers in each tactical formation.

Organized in the Fast Carrier Task Force of some fifteen carriers and 1,000 planes, these carriers provided the overwhelming firepower that spearheaded the Central Pacific offensive of 1943—45. Their optimum effectiveness occurred under the sagacious leadership of Adm. Marc A. Mitscher as the fast carriers overcame virtually all enemy opposition. The only major changes were the introduction of four-plane night fighter teams aboard each *Essex*, three carriers equipped primarily for night operations, and an increase of fighters, including the F4U Corsair, over bombing planes to counter the kamikazes, Japanese suicide planes. Only one of the new fast carriers was sunk, the light carrier *Princeton*, off Leyte.

In the Atlantic, to defeat Germany's U-boats, the navy depended on small, slow 18-knot escort carriers (CVE), eighty-four of which were commissioned. There were four major classes of CVEs, some converted from oilers but most mass-produced; they varied in size between 7,800 and 11,400 tons, and each carried a composite air group of nine fighters and twelve torpedo bombers. Operating primarily as an independent hunter-killer group, each escort carrier worked in concert with its five destroyers and destroyer escorts to track down and sink most of the U-boats destroyed between 1943 and 1945. Many of them also operated in the Pacific, where fighters outnumbered torpedo bombers in providing close air support during amphibious assaults. Light construction made the escort carriers especially vulnerable, and several were sunk by bombs, gunfire, submarine torpedoes, or kamikazes.

Three large (CVB) 45,000-ton, *Midway*-class carriers, commissioned after the war ended, featured armored flight decks in order to nullify bomb hits. Each had a 986-foot flight deck and a 137-plane air group of fighters and dive-bombers. The future of the carrier and its vulnerability to nuclear weapons became a cause of bitter controversy in the late 1940s, a controversy complicated by interservice *rivalry. The navy depended upon the older *Essexes* in the Korean War (1950-53). Their air groups were comprised of F4U fighter bombers, F9F jet fighters, and piston-engine AD (later A-1) Skyraider attack planes. Atomic bombs were first deployed aboard carriers in the early 1950s.

The *Korean War and the menace of the Soviet Union served to stimulate new carrier construction. During the 1950s and 1960s eight attack carriers (CVA, later CV again) belonging to the *Forrestal* and *Kitty Hawk/America* classes were built. Each displaced 56,000 to 61,000 tons and had 1,046-foot flight decks to accommodate new and heavier planes. Air groups (later air wings) were comprised of up to 100 fighters and attack planes, mostly jets. The major fighters were F-8 Crusaders and F-4 Phantoms IIs, the bombers A-1s, A-3 Skywarriors, A-4 Skyhawks, A-6 Intruders, and A-7 Corsair IIs. Cruising endurance was greatly increased with the commissioning in 1961 of the first nuclear-powered carrier (CVN), the 75,700-ton *Enterprise*, which did not require refueling at sea. To deal with the large Soviet submarine force, thirteen *Essexes* were redesignated as antisubmarine carriers (CVS) between 1954 and 1973; these operated S-2 Tracker piston-engine search planes and H-34 Seabat and H-3 Sea King antisub *helicopters. All of these carrier types and planes supported ground operations during the *Vietnam War (1965-73). In addition, three converted *Essexes* acted as amphibious-assault helicopter personnel carriers (LPH) during the 1960s, until superseded by the *Iwo Jima* (LPH) and *Tarawa*

(LPA) classes (landing platform, helicopter or assault) built specifically for that purpose.

During the 1970s, doctrinal confusion and criticism over retention of the large and seemingly vulnerable attack carriers continued. They were retained because of repeated crises in the Middle East and the growing Soviet surface fleet, which though basically defensive, included a few carriers. Eight 81,600-ton nuclear-powered carriers of the Nimitz class with 1,089-foot flight decks were added between the late 1960s and late 1990s to begin replacing older oil-fueled ships. Each was accompanied by a protective screen of missile-bearing escort ships and formed a carrier battle group. They provided the core of the offensive power projection that effectively deterred the Soviet Navy. F-14 Tomcat fighters and F/A-18 Hornet fighter attack planes joined the carriers during the 1970s and 1980s, respectively, along with S-3 Viking antisub jet search planes to augment E-2 long-range early warning radar carrier aircraft.

Throughout the *Cold War, attack carrier strength remained fairly constant between twelve and fifteen, but even the collapse of the Soviet Union in 1989-90 did not diminish the need for carriers to help deter and quell global tensions. Thus, six carriers participated during 1990-91 in the *Persian Gulf War. The continuing requirement for such large numbers of these extremely versatile carriers has been governed by the fact that, generally, for every carrier operating on station, one is home-ported undergoing refit and overhaul, and another is in transit to or from the operating area. In this way, the United States has maintained the long-legged global reach of its naval power.

AIRCRAFT INDUSTRIALISTS. Among the ever-widening links between military and social institutions, few have been as extensive or dynamic as the relationship between the U.S. military and the aircraft industry. From the industry's origins before World War I through the early *Cold War period, this relationship, though heavily mediated by Congress, was made up of army and navy officers and individual aircraft industrialists who for the most part owned and operated independent firms. These firms performed research and development for new military aircraft and also manufactured them. During the interwar years, suggestions that the aircraft industry be nationalized were occasionally heard but never really challenged the consensus that the industry ought to remain in private hands and that the military ought to relate to aircraft firms on contractual business terms kept as distant and impartial as possible.

From the first flight at Kitty Hawk in 1903 through World War I, the aircraft industry was dominated by two firms named after this technology's pioneers, the brothers Orville and Wilbur *Wright and Glenn Curtiss. When the U.S. Army, U.S. Navy, and Congress pushed for large-scale

airpower during World War I, other firms entered the industry to try to meet the enormous demand. Most notable were two automobile companies, Fisher Body and Willys-Overland. The Ford Motor Company also engaged briefly in large-scale production of the Liberty aircraft engine. But despite the expenditure of hundreds of millions of taxpayer dollars, wartime military aircraft production proved a fiasco, mainly because of the misguided effort to mass-produce air frames according to the automobile industry's assembly-line manufacturing methods. Nevertheless, many blamed an "Aircraft Trust," supposedly composed of corrupt corporate executives and military contracting officers who profited enormously but failed to produce aircraft. The U.S. Congress imposed a punishing postwar business environment for military aircraft that meant unprofitability for the industry. Worried about possible collusion, Congress also blocked efforts to streamline the industry's dealings with the military.

Throughout the interwar years, military aircraft design and manufacture remained highly competitive, despite severely limited military spending. Congress maintained easy access for new entries through price-competitive contract laws, which military officers were obliged to follow. Low start-up and capital costs also eased entry for the many aircraft entrepreneurs who wanted to be part of the exciting new technology despite business risks. The energies of this group of competitive entrepreneurs/industrialists, many of whom were independently wealthy and willing to absorb steady losses, were key to the industry's viability until mass demand developed during World War II. They maintained an airpower supply base that was inferior to, but at least comparable with, those of the world's leading military powers.

In this period, tiny new companies emerged to give the aircraft/aerospace industry many of its familiar names. Glenn Martin, William Boeing, Donald Douglas, Chance Vought, Charles Lawrence, and Clyde Cessna found plenty of room to compete with the two larger firms under the Wright and Curtiss names. Three other lesser-known but significant figures also entered the industry during the early 1920s. In 1923, Reuben Fleet established Consolidated Aircraft in Buffalo, New York, and moved it to San Diego in 1935, where it eventually became an important part of General Dynamics. In 1926, Frederick Rentschler reorganized Pratt & Whitney into a major supplier of aircraft engines. The most prominent aircraft industrialist during the 1920s was Clement Keys, a Wall Street financier deeply committed to aeronautics. He bought Curtiss Aeroplane in 1920 and arranged the Curtiss-Wright merger in 1928, which combined aircraft and engine production and became a critical airpower supplier during World War II.

Aviation companies became a focus for much of the investment frenzy of the 1927-29 stock market boom. Some aircraft firms merged, but new, independent ones also appeared. All found access to new investment capital that helped sustain a competitive industry during the early depression years. Most notable among the new entries were Leroy Grumman, John Northrop, Igor Sikorsky, Sherman Fairchild, Lawrence Bell, and Alexander de *Seversky. Seversky's firm was reorganized as Republic Aircraft in 1938. North American Aviation, controlled by General Motors, was incorporated in Baltimore and moved to Los Angeles in 1935 under the guidance of James Kindelberger. The Loughead brothers established a company, but changed its

name to Lockheed because it was so often mispronounced. In 1931, two entrepreneurs from Boston, Robert and Courtland Gross, bought Lockheed and made it an important innovator in Los Angeles. During the 1930s, Howard Hughes also began competing from Los Angeles. In 1939, James McDonnell established a company in St. Louis.

In the 1930s and even during World War II, the industry remained fragmented, highly competitive, and geographically dispersed. Companies pursued resolutely independent business and technological strategies. Most snubbed the industry's trade association in Washington, D.C., unwilling to suspend their separate interests for a common industry front that might alter the debilitating contracting risks they all faced in their dealings with army and navy officers. In 1940, Congress authorized cost-plus contracts and advance payments. But even after these reforms and the massive new demand for warplanes, the industrialists remained highly independent and wary of one another and the government. Some giant aircraft corporate combine: expanded or emerged during the war, such as Curtiss-Wright and Consolidated-Vultee (Convair), and automobile companies—General Motors, Ford, and Chrysler—entered the industry on a large scale. But aircraft manufacture still did not become heavily concentrated.

The industry's relations with the military also remained erratic, ad hoc, and unpredictable. The early aircraft industry scarcely resembled a common perception of military industries as appendages of a "warfare state" or a state-centered military-industrial complex. The government had no overall plan or coordinated approach for mobilizing the aircraft industry or demobilizing it in 1945. It relied on the independent strengths and abilities of the manufacturers. The military's involvement with firms rarely went beyond issuing aircraft specifications and contracts, providing financing, and selecting sites for new factories. Industrialists continued to give only nominal support to their trade association. They plotted individual competitive strategies for the postwar military and civilian market. Relations between firms and the air force and navy became more integrated only when the industry's viability seemed threatened by balance sheet crises during the late 1940s and the Korean War. Rapid technological development meant far greater complexity in aircraft design and production and also seemed to mandate more stable, predictable, and longer-term relations.

AIR FORCE, U.S.

Overview

Predecessors of, 1907-46

Since 1947

AIR FORCE, U.S.: OVERVIEW

The U.S. Air Force, the world's most powerful air arm, was not always the most potent. The force dates its beginnings from 1907 as an organization of three men and no opera-

tional aircraft within the U.S. Army. During and immediately after World War I, the Army Air Service remained much smaller and less capable than European air forces. However, as the Army Air Forces, it grew during World War II to become the mightiest air force in the world, with 2.4 million uniformed people in 1944 and nearly 100,000 operational aircraft. In 1947, as the U.S. Air Force (USAF), it finally became an independent service, reaching its maximum size in 1955 during the Cold War era (960,000 people). By 1998 it had "downsized" to 381,100 active duty, uniformed personnel (plus 184,000 in the Air Force Reserve and Air National Guard). But today's force, with its 580 intercontinental ballistic missiles, 4,700 aircraft (another 1,900 in the Air Force Reserve and Air National Guard), and numerous space-based reconnaissance satellites, has much greater range, capability, mobility, and flexibility than the numerically larger Army Air Force of World War II.

The USAF provides its aircrews with more flying hours and more realistic training than any other comparable force in the world, and its equipment is unmatched technologically. Those that can compete with USAF crews in skill are all regional: Israel, the United Kingdom, Germany, France, and Australia retain motivated, capable air forces, but all are range-limited and considerably smaller. Although some air forces approach the size of the USAF in aircraft numbers (e.g., China's), all of them are range-restricted and most of their aircraft are obsolete. The Soviet Union came closest to possessing a large, global air force, but since 1991 Russia's airpower has greatly deteriorated.

The American air forces have been reorganized several times. From 1907 to 1947, the force was part of the U.S. Army. Within the army, it became sequentially the Aeronautical Division of the U.S. Signal Corps (1907-14), the Aviation Section of the Signal Corps (1914-18), the Army Air Service (1918-26), the Army Air Corps (1926-41), and the Army Air Forces (1941-47). Since 1947, the force has been on a par with the army and navy.

Through 1918, its primary mission was reconnaissance, although some air supremacy fighting and ground attack did occur during World War I. It was not until 1923 that army doctrine officially recognized combat strike uses for airplanes. During the 1920s and 1930s, the Army Air Corps developed the strategic bombing doctrine in which "air power" was envisaged as being decisive in war: an enemy's vital targets would be bombed, and the war could end before ground or naval forces became engaged.

The idea of strategic bombing dominated air force thinking and force structure through World War II and for twenty-five years thereafter. In the 1930s, the Army Air Corps developed robust four-engine bombers, but poor

* fighter-aircraft, because fighters were seen as unnecessary for escorting the defensively armed and armored bombers that it was believed "would always get through." It was thought a war would end before fighters became necessary to support ground forces. The Army Air Forces (together with Britain's Bomber Command) blasted German cities into rubble using mainly B-24 and B-17 heavy bomber aircraft, but the war in Europe ended only when Allied armies occupied Germany's territory. The Army Air Forces achieved more decisive results in the Pacific, but only after the army, navy, and Marine Corps captured enemy territory to bring very long range B-29 bombers within range of Japan. Massive bombardment in 1945, culminating in

the atomic bombings of *Hiroshima and Nagasaki, was probably the most important factor causing Japan to surrender without an invasion.

Convinced that aerial bombardment had won both the European and the Pacific Wars, air force leaders developed a huge strategic bombing force during the 1950s that would deter the Soviet Union, or defeat it should war occur. While the USAF developed superior interceptor aircraft, it discounted the value of tactical aircraft for supporting ground forces. The * Korean War did not dramatically alter this situation, nor did the growing power of the Soviet ground forces in the 1950s. Today's air force, however, is more flexibly equipped.

Its current mission is to control air and space in order to provide freedom of action for air, sea, and ground forces to secure national security objectives. And the USAF is more capable of performing multiple missions than in the past. One can track the change in doctrinal emphases from the "Vietnam War, when the emphasis on strategic bombing gave way to increased emphasis on tactical operations. Since 1982, six consecutive air force chiefs of staff have been fighter pilots, none of whom had any flying time as strategic bomber crew members. In 1992, with the collapse of the Soviet Union, the Strategic Air Command (SAC), the command most identified with strategic bombing, was disestablished. SAC's nuclear strategic missions were placed in a new joint (multiservice) command, the Strategic Command. (SAC's conventional missions went to other organizations.)

Today's balanced air force is divided into eight major commands, thirty-eight field operating agencies, and three direct reporting units. The eight major commands contain almost 94 percent of the uniformed personnel. Air Combat Command is the largest, with 28 percent of the people. It has fighters (F-15s, F-16s, F-117s, A-10s, etc.) and bombers (B-52s, B-1s, B-2s). Two other commands also possess fighters. U.S. Air Forces in Europe and Pacific Air Forces (combined, 16% of the air force) would both be supplemented by Air Combat Command aircraft if needed. The Air Education and Training Command, about 17 percent of personnel, is equipped with training aircraft (T-37s and T-38s, etc.), and is responsible for training and most professional education. The Air Mobility Command (about 15%) has aerial refueling tankers (KC-135s and KC-10s) and transports (C-130s, C-141s, C-5s, and C-17s). The Space Command (6%) maintains the strategic missile forces during peacetime and the space-based satellites. The Special Operations Command (2%) is equipped with *helicopters, some specially equipped C-130s, and gunships. The Materiel Command (10%) equips the force through research, development, and acquisition of systems, and sustains it through maintenance and supply.

The thirty-eight field operating agencies, such as the Air Weather Service, contain 5 percent of personnel. Finally, the three direct reporting units (e.g., Air Force Academy) contain about 1 percent of personnel.

The USAF today is engaged in missions around the world, demonstrating daily its global power and reach.

AIR FORCE, U.S.: PREDECESSORS OF, 1907-46

On 1 August 1907, the U.S. Army's chief signal officer established an Aeronautical Division within the Signal Corps. Two years later the Signal Corps accepted an airplane from the Wright brothers, and by 1911 Lt. Thomas DeWitt Milling had begun early experimentation with an aircraft bombsight. Despite these developments, army attitudes to aircraft remained conservative: the role of aircraft, like that of dirigibles, would be to assist in observation and reconnaissance. Most army officers remained unmoved by the extensive body of predictive literature—of which H. G. Wells's novel, *The War in the Air* (1908), was only one example—which assumed that aircraft would be the most important tools in the wars of the future.

Between Orville and Wilbur *Wright's triumph in 1903 and the beginning of World War I, the Europeans generally outpaced the Americans in aviation. The U.S. Army failed to use aircraft successfully in its 1916 attempt to punish Mexican outlaw Pancho Villa, exposing the inadequate nature of its aerial program. Nonetheless, upon entry into World War I in 1917, the Americans quickly developed plans to produce a major air force. But such plans turned out to be overambitious since they implicitly assumed that essential technological and bureaucratic structures might be put into place almost overnight. Ultimately the Americans were able to supply trainer airplanes, aircraft engines, and pilots—but they had to rely heavily on the Europeans for material and expertise.

The most important World War I air action for the Americans took place in September 1918, when Gen. Billy *Mitchell, of the Air Service of the American Expeditionary Force, commanded American, British, and French squadrons in support of the U.S. First Army at St. Mihiel. This action brought the Americans important experience in the realm of tactical—or battlefield—aviation, but they did not have an opportunity to develop similar experience in what was then called "strategical" (later strategic) bombing, which focused on the use of long-range bombers to fly over the heads of an opposing army and directly undermine the enemy's capacity and will to fight.

Nonetheless, the Americans were able to observe European efforts and even developed a plan for the future use of long-range bombers—though it leaned heavily on the work of a leading British planner, Lord Tiverton. Indeed, the Americans were interested enough to undertake their own postwar survey of long-range bomb damage in Europe. Heeding the arguments of the British Air Staff, the Americans concluded that the most effective planning would be achieved by making a careful study of the enemy's war economy, identifying those industries most vital to its continued functioning, and aiming to destroy them.

Without direct experience of aviation other than for purposes of reconnaissance and battlefield support, American airmen were not in a strong position to push for post-

war independence from the army. The determined aerial stunts of General Mitchell raised the public profile of aviation, but his insistent demand for service independence angered army leadership and brought his career to a premature end. In the 1920s, when military budgets were tight and the nation's foreign policy was isolationist, American airmen were compelled to keep their more futuristic ideas to themselves. Despite a number of interwar congressional bills proposing a separate service, the airmen remained part of the army. Gradual change commenced in 1926, when new legislation transformed the Air Service into the slightly more autonomous Air Corps. In the early 1930s, the Air Corps Tactical School (ACTS) gained a new home at Maxwell Air Force Base, Alabama. The 1931 MacArthur-Pratt agreement divided land-based and naval aviation between the army and the navy, and gave the former an officially sanctioned use for long-range bombers: defenders of the American coastline. Increasingly, instructors at ACTS defied army ideological constraints by developing a set of ideas about the independent use of long-range bombers against an enemy's industrial economy; these ideas ultimately would serve as the foundation of American bombing strategy in World War II.

Viewing advanced industrial societies as complex and interdependent entities subject to economic disruption, American air planners sought out those "bottleneck" targets that might be central to an enemy's functioning in wartime. They posited that if these could be attacked with swiftness and precision, then the enemy might be defeated. This theory was bolstered by the development of new technologies that seemed to make the plan feasible, specifically the B-17 long-range bomber and the Norden bombsight. Both the B-17 and the Norden bombsight (a product of the navy's in-house designer, Carl Norden) were originally designed to help the United States defend itself from hostile threats at sea. Being able to hit a hostile target at sea naturally put a premium on accuracy, and this in turn reinforced American confidence in the notion of what would come to be referred to, optimistically, as "precision bombing."

As the threat of war loomed increasingly large in the summer of 1941, President Franklin D. *Roosevelt decided to invest heavily in the newly renamed U.S. Army Air Forces (USAAF). His decision, not unlike the decision undertaken on America's entry into World War I, probably rested on the appeal of a high-technology mode of war fighting, which seemed to promise reduced "casualties and quicker results. In August 1941, a handful of American air planners (former instructors at ACTS) devised a plan for massed bombers to fly in daylight against critical targets in the German war economy. Like their British Allies, the Americans generally had come to believe that the bomber "would always get through." They assumed that the speed and multiple guns of the B-17 "Flying Fortress" would enable them to fly in self-defending groups—without long-range fighters to fly alongside as protective escorts.

As in World War I, gearing up for total warfare proved to be more complicated and time-consuming than anticipated. It took most of 1942 for the Americans to train the pilots, and to build the planes and infrastructure for a large-scale bombing offensive. In the meantime, the efforts of Britain's Bomber Command had increased steadily in scale and destructiveness. The British had discovered that

strategic bombing was a difficult and complicated enterprise. The unexpected effectiveness of German defense forced them to fly under cover of night, and the difficulty of finding targets led them to concentrate on those places they could find reliably: cities. Fearful that the Americans would experience the same problems, Prime Minister Winston *Churchill urged his ally to join the night bombing offensive. Stubbornly clinging to their theory of air warfare, the Americans resisted.

American faith in the self-defending bomber was badly shaken in the summer and fall of 1943. In two separate raids against ball bearings factories deep in German territory at Schweinfurt, the Americans suffered huge losses. The USAAF was now forced to make changes, too. Still wedded to the idea of daylight "precision" bombing, the Americans sought to solve their problem by bringing large numbers of escort aircraft into the European theater. Equipped with jettisonable fuel tanks for range, these could fly over enemy territory with the bombers, and engage German defensive aircraft head-on. American bombers drew German fighters into the air, and through the winter and spring of 1944 the two air forces fought ferocious battles of attrition. In the end, the Americans were able badly to erode Luftwaffe strength—a result that greatly facilitated the Anglo-American *D-Day landing at Normandy in June, and exposed German factories and cities to the full weight of Allied bombardment.

By the autumn of 1944 and continuing into 1945, Bomber Command and the USAAF were in a position to pummel targets in Germany with near impunity. In heavy strikes against railway lines and synthetic oil plants, the Allied air forces sought to halt the German war effort by crippling its ability to move men and supplies, and by eliminating its fuel supply. Convinced that the Germans would capitulate in the face of vast destruction, Bomber Command chief Sir Arthur Harris chose to continue attacks on cities as well. But if Harris and the Americans differed over priorities, the line between British "area bombing" and American "precision bombing" was not always so clean as the Americans claimed. On those frequent occasions when they were forced to bomb through cloud (rather than visually), the Americans achieved accuracy rates not much different from—indeed, sometimes rather worse than—the British. And in the Pacific theater, the Americans ultimately adopted bombing tactics which had much in common with Bomber Command's incendiary raids on German cities.

In the Far East, the Americans initially tried to use the same "precision" tactics they had employed in Europe. But heavy, incessant cloud cover prevailed over Japan, and the strong winds of the Pacific jet stream bedeviled formation flying. By the winter of 1944-45, the American bomber fleet (equipped with powerful B-29 bombers) had little to show for its efforts. Abandoning their preferred tactics, the Americans—now under the field command of Gen. Curtis E. *LeMay—began to fly low-level, nighttime incendiary attacks against Japanese cities. Some sixty-six Japanese cities were firebombed in the months prior to the atomic bombings of *Hiroshima and Nagasaki. In concert with the navy's blockade of Japan and mining of its harbors, the objective of the devastating air campaign was to weaken the enemy army and the entire nation prior to invasion, and, if possible, bring about Japanese capitulation. Because

of the often indiscriminate nature of strategic bombing during World War II, the Anglo-American air campaigns have been the subject of emotional postwar debate.

Members of the USAAF believed that their performance in World War II put them in a strong position to argue for independence from the army. In addition, their new role as the first service able to deliver atomic bombs moved them to a position of central importance in the postwar American defense establishment. The precise nature and organization of that establishment, however, remained to be determined. Its initial form was hammered out in lengthy and often acrimonious debates—held from 1945 to 1947—in which the navy fought hard to resist a centralized defense department, and to maintain authority over aircraft with sea-related missions. American airmen finally achieved their long-standing goal of autonomy when the *National Security Act of July 1947 gave the newly named United States Air Force co-equal status with the army and the navy within the broader framework of a national military establishment headed by a civilian secretary. The act was a problematical compromise, though, and had to be amended in 1949. The amendments strengthened the power of the secretary of defense over the services, but did not end the debates, which continue to this day, over roles and missions, and how the services should divide up control over the aircraft they need for their individual tasks.

AIR FORCE, U.S.: SINCE 1947

The United States Air Force (USAF) was formally established by the *National Security Act of July 1947. The creators of the USAF envisioned a service capable of winning wars independently by destroying the enemy's warmaking capability. This has remained the primary focus of the air force, whether through the use of *nuclear weapons or precision conventional strikes. The air force has been characterized as well by a concentration on the development and employment of new technology to a higher degree than any of the other services.

As early as 1942, leaders of the predecessor organization, the Army Air Forces (AAF), realized that World War II gave them the opportunity to justify their status as a co-equal service with the army and navy. Commanding Gen. "Hap" *Arnold nevertheless restrained his more outspoken subordinates. He intended to earn postwar independence in recognition of a decisive AAF contribution to victory, as well as through the support he garnered from a close relationship with Army Chief of Staff Gen. George C. *Marshall. Arnold demanded maximum efforts from his commanders, and secured ample publicity for those operations. The AAF received increasing autonomy as the war went on, and Arnold's campaign was finally rewarded

with army support for air force independence after the war. The harmony between the two services was also strengthened by the fact that Arnold's successor in 1946, Gen. Carl A. *Spaatz, had been the principal air commander in Europe for the new army chief of staff, Gen. Dwight D. *Eisenhower.

Arnold put his stamp on the air force in a number of specific ways. He emphasized the decisive nature of air warfare and the importance of anticipating and exploiting new technology. Spaatz followed by reorganizing the postwar AAF into three major functionally defined combat commands based in the United States—Strategic Air Command (SAC), Tactical Air Command (TAC), and Air Defense Command (ADC)—in addition to separate commands for training and support. Overseas theaters had their own air commands as well. This structure worked well enough to be retained by the new USAF when, after a two-year battle with the navy, which retained naval aviation, it finally achieved independence.

Interservice *rivalry continued, however, as postwar military forces and defense budgets were reduced. The *Key West Agreement—a gentleman's agreement between the services on roles and missions—of 1948 gave the air force sole responsibility for strategic airpower, but that consensus soon dissolved in budget squabbles. Cutbacks of a strategic "supercarrier" and in naval aviation brought on the "Revolt of the Admirals" in 1949. The navy particularly questioned USAF capability to perform its strategic mission with the massive B-36 bomber. The navy also argued that atomic attacks on cities were immoral, a claim it conveniently forgot when it established its own potent nuclear forces later.

In the meantime, the development of the air force's combat commands was hampered by budget constraints and personality conflicts. Defense cuts reduced the organization from a planned seventy air groups to only forty-eight by 1950, and eventually Secretary of the Air Force Stuart Symington resigned in protest. The AAF had had more than 2.5 million personnel on V-J Day, but by May 1947, its strength was down to 303,600 military and 110,000 civilians. Emphasis on strategic airpower ensured SAC would get support, but it initially languished under Gen. George Kenney, whose leadership style caused low morale and training readiness at SAC. Not until Chief of Staff Gen. Hoyt *Vandenberg relieved Kenney and replaced him with Curtis E. *LeMay in 1948 did SAC begin to evolve into an elite force.

LeMay's dynamic leadership and personality would keep the USAF primarily focused on its strategic mission for the next two decades. TAC was temporarily absorbed into Continental Air Command in 1949, but was reactivated in 1950 and began to expand its responsibilities to include delivering tactical *nuclear weapons. ADC was always a low priority, and though it had established the distant early warning (DEW) Line by 1955, it was slow to get adequate aircraft or personnel. By the time its fighters, "missiles, and *radar were integrated into an effective homeland defense system, the threat of the Soviets' manned bomber had declined, and it was eventually deactivated in 1980.

Vandenberg's skillful lobbying and the exigencies of the *Korean War helped sustain the USAF through the early 1950s. The depleted service was initially forced to rely on

many World War II aircraft. By the end of the war, however, most bombing missions were being conducted by jet fighter-bombers. The most glamorous and challenging roles were filled by the F-86 interceptor pilots battling MiG-15s for air superiority, and Sabre jet aces soon became America's—and the air force's—idols. Each service drew very different aerial lessons from its experience. The navy emphasized the failure of interdiction and problems with * command and control of joint air operations. The army was dissatisfied with the amount and conduct of close air support. In contrast, the air force trumpeted that airpower had ultimately been successful, claiming its "air pressure" campaign had finally forced the enemy to sign the armistice.

In the decade after the Korean conflict, the emphasis of the air force in the *Coldwar remained on deterring and winning a general war against the Soviet Union. SAC's aging B-29s had been driven out of the daylight skies over North Korea in October 1951, but by the mid-1950s its B-47 medium and B-52 heavy *bomber aircraft were the most advanced jet planes of their type in the world. The 1952 budget authorized ninety-five air force wings, a full third of them to SAC, which was the centerpiece of President Eisenhower's "New Look." By 1960, it had over 2,000 bombers. Service strength had peaked at 960,000 in 1955, but it was still over 800,000 five years later. Air force interests were also furthered by the selection of Gen. Nathan *Twining as first USAF chairman of the * Joint Chiefs of Staff (JCS) in 1957.

As the new decade opened, another technology was becoming the cornerstone of America's deterrent—missiles. Under the capable leadership of Gen. Bernard Schriever, the USAF Ballistic Missile Division guided the service and the missile industry through the completion of four separate launch systems in 1955-62: Atlas, Thor, Titan, and Minuteman. The first SAC missile wing was activated on 1 January 1958; within five years, 13 Atlas squadrons with 127 missiles had been deployed. Along with the new technology came a new way of thinking about general war. Most of the analysis of American nuclear strategy during the 1950s was being conducted by the RAND Corporation, a civilian "think tank" created by the air force after World War II that was independent in title but contracted to do service research. USAF has always led the way in the use of civilian experts and systems analysis to evaluate its technology and operations.

LeMay became USAF chief of staff in 1961, ensuring the predominance of strategic bomber proponents over more tactically focused "fighter jockeys" (a schism that affects most air services, with air transporters the lowest-ranking members of the flying caste) until the beginnings of the * Vietnam War. As a result, in the 1960s USAF found itself again with the wrong aircraft and tactics to meet the needs of a limited war. In Vietnam as in Korea, it chafed under political constraints, had problems with joint air control, and failed in its interdiction campaign. However, the late success of Operation Linebacker II enabled air force leaders to claim they had again brought an enemy to the peace table, and to use it to justify their performance as an example of what could have been accomplished if airpower had been applied with less restraint.

Despite such confident rhetoric, the air force did much to reform itself after Vietnam as it entered the trying decade of the 1970s. SAC's influence declined, and the ser-

vice focused more on its other missions. USAF strength hovered around 800,000 throughout the 1960s, but by 1975 it had declined by 200,000, and it was down to close to 550,000 by 1980. USAF provided two chairmen of the JCS during that time: Gen. George Brown, who as USAF chief of staff had changed regulations so others besides pilots could hold important commands; and Gen. David *Jones, later instrumental in creating the *Goldwater-Nichols Act. The service also began to consider the use of space, eventually creating its own Space Command in 1983, and providing the impetus for the unified U.S. Space Command established by the Department of *Defense, despite navy objections, in 1984. Though it was a difficult period for military budgets and programs, air force leaders proved very farsighted in developing technologies. They fielded the capable F-15 Eagle and supplemented it with the lighter and cheaper F-16; developed a specialized close air support aircraft in the A-10 as well as a new strategic missile, the Peacekeeper; and laid the foundations for Tomahawk cruise missiles, new strategic bombers like the B-1, and *stealth aircraft like the F-117. The appearance of the C-5A Galaxy significantly expanded national airlift capabilities.

Structural reforms also would have important future implications. Innovative training programs such as Red Flag honed the skills of active duty combat flyers, while the USAF response to Secretary of Defense James Schlesinger's call for a "Total Force" in 1973 considerably increased the readiness of the *Air National Guard and *Air Force Reserve. The air force has remained the most successful of all the services in keeping reserve elements prepared and integrating them into active plans and operations.

A new set of thinkers typified by Col. John Warden began to consider the proper application of this new force and technology, including *precision-guided munitions first used in Vietnam. The "smart" bombs employed against the Iraqis in the * Persian Gulf War of 1991 demonstrated a combination of accuracy and penetrating power unique in the history of warfare. The service also coordinated more closely with the army in developing doctrinal concepts of "Air-Land Battle." Though the USAF was down to 530,000 personnel as the Cold War came to an end, the defense buildup under President Ronald * Reagan had created the best trained and most technologically advanced air service in the world.

All the aforementioned factors came to bear in the impressive USAF performance in the Persian Gulf War. Aerial operations also demonstrated great improvement in the command and control of joint airpower, though the navy and Marines continued to resist the complete integration of their assets under a joint forces air component commander. Again air force leaders claimed the decisive role in winning the war. Service historians even claimed that airpower could now seize and hold ground without ground support. Media images were misleading, however, and the Gulf War Air Power Survey commissioned by USAF to verify its claims revealed numerous flaws in the conduct and results of the air campaign.

Disputes about the decisiveness of airpower swirled throughout the budget battles of the early 1990s, as Chief of Staff Gen. Merrill McPeak oversaw a reduction and reorganization of his service. By late 1997, active duty strength was down to around 370,000, supplemented by more than 155,000 civilians. SAC and TAC were dis-

banded, as their nuclear forces came under the new unified Strategic Command, while a new USAF Air Combat Command absorbed everything else. As air force leaders fought to get more B-2 stealth strategic bombers and the new F-22 to replace the F-15 and F-16, strategic airlift assets of the Air Mobility Command received increased funding in recognition of the increased need for Continental United States (CONUS) deployments as overseas bases closed. Plans to replace the A-10 with multirole F-16s made economic sense to the air force, but awoke old fears in the army that close air support was being relegated to a low priority. As USAF tried to exploit a perceived revolution in military affairs with continued emphasis on precision and the exploitation of new information technologies, it also had to come to grips with reduced budgets and a lack of appreciation for the strategic airpower that had been its *raison d'être*. The future holds much promise and many challenges for the premier air force in the world.

AIR FORCE COMBAT ORGANIZATIONS: TACTICAL AIR FORCES. Tactical air forces are air combat forces that are organized to conduct operations within a theater of war in support of military campaign and possibly national objectives. The traditional view of these forces is that they provide offensive and defensive support to ground and naval surface forces. However, after its creation in 1947, the United States *Air Force (USAF) increasingly viewed tactical air power as a potentially decisive factor in modern warfare that should be organized and used as an independent combat force whenever possible. The differing views on the proper roles of air power have often generated significant debates between the USAF (and its predecessors) and the other three armed services. The other services—*army, *navy, and *Marines—tend to view air power as a subordinate and supporting capability.

The modern USAF tactical air force structure has been built upon the framework of the early military aviation units and the experiences of air power in combat. The earliest basic U.S. aviation tactical unit was an aerosquadron, later called a squadron. As its role evolved, squadrons were characterized by a specific combat function and were normally equipped with a single type of aircraft. Squadrons were often subdivided into "flights." Squadrons remain the basic operational unit in the modern USAF. In the early years of U.S. military aviation, when used in combat, squadrons were assigned directly to ground units. This situation reflected the view of aviation units as primarily support for surface units, a role that was also illustrated by aviation's overall subordination as the Aeronautical Division or Aviation section within the Signal Corps until 1918.

The experience of *World War I led to the formation of a somewhat more independent organization, the Division

of Military Aeronautics of the U.S. Army, in 1918. The First World War experience also defined the basic roles of tactical air power: reconnaissance and observation, air superiority (control of the air—the most critical function of air power—through offensive and defensive action, normally by pursuit or fighter aircraft), attack (support for friendly surface forces either through close air support or interdiction), and bombardment (deep attacks on enemy surface forces and support capabilities). Air forces also showed promise for other missions, including emergency logistic support and tactical movement of ground forces. Many air leaders extrapolated from the experience and envisioned even greater roles for air power in future conflict. As a minimum, these leaders, like Gen. Billy *Mitchell, envisioned air power as a key to breaking away from the bloody trench warfare of the past war, and many believed that air power could change the very nature of future wars.

The debates on the role of air power that emerged during and after World War I have continued into the post-Cold War period. The more revolutionary perspective of air power potential has focused on the concept of strategic bombardment, meaning direct attacks on the enemy's homeland and his ability, as well as willingness, to support continued combat operations. Although strategic bombardment became the focal point of the effort to define the role of air power in modern warfare, many air leaders believed that the capabilities of air power must be used in a decisive manner in tactical operations as well. Air power advocates believed that air power, tactical as well as strategic, must be organized centrally under the control of airmen who understood the inherent abilities of air power as well as its limitations. This centralized control would allow air forces commanders to exploit the inherent offensive capability and flexibility of air power, to focus on air assets on potentially decisive targets, and to respond rapidly to changing combat conditions.

During the inter-war period, Army leaders maintained overall control of aviation forces, although the push for greater independence by air leaders led to the creation of the Army Air Service in 1920 and the Army Air Corps in 1926. Even more importantly, in 1935, the Army created General Headquarters (GHQ) Air Force to control all combat forces in the continental United States. In 1941, the Army created the Army Air Forces in recognition of the increasingly important role of the aviation branch. Along with the evolution of the higher command and control organizations, the operational forces also evolved. Squadrons remained the key tactical units, and were normally organized into groups, which in turn were organized into wings. A group normally included several squadrons and also controlled the support functions needed to operate an air base and sustain the operational forces stationed at the base.

During *World War II, wings contained several groups and were organized into numbered air forces (e.g. Eighth Air Force, Ninth Air Force, or Fifth Air Force). As needed, intermediate organizations, including divisions and commands, were formed under the air forces to meet theater or campaign requirements. The most important of these for theater operations was the tactical air command or TAC (e.g. IX TAC or XIX TAC), which was specifically formed to provide offensive and defensive support for surface forces. Air Force leaders believed that the experiences in Europe and the Southwest Pacific validated the value of tactical air power as a coequal combat power with the

surface forces. Army commanders generally concurred that air power had been a critical factor, but they viewed aviation as a supporting, indeed subordinate, capability, not a coequal force.

The creation of an independent USAF in 1947 and the associated changes in the national defense structure incorporated an increased emphasis on independent air power. The flight, squadron, and wing structure of the tactical forces remained the foundation of the combat capabilities. (Following the creation of the USAF, the wing replaced the group as the standard base-level unit controlling all the base activities, including the combat squadron.) Until the collapse of the Soviet Union, the strategic mission tended to dominate the image and the force structure of the USAF. But, centrally controlled tactical forces also provided important combat capabilities to the U.S. military. Due in part to the competition imposed by limited budgets, the other services aggressively criticized the USAF for both its emphasis on strategic operations and for its emphasis on centralized control in theater operation and for independent operations.

The USAF theater capabilities were organized to support the unified commanders within the U.S. national command and control structure. Each regional commander had a USAF component command—organizationally equal to the surface components—that was also a major command for the USAF. For example, in Europe, the air forces were commanded by the U.S. Air Forces in Europe (USAFE) and in the Pacific by first the Far East Air Forces (FEAF) and then Pacific Air Forces (PACAF). In the continental United States, the tactical forces were controlled by the Tactical Air Command (TAC) for most of the post-World War II period—replaced by the Air Combat Command (ACC) in the post-Cold War era. TAC trained forces, developed doctrine, and provided combat forces to overseas commanders. Within the major commands, the key subordinate organizations were number air forces, with air divisions providing another management level above the wings.

As the unified command structure matured and concepts of joint operations evolved, the theater command and control system developed to include a joint forces air component commander (JFACC), who controlled all air assets from all services involved in theater operations. The JFACC position represents the maturation of the concept of centralized control of theater air power. In the perspective of the USAF, the JFACC concept and the modern role of theater air power was validated in Operation Desert Storm against Iraq, in which air assets were used in a combination of strategic and tactical operations to independently create the conditions of victory. The interpretation of this experience varies: the other U.S. military services continue to argue that air power still primarily supports surface operations, while the USAF continues to claim that air power is indeed decisive in modern warfare, including theater or tactical operations, and must not be tied too tightly to surface force concepts.

AIR FORCE COMBAT ORGANIZATIONS: STRATEGIC AIR FORCES. First introduced as auxiliaries in support of ground and naval forces, aircraft offered a potential technological solution to the problems of warfare in the industrial age. Aerial forces could fly over defending armies and navies, which were tactical targets, and directly attack the strategic sources of an enemy's war-making capability—factories, "communications, *transportation, workers, and urban concentrations—without the need for bloody ground campaigns. A product of the airmen's special perspective from on high and the American love of technology, this strategic view of air war received its first expression in the United States from pioneer aviator Lt. Benjamin Foulois's proposal in 1907 that military aviation focus on targets behind enemy armies. In 1917, airpower prophet Lt. Col. Billy *Mitchell sought to divide American air units on the western front into tactical and strategic air forces, the former to support ground forces, the latter to attack "enemy material of all kinds behind the lines." Inadequate resources and the opposition of his staff encouraged Gen. John J. *Pershing, commanding the American Expeditionary Force (AEF) in France, to reject both Mitchell's proposal and a detailed plan to bomb "commercial centers and the lines of communications" by Mitchell's technical chief, Maj. Edgar Gorrell. Other nations engaged in strategic bombing in World War I, but the U.S. Army Air Service, America's wartime air force, remained a tactical force in support of army ground operations under the AEF.

In the interwar period, the Air Service and its successor, the Air Corps, struggled to win an independent role for army aviation by emphasizing strategic operations behind the army's battle lines. Opposed by the army and navy, General Mitchell, General Foulois, and World War II air commander "Hap" *Arnold nevertheless worked out the tactics, training, and technology of strategic bombing. Officers at the Air Corps Tactical School developed a strategic bombing doctrine based on high-altitude, daylight, precision attacks on an enemy's industrial infrastructure or "fabric," in contrast to European plans to employ airpower in support of armies or to attack cities. The appearance of the B-17 "Flying Fortress" bomber and the Norden bombsight, coupled with Adolf *Hitler's successful use of bombers to intimidate foes in the 1930s, convinced President Franklin D. *Roosevelt and army chief George C. *Marshall to support a strategic bombing campaign against Axis enemies in World War II.

For the war the Army Air Forces established America's first strategic bombing organizations, The Eighth and Fifteenth Air Forces against Germany and the Twentieth Air Force against Japan, to bomb primarily oil and transportation links, but also aircraft production, ball bearings, and other industries. Thirty-one months of strategic operations against Germany saw most bombs aimed at industry, while ten months against Japan brought mostly area attacks against urban concentrations. Though assigned the role of bombing the sources of enemy power under the

unified command of airmen, American air forces in Europe remained subordinate to ground commanders in pursuit of war objectives. Only against Japan did the Twentieth Air Force carry out an independent strategic air campaign.

During the *Cold War, the threat of strategic attack using *nuclear weapons dominated air force war planning. The Strategic Air Command (SAC), established on 21 March 1946, had the mission of conducting "long-range offensive operations in any part of the world," but its primary responsibility was to maintain a credible threat of assured destruction—any nation attacking the United States or its Western European allies would suffer an overwhelming counterattack. Based initially on manned bombers (the B-29 and B-36 to start, though primarily the B-52 from 1955 into the 1990s) and later intercontinental ballistic missiles (starting with the Atlas in 1958, followed by the Titan, Minuteman, and Peacekeeper) carrying thermonuclear hydrogen bombs and warheads, SAC war plans evolved from area attacks on Soviet urban industrial concentrations in the late 1940s to attacks on specific governmental, industrial, and military targets in the decades following.

Under the leadership of the hard-driving Gen. Curtis E. *LeMay from 1948 to 1957, SAC became an elite force that consumed a major portion of America's defense budget. LeMay and SAC's dominating influence also caused America's defense planning to focus on nuclear war preparations to the detriment of preparations for limited conventional war. Involvement in Korea and Vietnam propelled an unprepared USAF into strategic bombing operations using nonnuclear weapons. Targets remained consistent with 1930s doctrine—industrial infrastructure. In both wars, however, the vital industrial centers supporting enemy war efforts were in the Soviet Union and China, put beyond the range of strategic bombers by political considerations. The dearth of industrial targets in North Korea and North Vietnam, and the presence of strong defenses against air attack, created the ironic situation of strategic bombers attacking tactical targets in safer areas while more maneuverable tactical fighter-bombers went after the few strategic targets available.

In the *Persian Gulf War of 1991, tactical fighters such as the F-117 stealth aircraft replaced large strategic bombers such as the B-52 in carrying out a strategic bombing campaign against Iraq because of the need for greater accuracy and the dangers posed by Iraqi anti-aircraft defenses. A new bombing doctrine, building on the experience in the *Vietnam War, moved beyond the industrial focus of earlier strategies to envision Iraq's warmaking capability as a synergy between leadership, communication, industrial production, transportation, and military forces, merging tactical and strategic air warfare into a unified air campaign. Five weeks of intensive bombing aimed at Iraq's military, industrial, and governmental complex paved the way for a successful four-day ground offensive.

Doctrinal and technological developments so blurred the boundary between tactical and strategic bombing in the 1980s and 1990s that the USAF redefined the former as joint operations involving conventional weapons and the latter as independent operations involving nuclear weapons. Reflecting this change, the United States integrated its strategic nuclear forces, including land- and sea-based ballistic missiles and manned bombers, under the U.S. Strategic Command on 1 June 1992, simultaneously

disbanding SAC. At the same time, air force conventional bombing forces, including traditionally defined tactical and nonnuclear strategic bombers, reorganized as Air Combat Command.

AIR FORCE RESERVE. The U.S. Air Force Reserve was established on 14 April 1948. This and the activation of the Continental Air Command on 1 December 1948 to oversee the reserve unit program represented the air force's desire to achieve greater coherence in its federal reserve component program, which in various guises dated back to 1916.

Air Force Reservists first participated in combat in the *Korean War. All 25 flying wings of the reserve, a total of 30,000 personnel, were mobilized, plus nearly 119,000 individual reservists. The Air Force Reserve emerged from its wartime service with significant program problems, and the air force spent the remainder of the 1950s rebuilding it. Key milestones included the establishment of the Air Reserve Personnel Center and the implementation of an Air Reserve Technician program, which established a full-time cadre of civil servants who were also military personnel in Air Force Reserve units.

During the 1960s, the Air Force Reserve demonstrated its operational readiness and underwent further organizational changes. Reservists participated in numerous *Cold War events, including the 1961-62 Berlin Crisis and the Korea and Vietnam mobilizations of 1968-69. The Department of *Defense sought to merge reserve and National Guard components, but this was halted by Congress in the Reserve Forces Bill of Rights and Vitalization Act of 1967. The act also established the Office of Air Force Reserve as part of the Air Staff. On 1 August 1968, Headquarters Air Force Reserve replaced the Continental Air Command, and assumed responsibility for Air Force Reserve unit program.

By the 1970s, air force officials increasingly called upon the reserve to support a variety of national security objectives. With the establishment of the Total Force policy in 1973, reservist and *Air National Guard personnel were trained to active duty operational readiness standards. More than 23,500 Air Force Reservists took part in the 1991 *Persian Gulf War. Other post-Cold war operations included participating in United Nations and *NATO-sponsored relief and peacekeeping missions in Africa and the Balkans.

AIR NATIONAL GUARD. The Air National Guard (ANG) was established as a separate reserve component of the U.S. *Air Force (USAF) by the *National Security Act of 1947. The Guard's involvement in aviation began before World War I, when a few states established small but

poorly funded flying programs. In 1915, the first viable National Guard aviation unit—the First Aero Company of New York—was organized, and a year later it was mobilized during the border crisis with Mexico. All-Guard aviation units were disbanded by the War Department in 1917. Instead, Guardsmen played important leadership and combat aviation roles as individual volunteers in the U.S. Army Air Service.

After World War I, despite War Department opposition, Guard aviation was placed on a permanent footing. The army organized twenty-nine Guard observation squadrons during the interwar period. Those units, with 4,800 experienced personnel, were mobilized in 1940–41. Although many remained intact, they lost the majority of their personnel to other units of the Army Air Forces (AAF) during World War II, when Guard aviators served in every operational theater.

A reluctant AAF was compelled by political pressure from National Guard interests to develop a dual-component postwar reserve system consisting of the ANG, a force with federal and state roles, and the Air Force Reserve (AFRES), an organization with a strictly federal role. At first, the ANG was little more than a poorly trained and equipped flying club.

The *Korean War (1950–53) proved a turning point for the ANG. Some 45,000 Air Guard personnel, 80 percent of the force, were called into federal service, but they were unprepared for combat. Eventually, ANG units and individual Guardsmen contributed substantially in the air war in Korea and the USAF's global buildup. *Mobilization problems and political controversy forced the USAF to revamp its reserve programs. In 1951, the USAF included the ANG in its war plans. Two years later, ANG units began augmenting the nation's air defense runway alert forces. That program integrated training and operational support of the USAF by the ANG on a daily basis. The innovation served as a precursor for the Total Force policy implemented in 1973 by the Department of *Defense.

ANG units gradually improved their readiness after the *Korean War and were integrated into a widening circle of planning activities, exercises, and operational missions. The ANG became a mixed force of fighters, airlifters, tankers, and support units.

Mobilization performance continued to improve in the Berlin crisis (1961) and the USS Pueblo and *Tet Offensive crises (1968). From 1967 to 1977, ANG volunteers operated a tanker task force in Europe on a continuous basis, foreshadowing the extensive use of reserve forces abroad in a nonmobilized status. During the 1970s, significant numbers of women and minorities began to enter the ANG, and with the draft's end in 1973, it became an *A11-Volunteer Force. The ANG evolved into a well-equipped force capable of rapid global deployment. During the Persian Gulf crisis (1990–91), over 12,000 Air Guard members performed ably. Since then, the ANG has assumed a growing share of the USAF's missions.

AIR WARFARE. Despite having given birth to the airplane in 1903, the United States was slow to explore the military

applications of aviation and had effectively no air arm when war broke out in August 1914. By contrast, Germany, France, and Britain went to war with remarkably efficient aviation establishments, and even Austria-Hungary and Russia possessed useful air arms. Limited by feeble engines and drag-producing, externally braced structures, few aircraft in 1914 could carry more than a pilot and an observer. Nevertheless, they played a pivotal role in key early battles, notably the Marne, where British Royal Flying Corps reconnaissance reports were instrumental in turning the Germans back from Paris.

The value of visual reconnaissance was evident from the outset, but when the war deadlocked in the trenches, new missions emerged as designers and manufacturers struggled to improve aircraft performance. By 1916, aerial photography was a crucial element of intelligence: photo mapping provided the detailed charts needed for operational planning; and spotting and adjustment of artillery fire by radio-equipped aircraft was essential to the massive barrages that dominated the land war on the western front.

The advantages of denying the air to an enemy were obvious, but the first effective means of doing so appeared only in April 1915, when French pilot Roland Garros fielded a device that enabled a machine gun mounted on the engine cowling to fire through the propeller arc, turning his aircraft into a flying gun, a *fighter aircraft. After a brief string of aerial victories, Garros was forced down and captured along with his aircraft. Concerned at Garros's success, the German High Command asked Dutch designer Anthony Fokker to copy his device. Instead, Fokker designed his own mechanical synchronization gear (Garros's device was unreliable, relying on steel deflector plates on the blades), which Fokker fitted to his single-place E-III monoplane. Fokker's *Eindeckers* soon reached the front, launching a "Fokker scourge" that lasted until the following spring when superior French Nieuport and British De Havilland fighters appeared. The Germans responded with Albatros scouts, initiating the struggle for air superiority that was central to both world wars.

By the time America entered the war in April 1917, aviation was crucial to victory, particularly on the western front where the opposing industrial powers squared off. The German High Command implicitly recognized this by allocating high-performance aero engines top production priority in their *Amerika Program*, designed to produce victory before America's industrial might could be brought to bear. In the event, British and French aircraft production far surpassed Germany's producing air superiority over the trenches and guiding the devastating artillery barrages that broke the German Army. Despite enormous productive capacity, America's intervention in the air war was disappointing. Aside from a handful of Curtiss "Big America" flying boats, America produced no one battle-worthy aircraft. The vaunted Liberty engine was produced in impressive numbers, but had mediocre performance and arrived too late. The air component of the American Expeditionary Forces fought well, but mostly in cast-off French aircraft.

America's most impressive achievement was in training large numbers of aviators and mechanics, but they too arrived late. Most American pilots who saw combat were French-trained. An important consequence of the U.S. commitment to the air war was the release on the postwar economy of huge numbers of surplus Liberty engines and Curtiss JN-2 "Jenny" trainers. The results were mixed: on

the one hand, the availability of cheap engines and aircraft exposed large numbers of Americans to aviation, notably in the form of touring "flying circuses"; on the other, cheap surplus materiel rendered the civil aviation industry temporarily moribund and stifled technical innovation.

America's huge expanse and thin rail net intervened, creating a larger civil aviation market than the rest of the world combined. The competitive nature of that market led to steady advances in aircraft design, and by the mid-1930s the best U.S. civil transports could outperform first-line European bombers and fighters in speed, range, and—most important—useful load as a function of empty weight. This was particularly impressive since, in contrast to Europe and Japan, military aviation subsidies in the United States had all but ceased with the Great Depression.

During the interwar years aerial bombardment was used widely in colonial wars, with the Spanish in Morocco and the Italians in Libya and Ethiopia dropping poison gas on a large scale. U.S. Navy and Marine Corps experiments in the 1920s led to the development of one type of *bomber aircraft, the dive-bomber. These and specialized torpedo bombers comprised the attack complement of *aircraft carriers commissioned by the British, American, and Japanese navies. The 1936-39 Spanish Civil War served as a testing ground for aerial combat, with Nazi Germany and Fascist Italy pitted against Soviet Russia. The Luftwaffe perfected its ground support doctrine and revolutionized air-to-air tactics with voice radio-equipped fighters. At the beginning of the conflict, German Ju-52 transports ferried Spanish regular troops from Morocco to secure Andalusia for the Nationalist rebels in the first decisive use of *transport and supply aircraft.

By the late 1930s, few doubted that war was imminent and that airpower would play a major role in its outcome. In 1938, some 80 percent of all aircraft in the world were American civil craft, reflecting the robustness of an industrial and social base that would produce prodigious quantities of aircraft and, of at least equal importance, an inexhaustible flood of pilots, aircrew, and mechanics. But that robustness represented only potential, for the United States possessed only one world-quality warplane, the Boeing B-17 bomber, and that only in prototype. At the time of the Japanese attack on *Pearl Harbor, America's only battleworthy fighter in service was the Navy F4F Wildcat: not until 1943 did U.S. fighters routinely take the measure of their Axis opponents. In contrast, Britain, Germany, and Japan all entered the war with world-class fighters, and if prewar Axis bombers lacked the payload-to-weight ratios of their American equivalents, they had been battle-tested in China and Spain.

Only three air forces entered World War II with coherent strategic doctrines: the Luftwaffe with an embryonic theory of strategic bombardment; the Royal Air Force with an air defense doctrine based on radar-directed intercepts; and the United States Army Air Forces (USAAF) with a well-articulated theory of strategic daylight precision bombardment. The Luftwaffe, Japanese Navy Air Force (JNAF), and the U.S. Navy's air arm were well trained and equipped to support surface operations; the Royal Navy's Fleet Air Arm was superbly trained, but had mediocre aircraft. Of the rest, the French Armée de l'Air had high standards of training and some good aircraft, but was shackled to obsolete tactical support doctrine and caught in the middle of a major reequipment program when Germany invaded in May 1940; the Soviet Union's Red Air Force was

enormous, but had obsolescent aircraft, mediocre training, and, in the wake of Josef *Stalin's purges, a shortage of competent leaders; the Italian Regia Aeronautica was well trained, but with obsolescent equipment and an inadequate industrial base; the Japanese Army Air Force (JAAF) was well trained, but possessed indifferent equipment.

The strategic initiative, sound tactical doctrine, and battleworthy materiel carried the day for Germany and Japan in the initial clashes of the air war, punctuated only by British victory in the Battle of Britain. The Luftwaffe virtually obliterated the Red Air Force at the start of Operation Barbarossa, and Japanese carrier aviation went from victory to victory during the first six months of the Pacific War. The tide turned in the summer of 1942, when U.S. carrier aviation blunted the JNAF's cutting edge at the Battle of *Midway just as the British, with copious American aid, were wresting superiority from the Luftwaffe in the Mediterranean. By the eve of the *D-Day landing, heavy losses at Stalingrad, in North Africa, at Kursk, and in Italy had forced the Luftwaffe to concede air superiority everywhere save over Germany, where the hammer blows of RAF Lancaster and Halifax bombers by night and USAAF B-17s and B-24s by day forced a maximum defensive effort. The cost in aircraft (which could be replaced) and skilled aircrew (who could not) broke the back of the Luftwaffe. Meanwhile, the JNAF had been destroyed in the Solomons, and the JAAF ruined in the New Guinea. The critical losses were in trained aircrew. Japanese aircraft production increased dramatically and showed remarkable resilience under heavy bombing, but U.S. air superiority was never seriously threatened thereafter, the shock of kamikaze attacks on warships notwithstanding. There is not doubt that airpower was crucial to the defeat of the Axis, but just how and why was—and is—a matter of debate.

Strategic bombing advocates, notably the leaders of the USAAF and its successor, the U.S. Air Force, argued that Germany and Japan were defeated by strategic bombing, or, in the case of Germany, could have been with different targeting priorities. Detractors argued that Nazi Germany fell only to ground invasion, and pointed to the effects of naval blockade on Japan, a resource-poor island nation, attributing Japanese surrender to shock at the awesome power of the atomic bomb rather than to the economic effects of bombing. Focus on this argument, which formed the backdrop to public debate over America's *Cold War military priorities, has obscured awareness of other elements of airpower, notably transport and antisubmarine aviation, both of which were pivotal in World War II; and flight training, which was arguably decisive.

The reality of nuclear *deterrence made World War II the last war in which industrialized nations actually tried to destroy one another from the air, and the few massive air campaigns since have been mounted against nonnuclear states by a superpower, a superpower-led coalition, or a superpower client. The classic early examples are Korea and Vietnam, in which U.S. *bombs were pitted against enemy troops and lines of communication. The Soviet Union did commit first-line equipment and personnel to combat against American air forces—MiG-15 jet fighters in Korea, and SA-2 surface-to-air missiles plus MiG-17, MiG-19, and MiG-21 fighters in Vietnam—but did so discreetly to avoid overt confrontation. The provision of British and American shoulder-launched, heat-seeking antiaircraft *missiles to the mujahiddin in opposition to the Soviet invasion of Afghanistan is a parallel example. Israel's air campaigns

against its enemies fall into the same category, particularly the 1973 Yom Kippur War, in which U.S.-provided Israeli aircraft were pitted against Soviet-designed SA-6 surface-to-air missiles and SPU 23-4 mobile gun systems which amounted to a technical and tactical extension of the air war over North Vietnam. The most recent example is the coalition air campaign in the 1991 *Persian Gulf War.

The operational and tactical parameters of air warfare have changed enormously since 1945 as a result of jet propulsion; "helicopters; guided air-to-air, surface-to-air, and air-to-surface "missiles; "precision-guided munitions; and, from the 1970s, infrared technology, micro-miniaturized, transistor-based, flight control, guidance, and navigation systems; and, finally, "stealth aircraft. Indeed, the differences between the attritional air campaigns of World War II, Korea, and Vietnam, and that of the 1991 Gulf War, in which all the elements of change enumerated above came into play for the first time, are so stark that some have argued that the latter represents a revolution in military affairs.

Be that as it may, elements of continuity stemming from the robustness of America's aviation industry are arguably of equal importance. The engineering skill, productive capacity, and the underlying market forces that swamped Axis airpower in World War II are still very much in evidence. To make the point by example, the Boeing B-52, arguably the most successful bomber ever built, entered service in 1955, played a major role in the Cold War and Vietnam War, and is slated to remain in service into the 2040s. Its immediate predecessor was the Boeing B-47, a bomber of radical design powered by six jet engines suspended on pylons beneath its thin, swept wings. The B-47 inspired not only the B-52s, but the Boeing 707, the first truly successful jet airliner and ancestor of the Boeing airliners that dominate world air traffic today. Many of the high-capacity civilian air transports called to duty in the 1991 Gulf War as part of the U.S. Civil Reserve Air Fleet were Boeing 747 jumbo jets, descendants of the B-17 of World War II.

ALAMO, BATTLE OF THE (1836). In fall 1835, a political revolution broke out among the North American settlers in Mexican Texas. After the colonists ousted the Mexican garrison from San Antonio in December, the Mexican president, Gen. Antonio López de "Santa Anna, led an army northward to avenge the loss. Texan commander Sam Houston recognized that San Antonio had no strategic value and ordered Texans there to evacuate to the east.

Approximately 150 men decided to stay and fortify the abandoned mission known as the Alamo. By 24 February 1836, Mexican troops initiated a siege. Texas Col. William Barrett Travis sent out messages pleading for reinforcements, but only thirty-two men responded.

On 6 March, Santa Anna launched an overwhelming assault with about 1,800 troops. The defenders fought desperately, killing or wounding some 600 Mexicans, but by sunup, the approximately 180 defenders, including Travis and David Crockett, were dead.

Word quickly reached the American settlements of Texas, and the slogan "Remember the Alamo!" helped mo-

tivate the remainder of the Texas army. On 21 April Sam Houston led his men to victory over Santa Anna at the Battle of "San Jacinto—thus guaranteeing Texas independence.

ALCOHOLISM. See Substance Abuse.

ALIEN AND SEDITION ACTS (1798). In 1798, the Federalist Congress passed four laws to check a perceived French threat during the Undeclared Naval War with "France. The Naturalization Act (18 June) extended required residence from five to fourteen years before an alien could become a citizen. The Alien Friends Act (25 June) allowed the president to deport any alien deemed dangerous to "peace and safety" and the Alien Enemies Act (July 6) allowed the deportation of any alien from a country at war with the United States. The Sedition Act (14 July) rendered it a crime to make statements intended to defame or bring the president, Congress, or government into contempt or disrepute. Those convicted could be fined up to \$2,000 and jailed for two years. The Naturalization and Enemies Acts were permanent; the Alien Friends Act would expire in 1800, and the Sedition Act in 1801. Not vigorously enforced, the Alien Acts convinced many aliens to leave the United States.

Ultimately twenty-one people were indicted for sedition, and eleven were convicted, receiving sentences of up to eighteen months and fines of \$1,000 or more. Influential Republican editors and leaders were the main targets, but any criticism was a federal crime. The Federalists argued that by allowing truth as a defense, the Sedition Act advanced civil liberties. Federal judges at sedition cases, however, interpreted the law so as to guarantee convictions: the accused must prove the truth of their opinions.

In November 1798, Vice President Thomas "Jefferson and former congressman James "Madison secretly drafted resolutions adopted by the Kentucky and Virginia legislatures challenging the Alien and Sedition Acts. These resolutions argued that the states had not delegated power to punish libel to the federal government, and that free government rested on the people's free opinions. As president (1801), Jefferson pardoned all convicted under the Sedition Act and helped pay their fines.

ALL-VOLUNTEER FORCE. In 1973, Defense Secretary Melvin "Laird announced the formation of the All-Volunteer Force (AVF) and the end of the conscription that had been the major basis of America's "Cold War army. Although volunteerism had been America's peacetime military tradition prior to 1940, the AVF represented the nation's first attempt to maintain a standing force on a completely voluntary basis.

The blueprint for the AVF was prepared by President Richard M. "Nixon's Commission on an All-Volunteer Armed Force, appointed in 1969. Driven by political pressure to end the draft and an ideological commitment to

free market forces, the commission headed by Thomas *Gates had concluded that a volunteer force, supported by the potential to reintroduce the draft, was preferable to a mixed force of conscripts and volunteers, and that, based on labor market dynamics, it was economically feasible to raise a volunteer army. The Gates Commission also believed that the end of conscription would have no major effect on racial or gender composition of the service.

In 1973, the American economy was troubled, youth unemployment was high, entry-level military pay was comparable to civilian pay, and the All-Volunteer Force initially appeared to be a success. There were major increases in the representation of African Americans and women. A standby structure for conscription was retained, but the military became more dependent on the reserve components as its primary base for *mobilization. These too experienced major increases in women and minority personnel.

During the late 1970s, funding for recruiting was cut, and the purchasing power of the average enlisted person declined. In 1976, the *G. I. Bill ended; simultaneously, a new selection and classification test, which had been miscalibrated, was introduced. Recruit quality declined, and in 1979, the army fell 17,000 soldiers short of its recruiting goal: the worst recruiting year in postwar history. During this period, the force was derided as a "hollow army."

A recovery in the early 1980s was driven by pay increases and new educational incentives for enlistment. In 1983, on the tenth anniversary of the All-Volunteer Force, Defense Secretary Caspar *Weinberger announced that on the basis of this success, the Department of "Defense would no longer use the title "All-Volunteer Armed Forces," but merely "Armed Forces." In the subsequent decade, the recruiting environment remained relatively poor, and recruit quality was at best stable, in an increasingly smaller force.

The army in 1973 had about 800,000 soldiers; in 1990 it still had 732,000. After the end of the Cold War, President Bill *Clinton proposed to bring the army down to 491,000 soldiers by 1999. The total AVF dropped from 2 million in 1975 to 1.5 million in 1996. The smaller volunteer force has been involved in an expanded number of operations in recent years, including the use of 30,000 troops in the 1989 invasion of Panama to seize Manuel *Noriega and some 650,000 American personnel (active and reserve) in the *Persian Gulf War in 1990-91.

AMERICAN CIVIL LIBERTIES UNION. The American Civil Liberties Union (ACLU), founded in 1920, is a non-profit organization devoted to the defense of individual rights under the U.S. Constitution. The ACLU was an outgrowth of the National Civil Liberties Bureau, founded (1917) to provide assistance to conscientious objectors (COs) and to defend the free speech rights of critics of U.S. involvement in World War I. Roger Baldwin, founder and executive director of the ACLU from 1920 to 1950, was a pacifist as well as a civil libertarian, as were many other early ACLU leaders. Defending the right of individuals to criticize the government, even during wartime, became the

cornerstone of the ACLU's approach to civil liberties.

In the 1920s and 1930s, the organization opposed compulsory military training in public schools and colleges. During World War II, the ACLU helped establish the National Committee on Conscientious Objectors to provide assistance to COs. It also provided legal assistance in Supreme Court cases challenging the presidents order directing the military to relocate and intern Japanese Americans on the West Coast.

During the *Vietnam War, the ACLU assisted COs and defended the free speech rights of opponents of the war. In 1970, it declared the U.S. military involvement unconstitutional on the grounds that Congress had not officially declared war. The ACLU and its New York State affiliate provided legal counsel in several cases challenging the legality of the war. The organization strongly supported the 1973 *War Powers Resolution, which sought to limit the presidential power to send U.S. military forces into combat without congressional approval.

AMERICAN LEGION. The American Legion was founded in 1919 by World War I veterans seeking to preserve comradeship fostered in service, to obtain medical care and compensation for the disabled, and to combat postwar radicalism during the Red Scare. It immediately became the largest veterans' organization in U.S. history: membership varied between 600,000 and 1.1 million from 1919 to 1941, and has remained over 2.5 million since 1945. Unlike the *Veterans of Foreign Wars, the Legion admits all veterans of periods of conflict, regardless of whether they served in a theater of combat. More than 10,000 local posts elect delegates to state and national conventions. The Legion lobbied to create the precursor of the "Veterans Administration in 1921 to pay adjusted compensation of the veteran "bonus" ahead of schedule in 1936, and later to provide a "G.I. Bill of benefits for World War II veterans.

Domestically, the Legion has been a major force for national defense and against radicalism. A number of posts resorted to vigilante tactics during the Red Scare of 1919 and against industrial unionization in the 1930s. The Legion is known for community service and disaster relief, Legion baseball, and for an interest in patriotic school curricula. Although politically conservative, the organization has always supported representative democracy, welcoming a diverse ethnic and religious membership and embracing no economic programs besides veterans benefits. Its aging members disagreed initially with many of the younger veterans of the "Vietnam War.

AMERICAN PEACE SOCIETY. The American Peace Society (APS) was formed in 1828 out of the Massachusetts Peace Society (1815) and other local and state groups. Its principal organizers, William Ladd (1778-1841) and George Beckwith (1800-1870), recruited members, edited

its journal—*The Advocate of Peace*—and publicized Ladd's idea of a league of nations with an international court of arbitration. The society embraced peace advocates of every persuasion, although in the 1840s it found the attraction of absolute "pacifism very strong. It opposed the "Mexican War of 1846-48, but endorsed the "Civil War.

In the last quarter of the century, the APS returned to an international campaign for arbitration treaties. A coalition with other peace societies was shattered by World War I (which the society endorsed), and by the postwar debate over the "League of Nations (which the society rejected insofar as it was designed to enforce peace).

The APS never resumed a vigorous advocacy role. In 1932 its journal, now factually oriented, was renamed *World Affairs*. After a flurry of activity during the 1940s on behalf of a "United Nations, the society limited its activity to publication.

AMERICAN WAY OF WAR. *See* War: American Way of War.

AMHERST, JEFFREY (1717-1797), British general and governor-general, British North America. Born in Kent, England, Amherst used his family's political connections to secure a commission in the British army in 1731. Rising in rank by strategic aide-de-camp appointments, he served as Gen. John Ligonier's aide and later joined the earl of Cumberland's staff. In 1758, William Pitt, acting on Ligonier's advice, promoted Amherst to major-general and sent him to America to take command of 14,000 men during the siege of Louisbourg, on Cape Breton Island. This victory seemingly shifted the momentum of the French and Indian War, and convinced Pitt to make Amherst commander in chief in North America. Amherst captured Ticonderoga and Crown Point in 1759, and accepted the surrender of New France at Montréal in 1760.

Appointed Governor-general of British North America in 1761, Amherst inherited a tense relationship with the Indians of the Ohio Region, then aggravated matters by cutting off diplomatic gifts to the western tribes, forbidding alcohol sales, and altering the terms of trade. The western Indians rebelled in 1763, and Amherst was recalled to Britain. Within a few years, however, he regained his stature, eventually becoming a field marshal and commander in chief of the British army.

AMPHIBIOUS SHIPS AND LANDING CRAFT. Amphibious operations—large-scale attacks of hostile shores by combined naval and land forces—were a special feature of World War II. The need for special craft to support amphibious assault had been clearly foreseen and U.S. Fleet maneuvers of the 1920s and 1930s tested designs for boats to carry artillery, tanks, and assault troops. In the thirties two commercial designs emerged: the "Eureka," designed

by Andrew C. Higgins for work in the Louisiana swamps; and the "Alligator," Donald Roebbling's track-laying rescue vehicle for the Florida Everglades. These became the workhorses of the U.S. forces—the Landing Craft Vehicle Personnel and Landing Craft Mechanized (LCVP, LCM) from the Higgins boat and the Landing Vehicle Tracked (LVT, in later development redesignated Assault Amphibian Vehicle, AAV) from the Alligator. The LCVP had a capacity of 36 troops or 8,100 pounds of cargo; the LCM carried 30 tons; and the LVT 24 troops.

The design for larger landing ships was spurred by the need to transport and land large mechanized forces in the European theater. Two general types derived from British designs (1940-41) were conceived: the Landing Ship Tank (LST), which beached, opened its bow doors, and let down a ramp to rapidly offload tanks and other vehicles; and the Dock Landing Ship (LSD), a combination troop transport and floating dry dock capable of transporting the largest landing craft in its well deck and launching them by opening a stern gate.

Other British designs adopted for American use were the Landing Craft Tank (LCT; in later development Landing Craft Utility, LCU) and the Landing Craft Infantry (LCI). The LCT was equipped with a bow ramp and the largest model carried up to three 50-ton tanks; the largest LCI carried 200 troops, who debarked on deployable gangways. The most important U.S. Army development was the DUKW, a 6x6 cargo truck surrounded by a boat-shaped flotation hull; it was propelled in water by a stern propeller and on land by its truck wheels.

U.S. wartime developments included attack transports (APA), attack cargo ships (AKA), and amphibious command ships (AGC), all more suitable for operating in forward battle areas than prewar troop transports; the APA and AKA were capable of carrying large numbers of deck-loaded landing craft. Many other modifications to ships and craft throughout the war added a variety of guns, armor, communications, and other special capabilities. In all, some fourteen types of personnel landing craft, twenty-one types of vehicle and tank landing craft, twenty types of landing ships, and three types of amphibian vehicles were in use by the Allies by the end of the war.

After World War II, amphibious forces were retained, and, with embarked Marine combat units, soon became a standard feature of the forward-deployed naval forces of the "Cold War. The most notable use of amphibious forces was the dramatic landing at "Inchon, which reversed the course of the "Korean War. Other operations were "Lebanon in 1958, the "Dominican Republic in 1965, and the initial combat troop deployments to Vietnam. Throughout that war, special landing forces were employed in the I Corps area and numerous landing craft were adapted for riverine warfare in IV Corps. Early in the war, a new class of dock transport (LPD) was developed to add a small helicopter flight deck and hangar, allowing it to carry up to six medium helicopters. Ultimately, fifteen of this class were built.

The most important postwar development in amphibious ships was the creation of three new classes of assault ships: the seven-ship, 18,000-ton *Iwo Jima* class (LPH) in 1961; the five-ship, 39,300-ton *Tarawa* class (LHA) in 1976; and—the world's largest amphibious ships—the five-ship, 40,500-ton *Wasp* class (LHD) in 1989. All are fully capable aircraft carriers, with hangar decks and eleva-

tors able to operate twenty medium helicopters in the *Iwo Jima* and *Tarawa* classes and thirty in the *Wasp* class. The latter two classes have well decks to accommodate the navy's new air cushion landing craft (LCAC). Rapid surface assault to complement helicopter assault is now a reality with the 40-knot, 60-ton payload LCAC.

The U.S. Navy plans a total of ninety-one LCACs. Four of the *Tarawa*- and all of the *Wasp*-class ships can accommodate up to eight Harrier jet attack aircraft, as well as helicopters, adding a new dimension. These amphibious assault ships with their embarked Marines have proved important in every large operation of the 1990s and their role into the next century seems assured.

AMPHIBIOUS WARFARE is the projection, transition, or movement of military force from sea against a hostile shore. As a form of warfare, it is as old as seaworthy ships.

Britain's grasp of amphibious warfare was one of the secrets of its empire-building. The American colonies had ample exposure to its uses prior to the Revolution. Not surprisingly, the Continental Congress foresaw amphibious as well as shipboard uses for Marines and authorized the raising of two Marine battalions on 10 November 1775 for a never-executed operation against Nova Scotia. The British, however, repeatedly moved amphibiously against the Americans, but the one large-scale operation attempted by the Americans against Fort George at Penobscot, Maine, in July 1779, was a failure, chiefly because of squabbling between the naval and land force commanders. More successful were amphibious raids conducted by the *Continental navy against the British in the Caribbean and even against the British home isles.

The British gave the Americans further lessons in amphibious warfare in the *War of 1812 with their harrying of the Atlantic Coast, which included the burning of Washington and the failed attack against Baltimore. The war would see, however, the humiliating defeat of Britain's largest amphibious expedition of the war. Sir Edward Pakenham executed a technically superb landing and approach to New Orleans in December 1814, but in a final, overconfident attack against Andrew *Jackson in January 1815, he met his own death and disastrous defeat.

In the *Mexican War (1846-48), the United States made singularly enlightened use of amphibious warfare. Not only were there a series of highly successful amphibious raids and lodgments against the California and Gulf coasts of Mexico, but the conclusive operation of the war hinged on the landing of Winfield *Scott's army at Vera Cruz in March 1847.

Most of the amphibious lessons learned in the Mexican War were forgotten by the time of the * Civil War, less than a generation later. Landing operations, often ineptly conducted, against Confederate forts and positions on the Atlantic and Gulf coasts were an inevitable extension of the Union blockade. As the war went on, successful Union

lodgments increased. The final large amphibious operation was the assault against Fort Fisher, which guarded the river approaches to Wilmington, North Carolina, the Confederacy's last remaining major port. The first assault, made in December 1864, failed. The second assault, in January 1865, after Grant's personal intervention in matters of command, was an overwhelming success.

During the remainder of the nineteenth century, the United States, increasingly involved in foreign affairs, found its navy making dozens of landings, amphibious operations in very rudimentary form, to "protect American lives and property" around the globe.

The *Spanish-American War (1898), because of the insular nature of Spain's colonial possessions in the Caribbean and the Far East, was largely naval and amphibious in nature.

Thereafter, the United States increasingly involved itself in interventions, in such places as China, Cuba, Haiti, Nicaragua, and Santo Domingo, of much longer duration than the transitory landings of the previous century. The experience of the Spanish-American War and the increasing professionalization of their officer corps caused the U.S. Navy and Marine Corps to give at least some attention to the development of the doctrine, tactics, and techniques needed for modern amphibious warfare. These largely experimental studies had an almost comic opera testing in the April 1914 landing at Vera Cruz.

In World War I with secure bases available in France, there was no requirement for amphibious operations to introduce the American Expeditionary Forces to the European battlefields. The sole great amphibious operation of that war, the Franco-British landing at Gallipoli in 1915, had ended in disaster for the invaders.

The experience of the first two decades of the twentieth century seemed to leave the U.S. Marine Corps with two destinies: to provide colonial infantry for the garrisoning of such places as Haiti and Santo Domingo, and to provide cloned augmentation of the U.S. Army in larger wars. Some Marine officers, most notably Lt. Col. Earl H. "Pete" *Ellis, and some fewer Navy officers studied War Plan Orange, the long-lived plan for the eventuality of a war with Japan, coupled with a study of the British failure at Gallipoli, and saw a need for specialized amphibious ships and troops and a doctrine to manage their use.

In 1934, a *Tentative Manual for Landing Operations* was published by the Marine Corps Schools at Quantico, Virginia. In the few years that remained before the entry of the United States into World War II, this tentative manual, tested in fleet exercises, was refined into a doctrine accepted by the U.S. Navy, the U.S. Army, and perforce all the Allies. The amphibious ships and landing craft needed to make the doctrine work also evolved, and were built in huge quantities.

The reentry of the Allies into Europe was predicated on a series of amphibious invasions, first of North Africa, then of Italy, and then of Normandy and the South of France. In the Pacific, with its vast watery spaces and limited land areas, amphibious operations were more often seizures rather than invasions. The abrupt end to the war precluded the planned amphibious invasion of the Japanese home islands.

The * Korean War saw not only the amphibious triumph of *Inchon Landing (September 1950) but also the very

successful amphibious withdrawal of the X Corps from Hungnam (December 1950).

In the "Vietnam War, there were no great amphibious assaults of defended beaches. The possibility of a great turning movement in the manner of Inchon, perhaps at Vinh, North Vietnam, was much discussed but never ventured. Amphibious techniques were used to land American ground forces in South Vietnam as a substitute for adequate port facilities, and there were many minor landings that attempted to catch the elusive Viet Cong along the coast.

The next large use of amphibious techniques was in the "Persian Gulf War during the buildup of American and Coalition forces in Operation Desert Shield (1990). When Desert Shield became Desert Storm and the allies went on the offensive to recapture Kuwait, U.S. Navy and Marine forces afloat in the Persian Gulf, although unused, posed a palpable threat to Iraq's seaward flank.

ANTIETAM, BATTLE OF (1862). The appointment of Gen. Robert E. "Lee as commander of the Army of Northern Virginia on 1 June 1862 helped reverse the momentum of the Civil War. Union armies and naval forces had won impressive victories along the South Atlantic and Gulf coasts and the river systems of Tennessee, Mississippi, Louisiana, and Arkansas, overrunning some 50,000 square miles of the Confederacy. In Virginia, Maj. Gen. George B. "McClellan's large and well-equipped Army of the Potomac had advanced westward up the Virginia Peninsula to within six miles of Richmond. The Confederate States of America seemed doomed. But during Lee's first three months in command, he launched a series of counteroffensives. In the Seven Days' battles and the battles of Cedar Mountain and Second Manassas, Southern victories shifted the war in Virginia from the gates of Richmond to the environs of Washington. Hoping to strike a knockout blow that would force the Lincoln administration to sue for peace, Lee decided to invade Maryland.

Great possibilities rode with the Army of Northern Virginia as it began crossing the Potomac River northwest of Washington on 4 September 1862. The most powerful nations in the world, Britain and France, were considering diplomatic recognition of the Confederacy; one more military victory would win that crucial goal. A large faction in the Northern Democratic Party wanted peace negotiations; another Union defeat might enable them to capture the House of Representatives in the fall. President Abraham "Lincoln had decided in July to issue a proclamation to free the slaves in Confederate states and was awaiting a Union military victory to announce it.

After the defeat at Second Manassas (Bull Run), Lincoln had merged the Union Army of Virginia into the Army of the Potomac and given McClellan command, ordering him to "destroy the rebel army." Cautious as always, McClellan probed northward along the Potomac. On 13 Sep-

tember at Frederick, Maryland, he had extraordinary luck: two Union soldiers found a copy of Lee's invasion orders wrapped around some cigars lost by a Confederate staff officer. Lee had divided his army into five parts, sending three under "Stonewall" "Jackson to capture the Union garrison at Harpers Ferry, which lay athwart Lee's line of communications with the Shenandoah Valley. If he moved quickly, McClellan could destroy the separated units piecemeal. He did not move quickly. Union attacks did overrun Confederate defenders in the South Mountain gaps west of Frederick on 14 September, but failed to save the 12,000 Union troops at Harpers Ferry, which surrendered to Jackson on 15 September. McClellan's tardiness enabled Lee to reunite most of his army along high ground east of the village of Sharpsburg—his left flank on the Potomac and his right on Antietam Creek. Although he outnumbered Lee by about 80,000 troops to 45,000, McClellan assumed that the enemy outnumbered him.

After deliberate preparations that gave Lee time to unite his army, McClellan attacked at dawn on 17 September. His plan called for a one-two punch against the Confederate left and right, followed by reserves to exploit whatever breakthrough might occur. The Union attacks were uncoordinated, enabling Lee to shift troops from quiet sectors to threatened points. During the early morning hours, assaults by six Union divisions on Jackson's corps were contained in vicious fighting in locales that became forever famous: the Cornfield, the West Woods, and the Dunkard Church. Meanwhile, the commander on the Union left flank, Maj. Gen. Ambrose "Burnside, tried to force his troops across a bridge over the Antietam instead of fording that shallow stream. In the center at midday, two Union divisions broke through Confederate defenses along a sunken farm road known ever after as Bloody Lane, but McClellan failed to exploit this success because he feared Lee's nonexistent reserves. Burnside finally punched across the Antietam in early afternoon and advanced toward Sharpsburg, threatening Lee's rear and his retreat route across the Potomac. But at about 4:00 p.m. Maj. Gen. A. P. "Hill's Confederate division arrived after a forced march from Harpers Ferry and hit Burnside's flank, halting the Union advance.

The sun set on the deadliest single day in the Civil War—indeed, in all of American history. Some 6,000 men lay dead or dying, and another 16,000 were wounded. The fighting was not renewed next day, and that night Lee retreated to Virginia. McClellan failed to follow up, but nevertheless claimed a victory. Britain and France did not recognize the Confederacy. Republicans retained control of the House in November. And five days after the battle, Lincoln issued his preliminary "Emancipation Proclamation.

ANTIMILITARISM. See Militarism and Antimilitarism.

ANTIPERSONNEL WEAPONS have been defined as being "designed to destroy or obstruct personnel." The first antipersonnel (AP) mine device activated by human foot pressure, a *fladdermine*, was described by a German author

in 1726. During the American * Civil War, Gabriel Rains (1803-1881) devised step mines activated by foot pressure and small AP devices set off when attractive items laid on the ground activated a cord attached to the buried mine. Despite outraged objections from critics in both the North and South, work on AP devices continued during that war. In World War I, the *tretmine*, or step-on mine, containing shrapnel, was used mainly in *trench warfare. Most early twentieth-century AP mines were intended to dissuade enemy personnel from disabling heavier antitank mines.

All modern mines have fuses, detonators, booster and principal charges, and a case; but they come in a variety of types. *Bounding fragmentation mines*, such as the German S-Mine (1935), sprang up to 2 yards above the ground before they exploded, effectively spewing metal to a radius of some 150 feet, though injuries were possible up to several thousand feet. The M-2 was the first U.S. mine of this type (1942). The M-3 *fixed*, or *nondirectional fragmentation mine* (1943) was an early example of a weapon that effectively spewed metal fragments to a distance of 30 feet, though some shards might travel for several hundred more. The Claymore mine, developed by the American Norman A. MacLeod in the early 1950s, was a *directional fragmentation mine*, utilizing several pounds of explosive to disseminate hundreds of irregularly shaped steel cubes. Lighter types were utilized by infantrymen in the *Vietnam War.

Blast mines achieve results through their bursting effect. Some of these are very lightweight, can be fabricated in the field, and have increasingly been made of plastic, glass, wood, and other nonmetallic substances, with nonmetallic fuses, rendering them virtually impossible to detect. The *wide area antipersonnel mine* (WAAPM) was a flanged metal sphere with tripwires spread by springs. Scatterable blast-kill, tripwire-activated mines, dispensed from magazines or drums on truck trailers, have seen much use since the 1970s. By 1996, there were some 2500 different types of AP mine and fuse combinations worldwide.

Detection of mines by hand or by hand-held detectors is still the most effective method, but it is labor-intensive. Vehicular clearing methods have entailed the use of flails, plows, and lightweight rollers. Breaching of minefields can also be done by electronic means, or by the use of explosives. By the late 1980s, more than 90 percent of casualties due to AP mines worldwide were civilians. And by 1995, approximately 110 million AP mines had been deployed around the world. In 1992, the U.S. Congress enacted a moratorium on the sale of AP mines, and the *United Nations and other nations have since done the same. In 1997, the United States refused to sign a multinational treaty banning the use of antipersonnel land mines because the U.S. Army uses such devices to protect American troops on the Korean peninsula.

ANTISUBMARINE WARFARE SYSTEMS are designed to defeat the warmaking use of enemy submarines. This is done through the destruction of submarine bases or construction facilities, and most commonly by seeking out and destroying hostile submarines themselves.

There are two operational approaches to antisubmarine warfare. The most direct is to detect, classify, locate, track, and attack hostile submarines. The more indirect is to deny hostile submarines access to their targets.

Actual antisubmarine warfare occurred mainly during the two world wars, although planning and practice operations have been a major part of U.S. naval operations in the *Cold War. Antisubmarine warfare in World War I was conducted particularly by the British and American navies against German U-boats. The British use of barriers of mines in the English Channel in 1917-18 was relatively ineffective in destroying German submarines, but it apparently forced them to take the more distant North Sea route to the Atlantic. Nor did the Royal Navy's shelling of U-boat bases on the Belgian coast do much damage. Much more effective was the combination in 1917-18 of the replacement of individual merchant ship sailings with the protected convoy system, plus the use of aerial and surface surveillance and then the destruction of submarines by British and American destroyers, frigates, and small subchasers dropping depth charges. The majority of the 159 German U-boats destroyed in enemy action were sunk by surface ships. By the summer of 1917, the British and Americans had greatly limited the effectiveness of the German submarine campaign.

During World War II, British and American efforts against German submarines were more sophisticated and much more extensive. Allied bombers raided U-boat bases, particularly on the French and Norwegian coasts, but failed to penetrate the concrete-roofed submarine shelters. However, after extensive German operations in the Atlantic in 1940-42, the Allies became increasingly effective in locating and destroying German submarines in the Atlantic, largely curtailing the U-boat menace by the end of the war. In part this was due to the protected convoy system, but in large part it resulted from the Allied decryption of the German submarine fleet's cipher (through *ULTRA) and the interception and location of U-boat radio traffic through high-frequency direction-finding equipment. Particularly effective was the Allied campaign to locate and destroy the "Milk Cows"—fuel replenishment submarines for the German underwater "wolf packs." The development of *radar and improvement of *sonar detection also aided the blimps and airplanes, frigates, and destroyers as they sought out enemy submarines and attacked them with depth charges. More than half of the 728 German U-boats destroyed in action were sunk by aircraft. In the Pacific, the U.S. *Navy sank 124 Japanese submarines (most of them by surface ships), while ineffective Japanese action resulted in the sinking of only 44 U.S. submarines. The Japanese proved unable to prevent American undersea vessels from imposing against Japan the most effective submarine blockade in history.

During the Cold War, the increased stealth provided by the development of nuclear-powered and quiet-running submarines posed major challenges. This became even more important when submarine-launched ballistic *missiles made the undersea boats a major factor in nuclear warfare. The U.S. Navy and other *NATO forces prepared major plans and weapons systems to detect and destroy Soviet submarines. Systems were stationed at particular strategic positions to track or deter Soviet submarines, for example, outside their bases or in the entrance to the North Atlantic between Iceland and Greenland.

Modern antisubmarine warfare is conducted by three major naval platforms: hunter-killer submarines; surface ships such as frigates and destroyers; and maritime patrol aircraft. Hunter-killer submarines use hull-mounted sonar as well as towed arrays to detect enemy submarines (by permitting listening at some distance from the noise of the ship itself); their principal weapons to destroy other submarines are heavy-homing *torpedoes. Modern frigates also have hull-mounted sonar and passive towed arrays, as well as depth charges to destroy submarines. However, the frigates also employ *helicopters, which can use dipping sonar and dropped sonobuoys (radio-equipped buoys) for detection, and which can attack the submarines with lightweight honing torpedoes. Aircraft use sonobuoys and magnetic anomaly detectors for locating submarines and lightweight torpedoes for destroying them. Against submarine, as well as aircraft or missile, attack, modern U.S. naval carrier task forces rely particularly on protection in depth, with an outer ring of detection and destruction systems provided on, above, and under the sea.

ANTITANK WEAPONS. Tanks first appeared in battle in *World War I. Their bolted armor plate protected crews, weapons, power train, on-board ammunition, and fuel against machine gun and artillery fire. Firepower was provided by artillery cannon and *machine guns. Full tracked, tractor-like chassis provided mobility to both weapons and armor, but mobility was considerably inhibited by trenches, shell craters, and Western Front mud. No antitank weapons specifically designed for that purpose were employed against 1917-18 tanks.

By *World War II, antitank weapons included rounds from high velocity cannon, shaped charge warheads on shoulder fired rockets, and antitank mines. Cannon, on towed mounts, tanks, or motorized gun carriages, were adaptations of artillery or air defense weapons. Cannon sought to defeat armor using explosive (blast energy), high velocity (kinetic energy), or shaped charge (chemical energy) warheads. Kinetic energy from high velocity rounds is a function of half the projectile mass multiplied by the square of projectile velocity. Shaped charge cannon warheads, similar to those of portable shoulder fired antitank rockets, are designed to defeat armor with a high velocity jet of extremely small particles formed from detonation of a cone-shaped explosive charge. Since penetration by shaped charge is a function of the diameter of the explosive cone, larger diameter charges promise greater penetration than smaller diameter warheads, where size and weight are limited by cannon caliber or the need for man-portability. Finally, antitank mines are designed to immobilize tanks, principally by damaging track and suspension gear. Armor had been improved to counter new antitank weapons. Welded seams replaced riveted joints, cast or rolled homogenous armor replaced boiler plate; all served to limit antitank lethality to ranges of about 1100 meters.

By the 1991 * Persian Gulf War, large diameter long range antitank guided *missiles, with acronyms like SAGER, TOW, HOT, MILAN, and HELLFIRE, guided by

wire, radio, or laser, fired from vehicles or aircraft, with effective hit-kill ranges of four kilometers or more, had been fielded. Shaped charge antitank mines, and small, self-forging penetrator warheads were employed for attack of less well protected areas, e.g. belly, sides, and tops of armored vehicles. Tank cannon rounds featured more powerful kinetic energy penetrators which, for the first time, were competitive with shaped charge warheads. Together with vastly improved fire control, day and night, these weapons more than quadrupled World War II lethal tank gun engagement ranges. To counter more lethal antiarmor weapons, armored vehicles featured armor with tougher penetration resistant materials, including ceramics and depleted uranium, and more effective, less penetrable, geometries, all logical extensions of the never-ending armor/antiarmor competition.

ANTIWAR MOVEMENTS. See Peace and Antiwar Movements, Vietnam Antiwar Movement.

ANZIO, BATTLE OF (1944). In the skillfully defended terrain of southern Italy, the Allies in November 1943 during World War II were advancing so slowly that they decided to go around the German defenses by sea, hoping to speed progress to Rome. In December, they canceled the planned amphibious venture because Anzio was too far ahead of the front to guarantee swift overland linkup with an isolated, vulnerable beachhead. Also, they doubted whether the ships remaining in the Mediterranean after a sizable number was transferred to England for Operation Overlord, the cross-Channel attack, could sustain the attack.

Prime Minister Winston *Churchill, who favored the Italian campaign over Overlord, received permission from President Franklin D. *Roosevelt to hold the ships scheduled to depart and in January 1944, reinstated the enterprise. By now, instead of depositing 14,000 men just ahead of the front, 110,000 were to land deep in hostile territory.

The different outlooks of Gen. Sir Harold Alexander, the British Army Group commander, and Lieut. Gen. Mark *Clark, the Fifth U.S. Army commander, confused expectations. As other units of the Fifth Army tried vainly to cross the Rapido River and penetrate the Gustav Line in order to start the cross-country movement to Anzio, troops of Maj. Gen. John Lucas's U.S. Corps achieved surprise at Anzio and waded ashore on 22 January 1944.

Should Lucas have driven inland 20 miles to the Alban Hills, the last natural barrier on the southern approaches to Rome and tried to enter the undefended capital, as Alexander desired? Or should he, as he would choose to do, have built up port and depot facilities to secure supplies coming by sea from Naples, as Clark wished? The questions inspire controversy today.

German troops rushed from northern Italy, the Balkans, southern France, and Germany contained the beachhead, then attacked to eliminate it. From the Alban heights, they had excellent observation of the Anzio plain, and their artillery and aircraft pounded Allied positions and the ships offshore. In fierce and close range fighting, the Germans pushed back the VI Corps almost to the water's edge. Reinforcements from the main front enabled the Allies to hang on.

Four months later, Alexander brought most of the

British Eighth Army across the Apennines to bolster Clark's forces, then launched a massive offensive on 11 May. These units made contact on 25 May with the VI Corps, now commanded by Maj. Gen. Lucian Truscott, Jr. As the two fronts joined, the Germans gave way, and the Allies entered Rome on 4 June, two days before the Overlord D-Day.

Allied "casualties in the Anzio beachhead numbered around 25,000; losses in the forces advancing to join the beachhead totaled an additional 25,000.

ARCTIC WARFARE. Characterized by subzero temperatures, rapidly shifting weather fronts, and vast expanses of tundra or icefields, the arctic is an especially hostile environment in which to conduct combat operations. The severity of conditions dictates that military operations differ markedly from those in more temperate regions. Virtually all operations are performed by highly trained, specially equipped light infantry units, skilled in the use of skis, snowshoes, *ahkios* (sledges, either man- or dog-drawn), and, more recently, snowmobiles and tracked personnel carriers.

Prior to 1941, the U.S. military had little experience of arctic warfare. However, in World War II, the military established outposts in Newfoundland, Danish Greenland, and Iceland, from which aircraft were transported to Europe and from which air and sea patrols provided escort, weather intelligence, and early warning for convoys bound for Britain and the Soviet ports of Archangel and Murmansk. In the Pacific theater, some 58,000 troops were stationed in Alaska and islands of the Aleutian chain located along the shortest route from the United States to Japan in terms of defense, and to Vladivostok in terms of Lend-Lease shipping headed to the USSR.

In June 1942, a Japanese invasion force under Adm. Kakuiji Kakuta launched air raids on the U.S. base at Dutch Harbor on Unalaska Island, and captured the islands of Attu and Kiska. Not until May 1943 did a joint U.S. task force under Adm. Thomas C. "Kinkaid and Maj. Gen. Eugene Landrum recapture the island of Attu after almost a month of heavy fighting. Of 2,300 Japanese defenders, only 29 survived; many took their own lives. U.S. losses totaled 549 killed and 1,148 wounded in action. The Japanese garrison on Kiska evacuated without a fight.

During the *Cold War, the United States saw the arctic regions as a first line of defense against aerial attack from the Soviet Union across the pole, and undertook the construction (1950s) of remote "radar detection sites close to the Arctic Circle. The DEW Line, a chain of fifty-seven radar sites stretching from Iceland to Alaska, was designed to provide distant early warning (DEW) of manned bomber or intercontinental ballistic missile (ICBM) attacks. The DEW Line (1957) supplemented the Mid-Canada or McGill Line (1955) of microwave detection sites and the Pine Tree Line (1954) of thirty-four radar stations that straddled the U.S.-Canada border. These defenses were supplemented (1958-60) by ballistic missile early warning (BMEW) sites at Thule, Greenland, and Clear, Alaska. The Strategic Air Command also established forward-placed bomber and interceptor bases in Thule and in Elmendorf, Alaska.

The U.S. Army in the 1980s and 1990s maintained arctic training facilities at Alaskan Forts Wainwright and Richardson and reactivated the 10th Mountain Division—specially trained in winter warfare techniques—at Fort Drum, New York.

ARMED FORCES RESERVE ACT (1952). The Armed Forces Reserve Act of 1952 was a response to the severe weaknesses in the U.S. reserve forces and inequities for veterans revealed by the partial "mobilization during the "Korean War. Pressured by reserve and veterans' organizations, Congress sought to improve reserve organization and most immediately to restrict the vulnerability of Korean War veterans to future service. The act established three categories of reserve forces—ready, standby, and retired—subject to different liabilities for mobilization. The most important of those categories, the ready reserve, was authorized a strength of 1.5 million personnel, including the entire National Guard. The ready reserve could be mobilized in a national emergency declared by the president. The act allowed individual reservists and Guardsmen to volunteer for active duty. That enabled the armed forces to use them in routine peacetime operations and contingencies without incurring the political and diplomatic risks associated with mobilizations. The act strengthened the influence of reserve and Guard officers in the military planning process.

• Eileen Galloway, "History of U.S. Military Policy on Reserve Forces, 1775-1957," 1957. Charles J. Gross, *Prelude to the Total Force: The Air National Guard, 1943-1969*, 1985.

—Charles J. Gross

ARMED SERVICES LOBBYING ASSOCIATIONS. Voluntary organizations designed to support a specific branch of the American military have always existed in the United States. In the nineteenth century, many groups organized along specialist lines to publish professional journals and bring together active duty and retired military personnel. Real influence on military policy did not come until the twentieth century, when lobbying associations were formed for each armed service. These modern associations defined their primary purpose as lobbying Congress, explaining defense issues to the public, and working in close alliance with the branch of the armed services they represent. Such private, dues-collecting organizations often brought intraservice rivalries into the political arena. By the 1960s, they were considered part of the "military-industrial complex, allowing defense industry advertising to subsidize their publications. Though their opponents tended to exaggerate their power to influence policy, reserve organizations served as critical links between the service branches, the public, and Congress during times of open debate over military policy.

The nation's oldest military lobbying association is the National Guard Association (NGA). Maj. Gen. Dabney H. Maury, a former Confederate officer, organized the NGA in 1878 after the militiamen of the West Virginia National Guard refused to fire on strikers in the Great Railroad

Strike of 1877. The NGA, an organization of National Guard officers, had two early goals: better training and funding for internal policing duties and recognition of the National Guard as the country's main ready reserve for national defense. At first the boost in funding came primarily from state governments, though the federal government gave the Guard substantial grants-in-aid by loaning materiel for training camps. Federal funding increased when Congress recognized the Guard as the first line military reserve in the Dick Act of 1903 and other *Militia Acts, and in the *National Defense Acts of 1916 and 1920. The NGA lobbied successfully throughout the twentieth century to preserve this reserve status, though the cost has been increased supervision and control by branches of the federal armed forces.

The Navy League organized in 1902 when similar professional groups designed to unite civilians and others interested in naval issues appeared throughout Europe. Never numbering more than 19,000 in its first 50 years, the Navy League had many prominent businessmen and industrialists as members. The League pressed continuously for larger naval appropriations and often provided sympathetic members of Congress with critical statistics when naval legislation was pending. The U.S. *Navy depended heavily on the Navy League to defend its policies. During the isolationist 1920s and 1930s, the League recorded its greatest success by keeping interest in a naval shipbuilding program alive. In the *Cold War, the Navy League promoted the navy's concerns about the policy of massive retaliation and its competition for appropriations with the army and air force.

The Air Force Association (AFA) was founded in 1946 by Gen. "Hap" *Arnold to provide the Army Air Force with an effective lobbying group. The new organization drew on well-known war heroes, such as Gen. James *Doolittle and Hollywood actor James Stewart, to bring attention to the importance of airpower issues. The AFA enjoyed an immediate victory when the independent U.S. Air Force separated from the army in 1947. Two years later, the AFA successfully opposed the navy during the "Revolt of the Admirals" against the cancellation of their supercarrier in favor of the B-36 bomber. More recently, AFA opposition to a controversial 1995 Smithsonian exhibit on the atomic bombings of *Hiroshima and Nagasaki initiated a highly publicized debate. This led to a complete reorganization of the exhibit, which the AFA and its supporters in Congress charged was too sympathetic to Japanese victims of the atomic bomb blast and failed to present the full horror of Japanese * aggression and violence in Asia. Membership in the AFA has ranged from a low of 40,000 in the mid-1950s to a high of 230,000 in the late 1980s.

The Association of the U.S. Army (AUSA) was founded in 1950 when two of the army's older organizations, the Infantry and Field Artillery Associations, merged. Senior army leaders feared that branch parochialism was undermining funding for an adequate land force, and wanted an organization that would help the army speak with one voice to Congress. AUSA absorbed the Antiaircraft Association in 1955. The 100,000-member association drew retired army generals to its board, and until 1956, AUSA leadership consisted of uniformed soldiers. The difficulty confronting active duty personnel in openly debating army policy with Congress caused the AUSA to restrict key lobbying and policy positions to nonactive duty members.

Like the AFA and Navy League, the AUSA publishes a professional magazine to evaluate contemporary doctrinal and funding issues, organizes local chapters, holds annual conventions, and provides experts to testify at congressional hearings.

ARMORED VEHICLES. The evolution of armored vehicles, cars, and personnel carriers has paralleled the development of the tank. In World War I, to overcome the stalemate of the western front, and break through the mud, barbed wire, and * machine guns, the British and French developed a fully tracked, armored, heavily armed vehicle—the tank—in 1916. This was followed closely by the armored car and other hybrid car/track combinations. Though the tank might provide shock value, it lacked the speed and mobility for reconnaissance and patrol; other armored vehicles would take over these traditional roles of cavalry. Lightly armored cars equipped with machine guns were used successfully by the British in Mesopotamia.

Between the wars, the U.S. Army began to develop armored vehicles. Brig. Gen. Adna Chaffee in particular saw armored cars as part of a greater effort to mechanize cavalry functions. Some results of this experimentation were the M8 Scout Car and the M3 Armored Half-Track that the U.S. Army would use in World War II in cavalry, tank, infantry, and artillery units. The M8 (wt: 7,485 kg [16,500 lbs]; spd: 90 kmh [55 mph]; arm: 37mm gun/2x mgs, 7.62 and 12.7 mm), manufactured by Ford, was a wheeled, lightly armored reconnaissance vehicle that was one of the first effective replacements of light horse cavalry. It was adopted in 1943. The M3 Armored Half-Track (wt: 8,872 kg [19,558 lbs]; spd: 70 kmh [45 mph]; arm: 2x mgs, 12.7 and 7.62mm), manufactured by Autocom, Diamond T, International Harvester, and White, was a revolutionary vehicle in that it represented an early armored personnel carrier for U.S. infantry. An all-purpose weapons carrier, the M3 would carry a variety of weapons and was adopted by the U.S. Army in 1940. Mechanically as well, the M3 was novel in that it had wheels mounted in front used to guide the vehicle while rear-mounted tracks provided propulsion.

Since the end of World War II the U.S. military has been at the forefront in armored vehicle development, which centers on two areas: cavalry and infantry. These vehicles are lighter than tanks, speedy, lightly armed and armored, and less expensive to purchase and maintain. Two vehicles in particular have been revolutionary in their impact on armored warfare in the late twentieth century. The M113 Armored Personnel Carrier and the M2/3 Cavalry/Infantry Fighting Vehicle (Bradley). The M113, currently manufactured by United Defense, was a product of the 1950s, one of the first successfully fully armored infantry vehicles; over 74,000 were produced worldwide. The Bradley M2/3 (wt: 29,940 kg [65,868 lbs]; spd: 61 kmh [38 mph]; arm: 25mm gun, 7.62mm mg, tube-launched, optically-

tracked, wire-guided weapon system), manufactured by FMC Corporation, holds nine infantry or five cavalrymen and was adopted by the U.S. Army in 1981, replacing the M13 series. Despite early fears of compatibility and problems with transmissions and weight, the Bradley proved its worth in the *Persian Gulf War.

ARMS, RIGHT TO BEAR. The Second Amendment's brief but tangled declaration that "[a] well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed" remains among the Constitution's most controversial provisions.

The modern debate centers on whether the amendment safeguards individual rights or whether it merely preserves a state's right to maintain militia forces (the "collectivist theory"). English antecedents not only allowed the possession of arms by the male citizenry, but also frequently compelled it, and many American colonies followed suit.

The amendment itself, however, arose out of Antifederalists' fears about the oppressive potential of a central government protected by a standing army. Cognizant that standing armies often aided European tyrants, and recalling the repression British regulars enforced prior to the revolution, the framers were leery of professional militaries. They were also concerned about the enormous expense of sustaining a full-time force.

Nevertheless, influential leaders like George *Washington insisted that some professional forces were required. The compromise reflected in the Constitution provides for both a full-time national military and part-time state-based militias. The Second Amendment, the Supreme Court said in *U.S. v. Miller* (1939), was intended to "assure the continuation and render possible the effectiveness" of these militia, which were meant to counterbalance the dangers of a standing army, as well as to provide a cost-effective supplement to the nation's defense.

According to the Supreme Court in *Miller*, the amendment extends only to "ordinary" militia arms. The Militia Act of 1792, for example, required the maintenance of little more than a musket and bayonet, small arms that the ordinary male citizen would have at home in the 1780s and could physically "bear."

Eighteenth-century warfare was organized around the massed effect of such relatively simple personal weapons. Over the next two centuries, however, the nature of warfare shifted and the strategic value of small arms declined. Today, civilians equipped with small arms hardly counterbalance the heavy weaponry of military professionals.

Twentieth-century American laws limiting the right to bear arms are largely a response to the rise in firearm-related crime and are usually upheld by the courts. Many follow the collectivist theory and hold that the amendment only shields state-organized militias. Others, like the *Miller* decision, find that an individual's possession of a particular weapon is unrelated to a militia's "preservation or efficiency" and can therefore be controlled. Following the Supreme Court in *Presser v. Illinois* (1886), most courts sanction state firearms restrictions by declaring that the amendment bars only federal interference.

Despite these rulings, polls show that an overwhelming number of Americans believe the U.S. Constitution guarantees them the right to own a gun. Indeed, 80 million Americans own firearms, primarily for sporting or safety purposes. The absence of any recent Supreme Court cases addressing the Second Amendment, as well as new arguments in the 1990s that a right to bear arms might exist in the penumbra of the Ninth or Tenth Amendments, seems to assure that the nature and scope of the right to bear arms will remain contentious in the United States.

ARMS CONTROL AND DISARMAMENT: NON-NUCLEAR. "Arms control," or "arms limitation," generally refers to efforts to refigure arsenals or to limit their growth. "Disarmament" refers to more ambitious efforts to reduce or eliminate certain weapons. Historically, disarmament efforts came first. The *Rush-Bagot Agreement of 1817 between Great Britain and the United States disarmed the Great Lakes and gradually made the U.S.-Canadian boundary the longest undefended border in the world.

The idea of negotiating disarmament among sovereign nations in peacetime is relatively recent. In 1899 and 1907, Czar Nicholas II of Russia instigated The *Hague Peace Conference with the declared aim of ensuring universal peace and reducing excessive armaments. The Czar's motives were not entirely altruistic. He hoped to freeze the military modernization efforts of the Austro-Hungarian and German empires and cause them to spend on industry and commerce, not armaments. The Conferences outlawed the use of dum dum bullets and asphyxiating gases; regulated the use of underwater mines; improved arbitration procedures; and codified certain laws of war. However, the disarmament goals were unfulfilled because of fears of eroding national sovereignty and suspicions that others would gain strategic advantage.

Following "World War I, assertive, widely supported *peace and antiwar movements emerged, dedicated to promoting general disarmament among the major powers. The public drew the lesson from the prewar Anglo-German naval race that arms races led to war. Disarmament would eliminate the means to wage war and also restrain weapons manufacturers, at the time called "merchants of death," who were thought to profit from and to stimulate war. In the United States, an unprecedented movement to disarm emerged. The idea that maintaining peace required arms reductions was enshrined in President Woodrow *Wilson's famous *Fourteen Points (1918).

The *Treaty of Versailles, negotiated after the war, imposed on Germany the most complete and rigorous disarmament in modern history. It severely restricted Germany's army and navy, forbade aircraft and *submarines, and drastically curtailed the manufacture, import, and storage of arms. However, general disarmament did not occur.

The first extended effort to limit arms in the history of the United States were the treaties negotiated to end the naval competition among the United States, Great Britain, and Japan in Washington in 1922 (the *Washington Naval Arms Limitation Treaty), and the London Conferences of

1930 and 1936. In 1921-1922, invoking the analogy of the Anglo-German pre-World War I naval race, Republican Senator William Borah generated passionate public support for naval limitation to halt a competition in building among the three great naval powers. Borah argued that the arms race was the basic cause of World War I and of war in general. Borah's views echoed popular conceptions. They also meshed with demands for economy and sound fiscal policy. Businessmen welcomed arms limitations to reduce spending and lower taxes. Isolationists were attracted to the prospect of arms reduction without alliance or the "League of Nations. There was even some support with the U.S. naval establishment that helped to mute the impact of naval opposition. Naval limitation fit well with America's desire for peace and a strong economy, and with its isolationist sentiments. Over the course of fifteen years, the leading naval powers limited their navies, established spheres of influence in the Pacific, and pledged to uphold the territorial and administrative integrity of China, the naval treaties initially diffused tensions but cooperation began to collapse by the late 1920s under the pressures of worldwide depression, the Nationalist unification of China, and German rearmament.

Further the 1932 Geneva World Disarmament Conference fell victim to European politics. France would not disarm for fear of losing military superiority over Germany. After France conceded to arms equality with Germany, Adolf Hitler became Chancellor of Germany, scuttling any hopes for disarmament.

Given the failure of disarmament efforts in the 1920s, 1930s, and after "World War II, the idea of disarmament fell from favor. In the late 1950s and 1960s, "new thinking" on arms control emerged, chiefly in the United States, partly in response to early failures at disarmament within the United Nations framework. "Arms control" diverged from traditional disarmament doctrine in its emphasis on managing the U.S.-Soviet rivalry and fostering strategic stability between superpowers with growing arsenals. The goals were to reduce the probability of war, reduce the destructiveness of war should it occur, and to save money. Arms control might or might not reduce levels of armaments. Arms control also came to encompass measures to verify compliance, to build confidence among states through measures that increase transparency over military exercises, deployments, budgets, and doctrine, and to reduce the risk of accidental war.

Post-World War II conventional arms control was overshadowed by its nuclear counterpart, emerging on the east-west agenda only in 1973 with the Mutual Balanced Force Reduction (MBFR) talks. In 1966, U.S. Senator Mike Mansfield called for unilateral reduction in U.S. forces stationed in Europe and this catalyzed both U.S. and Soviet leaders. The "Nixon administration feared the impact on western defense and "NATO's viability; Soviet leaders feared that large-scale reduction in U.S. forces would lead to an increase in German forces. MBFR, however, was largely a stalemated process, foundering as past conventional arms control efforts had on the difficulty of defining parity given asymmetries in geography, force structure, and doctrine, and of constructing a verification regime, particularly for manpower. The Soviet Union opposed Western calls for asymmetric troop reductions to compensate for geographic proximity. Not surprisingly, more progress was made in promoting "soft" arms control, or

confidence and security building measures, under the Conference for Security and Cooperation in Europe (CSCE) process launched in 1975.

The Conventional Forces in Europe (CFE) negotiations produced more rapid progress. Begun in 1989, one month after the MBFR talks ended, CFE successfully concluded with the signing of the "CFE Treaty in Paris in 1990. The treaty is the first significant conventional arms control agreement to cover most of Europe from the Atlantic to the Urals. CFE benefited from the MBFR experience, but success stemmed largely from Soviet desires to address their dire economic situation and to close a perceived technological gap with the West. The treaty was modified after the break-up of the Soviet Union with the Oslo Document, and follow-up negotiations concluded with the CFE-1A Agreement of 1992. Despite its successes, CFE still confronts several thorny issues, particularly turmoil along Russia's borders, which have raised Russian concerns about flank limitations. CFE will also have to adapt to newly emerging European security issues including NATO enlargement, Russian and Turkish policy in the North Caucasus, Russia's future relations with former states of the Soviet Union, Russia's developing relationship with the West, and Russia's domestic political problems.

ARMS CONTROL AND DISARMAMENT: NUCLEAR.

During the Cold War, at the same time that the United States and the Soviet Union were engaged in a massive "nuclear weapons arms race, the two countries negotiated to limit that race. In the beginning, there was hope that these negotiations would, first, reduce the destructiveness of any war between the two; second, reduce their defense budgets; and, third, reduce the risks of war between them. Until the Cold War ended, however, only the last of these purposes was clearly served: The negotiations did help to manage the rivalry between the Soviet Union and the United States, to slow the global spread of nuclear weapons to other countries, to produce Soviet-American cooperation in fields other than arms control, and, eventually, to achieve detente and an end to the Cold War.

After the failure of the Baruch Plan in the Truman administration, serious negotiations began during the administrations of President Dwight D. Eisenhower and Premier Nikita Khrushchev in 1958. Except for a brief period at the beginning, little progress was made until after the "Cuban Missile Crisis of October 1962. Then, having come close to an exchange of nuclear-tipped missiles, Khrushchev and President John F. Kennedy made a determined search for ways to reduce the future risk of nuclear war. Because they had experienced dangerous delays in exchanging messages relating to the crisis, their first agreement was to install a "hot line" between Moscow and Washington for crisis communications.

Their next was to limit nuclear testing. Testing was essential for designing new weapons and had come to symbolize the nuclear arms race. Moreover, if no new countries learned how to make nuclear weapons because of a ban on testing, the chances of such weapons ever being used by others would clearly be decreased.

Gaining Soviet agreement to "on-site" inspection to

make sure a test ban was observed was a problem from the beginning. Because inspections were unnecessary to verify a ban on tests above ground, American negotiators proposed a ban on all tests *except* those underground. The Soviets at first rejected this as an inadequate alternative to a "comprehensive" ban on all testing. After Kennedy wrote to Khrushchev, appealed to the Soviets publicly in his famous American University speech of June 1963, and sent a personal representative to Moscow for negotiations, Khrushchev relented and agreed to ban all but underground tests. In 1996, long after the end of the Cold War, a comprehensive ban on all tests with provisions for inspections to assure compliance was finally agreed.

Efforts to find common ground continued under President Lyndon B. Johnson (1963-69) and Premier A. N. Kosygin, despite their assistance to opposing sides in the Vietnam War. Their common interest in preventing the spread of nuclear weapons to additional countries again produced agreement, this time in the Treaty on the Non-proliferation of Nuclear Weapons of 1968. Made permanent in 1995, the treaty now has as many members as the UN Charter. In it, nonnuclear countries promise not to acquire nuclear weapons and the five avowed nuclear powers—Britain, China, France, Russia, and the United States—promise not to transfer them.

Then came efforts to slow the U.S.-Soviet nuclear arms race by freezing the levels of intercontinental ballistic missiles and by prohibiting defenses against such missiles. Each side had sufficient weapons with which to retaliate against a first strike by the other and to cause "unacceptable damage" in retaliation. As a result, each was restrained from striking first by the risk of mutual suicide. However, if an effective defense against missiles could be built, the side having such a system (called an anti-ballistic missile system) could strike first without fear of a devastating missile retaliation by the other. Thus, both sides would race to build a missile defense and, if both did, neither would be better off.

Agreements to prevent this were negotiated during the Nixon administration (1969-74). In his inaugural address, President Richard M. Nixon announced an "era of negotiations." He and his national security adviser Henry Kissinger came to see Strategic Arms Limitation Talks (SALT) as a major element in a broad strategy of detente to reduce the risk of nuclear war, curb military budgets, and gain Soviet help in resolving disputes in regions of conflict such as Vietnam and the Middle East. The Soviets were not as cooperative on all these subjects as Nixon and Kissinger hoped, but they also wanted to reduce the risk of nuclear war. Negotiations produced improved relations between the two countries and a period of detente resulted. The biggest arms control achievements were the Anti-Ballistic Missile Treaty of 1972, permitting only limited missile defenses on each side, and a five-year SALT I interim agreement freezing the number of missiles and aircraft on each side capable of delivering nuclear weapons to the other.

Detente continued under President Ford but came to an end under President Jimmy Carter (1977-81). Carter had the opportunity to turn a Ford-Brezhnev agreement "in principle" into a SALT II treaty with more effective limits on warheads than SALT I. However, he wanted much more. He combined idealism about deep nuclear reductions with righteousness about Soviet failure to respect human rights and inexperience in both foreign affairs and

Washington politics. He tried for too much and botched the job—managing to alienate both the Soviet leaders and conservatives in the U.S. Senate whose support he needed to gain approval for the SALT II Treaty he negotiated. While the treaty was pending in the Senate, the Soviets invaded Afghanistan. Senate approval became not just doubtful but impossible.

President Ronald * Reagan (1981-89) pursued a major defense buildup rather than arms control. He called the Soviet Union an "evil empire" and proposed a "Star Wars" high-tech antiballistic defense known formally as the *Strategic Defense Initiative (SDI). His administration argued that the Anti-Ballistic Missile Treaty of 1972 did not apply because the technology of Star Wars was far different from that of 1972. Although, like Carter, Reagan was inexperienced in both foreign affairs and Washington's ways, unlike Carter, he opposed arms control negotiations with the Soviets. And he was very successful in gaining approval from Congress for a major anti-Soviet defense buildup.

Reagan was finally persuaded to begin arms control negotiations over Soviet missiles aimed at Europe rather than the United States, negotiations that had been promised to *NATO allies by Carter. Soviet leaders had deployed new accurate, intermediate-range missiles aimed at Europe without serious consideration of the possible European reaction, and were then outraged when their deployment produced a NATO consensus favoring U.S. deployment of new, accurate, intermediate-range missiles in Europe aimed at the Soviet Union.

By the end of 1985, Reagan was persuaded that a new Soviet leader, Mikhail Gorbachev, was a man Americans could do business with on arms control. This came about as the result of Gorbachev's "new thinking," plus the effective work of Reagan's secretary of state, George Shultz, and personal communications and meetings between Gorbachev and Reagan. Part of Gorbachev's new thinking was to understand that Soviet deployment of new missiles aimed at Europe was a great mistake because it reduced Soviet security by producing new, accurate American missiles that reduced the warning time to ten minutes for Soviet leaders to implement a retaliatory strike and get to bomb shelters.

The first Gorbachev-Reagan summit produced a joint communiqué agreeing that nuclear war could not be won and must never be fought. Eventually, the two sides agreed to eliminate all missiles with "intermediate" ranges (i.e., from 300 to 3,300 miles). The Intermediate Nuclear Forces Treaty of 1987 became the first true nuclear arms reduction treaty between the two countries. It cemented a new era of U.S.-Soviet friendship. Detente returned and cooperation in other fields was renewed.

Negotiations to reduce long-range (strategic) nuclear aircraft and missiles also started up again. These came to be known as * START, the Strategic Arms Reduction Talks. Again, Gorbachev was responsible for concessions that made agreement possible. But the treaty was not completed until after the fall of the Berlin Wall in 1989, an event that came to symbolize the end of the Cold War.

The START Treaty of 1991 was the first to reduce long-range nuclear aircraft and missiles. It was signed shortly before the attempted August 1991 coup by Soviet conservatives against Gorbachev. Seeing a much weakened central Soviet government and aware that Soviet nuclear weapons were dispersed in parts of the Soviet Union that might seek

independence, President George *Bush (1989-93) acted quickly to deal with short-range American and Soviet nuclear weapons, more widely dispersed around the world than the long-range weapons that had been the subject of the SALT and START agreements. Bush announced a global American withdrawal of nuclear weapons for artillery, and for ground-launched and ship-launched missiles wherever deployed in the world. He called upon Gorbachev to reciprocate.

Gorbachev matched Bush and went beyond him. For example, the short-range nuclear shells, bombs, and warheads withdrawn to Russia would total about 12,000 as compared with the Americans' 4,000. As a result, all short-range nuclear weapons were moved out of the territories of Soviet republics that later declared independence.

By 1996, however, legislators hostile to nuclear arms control treaties were in control of both the U.S. Senate and the Russian Duma, approval by both of which was necessary for treaties to become fully effective. By early 1999, the Duma had not approved START II, signed six years earlier by Bush and President Boris Yeltsin. And President Bill *Clinton had been unable to persuade the Senate to approve the Comprehensive Test Ban, negotiated during his administration and signed by him in 1996. This treaty, sought by Presidents Eisenhower, Kennedy, John, and Carter, as well as Clinton, would ban all future nuclear weapons tests.

Though slow-moving before the end of the Cold War, arms control negotiations clearly helped reduce the risk of nuclear conflict and bring an end to the Cold War. What their future will be in the post-Cold War world only time will tell.

ARMS RACE

- Overview
- Naval Arms Race
- Nuclear Arms Race

ARMS RACE: OVERVIEW

The term *arms race* has been used since the 1850s to describe periodic competitions between states to shift (or preserve) the balance of power between them by modernizing their weaponry and increasing the magnitude of various

arms stocks. However, it was not until the end of World War I that arms races were viewed as a special pathology of interstate behavior that required explanation. At a loss to account for a war whose duration and horror seemed inexplicable by the logics of political or strategic calculation, both politicians and the public seized upon the idea that arms competitions could assume a deterministic dynamic that made war inevitable. It followed that the best way for states to ensure that conflicts of this sort would not occur in the future was to regulate the building of armaments or, as it is known today, to practice arms control. President Woodrow *Wilson fought to include a commitment to arms control in the "League of Nations Covenant, and his sentiments received widespread bipartisan support. Even Senator William Borah, an ardent opponent of the League, argued that the postwar naval competition between the United States, Great Britain, and Japan had already begun to take on the characteristics of the prewar Anglo-German naval race. If not contained, it would lead to a cycle of threats and counterthreats that would eventually spiral upward into war, as fear and mutual hostility increased in proportion to the size of each side's arsenal.

The situation in which a state's attempt to achieve greater security by expanding its arsenal can, at the same time, decrease the security of its rival is known as the "security dilemma." The increasingly uncontrollable and volatile process of arms growth that can ensue as each state reacts to its rival's arms increases with increased suspiciousness about the rival's motives and an even greater increase of its own is termed the *spiral model*.

In 1960, Lewis Fry Richardson gave formal expression to this blind action-reaction vision of an arms race in a mathematical model that remains influential today. His model postulates that the rate of each side's arms increases is a simple function of its rival's increase in the previous period. Depending on the magnitude of each side's response, arms production either manages to achieve a stable rate of growth or accelerates until it can no longer be sustained, at which time war ensues. In keeping with the absence of foresight that animates the security dilemma, Richardson's model is basically deterministic: states react to each other as automata.

In the 1970s and 1980s, theorists attempted to formulate a richer, psychological account of the spiral model's dynamics. They argued that the real key to the perverse cycle of action and reaction lay in the operation of suboptimal decision-making biases and heuristics that are fundamental to human cognition. These cognitive limitations lead state leaders (1) to underestimate systematically the extent to which their rival's arms increases are driven by defensive concerns and internal, "pork barrel" politics and to assume that they are motivated exclusively by aggressive aspirations; and (2) to assume that the rival will appreciate the fact that it was forced to increase its military capacity as a defensive necessity. This leads to a psychologically driven propensity to interpret the rival's behavior as indicating growing hostility without showing any corresponding sensitivity to the implications of one's own actions. As a result, both sides' incentive to engage in preemptive or preventative war increases.

In the last twenty years, the emphasis of researchers has shifted from psychological biases to strategic calculation as the principal inspiration for arms races. Investigators looking at the nineteenth-century naval competitions be-

tween the British and the French; the naval competition between the United States, the Japanese, and to a lesser extent the British after World War I; and even the pre-World War I Anglo-German naval race—archetype of the spiral model—found each to be a calculated competition between a militarily weaker challenger state trying to increase its relative power and another militarily stronger state committed to defending the status quo. This rationalistic view of the arms race dynamic is partly corroborated by the fact that the state leaders involved often speak in terms of maintaining the balance of power and publicly commit themselves to not pursuing an open-ended building program. For example, in the U.S.-Japanese naval race of 1916-22, President Wilson emphasized that the U.S. building program would be discontinued as soon as an arms limitation agreement was achieved.

*Game theory, with its emphasis on rational expectations and complicated reciprocal effects, is a logical extension of the strategic calculation school, and its stylized models now underlie most theoretical work on arms races. Game theorists play down the role of psychological variables and argue that arms races are most frequently driven by a confluence of three factors: (1) the anarchic nature of the state system; (2) the presence of resources that permit both states to respond to the competitive incentives that it creates; and (3) uncertainty about the resources and motives of the rival state. Arms spirals tend to be seen as the product of severe (but rational) uncertainty regarding the ambitions and actions of the rival state.

Interestingly, given their close relationship with the “dismal science” of economics, game theorists tend to be more optimistic than their counterparts in the psychological or Richardsonian schools. Their most commonly used model, the repeated “Prisoners’ Dilemma,” suggests that states in protracted arms races, such as that between the United States and the Soviet Union, will eventually learn about the attributes and motivations of their rival and devise strategies that take advantage of the cooperative benefits offered by arms control. Game theorists even offer strategies by which a state can induce its opponent to slow or terminate an arms race. For example, they recommend demonstrating a resolve to build an amount of arms that effectively cancels out any advantage the opponent would gain, but no more. Unfortunately, there is little evidence to believe that every arms race is driven by the logic of the repeated Prisoners’ Dilemma. History suggests that different historical arms races are driven by “games,” or patterns of incentives, and not every type responds to a single strategy.

ARMS RACE: NAVAL ARMS RACE

Defined as intensive peacetime competition in the design and production of warships, naval arms races aimed at altering the balance of naval power between or among the states involved. All such arms races attempt to exploit

changing economic and technological conditions to gain military advantage. In the nineteenth and early twentieth centuries, most have sought to undermine the maritime supremacy of Great Britain until the Soviet naval challenge to the U.S. Navy in the 1960s and 1970s.

The ascendancy of the Royal Navy in the early nineteenth century rested upon geographical, social, and economic factors that no adversary could match by programmatic effort: an insular position astride the waters linking Northern Europe to the world’s oceans; a population inured to seafaring and shipbuilding, and thus a reliable source of naval manpower (the demands of military seamanship being, in this era, little different from those of maritime commerce); and a system of state finance tailored to ensure that the proceeds of Britain’s commercial economy would be available to support the king’s ships. The agrarian economies of the European Continent, and the mature technologies of naval warfare in the age of sail, offered scant leverage against such advantages.

In a tactical environment so stable that a well-maintained warship had a useful fighting life of half a century, the idea of a naval arms race could have no meaning. Even if a rival could contrive to outspend Britain on naval armaments for a period of years—a virtual impossibility for any state in need of a large army—the results would mean little when measured against the totality of such long-accumulated assets. The Industrial Revolution made naval arms races possible, in the first instance, by radically depreciating those assets. It destabilized a tactical consensus two centuries in the making, and raised the prospect that warships could be rendered obsolete by improvements in ship design or weapons technology. It also narrowed the gap in economic performance that separated Britain from its rivals, and increased the incentives for all advanced countries to maintain strong navies, by heightening the importance of trade and empire as elements of national success.

Observers first applied the metaphor of a “race” to naval arms production in the early 1890s. The principal contestants were thought to be Great Britain and its main rivals in the pursuit of empire, France and Russia—though many other nations, including the United States, embarked on naval building programs during this period. Most did so less from a desire to outbuild prospective rivals than because admiralties everywhere were finally achieving clarity about the optimal characteristics of modern warships. By the middle of the 1880s, thirty years of chaotic technological advance had transformed the battle fleets of the major maritime states into menageries of incongruent types, operating under a doctrine that envisioned fleet action as an impossible combination of disciplined gun duel and ramming *mêlée*. Uncertainty about virtually every aspect of naval armament and ship design was compounded by sharply rising costs. Construction of larger ships had fallen off everywhere, and disproportionately so in Great Britain, whose frustrations reached a climax in 1886 when the Admiralty suspended orders for new capital ships until their vulnerability to *torpedoes could be resolved.

The naval building programs of the 1890s marked an intensification of long-standing rivalries, driven by rising self-confidence that in turn rested upon a convergence of technical and doctrinal solutions to a number of long-standing problems of gun design, ships armor, fleet tactics, and particularly to producing modern *battleships. If the results were interpreted, a little too simply, as a “race”

among a few prime contestants, it was at least partly owing to the existence of a simple means of keeping score. Britain's Naval Defense Bill, put forward in 1889 in the wake of a study about the requirements for war with France, formally embraced the customary principle that Britain would maintain a navy "at least equal to the strength of any two other countries." "Strength," however, was now no longer a matter of informed professional judgment. It was to be measured directly, by counting the number of capital ships "of the newest type and most approved design"—a striking innovation reflecting the new sense of clarity that had descended upon naval affairs. The bill accordingly called for ten such battleships to be built over the next five years, along with forty-two *cruisers and eighteen torpedo gunboats, at a cost that doubled the annual rate of expenditure during the previous decade.

The Naval Defense Bill was intended to discourage Britain's rivals from embarking on building programs of their own. It failed. France announced new construction of similar scale and proportions in 1891 (its first major program since 1872). Russia, having laid down five new battleships between 1886 and 1889 (the first since the 1860s), added two more after 1890.

Britain included an eleventh battleship in its naval estimates for 1891-92, and two more in 1893-94—additions that still left the Royal Navy two ships short of its "two-power standard." The gap was finally closed in 1894-95 with the inauguration of a second five-year plan, calling for 7 new battleships (raised to 12 in 1895-96), 20 cruisers, and over 100 smaller craft. Thereafter, the British lead in capital ships was beyond the combined reach of France and Russia—though both continued to expand their navies for another ten years, until the ententes of 1904 and 1907 brought an end to the colonial rivalries that had given the contest its purpose.

The United States was at first less a participant in the race than an interested observer. It laid down three first-class battleships (its first) in 1890, though Congress insisted that the range of the ships be limited, so that no taint of imperialism attached to them. War with Spain in 1898 seemed to confirm the importance of a modern fleet, however, and thereafter naval building increased steadily, thanks in part to the strong support of President Theodore *Roosevelt. U.S. naval expenditures, which amounted to 7 percent of total federal spending in 1890, consumed 21 percent in 1905. By the eve of World War I, the U.S. fleet was third in the world.

It had been intended that it be second, behind only Great Britain. In the meantime, however, a new and unexpected rival had emerged in the form of the German High Seas Fleet. In contrast to the multilateral building programs of the early 1890s, which in retrospect resemble less a race than a festival of competitive modernization, the German effort was conceived from the start as a kind of marathon, whose distant finish line was defined by a bold and quixotic strategic calculus. To deter Britain from involving itself in a European war, contemporary theories of naval combat held that Germany would need a fleet of capital ships two-thirds as large—the smallest force deemed capable of winning a defensive fleet action. Beginning in 1898, Germany set out, on the basis of no experience whatsoever as a maritime power, to build such a fleet. Its naval leadership planned to lay down three ships per year for twenty years, with a program of regular replace-

ments thereafter. By 1918, Germany would dispose in perpetuity of a fleet of sixty modern battleships. To keep up, Britain would need to build ninety of its own, a burden that was judged impossible to bear, once the commitments required to sustain the empire were added to it. Other states reacted as well: one of the justifications for the expanded U.S. building program during these years was the need to deter German designs on South America.

The soundness of Germany's approach depended entirely on whether its calculations were correct, and whether they would remain correct for the two decades required to win the race. In the event, neither the economics nor the technology of naval armaments proved sufficiently constant. The building programs of the early 1890s had been helped by cost-cutting improvements in key ship-building components, above all, armor plate. By 1900, however, the cost of capital ship construction was again rising sharply, as naval guns, and the hulls and mountings needed to carry them, grew bigger and heavier. The price of a first-class battleship increased by about 20 percent between 1900 and 1905, an especially unwelcome development for Germany because, despite its inherent economic strength, its system of state finance remained hostage to social groups averse to the kinds of taxation needed to weather such increases.

These problems were made markedly worse by the launching, in 1906, of the HMS *Dreadnought*, a super battleship of radically new (and even more expensive) design that rendered all existing battleships obsolete. Compelled, in essence, to start over, and confronted by costs far higher than had originally been foreseen, there was little hope that the 2:3 force ratio required by German strategy could be achieved. In 1909, a German government went down to defeat in the Reichstag because it could not pass the tax reforms necessary to finance the construction of three Dreadnoughts per year. A few months earlier, Britain had declared its intention to build eight (a compromise, as Winston *Churchill remarked, between the Conservative demand for six and the Liberal demand for four). Although the race as such did not end, its outcome was increasingly foreseeable. When war came in 1914, Britain had twenty Dreadnoughts, Germany thirteen.

Particularly under President Theodore *Roosevelt, the United States joined the naval arms race. U.S. naval expenditures rose from 7 percent of total federal spending in 1890 to 21 percent in 1905. Focusing on battleships, the battle line of the U.S. Fleet had grown to thirty six ships by 1913 and ranked only behind both Britain and Germany in size.

The Great War brought an end to naval arms races. Navies have continued, in myriad ways, to try to outdo each other, but their efforts have never replicated the kind of tit-for-tat pattern that prevailed for a quarter century before 1914. A new naval race might easily have broken out in East Asia in the 1920s, involving Britain, the United States, and Japan, but all three nations quickly concluded that the costs would far outweigh gains that recent history suggested would be illusive at best. The result was the

* Washington Naval Arms Limitation Treaty of 1922, the first successful arms control agreement. More recently, naval arms buildups, like that embarked upon by the Soviet navy in the 1960s and 1970s in challenge to American naval supremacy, have been viewed not as independent phenomena, but as elements of broader military competition—a

pattern that is likely to continue as the capabilities of land, sea, and air forces grow increasingly interdependent.

ARMS RACE: NUCLEAR ARMS RACE

The United States, with Britain, developed atomic weapons during World War II and used them as a means to force Japan's early surrender. The first (and so far last) use of these weapons in hostilities came in August 1945 with the atomic bombings of *Hiroshima and Nagasaki. By then the seeds of the *Cold War were being sown as the two superpowers argued about the political reconstruction of postwar Europe. If the United States hoped that the Soviet Union would be sufficiently impressed by the destructive potential of a single bomb to become more conciliatory in its foreign policy, it was soon disappointed. Josef

* Stalin recognized that troops on the ground would determine the distribution of political influence in Europe and Asia, and he acted accordingly. By the time of Hiroshima he was already well informed about the American nuclear program, from sympathizers working within it, and he pushed forward with a Soviet program.

Suspicious between the two superpowers were too great for significant cooperation to prevent a nuclear arms race. They defeated an American scheme to place nuclear energy under international control (known as the "Baruch Plan"), presented to the *United Nations in 1946. As the Cold War intensified, the manufacture of American atomic bombs increased. In August 1949, far earlier than expected, the Soviet Union tested its first atomic device. From then on the United States could not escape the sensation of being in some sort of race, and this sensation influenced all decisions. The course of the nuclear age was no longer simply a matter of Western decision.

The first effect of the new situation was the decision to move from atomic weapons, based on nuclear fission, to hydrogen weapons, based on fusion. There were no obvious limits to the destructive capacity of thermonuclear weapons. Fearful of an inexorable march toward weapons and strategies of mass destruction, many of the most influential *atomic scientists opposed their development. President Harry S. *Truman overruled them, for now he could not be sure that Stalin would match any American restraint. In the event the first successful Soviet test of an H-bomb came not long after the first American test.

This did not mean that the Truman administration was convinced that nuclear weapons could play a domineering role in national strategy. Though the United States was on the verge of virtual mass production of nuclear weapons, when the * Korean War started in June 1950, stocks were still small and were not used in this conflict. The Truman administration saw nuclear superiority as a diminishing asset, for the Soviet Union would inevitably catch up. For

this reason, with the new North Atlantic Treaty Organization (*NATO), it set in motion a program of conventional rearmament.

This proved to be too expensive to implement completely. In January 1954, Secretary of State John Foster *Dulles announced what became known as the doctrine of *massive retaliation*. Dulles did not believe it was either feasible or desirable to develop local forces to counter Communist aggression at any of the many points where it might occur. He therefore argued the need to "depend primarily upon a great capacity to retaliate, instantly, by means and at places of our own choosing," implying nuclear attacks against Soviet cities.

The basic idea was to counter perceived Soviet advantages in conventional forces with American nuclear superiority, at least so long as it lasted. A couple of years later, Americans had good reason to believe that the period of their superiority was drawing abruptly to a close. Until now the United States had deployed its nuclear weapons on its powerful bomber force, to the point where the commitment of the USAF to the manned bomber had held back the development of long-range missiles. The Soviet Union had adopted a different approach, putting few resources into bombers and concentrating instead on missiles. In June 1957, it tested the first intercontinental ballistic missile (ICBM), but its program gained American attention with the world's first artificial earth satellite, Sputnik 1, launched in October 1957. This punctured American self-confidence in its technological advantages. For a while there was panic (from which President Dwight D. *Eisenhower remained commendably immune) as alarms were raised about an impending "missile gap." Now the Americans no longer had the luxury of wondering how to exploit their superiority, but the worry of what the Russians might do with theirs. In the event, and despite some embarrassing failures in tests, the American missile program surged ahead of the Russian (which was based on cumbersome designs) so that by the start of the Kennedy administration in 1961, the "gap" was in the other direction, with U.S. superiority.

John F. *Kennedy, and his energetic secretary of defense, Robert S. *McNamara, wished to back away from the doctrine of massive retaliation. They were reinforced in this view by their experience of the two most dangerous crises in the nuclear age. For some time the Soviet Union had been putting pressure on the West to abandon the outpost of West Berlin, situated in the East German heartland and a constant source of aggravation, as it was used as an escape route by disaffected East Germans. Kennedy resisted this pressure. In August 1961, a wall was constructed, dividing Berlin. While causing outrage in the West, it also eased the immediate crisis caused by the flow of refugees. The next year the discovery of Soviet missiles in Cuba led Kennedy to risk war by demanding their removal. After a tense week, the Russians backed down. Both sides were now deeply aware of the dangers of nuclear confrontation.

However, it was not so easy to reduce NATO's dependence on nuclear deterrence. As part of the earlier attempt to match *Warsaw Pact conventional strength, West Germany had been allowed to rearm. Germany had no intention of joining NATO in order to provide a battleground, so it required that its territory be defended at the East German border. If this could not be achieved through a conventional defense, then the task would fall to nuclear

deterrence. The prospect now loomed of Armageddon being triggered by any Warsaw Pact incursion from East to West Germany. American strategy was torn between an unaffordable conventional defense and an incredible nuclear deterrent.

Eventually a compromise was reached in the form of NATO's doctrine of **flexible response*. The basic idea was that the alliance should not move immediately to nuclear use but would do so if Soviet aggression could not be stopped by conventional military or political means. Before large-scale nuclear exchanges would be tried, it was envisaged that "tactical" nuclear weapons would be employed first.

Small nuclear weapons for battlefield use had been introduced during the 1950s and integrated with NATO's general purpose forces. At the time they represented an area of Western superiority, while the Soviet Union caught up with strategic weapons. It was hoped that concentrated enemy invasion forces would provide lucrative targets, but it soon became apparent that the same weapons could also help a Communist offense blast a way through NATO defenses. Nor would they be used "as if" they were merely hyper-efficient conventional firepower. Exercises in the mid-1950s indicated that use on a substantial scale by NATO alone would cause enormous * casualties among the population supposedly being defended. Later efforts by weapons' designers to reduce the collateral damage with more "tailored" munitions did not get round this problem. The main consequence would be as likely to start the processes of nuclear escalation a little earlier rather than restrict them to a limited level.

Winning a nuclear war would require disarming the enemy in a surprise, preemptive attack, destroying as much as possible of his means of retaliation on the ground, and intercepting any bombers or missiles that escaped before they reached their targets. The ability to execute such an attack was described as a *first-strike* capability; the capacity to absorb such an attack and then retaliate, a *second-strike* capability. A first strike would be the most demanding task ever to face a military planner. A first strike would fail if critical targets were not located or were not attacked effectively or if enemy missiles were launched on warning of an impending attack. Defenses might be able to cope with a limited second strike, but they would soon be overwhelmed by anything substantial. At all stages the devastating power of individual nuclear weapons left little room for a margin of error.

The development of the first submarine-launched ballistic missiles (SLBMs) in the late 1950s in the American Polaris program effectively defeated the first-strike concept. Submarines remained difficult to spot, track, and destroy. Even with advances in *antisubmarine warfare systems, the increased range of the missiles meant that *submarines could choose their patrol areas to maximize the problems faced by any attacker. By the end of the 1960s, the invention of multiple independently targeted reentry vehicles (MIRVs), a technique by which a large number of warheads could be put on top of a single missile, multiplied the problems that would be faced by ballistic-missile defenses.

The fear that the other side might obtain a first-strike capability, as much as a push for a national capability, began to drive the arms race. Instead of a competition to accumulate raw destructive power, national capability was

now seen to be largely technological in nature, and geared to gaining a decisive strategic advantage. Not only did this lead to constant and expensive innovation in weapons design and force structures; with both sides trying to anticipate each other's next moves, this could lead to them both fearing an imminent surprise attack in a crisis. As it became evident that neither side could achieve a first-strike capability, it became possible to think in terms of a stable nuclear balance. McNamara described the essential objective for U.S. strategic forces to be an *assured destruction capability*, which would leave no doubt that the result of a nuclear war would be the elimination of the enemy as a twentieth-century society. This set limits on the force levels required and the type of forces required. To achieve stability, both sides would need to follow the same approach, creating a condition of *mutual assured destruction*—which inevitably became known as MAD.

The situation was recognized through the strategic arms limitation talks, which began between the Soviet Union and the United States in November 1969 and produced agreements in May 1972. The Strategic Arms Limitation Treaty (SALT) of 1972 froze the number of missiles at current levels—at the time some 1,700 for the United States, but some 2,300 for the Soviet Union, which had been engaged in a major buildup in ICBMs since the mid-1960s and was beginning to overtake the United States in SLBMs. While these raw numbers did not recognize American technological advantages (and did not include the U.S. bomber fleet), they created a damaging impression that the process favored Moscow. This dogged efforts to conclude a second SALT agreement, and even when one was agreed in 1979, it was never ratified by the U.S. Senate because of a revival in Cold War tensions (and in particular the Soviet invasion of Afghanistan). President Ronald *Reagan was more ambitious, renaming the negotiations the Strategic Arms Reduction Talks (*START). They did not produce the dramatic cuts he sought until the Cold War was over.

In 1972, President Richard M. Nixon and Leonid Brezhnev had also signed the Antiballistic Missile (ABM) Treaty, which imposed strict limits on the number of defensive systems either side could deploy (no more than 100 launchers). In 1983, President Reagan appeared prepared to challenge the logic of this treaty when he launched his *Strategic Defense Initiative (SDI), to provide a shield against a nuclear attack. The technological problem he posed was not solved. As important was the president's view of SDI as an alternative to dependence on nuclear deterrence. Would it not be better, he asked, to "protect than to avenge." Unfortunately, SDI could also appear as an attempt to develop a first-strike capability and so a likely result was just another round in the arms race.

SDI was another symptom of a growing unease with the condition of mutual assured destruction. For the same reason, there was also an exploration of the possibilities of partial first strikes. One proposal was to aim for the enemy's political and military * command and control centers in so-called *decapitation* attacks, in the hope that leaderless forces would not launch their weapons. Assuming that such an attack could be executed, there would be risks of leaving the other side leaderless. With whom would it then be possible to negotiate an end to the war?

Another idea was to attack only land-based missiles in a *counterforce* attack, in the hope that it would remove the

most formidable part of the enemy arsenal with minimal civilian damage. However, such attacks would still cause massive civilian damage and so stimulate a ferocious retaliation. Furthermore, technological developments were improving bombers, cruise missiles, and SLBMs, so that even if ICBMs were lost, powerful and versatile forces would remain. Cruise missiles were pilotless aircraft, the descendants of the German V-1, suddenly rendered more potent by developments in engine design, miniaturization, and precision guidance.

The currency given to ideas such as these during the 1970s and 1980s in the United States reflected a fear that the Soviet Union had never accepted MAD and was seeking a real nuclear superiority. This was a particular problem given that it was the West that was most dependent upon a credible nuclear strategy, as a means of countering the perceived strength of the Soviet conventional forces facing NATO. Certainly Soviet thinking appeared to be based on the possibility of using the conventional phase of a war in Europe in order to prepare the basis (for example, by destroying NATO nuclear assets) for a decisive nuclear strike. The risk to the Soviet homeland (but not that of other members of the Warsaw Pact) would be limited by seeking an implicit deal by which the territories of both superpowers could be established as sanctuaries. If it looked as if the United States was preparing to strike at the Soviet Union, then Soviet doctrine would argue for a preemptive attack in order to limit the damage.

Soviet ideas for a "winnable" nuclear war were no more practicable than American, but they nonetheless prompted a Western response. The *countervailing* strategy was designed to deny the Soviet Union confidence that at any point in the ladder of escalation from crisis to all-out nuclear war, it could expect to so dominate the fighting that it would force NATO to surrender. In line with this, intermediate-range nuclear forces, including cruise missiles, were introduced into Europe. These stimulated powerful protest movements in Western Europe before their deployment began in 1983. However, not long after this, reformer Mikhail Gorbachev achieved dominance. Alarmed by the expense of the arms race, and anxious to improve relations with the West, Gorbachev in 1987 signed the INF (Intermediate-range Nuclear Forces) Treaty with President Reagan, which eliminated this whole category of missiles, including Soviet SS-20 missiles.

Two years later, in 1989, the Cold War was effectively over. By this time, both sides had over 10,000 strategic nuclear warheads. The political conditions were now propitious for more radical arms control. Moreover, with Russia now vulnerable to economic and political chaos, there was an incentive to decommission as many nuclear warheads as possible lest they become prone to accident or unauthorized use. By 1993, the START process was pointing to ceilings of 3,000 to 3,500 for each side. In 1997, further reductions of 1,000 were agreed. But by this time, the collapse in Russia's conventional strength meant that its parliament was reluctant to ratify such large cuts, and its military doctrine was moving to greater reliance upon nuclear threats.

The United States had become the most substantial conventional military power and had no need to resort to nuclear threats. For the same reason, potential enemies saw weapons of mass destruction as one of their few means of neutralizing this power. The United States was still unable to escape from the practice of deterrence.

ARMS TRANSFERS. Arms transfers—both imports and exports—have played a major role in American military history and defense policy since the founding of the nation. Initially lacking the capacity to produce all but the simplest of weapons, the American colonies and later the infant republic relied on imported European arms for their basic military needs. Guns supplied by France in 1778-83 helped to secure the American victory during the *Revolutionary War, and despite the subsequent development of indigenous arms industries, European arms continued to find service with American forces (including both sides during the *Civil War) until well into the nineteenth century. By 1900, however, the United States had become a major producer of all types of munitions, and, since then, it has been more a supplier to international arms markets than a recipient—a fact that has provoked periodic debate over the value, significance, and morality of arms transfers.

The debate over arms sales began in earnest during the interwar period following World War I. Prior to 1914, the United States exported relatively small quantities of munitions, and the private firms that dominated this traffic were subjected to few restraints by the government. In 1915, however, the United States began to produce vast quantities of weapons for foreign consumption—by one estimate, U.S. military exports rose from \$40 million in 1914 to \$1.3 billion in 1916 and \$2.3 billion in the succeeding nineteen months. At first, this remarkable effort was lauded as a significant contribution to the Allied war campaign; but later, as the immense scale of the carnage in Europe became known, many people concluded that the arms makers' desire for profit was itself a cause of conflict.

As the guns were stilled in Europe, world leaders set out to create a new international order based on consensus and negotiation—a task that was assumed to require curbs on the global arms traffic. Although the United States did not join the *League of Nations, fearing that membership would result in periodic entanglement in overseas conflicts, it did participate in a League-sponsored Disarmament Conference (1932-37) aimed at reducing global arms production. At the same time, antiwar organizations like the *Women's International League for Peace and Freedom campaigned for a public investigation into the munitions trade. Critical books and articles—most notably *The Merchants of Death* (1934), by Helmuth Engelbrecht and Frank Hanighen—further aroused public

opinion. Finally, in 1934, Congress established a Munitions Investigating Committee under the leadership of Senator Gerald *Nye of North Dakota to consider charges that American and European arms producers had conspired to instigate World War I in order to stimulate the demand for weapons.

The Nye Committee, as it was called, revealed that U.S. arms manufacturers often spread tales of imminent hostilities in order to play one buyer off against another; it failed, however, to demonstrate that they had conspired to ignite World War I or force the United States into the war. Although the investigation did not result in any legal action against American arms merchants, it did contribute to the mood of isolationism then sweeping the country, and helped ensure passage of the *Neutrality Act of 1935 (which compelled the president to impose an arms embargo on nations at war).

Although widely popular, the Neutrality Act and other expressions of isolationism appeared increasingly constrictive to President Franklin D. *Roosevelt as the Nazis in Germany began their quest for world domination. Roosevelt argued against repeal of the arms embargo in early 1939, but reversed his stance in September, when Germany invaded Poland. Two months later, when Congress repealed the embargo, Roosevelt authorized a series of "cash and carry" sales of U.S. arms to the European democracies. In 1940, he proposed a more ambitious program of arms transfers, under which the U.S. government would lend, lease, or donate military equipment to the nations fighting Adolf *Hitler. Our goal, he told the nation on 29 December 1940, is to make America "the great arsenal of democracy."

Ultimately, it was the commitment of American soldiers, rather than of American weapons, that was to turn the tide of war in Europe and the Pacific. But U.S. arms transfers under the Lend-Lease program (1941-45) enabled America's Allies—including the Soviet Union—to hold out for two years of unrelenting combat while American troops were trained for combat. All told, some \$50 billion worth of U.S. military equipment was furnished through this program, representing a vital contribution to the Allied victory.

The Cold War and Beyond. World War II was not followed, as World War I had been, by a wave of popular revulsion against American arms makers. Instead, U.S. military industries were viewed as a major source of America's overall strength. Thus, when U.S. allies in Europe began to feel threatened by growing Soviet aggressiveness, most members of Congress were prepared to support a new round of arms transfers along the lines of the Lend-Lease program. After the famous "Truman Doctrine" speech of March 1947 by President Harry S. *Truman on the need to resist Soviet *expansionism, Congress voted \$400 million in emergency military aid to Greece and Turkey. This outlay was soon followed by similar grants to other likely targets of Communist action, producing a stream of conventional military equipment to overseas friends and allies that was to continue undiminished for forty years. (Except for some technical assistance to Britain and France, the United States has not exported nuclear weapons or technology to any foreign country.)

In the first few decades of the *Cold War, U.S. arms aid was largely furnished to the *NATO countries in Europe and to key allies in Asia and the western Pacific (notably Australia, Japan, New Zealand, South Korea, and National-

ist China). Between 1950 and 1967, the United States supplied friendly countries with \$33.4 billion in arms and services under the Military Assistance Program (MAP), and another \$3.3 billion worth of surplus weaponry. The U.S. government also sold these countries \$11.3 billion worth of military equipment through its Foreign Military Sales (FMS) program—but the emphasis, in those early years of the Cold War, was on direct military assistance, not on sales.

Although the basic premise of American arms programs—to bolster the defenses of U.S. allies facing a military threat from the Soviet bloc—did not change over the years, many aspects of these programs were significantly altered. Whereas initially the bulk of U.S. weaponry was funneled to the industrialized powers of Europe and the Pacific, by the 1960s an increasing portion of it was being supplied to Middle Eastern and Third World countries. The primary impetus for this shift was the apparent Soviet success in using arms transfers to establish military links with Egypt (beginning in 1954), Syria (in 1955), Iraq (in 1958), and other developing countries. In order to combat the growing Soviet presence in the Middle East and Asia, Washington began supplying vast quantities of arms and ammunition to its own friends and allies in these areas—thereby stimulating fresh Soviet arms transfers to its allies, and so on, in what was to become an ongoing pattern of U.S.-Soviet competition.

At first, most of the U.S. and Soviet arms aid went to the Middle East. In the early 1960s, however, Washington began to focus considerable attention on Southeast Asia, where Communist insurgents had grown increasingly strong. As part of its effort to combat these guerrillas (and their supporters in North Vietnam), the United States provided \$18 billion worth of arms and military equipment in 1965-75 to the governments of Cambodia, Laos, South Vietnam, and Thailand. Substantial aid was also provided to South Korea and the Philippines in return for their agreement to supply troops for the U.S.-led counterinsurgency campaign in South Vietnam.

Although Washington was prepared to provide arms at no cost to its allies in Southeast Asia, it was not prepared to do so in other areas where key allies were capable of paying for their military imports. In order to stimulate overseas purchases of U.S. munitions—thereby diminishing America's balance-of-payments deficit and recouping some of its investment in weapons research—the Nixon administration barred grant aid to the industrialized countries and aggressively marketed U.S. arms through the FMS program. This new emphasis on military sales was first directed toward the states of Western Europe (which had by then recovered from the destruction of World War II) and later extended to the wealthier nations of Asia and the Middle East.

The continuing U.S. quest for allies and the growing emphasis on military sales soon led to a particular focus on Iran, then ruled by Shah Mohammed Reza Pahlavi. Eager to enhance his nation's regional power position while maintaining close relations with Washington, Shah Pahlavi ordered \$20 billion worth of U.S. arms between 1970 and 1978—at that time a record for military purchases by a developing nation. Iranian arms purchases were so massive that many in Congress became troubled by the scale of the U.S. sales program and its potential for abuse. Indeed, a 1976 report by the Senate Foreign Relations Committee

concluded that U.S. arms sales to Iran were “out of control.” This report, and others like it, led Congress—for the first time since the 1930s—to impose significant restrictions on U.S. arms exports (under the Arms Export Control Act of 1976).

The more restrictive approach favored by many in Congress was then adopted by President Jimmy *Carter when he assumed office in 1977. Arguing that the uncontrolled spread of conventional weaponry “threatens stability in every region of the world,” Carter announced a policy of “arms restraint” on 19 May 1977. During the next three years, he imposed a “ceiling” on the dollar value of U.S. arms exports to non-NATO countries. But growing tensions with Moscow (prompted, in particular, by the Soviets’ 1979 invasion of Afghanistan), coupled with the growing U.S. military commitment to Israel and Egypt, led Carter to abandon the ceiling in 1980.

Ronald *Reagan, who became president in 1981, repudiated what remained of Carter’s arms restraint policy and authorized stepped-up military aid to threatened allies abroad. “This Administration believes that arms transfers, judiciously applied, can complement and supplement our own defense efforts,” Undersecretary of State James Buckley explained in May 1981. In addition to aiding established U.S. allies through normal military channels, the Reagan administration (or elements thereof) also conducted clandestine arms transfers to Iran (then supposedly subject to an American embargo for its role in the Iran-Iraq War of 1980-88) and to anti-Communist insurgents in Nicaragua (after 1984 barred by Congress from receiving U.S. aid)—an endeavor that, when exposed in 1986, resulted in the scandal known as the “*Iran-Contra Affair.”

Throughout this period, U.S. arms exports were largely governed by Cold War priorities and a desire to reap the economic benefits of military sales. Between 1981 and 1990, the United States sold \$110.3 billion worth of arms to foreign buyers—far more than in the previous thirty years combined. But, once again, international events were to call these policies into question. When Iraq invaded Kuwait in August 1990, employing a massive array of imported weapons, many policymakers concluded that it was necessary to impose multilateral controls on the arms trade. With the support of President George *Bush, representatives of the five permanent members of the UN Security Council (the “P-5” powers) met in various locales in 1991-92 to develop mutual restraints on conventional arms exports.

Although initially supportive of the P-5 talks, President Bush drove them into limbo in September 1992 by announcing the sale of 150 F-16 *fighter aircraft to Taiwan—a move that prompted China to withdraw from the negotiations, which have not reconvened since. Bush then announced a number of other major transactions, raising U.S. arms exports to record levels. In approving these sales, Bush asserted that military exports were as important to the American economy as they were to American national security—an argument that had never been made so explicit before.

As a candidate for president, Bill *Clinton had voiced concern over the growth in American arms exports. Once in office, however, he embraced the more pragmatic stance initiated by his predecessor, arguing that arms sales were vital to U.S. economic health. On 17 February 1995, he announced a “Conventional Arms Transfer Policy” that

specifically identified economic concerns as a factor in arms export decision making. This announcement was followed by a series of major military sales to long-standing U.S. clients, including Egypt, Israel, Saudi Arabia, Turkey, and the United Arab Emirates.

Although, in the mid-1990s, American policymakers generally favored a relaxed policy on arms transfers, the historic U.S. concern over the moral aspects of such exports had not disappeared altogether. Many peace and religious organizations continued to argue that arms sales undermined American values and interests by enhancing the repressive capabilities of authoritarian governments, by fueling local arms races, and by encouraging states to seek military rather than negotiated solutions to their disputes with others. These concerns surfaced in a number of legislative proposals introduced by sympathetic members of Congress, and in occasional newspaper editorials. Whether they will have any impact on future policy remains to be seen, but such efforts are likely to continue as a significant feature of the national debate over foreign policy.

ARMY, U.S. *This entry consists of six articles that provide an overview and trace the basic history of the U.S. Army. The individual essays are:*

- Army, U.S.: Overview
- Army, U.S.: Colonial and Revolutionary Eras
- Army, U.S.: 1783-1865
- Army, U.S.: 1866-99
- Army, U.S.: 1900*1
- Army, U.S.: Since 1941

The overview outlines the basic characteristics of the U.S. Army. Subsequent articles describe the development of the army—its organization, personnel, equipment, doctrines, and actions—in five chronological periods. Extensive cross-references within and appended to these articles lead to more detailed information.

ARMY, U.S.: OVERVIEW

The principal land force of the United States, the U.S. Army traces its origins to the * Continental army of the *Revolutionary War. That army, a “national” force raised by the Continental Congress, had the mission of engaging British and Hessian regulars in essentially European-style combat, and was composed, insofar as its leaders could manage it, of long-serving volunteers. In these characteristics—an orientation toward conventional combat and a long-serving enlisted force—the Continental army set the pattern for its successor under the U.S. Constitution. The Army of the Constitution—the true United States Army—came into existence during the 1790s, amid bitter political war-

fare between Federalists and Democratic-Republicans primarily to meet the needs of frontier policing and defense. From that time, the existence of the U.S. Army has been continuous, although its strength has fluctuated widely.

From the Revolution, the American army included two components: the federally controlled professional "Continental" or "regular" army and the state militias of part-time citizen-soldiers. Most debates over American military policy centered on the relationship between these components and what role each should play in peace and war. States' rights and populist parties and movements tended to favor the militia; conservative, nationalistic elements supported the regulars. Complicating the issue was the fact that the militia of the eighteenth and nineteenth centuries was not a true army reserve. During wartime, its units turned out only for short-term local defense while furnishing men to temporary forces of U.S. *Volunteers, which campaigned alongside the regulars and in fact constituted the majority of the wartime army in the nineteenth century. During the last decades of the century, the volunteer state militia, the National Guard, began campaigning for the status of a genuine national reserve force, a status regulars were reluctant to concede as long as the Guard remained essentially under state control.

Beginning with the Dick Act of 1903 and especially the *National Defense Acts of 1916 and 1920, this issue was resolved through gradual federalization of the National Guard and other reserve components, culminating in today's "Total Army" concept. To some extent during the * Civil War, and more thoroughly during the two world wars and most of the * Cold War, the United States resorted to * conscription to fill all components of the army. In peacetime, however, volunteer military service has been the norm—a pattern reestablished with the end of the Cold War draft and the creation of the * All-Volunteer Force in the aftermath of the * Vietnam War.

Throughout its history, command of the army has been based on the principle of civilian control. During the nineteenth century, the president exercised his constitutional power as commander in chief through a civilian secretary of war who headed a War Department composed of a number of staff bureaus. The army lacked an effective uniformed head until 1903, when Secretary of War Elihu *Root persuaded Congress to create a chief of staff subordinate to the secretary of war but with authority over the staff bureaus as well as the line. Root also established a General Staff to provide the army with central planning and operational direction.

This system, although significantly revised and expanded during two world wars, persisted until the *National Security Act of 1947. Under that act and subsequent amendments, the War Department lost cabinet status to the new Department of * Defense and became the Department of the Army, with the mission of providing forces to multiservice joint commanders reporting to the *Joint Chiefs of Staff, of which the army chief of staff now was a member. As the army became increasingly enmeshed in a joint defense system, its internal administrative structure also changed, with the old bureaus disappearing into broader functional commands.

Throughout its history, the army has displayed doctrinal and tactical eclecticism and a command of *logistics. Strategically, it has tried to adapt effectively to the demands of both limited and total war; indeed, American of-

ficers understood the close relationship between policy and military strategy long before they began reading Carl von *Clausewitz in translation in the mid-twentieth century. In tactics and technology, the army until after World War II took its cues from Europe but adapted what it learned to the unique requirements of American campaigning. It kept abreast of and sought with varying success to assimilate the changing technologies of warfare, from the repeating rifle to *tanks, airplanes, and *missiles. Since World War II, the U.S. Army has led rather than followed in the evolution of military art and science, as attested by its success in complex combined arms warfare in the * Persian Gulf War of 1991. Faced from its earliest years with the need to support troops across the vast, economically undeveloped distances of North America, the army emphasized logistics and achieved a unique capacity for force projection. That capacity enabled it to discharge truly global missions during two world wars, the Cold War, and beyond.

The U.S. Army prides itself on being a "jack of all trades" among military services, able to do everything from waging continentwide warfare to feeding and housing disaster victims. In fact, it has done all those things and more besides. During most of its history, the peacetime standing army functioned primarily as a constabulary. It policed the frontier, maintained law and order, enforced *Reconstruction, governed overseas colonies, and responded to natural disasters. Its officers often were in the forefront of civilian as well as military scientific developments, for example, in engineering, medicine, and surgery. Yet its officer corps always kept sufficiently current in the art of *war to be able to raise citizen armies and lead them to victory in the nation's nineteenth- and twentieth-century conflicts. During the Cold War, the army received complex global missions, including forward defense and * deterrence in Europe and Asia, the waging of major local wars in Korea and Vietnam, and the provision of military advice and support to allies on every continent.

The end of the Cold War brought declining forces and budgets but no reduction in the variety of missions. The U.S. Army today continues to try to balance preparation for war fighting against the demands of international *peacekeeping and humanitarian intervention.

ARMY, U.S.: COLONIAL AND REVOLUTIONARY ERAS

In military terms, England's colonies moved slowly but steadily from amateurism to a kind of military semiprofessionalism in the century before the American Revolution. The militia, though often effective for social control and police functions, proved inadequate for participating in

the eighteenth-century imperial wars, since they were poorly trained, sometimes even lacking firearms, and were restricted by law to brief duty within their own colonies. The term *semiprofessional*, as used here, means forces that constituted a hybrid between the militia and a standing army. They comprised men who enlisted for a year or more in return for a bounty, served if necessary outside their own provinces, and faced stricter military law than that applied to the militia. They performed under officers who might aspire to military expertise, having read European treatises on training and tactics and having sought to learn firsthand from observing British officers in the field. Such provincial units, including Col. George *Washington's Virginia Regiment in the 1750s, were called upon to join intercolonial expeditions, possibly assigned to cooperate with British armies against French and Spanish citadels in the New World.

In some respects, the *Continental army during the *Revolutionary War at first appeared to resemble an extension of semiprofessional colonial forces. Except for several former British regular officers, most of its general officers had held provincial commissions in the final imperial conflict. In military justice, its Articles of War were less harsh than those of the British army. Its soldiers were enlisted for a year or less. But in 1776, the evolution of an American professional army continued, a process that saw it increasingly look like European military establishments of the day. These changes included longer enlistments, stricter martial law, more uniform tactical arrangements, and employment of Prussian and French military procedures and personnel. Friedrich Wilhelm von *Steuben, as inspector general, and Louis Duportail, head of the U.S. * Army Corps of Engineers, played critical roles in these developments.

Certainly, one reason that Washington and his abler subordinates learned quickly and had less to comprehend than would be true of commanders in a later age was that the nature of warfare scarcely changed in the mid-eighteenth century. Armies continued to move from column to line, employing linear formations in open battle, and engaging in siege operations when moving against fortresses and cities. (In a sense the War of Independence began with the siege of Boston and ended with the siege of Yorktown; and the most one-sided American defeat resulted from the successful British siege of *Charleston.) Moreover, British commanders who opposed American generals had been relatively junior officers themselves in the Seven Years' War (the *French and Indian War) and had seen hardly any active duty between the wars.

Nor did the Revolutionary War produce any new seminal military literature on either side. Officers still lacked a body of strategic doctrine to analyze a problem in systematic fashion. We find no parallel to what transpired in Prussia in the concluding stages of the Napoleonic era, where the War Academy stimulated the first modern analytical studies of conflict, highlighted by Carl von *Clausewitz's *On War*.

American army administration hardly anticipated future trends. The command system illustrates this point. Washington, as commander in chief, acted as the principal conduit of information between the army and its superiors in the Continental Congress. Always deferential to Congress and committed to civil control, the Virginian nonetheless remained candid with the lawmakers, even to voicing his disagreements with them. Since Washington

could hardly direct all theaters of operations, Congress created various regional departments as needed: New England, the northern, the middle, the southern, and the western. Congressional experiments with administrative oversight proved less than successful. The Board of War, in fact, received attacks from some in the army and in Congress for allegedly being hostile to Washington and wishing to replace him with Gen. Horatio *Gates, the victor at Saratoga in an overexaggerated episode known as the Conway Cabal.

Finally, in 1781, Congress created a war department, first headed by Gen. Benjamin Lincoln; but its powers were weak. Even so, it evolved into a substantial post late in the Confederation years. The second person to serve as war secretary, Gen. Henry *Knox, continued in that office under the new constitutional government in 1789.

If the army over eight and a half years—the longest American conflict before the *Vietnam War—displayed staying power, it scarcely hid its resentments toward Congress and American society, believing its sacrifices unappreciated. Lagging enlistments and *desertion led authorities to accept British prisoners, white servants, and African Americans in the service. Restlessness in the ranks grew worse because of inadequate provisions, clothing, and pay. Several regiments mutinied during the last years of the war. American leaders voiced more serious concern over the officers' discontent about Congress's failure to provide back pay and to make firm assurances of postwar pensions or lump-sum mustering-out bonuses. The senior officers remained loyal to the Revolution—with the notable exception of Benedict *Arnold—and this fact, along with Washington's shrewd response to the most vocal dissidents, explains the failure of the still somewhat mysterious *Newburgh "Conspiracy" in early 1783; but the rumblings and threats, mostly among field-grade officers, evaporated when Congress promised to move quickly on the officers' concerns.

With the end of the war in late 1783, the army disbanded peacefully. The principle of civil control of the military remained intact. That, unlike the results of so many revolutions, emerged as a great legacy of the American Revolution. And Washington, in this respect, proved a successful model for future American military officers.

ARMY, U.S.: 1783-1865

The U.S. Army as a permanent institution began on 3 June 1784, when the Confederation Congress approved a resolution to establish a regiment of 700 officers and men. Intended as a force to assert federal authority in the Ohio River Valley, the regiment deployed at a string of posts along the Ohio where it functioned as a frontier

constabulary during the last years of the Articles of Confederation era.

Congress adopted this tiny force after the reorganization of the government under the Constitution in 1789. Responding to the outbreak of Indian war in the Old Northwest—and especially to St. Clair's defeat in 1791, the worst setback at Indian hands in the army's history—the government expanded the military establishment to over 5,000 in 1792. Organized as the "American Legion" and commanded by Maj. Gen. Anthony Wayne, the army defeated the northwestern tribes at Fallen Timbers in 1794. During the same year, in response to European threats, the government launched a program of seacoast fortifications and added a corps of artillerymen and engineers to build and man them.

The army became the center of intense partisan controversy with the rise of political parties and conflicting ideologies. Federalists sought to maintain a relatively large regular force, while Democratic-Republicans opposed a sizable standing army that might require high taxes and threaten liberty. The result was a period of extreme instability in the army's size and structure. In 1796, the government reduced the army to 3,359. Two years later, however, the Undeclared Naval War with France led the Federalist Congress to expand the authorized level to over 14,000. Alexander Hamilton, appointed as inspector general and de facto commander of the army in 1798-99, strove to transform this force into a permanent, European-style standing army, capable of checking domestic opposition. This political role aroused intense suspicion, and in 1800, following the diplomatic settlement with France, Congress reduced the army to 4,436. After Thomas Jefferson and the Republicans won the election of 1800, they fixed the peace establishment at two regiments of infantry, one of artillery, and a tiny U.S. Army Corps of Engineers—a total official strength of 3,287. In 1802, they also established the U.S. Military Academy at West Point, New York, primarily to train future officers in military engineering.

Throughout Jefferson's administration, the War Department and the small regular army performed a variety of constabulary tasks: administering the Louisiana Purchase; regulating Indian-white relations; conducting diplomatic relations in the Spanish borderlands; and policing the Embargo Act against Great Britain and Napoleonic France. Meanwhile, deteriorating relations with Britain and France caused the Republicans to reassess their traditional antimilitarism, and in 1808, Congress authorized an increase to 9,921 officers and men. The onset of the War of 1812 continued the buildup, as the inadequacy of the militia for offensive operations left President James Madison little alternative but to expand the regular forces. The army's official authorized size reached 62,674 in 1814, although actual troop strength fell well short of this level.

The War of 1812 marked a major transition in the army's history. Until then, its dominant characteristics had been fluctuating size and organization, a high rate of turnover in the officer corps, and the absence of a clear sense of mission—conditions reflected in the poor military performance of the early war years. By 1814, however, the army's performance was improving, largely because of the rise of young, combat-proven commanders to high and middle rank, exemplified by Jacob Jennings Brown, Winfield Scott, and Alexander Macomb.

Although Congress cut the army to 12,383 in 1815,

many veterans remained in service, and they came to share a conviction that the army's chief mission should be preparation for a future war with a major European power. With the support of the Madison and Monroe administrations, they rationalized military management through permanent general staff bureaus, adopted uniform tactical manuals and regulations, launched a new and more systematic program of coastal fortification, and, under the direction of Capt. Sylvanus Thayer, revitalized the U.S. Military Academy. When Congress reduced the army to 6,126 in 1821, it tacitly followed a plan proposed by Secretary of War John C. Calhoun that called for a cadre organization: the retention of a high ratio of officers to enlisted men as a way to preserve military expertise and provide a framework for a rapid and efficient expansion in case of war (Skelton, 1992).

The reduction of 1821 was the last major cutback and reorganization of the army's basic establishment in the nineteenth century. It left a force of eleven line regiments under a major general with the title of commanding general of the army (a position held by Winfield Scott from 1841 to 1861), supported by a group of general staff bureaus—quartermaster, engineers, subsistence, ordnance, medical, and pay—reporting directly to the secretary of war. During the decades that followed, the army was usually dispersed at small garrisons along the frontiers and the Atlantic seaboard, where it continued to perform its customary constabulary duties. In particular, regulars enforced the Indian trade and intercourse laws and served as the government's principal instrument for conducting Indian removal. The latter duty produced one of the army's most tragic assignments—the removal of the Cherokee Indians in the so-called Trail of Tears (1838-39)—and the army's most frustrating experience of the antebellum era—the long guerrilla conflict in Florida of the Seminole Wars (1818, 1835-42, 1855-58).

The demands of national expansionism brought occasional increases in army strength, including the reintroduction of mounted regiments in 1833 and 1836, the first since the War of 1812. With the outbreak of the Mexican War in 1846, the army's basic establishment swelled to 17,812, achieved mainly by filling the understrength units with recruits; Congress supplemented this force with 10 temporary regular regiments and over 70,000 citizen-soldiers raised as U.S. Volunteers. Although the postwar demobilization left the army at 10,317, the occupation of the newly acquired western territories soon renewed the buildup. The government added 4 permanent regiments in 1855, bringing the total to 19; on the eve of the Civil War, the regular army's actual strength stood at 16,367 officers and men.

Within the army, the most notable development of the antebellum period was the professionalization of the officer corps. Beginning in 1821, West Point graduates received the vast majority of officers' commissions, and the stabilization of military organization encouraged growing numbers of regulars to make the service a long-term career. Despite the pressures of constabulary duty, many regulars took a serious interest in such professional topics as tactics, weaponry, fortification, and military education, and the era brought a steady infusion of European military thought into the army. Officers developed a service ethic—a collective image of the army as a politically neutral instrument of the government, performing sometimes un-

pleasant but essential tasks for the public welfare. In the Mexican War, the reformed army—officered largely by West Pointers and armed with elite batteries of light artillery—passed its first major combat test, validating the cadre concept and formal military education.

A yawning social chasm separated the officer corps from the enlisted ranks of the antebellum army. The great majority of enlisted men were urban laborers and journeyman artisans who enlisted for economic reasons. Although some *African Americans in the military served in regular units in the later stages of the War of 1812, most were discharged in the postwar *demobilization, and blacks were officially barred by a War Department order of 1820. On the other hand, white immigrants (mainly Irish and Germans) composed a sizable segment of the enlisted regulars throughout the period, and they reached two-thirds of the total with the great wave of immigration in the late 1840s and 1850s. Because of low troop *morale and harsh living conditions at frontier posts, *desertion and other disciplinary problems were common, and the officers countered with a severe and often arbitrary regime of physical punishment. Such treatment merely aggravated the problem of discipline and the result was chronic tension along the officer-enlisted boundary.

The Civil War confronted the army with a crisis of loyalty, and about one-quarter of the officer corps left to support the Confederacy. U.S. president Abraham *Lincoln drew mainly on state organized and federally funded ad hoc units of U.S. volunteers to raise the vast wartime army, which reached approximately 1 million in 1865. However, Congress expanded the regular establishment to 30 regiments in 1861 and increased the enlisted strength of all units, bringing the official level to 39,278. The War Department kept these units relatively intact, resisting pressures to scatter experienced personnel through the volunteer forces. Nevertheless, hundreds of active duty and former officers did obtain volunteer commissions, and regulars dominated the high command levels of the Union forces. The traditions, procedures, and identities of the antebellum army pervaded the war effort and shaped in numerous ways the conduct of the struggle: *strategy, tactics, "logistics, administration, and civil-military relations.

ARMY, U.S.: 1866-99

In the post-Civil War era, the 1-million-man *Union army was reduced by 1871 to a U.S. Army of 29,000, remaining around that level until the *Spanish-American War in 1898, when the wartime force grew to nearly 200,000 regulars and *U.S. Volunteers. It fell to about 80,000 by the end of 1899. From 1866 to 1898, the small regular army fulfilled its traditional primary task as a constabulary force on the Indian frontier, but it also took on new duties of mili-

tary occupation during "Reconstruction and of suppressing labor strife in industrial areas.

No other agency had the personnel to carry out federal Reconstruction policies in the South. In addition to "peacekeeping there, the army performed such civil functions as opening schools, operating railroads, rebuilding bridges, supervising banks, and holding courts of law. When President Andrew *Johnson and the Republican majority in Congress disagreed, Congress in 1867 passed Military Reconstruction Acts over Johnson's vetoes. The acts divided the former Confederate states into five military districts, each governed by a major general, and initiated the process for new state constitutions that declared slavery illegal, disavowed secession, and enfranchised African American men. The process was completed between 1868 and 1870. Thereafter, Southern Republican governors called on the army as a *posse comitatus* to protect freed blacks and others loyal to the Union, by guarding polling places and controlling paramilitary organizations like the Ku Klux Klan. Thus, the U.S. Army was involved in postwar politics in the South until the end of Reconstruction in 1877.

During Reconstruction, Congress for the first time authorized permanent units of black soldiers (albeit with white officers) for the army. In 1866, six such regiments were recruited, later reduced to four. Separate black regiments continued to exist until the *Korean War in the 1950s. In the 1870s, black soldiers patrolled the frontier and participated in campaigns against the Indians, who called them *"Buffalo" Soldiers. Some Indian scouts were employed. The majority of enlisted ranks were white soldiers, many of them recent immigrants.

The Indian-fighting army of the *Plains Indians Wars later became legendary in fiction and film, but its service was controversial. The federal government ordered the army to restrain or fight Indian tribes in order to open the West. Desire for the Indians' lands meant that conflict was inevitable. Gen. William Tecumseh Sherman and Gen. Philip H. *Sheridan supervised campaigns that inflicted defeats on the Indians. Indian noncombatants were killed in some campaigns. The Indians won a few battles, most notably the Battle of the *Little Bighorn (1876), but were never victorious in a campaign. The tribes were forced to sign treaties restricting them to reservations.

Historians debate whether the army was isolated from society in the Gilded Age. Senior officers hobnobbed in the East with political and economic leaders, while the majority of enlisted men and line officers served at isolated frontier posts. Several times between 1877 and 1899, the government sent army units to quell labor strikes in northern cities, along railroad routes, and in western mining camps. By 1890, several of the army's posts were located near large cities. The debate over the army's alleged "isolation" begs the questions of when, where, and which portions of the army may have been isolated from society.

In part reacting to European developments after the Franco-Prussian War of 1870-71, army officers sought modernization and reforms. In 1881, General Sherman established the Command and General Staff School at Leavenworth, Kansas. Sherman's protégé, Col. Emory "Upton, studied armies in other nations. Upton's classic, *Military Policy of the United States*, unfinished when he committed suicide in 1881, was not published until 1904. Upton's criticism of the traditional civilian control of the military and

of the *citizen-soldier, and his desire for pre-trained, European-style reserves, meant that he gained little influence outside the regular army.

The Ordnance Department, showing its inherent conservatism, was reluctant to acquire repeating rifles, like the lever action Winchester, that would rapidly consume ammunition. Ordnance adopted the breech-loading *Springfield Model 1873 rifle to replace the Union army's muzzle-loader, but both were single-shot weapons using black powder. Not until 1892 did Ordnance adopt a smokeless powder rifle, the bolt action Krag-Jorgensen, based on a Danish design; but it was still less effective than European clip-fed rifles. In 1898, due to shortages of ammunition and cleaning kits, Krags were not issued to the U.S. Volunteers at the beginning of the *Spanish-American War; consequently, most of them carried the obsolete Model 1873 into battle.

The army was not well prepared when Congress declared war against Spain, and the lawmakers bypassed the regulars plans by authorizing massive numbers of U.S. Volunteers. Pushed to act by President William *McKinley, the War Department cobbled together expeditions to the Spanish colonies of Cuba, Puerto Rico, and the Philippine Islands. Combining aggressiveness and luck, the Americans (regulars supplemented with U.S. Volunteers) won campaigns against larger if demoralized Spanish garrisons in all of the contested colonies. The Treaty of *Paris (1898) ending the war awarded the United States possession of Puerto Rico, Guam, the Philippines, and temporary control of Cuba. The army administered military governments in Cuba and the Philippines and continued to fight in the *Philippine War (1899-1902) against Filipino insurgents who sought independence. Responsibilities for garrisoning a new island empire, acting as the constabulary on a new overseas frontier, would occupy an expanded U.S. Army in the early twentieth century, even as the army sought to modernize and prepare for wars against other expanding world powers.

ARMY, U.S.: 1900-41

During the transitional period prior to 1920, the army abandoned its traditional constabulary duties on the Indian frontier to pursue preparation for modern warfare—adapting its organization, training, and doctrine for projection of American power abroad, fighting one world war, and preparing for another.

In the new century's first years, progressive officers convinced Secretary of War Elihu *Root that the nation must create a "war army" prepared for conflict with other great powers. The resulting Root reforms included an army war college; a strengthened system of officer education; a four-

fold increase in regular forces; improvement of the National Guard; and the *General Staff Act (1903).

Although the last seemed to clarify the relation of the commanding general (the line or field forces) and the bureau chiefs (the administrative and technical staffs) to one another and to the secretary of war, traditional line-staff rivalries persisted in new form as bureau chiefs battled the chief of the General Staff for the right, in the name of the war secretary, to control the army.

Other events during Root's secretaryship—the *Philippine War, U.S. military involvement in the *Caribbean and Latin America, and the China Relief Expedition—continued the army's constabulary role, if in new locations, as its units overseas reflected the Progressive Era's spirit by keeping order, sponsoring local government, conquering yellow fever, and building roads, sewers, schools, and water systems.

Fear of an expanding Germany and Japan, however, aided advocates of a "war army," and during the secretaryships of Root and Henry L. *Stimson, the army resumed annual maneuvers. Congress appropriated modest sums for modern rifles (the *Springfield Model 1903), *artillery, and field telephones, and for experimentation with aircraft, motor transport, and *machine guns. At the urging of Chief of Staff Leonard *Wood, Stimson established the nation's first peacetime divisions: self-contained and self-supporting fighting units of approximately 10,000 men.

The Preparedness movement—prompted by the outbreak of World War I—contributed to farther land force modernization, which included attempts to resolve the long-standing debate over how to raise trained manpower sufficient to match the armies of Europe. The resulting National Defense Act of 1916 sought gradually to expand both regular forces and the National Guard, strengthen the latter, and lay the foundations of *ROTC (Reserve Officer Training Corps).

The army nevertheless remained unprepared for World War I, and when Gen. John J. *Pershing sailed for France in June 1917 at the head of the * American Expeditionary Force, he took with him trained personnel sorely needed to manage an 18-month expansion of the army from just over 100,000 regulars to a wartime force of almost 4 million men, more than two-thirds of whom were draftees.

The strains of economic *mobilization finally prompted Secretary Newton D. *Baker to appoint a vigorous new chief of staff—Gen. Peyton C. *March—and use the powers granted by the Overman Act of 1918 to strengthen the General Staff, reorganize the supply bureaus under Gen. George W. *Goethals, and cooperate with the War Industries Board. Even so, soldiers of the world's leading industrial power went into battle using many French or British weapons.

The postwar National Defense Act of 1920 returned to a peacetime, volunteer army, enlarged the General Staff, and confirmed the authority of its chief. As chief of staff after 1921, Pershing created the structure—personnel, intelligence, training/operations, supply, and war plans divisions—that the General Staff would carry into World War II. The army also studied the Great War's economic demands and produced a series of industrial mobilization plans in the 1930s that improved upon the work of the prewar Council of National Defense.

In 1920, Congress rejected General March's proposal of

a half-million-man expandable regular force backed by reservists given three months of compulsory military training. Instead, Congress authorized a ready-to-fight regular army roughly half that size and a program of voluntary training for an expanded National Guard and organized reserve.

By 1922, a budget-conscious Congress reduced the regulars to 150,000. The National Guard and enlisted Reserve Corps remained far below authorized strengths. Mistakenly keeping the 1920 act's sprawling organizational structure intact, and abetted by a Congress unwilling to fund new weapons, the army maintained a poorly armed skeletal force incapable of rapid deployment, and, by the mid-1930s, lacked a single combat-ready division.

Unwisely assigning its * tanks to the infantry rather than the cavalry, the interwar army was hampered by more than a lack of funds from creating a modern armored force. Although the Army Air Corps received funding for new aircraft, doctrinal battles highlighted by the court-martial of Gen. Billy * Mitchell emphasized strategic * bomber aircraft, and left it without planes, doctrine, or procedures for tactical close air support of ground troops or even adequate fighters to escort the strategic bombers.

In the interwar years, the army turned to extensive planning and officer education to keep alive skills needed for future warfare. This included joint planning by army and navy officers for war with potential enemies. In addition, at the Infantry School (1927-32), Col. George C. * Marshall emphasized education as he revolutionized infantry tactics and troop-leading procedures. Two hundred of the school's faculty and graduates would become general officers in World War II. Branch schools, the General Service School (Leavenworth), The Army War College, even army posts became scenes of intense activity led by spelling of such dedicated officers as Fox Conner, George S. * Patton, and Dwight D. * Eisenhower. Nevertheless, the army did not hold its first genuine corps-sized maneuver until April 1940.

Beginning in 1935, Congress gradually increased the army's size and soon authorized an ammunition reserve and "educational" contracts—small orders for new weapons to encourage industry to obtain machine tools and develop techniques for a rapid, emergency increase in arms production. Even with the outbreak of war in Europe in September 1939, however, President Franklin D. * Roosevelt refused to implement army plans for industrial 'mobilization. The German defeat of France in June 1940 led to further expansion of the regular forces, federalization of the National Guard, a reserve call-up, and the nation's first peacetime * conscription, with the aim of creating, by mid-1941, a better-armed field force of 1.5 million organized into thirty-four semimotorized triangular divisions and thirty-five air groups.

Military planning made a further shift by 1941 when adoption of a "Germany First" strategy, Anglo-American coordination, the American occupation of Greenland and Iceland, and the navy's escorting of convoys as a result of the 'Lend-Lease Act and Agreements (1941) to Britain. These brought the United States to a de facto if still limited military involvement in the European War—a limitation abandoned following Japan's attack on * Pearl Harbor in 1941 and Hitler's subsequent declaration of war upon the United States.

ARMY, U.S.: SINCE 1941

During World War II, the U.S. Army developed into a powerful and flexible war machine. Numbering over 8 million officers and men, its ranks filled by a comprehensive draft, the army fielded ninety-eight combat divisions, as well as a large tactical and strategic air force and the service troops needed to sustain worldwide deployments. The most highly mechanized of World War II ground forces, the army fought effectively in a wide variety of environments. It also mastered joint operations, culminating in the * D-Day landing in the invasion of * Normandy. Backed by American industry, the army established a global logistical system that sustained forces over vast distances with a lavishness unprecedented in history. The U.S. Army accomplished its basic mission: the total defeat of Nazi Germany and Imperial Japan.

After V-J Day, 2 September 1945, the World War II army quickly melted away. By mid-1950, army strength totaled about 590,000 in 10 understrength divisions. However, the beginning of the * Cold War with the Soviet Union, the U.S. commitment to the North Atlantic Treaty Organization (* NATO), and the outbreak of open hostilities in Korea soon brought renewed expansion sustained by * Conscription and draft-induced volunteers. The Cold War army fluctuated in strength from 1.5 million at the height of the * Korean War, to 873,000 under the President Dwight D. * Eisenhower "New Look," to just over 1 million under President John F. * Kennedy's * Flexible Response. After the 1950s, it was no longer a racially segregated force, but integrated * African Americans in the military.

Until the * Vietnam War, the largest concentrations of army troops were in three areas: Europe, where they formed a major component of NATO's ground forces; Korea, where they guarded against renewed North Korean attack; and the United States, where a pool of divisions was available to reinforce the overseas theaters or respond to new contingencies. Under the National Defense Acts of 1947, 1949, and 1958, the Department of the Army—now part of the Department of * Defense and no longer with cabinet status—organized, trained, and supplied these forces for regional joint commands but no longer itself directed combat operations. The army's chief of staff served as a member of the * Joint Chiefs of Staff, along with the heads of the navy and Marine Corps and of the air force, which had been separated from the army in 1947. The army command and staff meanwhile underwent repeated reorganizations, all tending to eliminate the old War Department bureaus in favor of broad functional commands such as the Strike Command, Continental Army

Command, Air Defense Command, and Material Command, all created in 1963.

In the so-called joint arena, where the services competed for funding, roles, and missions, the army had mixed fortunes. Under Eisenhower's post-Korea "New Look," which emphasized nuclear *deterrence, the air force and the navy received budgetary priority. The army seemed in danger of being relegated to serving as a nuclear trip-wire in Europe and dealing with minor "brushfire" conflicts elsewhere. Under President Kennedy, who sought other than nuclear means of preventing Communist inroads, the army moved back to center stage as the principal agency for conventional defense in Europe and for *counterinsurgency against Communist revolutionary warfare in the Third World.

These fluctuations of emphasis notwithstanding, the basic tasks of the Cold War army remained throughout forward defense and deterrence in Europe and Korea; conduct of short-of-war interventions, as in the *Lebanon Crisis (1958) and the Dominican Republic (1965); and the provision of arms, training, and assistance to America's allies around the world. Additionally, during the domestic racial and social upheavals of the late fifties and the sixties, the army repeatedly was called on to help control civil disturbances at home.

Weaponry and tactical organization were in a state of transition in the 1950s and early 1960s. Under the "New Look," the army developed a family of tactical *nuclear weapons and competed with the air force in the emerging field of ballistic missile research and development. It reorganized its divisions on the "Pentomic" pattern of five battle groups, supposedly able to operate effectively on a nuclear battlefield. More productively in the long run, the army experimented with *helicopters as a means of both troop transport and fire support. Under Flexible Response, the army modernized its material for nonnuclear warfare. It acquired new models of *tanks and *armored vehicles, adopted new standard infantry *sidearms, and brought air mobile tactics to full development. The service restructured its divisions on the ROAD (Reorganization Objective Army Division) pattern of three task-organized brigades, a formation adaptable to both nuclear and non-nuclear operations. To assist American allies in counterinsurgency, the army organized its green beret-wearing *Special Operations Forces.

When Presidents Kennedy and Lyndon B. *Johnson committed the army to the Vietnam War, the service was at a peak in training, administrative efficiency, *troop morale, and popular acceptance. The long, inconclusive Vietnam conflict ended this state of affairs and brought the army to the edge of disintegration. Not all was failure. Most of the army's draftee and volunteer soldiers fought bravely; the ROAD division performed well; and the helicopter and air mobility revolutionized the conduct of ground operations. Yet * victory proved elusive. The army had to fight a major war without the *Army Reserves and National Guard, under budgets inadequate both to sustain the conflict and maintain its worldwide commitments.

As the war absorbed men and materiel, army forces in Europe and the United States became hollow shells, lacking *combat effectiveness. The quality of leadership and discipline deteriorated; racial violence, drug abuse, assaults on officers and NCOs, and general defiance of authority proliferated in Vietnam and worldwide. Scandals, such as

the *My Lai Massacre (1968) and its cover-up within the chain of command, tarnished the army's public image and undermined its self-esteem. The war alienated the army from much of the American public. Responding to anti-war, antimilitary sentiment, President Richard M. *Nixon ended the draft, leaving the army with a whole new set of manpower procurement problems.

During the two decades after the end of the Vietnam War, a dedicated cadre of leaders pulled the army back together. Accepting the challenge of creating an *All-Volunteer Force with a strength fixed at about 780,000, they overcame the service's race, drug, and discipline problems, and adopted programs to bring well-educated young people into the ranks. In the process, they integrated women into the service until they could be found in all but the highest general officer ranks and in every specialty except direct ground combat. Helped by the generous defense budgets of President Ronald *Reagan's administration, army leaders made up for lost time in securing new weapons and equipment in the 1980s. They radically revamped army training and tactics in the light of the lessons of the 1973 Arab-Israeli War, evolving the concept of a highly mechanized, fast-moving "AirLand Battle." Their objective was to create an army ready to fight and win the first battle against Soviet forces superior in numbers and very nearly equal in technology. The rebuilt army successfully met the test of combat during the U.S. intervention in *Grenada (1983) and in Panama. During the *Persian Gulf War (1991), it outmaneuvered and outfought what had been thought to be a formidable Iraqi opponent.

Yet victory over Iraq was followed by new challenges. With the end of the Soviet Union and the Cold War, America's army had to cope with declining budgets and the painful necessity of reducing a force of professionals who had expected to make the service a career. Lacking a dominant threat on which to center their plans and programs, army leaders contemplated a range of new missions and contingencies. Throughout, they expressed their determination to maintain a high level of readiness and retain their technological advantage over any likely enemy.

ARMY AIR CORPS, U.S. See Air Force, U.S.: Predecessors of, 1907-1946.

ARMY COMBAT BRANCHES: INFANTRY. The infantry is the oldest and most important of the U.S. Army's combat arms. Its insignia consists of crossed muskets, Model

1795; its motto is "Follow Me." Its primary mission is to close with and destroy or capture the enemy.

The infantry does not fight alone. It often fights with, sometimes supports, but more frequently is supported by the army's other arms and services, and by the air force, the navy, and the Marine Corps.

Although the infantryman can arrive on a battlefield in a variety of ways, he is always a ground combat soldier, who fights on foot with the weapons and ammunition he can carry. He can fight from *armored vehicles when the situation demands. His basic weapon is the rifle and bayonet, although he has used *grenades and *grenade launchers, "machine guns, *mortars, *flamethrowers, and some hand-held *antitank weapons to bolster his combat effectiveness.

On 14 June 1775, the Second Continental Congress authorized the raising of ten companies of riflemen to be part of George *Washington's new *Continental Army besieging Boston at the outset of the *Revolutionary War. There, these companies were grouped into regiments, an organization that for the next 181 years remained the infantry's primary tactical and administrative unit.

Over time, the regimental structure underwent several changes. Until the *Spanish-American War, infantry regiments consisted of ten companies grouped under one headquarters. In 1898, each regiment was given two battalions, each battalion consisting of four companies. The battalion then became the primary tactical organization while the regiment retained administrative and tactical oversight functions.

When the United States entered World War I in 1917, the number of battalions in each regiment was increased to three, each battalion still containing four companies. This remained the standard regimental structure until 1956, when the entire regimental structure was done away with, to be replaced by the Pentomic battle group—a unit smaller than a regiment but larger than a battalion. The army's leaders had become convinced that a different type of unit was needed to meet the demands posed by growing *nuclear weapons and chemical warfare threats.

The Pentomic structure lasted only a few years; in 1961, a new organizational concept was introduced: Reorganization Objective Army Division (ROAD). ROAD eliminated the infantry battle group and brought back the battalion, but not the regiment, as the infantry's primary tactical and administrative organization, a position it still holds. Despite the U.S. Army's attempts to perpetuate regimental traditions, honors, and lineages through the Combat Arms Regimental System (CARS), the infantry community has never fully recovered from the loss of the regiment, the traditional key unit in the British army and many other forces.

Various types of infantry units have been developed over the years to permit the American infantry better to accomplish its mission in various parts of the world and on differing types of terrain, among these specialized forms of infantry are the following: light, airborne, air assault, mechanized, and ranger. In the process, the infantry has become the most mobile and flexible of the army's combat arms.

Despite furnishing the bulk of the United States's men and suffering by far the greatest number of battle "casualties, infantry service, at least until World War II, was never considered choice military duty. U.S. Military Academy graduates, for example, invariably chose the U.S. *Army Corps of Engineers, the cavalry, or the artillery before the

infantry. Even today, service with line infantry units is not considered choice duty. Service with airborne or ranger infantry units, though, is deemed necessary for infantry officers who hope to reach flag rank.

As a result of this attitude, after years of struggle, the infantry was finally given its own home base and training school at Fort Benning, Georgia, in 1918. Until then, infantry officers and noncommissioned officers were given special training, if at all, at other service schools or on the fields of battle.

Many outstanding U.S. military leaders and warriors have come from the infantry's ranks, Robert Rogers, George Washington, Joshua Chamberlain, Nelson Miles, Alvin *York, Audie *Murphy, George C. *Marshall, and Dwight D. *Eisenhower among them.

Despite the technological advances that have marked the army's progress in recent years, the role of the infantryman on the future battlefield will not change but will remain as important to future success as it has been in the past.

ARMY COMBAT BRANCHES: ARTILLERY. Beginning in colonial times, American *artillery has served as coast artillery to defend the coasts, siege artillery to bombard *fortifications, garrison artillery to defend land fortifications, and field artillery to support infantry and cavalry. Although artillery made an early appearance with the initial English settlement in Jamestown in 1607, it played a minor role in military operations during colonial times.

The *Revolutionary War of 1775-83, however, encouraged the Americans to broaden the employment of their artillery. During that war, they used light, mobile cannons as field artillery and heavier pieces as siege, garrison, or coast artillery. Early in 1776, American siege and field artillery bombarded the British in Boston and caused them to sail for Halifax, Nova Scotia, in defeat. Two years later, in June 1778, Americans massed field artillery fire to help defeat the British at the Battle of * Monmouth, New Jersey. In October 1781, American and French field and siege artillery destroyed British defenses in the Battle of *Yorktown, Virginia, and induced the British to surrender. Henry *Knox, who commanded the *Continental army's artillery during most of the war, later became secretary of war.

By the mid-nineteenth century, the Americans had bronze field artillery and cast-iron siege, garrison, and coast artillery, as well as *mortars and rockets. During the * Mexican War of 1846-48, U.S. artillery, much more modern than that of the Mexicans, played a critical role in many battles. At Palo Alto in May 1846 and the Battle of *Buena Vista in February 1847, U.S. Army gun crews boldly pushed field guns within range (300-400 yards) of numerically superior Mexican forces and raked them with devastating antipersonnel canister fire. In 1848, U.S. siege batteries, composed of howitzers, guns, and *mortars, proved essential in the Battle of *Chapultepec and the capture of Mexico City.

The introduction of the rifled *musket in the 1850s

with ranges greater than canister altered the role of field artillery. Field artillerymen learned early in the * Civil War that they could no longer safely push their field guns within canister range of the enemy. To protect themselves and their guns, they had to site them out of range of small-arms fire. Although during the Civil War this transformed field artillery's role from an offensive to a largely defensive one, massed fire from Union field and siege artillery at Malvern Hill in 1862 demonstrated the lethality of rifled and smoothbore field and siege artillery on the defensive, while siege and field artillery contributed to a Union victory in the siege of *Vicksburg (1862-63).

Recoil systems, breech-loading systems, cartridge ammunition, and high explosives dramatically enhanced the lethality of artillery during the latter decades of the nineteenth century. Recoil systems and cartridge ammunition increased rates of fire of breech-loading weapons over that of muzzleloaders, while high explosives produced ranges greater than black powder artillery did. The Americans armed their coastal fortifications in the United States, Cuba, Panama, and the Philippine Islands with rifled coast artillery for harbor defense, while the field artillery introduced its first rapid-fire field gun during the first decade of the twentieth century.

World War I provided an opportunity for the Americans to employ their new rifled artillery in battle. Requiring more firepower to destroy sophisticated German fortifications along the western front, the Americans also mounted coast artillery guns on railcars. During the Battle of *St. Mihiel and the *Meuse-Argonne offensive in 1918, American gun crews employed field, siege, and coast artillery to destroy complex German defenses and contributed to Allied victories.

Seeking to avoid a repetition of *trench warfare, Americans improved the mobility of their artillery during the two decades following World War I. By the 1940s, they had adopted towed and self-propelled field artillery, antiaircraft artillery, and towed and self-propelled antitank artillery. Because of the requirement for tremendous amounts of firepower during World War II, Americans often employed antiaircraft artillery, antitank artillery, and coastal artillery in a field artillery role. At the siege of Metz in 1944, during the liberation of *France, for example, heavy coast artillery pieces and field guns shelled the fortresses there. Later, in the *Korean War, vintage artillery from World War II saw action supporting infantry and armor.

After World War II, the Americans made significant changes in their artillery. Because aerial *bombs and high-velocity naval guns could easily destroy concrete coastal fortifications, the coast artillery was abolished as a branch of artillery; it consolidated its antiaircraft mission with the field artillery in 1950. During the 1950s, in their drive for more firepower, Americans adopted cannon, rocket, and guided missile artillery that carried nuclear and conventional warheads to complement their conventional artillery for possible battle in Europe in the *Cold War.

However, the new artillery with conventional munitions saw its first combat in Southeast Asia in the early 1960s. During the * Vietnam War, American field artillery, sited in fire bases, provided effective close support to the infantry, while air defense artillery, composed of guns and surface-to-air missiles, played a minor role because the enemy lacked aircraft to attack American forces.

In the 1970s and 1980s, Americans introduced new ar-

tillery systems. Field artillery and air defense artillery fire adopted computers to calculate fire direction and precision-guided munitions. The first opportunity to employ the new technology came during the * Persian Gulf War of 1991. In that war, precision-guided munitions from American field artillery destroyed Iraqi bunkers and command and control centers, while the Patriot air defense missiles downed many Iraqi Scud missiles launched against Israeli and Saudi-Arabian targets.

ARMY COMBAT BRANCHES: CAVALRY. Starting with the colonial militias, the cavalry has always had an elite status in the American military. Despite its prestige, however, this branch has played a secondary role to the artillery and infantry in combat operations. Traditionally, there were several utilizations of the mounted warrior in combat. Heavy cavalry could charge enemy positions in force or pursue retreating units, using pistols, swords, lance, and the intimidating power of massed horses to overwhelm soldiers on foot. Light cavalry units were used for picket duty, reconnaissance, and raiding.

Cavalry units were elite organizations in colonial times, partly because of the financial costs involved in acquiring, feeding, and housing the horses, but also because of traditional images of aristocratic daring. George *Washington has been criticized for making little effort to employ cavalry during the *Revolutionary War, even though the terrain of most battle sites was appropriate for its use. Washington's indifference stemmed largely from his early military experience as an officer in the *French and Indian War, when he commanded units in wooded, hilly terrain, where the cavalry had limited utility. During the Revolution, in the southern colonies (outside Washington's area), American partisans used the horse as mounted infantry. These so-called dragoons would ride into combat, and then dismount and fight on foot.

Building on this heritage, the U.S. Army later utilized horse soldiers in combat as dragoons during the period of the early republic. Between 1802 and 1808, however, the army briefly did away with horse units altogether. This represented partly a Jeffersonian reaction against the social and economic elite status of the cavalry, but to a larger extent it was a cost-cutting measure that eliminated an element of the military that then had little utility. The main mission of the U.S. Army during this period was Indian fighting. The heavily wooded terrain of the western frontier was not appropriate for cavalry units. Nevertheless, the army published Col. Pierce Darrow's *Cavalry Tactics* in 1822, the first official tactical manual for the cavalry. Cavalry was little used in the * Mexican War.

During the *Civil War, both the *Union army and the *Confederate army used cavalry, mainly in reconnaissance and raiding roles. Technological innovations limited the utility of heavy cavalry. The rifled *musket allowed infantrymen to direct accurate fire at large targets long before the cavalry closed in, preventing the shock and force

of massed cavalry. The light firepower of cavalry units, armed with carbines and pistols, also made it difficult for a mounted force to hold positions against infantry attack or counterattack. Commanders on each side, however, like J. E. B. *Stuart and George Armstrong *Custer, made a name for themselves leading or directing units performing the functions of light cavalry.

The *Plains Indians Wars were unique. Cavalry was of fundamental military importance in these conflicts. Once they moved to the plains, the Indians adopted the horse, which had been brought to the Americas by Europeans, and made it central to their culture. These nomadic peoples used the horse to travel across the plains in search of the American bison, which provided the material underpinning of their societies. The warriors of the plains fought primarily on horseback, performing functions similar to light cavalry. The U.S. Army used a similar force organized into cavalry regiments to fight the Plains Indians, and conducted many of the campaigns in the winter months when the lack of foliage available for grazing would weaken Indian ponies. Although the cavalry played a key military role in these conflicts, the force of demographics and the destruction of the “buffalo” herds played a larger role in the ultimate conquest of the Indians.

Toward the end of the nineteenth century, technological innovations again made the future of cavalry questionable. *Machine guns allowed infantry soldiers to direct heavy fire at an opponent, making direct cavalry charges futile. Indeed, no U.S. units fought as cavalry in Europe during World War I. Instead, *tanks and *armored vehicles, which were developed during the war, assumed the ability to perform many of the cavalry functions. Armored units could act with the speed and shock of cavalry, and the staying power of infantry. Armored vehicles could perform wide ranging reconnaissance.

During the interwar period, the chiefs of the cavalry branch of the U.S. Army fought innovation, seeing the advocates of the tank as individuals who sought mainly to destroy the cavalry. The National Defense Act of 1920 created the position of branch chief, and made the officer serving in that position responsible for tactical doctrine for each combat branch. This authority allowed the proponents of the horse cavalry to reject the new weapon, the tank. By the late 1930s, some cavalrymen, such as George S. *Patton, supported armored warfare. In 1940, the success of German Panzer units in France, and the inadequacy of horse units against armor units, overcame even the most dedicated cavalryman's resistance. During World War II, the First Cavalry Division (1st Cav), still technically a mounted force in matters of structure, was the only cavalry unit to see combat in the war but fought as an armored unit without its horses. The horse cavalry and the cavalry branch were formally abolished with the reorganization following the *National Security Act of 1947, although the First Cavalry Division, first with armor and then air mobile via helicopters, retained the insignia and designation.

• Russell F. Weigley, *History of the United States Army*, 1967. Lucian K. Truscott, Jr., *The Twilight of the U.S. Cavalry: Life in the Old Army, 1917-1942*, 1989. —Nicholas Evan Sarantakes

ARMY COMBAT BRANCHES: ARMOR. The motto of the U.S. Army's armor branch is “The Combat Arm of Decision.” Equipped with *tanks and supported by infantry,

*artillery, *helicopters, and air forces, armor units close with and destroy enemy forces using maneuver, protected firepower, and shock.

Though armor only became a separate branch with the U.S. *Army Reorganization Act of 1950, American armor saw combat during World War I. Inspired by British and French tanks, Gen. John J. *Pershing in 1916 approved plans for an overseas U.S. Army Tank Corps. On 10 November 1917, Capt. George S. *Patton, Jr., became the first soldier assigned to the new Tank Corps, which would be headed by Col. Samuel D. Rockenbach. During the war, 1,235 officers and 18,977 enlisted men served in the Tank Corps, two-thirds of their overseas forces. While Patton organized the light tank school and its two battalions in France, the 301st Heavy Tank Battalion trained at a British tank school.

Equipped with 144 French-supplied Renault tanks, Patton's was the first U.S. tank unit into battle on 12 September 1918 in the Battle of *St. Mihiel. The U.S. heavy tank brigade first fought on 29 September, using forty-seven British-supplied Mark V tanks. American-made tanks, modified from French and British designs, did not reach Europe during the war.

After World War I, U.S. tank forces all but vanished in the midst of strong and widespread antimilitary sentiments. The National Defense Act of 1920 disbanded the Tank Corps and transferred responsibility for tanks to the chief of infantry who broke the corps into separate tank companies, assigning one per infantry division. During the 1920s, while far-sighted American officers like Patton, Dwight D. *Eisenhower, Daniel Van Voorhis, Robert W. Grow, Bradford G. Chennoweth, and Adna R. Chaffee followed the armor doctrine evolving in Europe through Britain's Basil H. *Liddell Hart and J. F. C. Fuller, France's Charles de Gaulle, and Germany's Heinz Guderian, the U.S. War Department viewed tanks simply as support for advancing infantrymen.

In 1931, after becoming chief of staff, Gen. Douglas *MacArthur directed each branch of the army to pursue mechanization on its own. The cavalry took over the mechanized force, then at Fort Eustis, Virginia, moved it to Fort Knox, Kentucky, and formed it into the Seventh Cavalry Brigade (Mechanized). It developed annually about two experimental “Combat Cars”—a euphemism for cavalry's light and medium tanks, since the law allowed only the infantry branch to have tanks. These experiments included the high-speed vehicle developed by J. Walter Christie, which America abandoned but the Soviet Union adopted as the concept behind its highly successful main battle tank of World War II, the T-34. The U.S. cavalry's M1 and M2 Combat Cars became the basis for the Light Tank M3, the Stuart, which was designed in the spring of 1940 and saw U.S. and British service in World War II. The infantry formed a provisional tank brigade at Fort Benning, Georgia, and carried out its own limited experiments.

On 15 July 1940, in reaction to the stunning German armored successes in Poland and France and its own experiments with armor units, the U.S. War Department created the Armored Force under Chaffee, earning him the title, “Father of the American Armored Force.” The Fort Knox and Fort Benning brigades formed the nuclei for two new armored divisions assigned to an armored corps. From this small beginning, the Armored Force grew during World

War II to sixteen armored divisions, which fought in Europe (armor played only a minor role in the Pacific theater). Five armored regiments and 119 tank battalions saw combat. Starting in 1940 with under 1,000 obsolete World War I-era tanks and only 28 new ones, the United States produced nearly 90,000 tanks by 1945. Cavalry units also used tanks. By mid-1942, the Armored Force had nearly 150,000 men.

The workhorse of U.S. armor units in World War II was the M4 Sherman tank and its numerous variants. This medium tank was relatively fast and agile, combining armored protection, speed, and firepower. It was out-matched, however, by Germany's heavy Panther and Tiger tanks. In February 1945, the United States fielded in Europe the first 20 of 200 T26E3 Pershing heavy tanks, which were nearly a match for the Tiger. The Pershing also saw action on Okinawa in the Pacific.

Additionally, World War II units of thin-skinned, self-propelled, fully tracked *tank destroyers—created to defeat enemy tanks—peaked in early 1943 at 106 battalions with about 100,000 men. Battlefield experience showed that tanks were superior to the vulnerable tank destroyers, and the U.S. Army abandoned tank destroyers shortly after the war.

Using doctrine that emphasized their mobility, protected firepower, and shock effect, tank units sliced through weak points, dashed around enemy flanks to strike deep into the enemy rear, or sped to plug gaps and blunt attacks. Armor employed in mass proved an effective way to exploit success. The dash of Patton's Third Army across the countryside in the liberation of *France in 1944 exemplified these tactics, with the Fourth Armored Division's encirclement of German forces at the city of Nancy in Lorraine, a classic example.

In the *Army Reorganization Act (1950), Congress designated armor a new branch. The cavalry was merged into it, and Congress directed that the new branch be considered "a continuation of the cavalry." The new armor branch assumed responsibility for traditional cavalry missions—reconnaissance, scouting, security, covering force operations, and pursuit, in addition to new missions of penetration, counterarmor, and infantry support.

After World War II the active army divisions were cut from ninety-two to ten, the sixteen armored divisions down to one. With the outbreak of the *Korean War in June 1950, there were no U.S. tanks in the Far East that could match the enemy's Soviet-made T34s. The first U.S. tanks into Korea were light, thin-skinned M24 Chaffees. In early August, the United States sent to Korea three hastily cobbled together tank battalions with a hodgepodge of about 200 M4A3E8 Shermans, M26 Pershings, and untested M46 Patton heavy tanks.

By January 1951, there were over 600 American tanks in Korea. At the 1953 armistice, there were also a few new seventy-five M47 Pattons and T41E (experimental) Walker Bulldog tanks. This mishmash of obsolescent and untested experimental tanks seriously degraded the effectiveness of American armor in the war.

Armor units also fought in the * Vietnam War, though they did not play a major role. The main battle tank used in Vietnam was the M48A3 Patton; nearly two were sent there. More important was the lightly armored M551 Sheridan Armored Reconnaissance Airborne Assault Vehicle, which weighed only 16.5 tons and was amphibious and

air-droppable. It fired a guided antitank missile in addition to conventional tank rounds and a special antipersonnel round containing thousands of tiny dartlike flechettes. The Sheridan arrived in Vietnam in 1969; by late 1970, over 200 were issued to almost every ground cavalry unit there. Armor in Vietnam was primarily employed piecemeal and used mainly to clear roads, protect logistical areas, and as reaction forces.

In Europe during the *Cold War, both sides expended considerable resources on armored formations. The United States increased its *NATO divisions to sixteen (four armored, six mechanized, and six infantry) with three armored cavalry regiments. The 1967 and 1973 Arab-Israeli wars, where armor played a key role, showed the need for new American equipment, doctrine, and more realistic armor training. The result was the M1 Abrams tank, fielded in 1980, the squad-carrying Bradley infantry and cavalry fighting vehicle, and other modern battlefield systems key to the execution of the new "AirLand Battle" doctrine. The new doctrine, designed to defeat a *Warsaw Pact attack into Central Europe, deemphasized defensive operations and stressed offensive reaction and the combined effects of rapid maneuver, surprise, firepower, and airpower to bypass enemy strengths and to strike deep into the enemy's rear.

During the *Persian Gulf War in 1991, the U.S. Army deployed 3 armored divisions and 2 mechanized infantry divisions equipped with nearly 2,000 Abrams tanks and another 1,600 Bradley infantry and cavalry fighting vehicles. The Soviet-modeled Iraqi Army proved no match for these formations.

By the 1990s, however, the U.S. Army had downsized to ten divisions and two armored cavalry regiments. Among the ten were two armored and four mechanized divisions which contained the remaining twenty-nine armor battalions. In the twenty-first century, the armored forces faced an uncertain future, and their usefulness in *peacekeeping operations, such as Somalia and the *Bosnian Crisis, remained an open question.

ARMY COMBAT BRANCHES: AVIATION. The army aviation combat branch consists of those aircraft so essential to the day-to-day operations of ground forces that they are placed under the command and control of a ground commander. In the United States, modern army aviation dates from the efforts of the field artillery to obtain adequate aerial observation just before *World War II. The War Department approved the air-observation-post program on June 6, 1942. Each firing battalion of field artillery received an artillery air section of two light planes, usually L-4s, flown and maintained by field artillerymen. Eventually, air sections of varying strength joined all field artillery staff echelons from division to theater level. The Department of

Air Training at the Field Artillery School, Fort Sill, Oklahoma, provided advanced training for field artillery pilots and aviation mechanics. Air observation posts, as the Army designated the aircraft, were most important in providing observed fire for field artillery and transportation for commanders and staff officers in the battle zone.

The success of the program led the War Department to expand it to the other ground combat branches in July 1945. Renamed Army Ground Forces light aviation, it received legislative sanction in the *National Security Act of 1947, which also created an independent Air Force. In 1949 the Department of the Army renamed the program Army aviation. Not until 1983 did the specialty become a separate branch of the Army.

During the late 1940s, the Army obtained limited numbers of helicopters as well as a slightly larger fixed-wing aircraft. The Army used *helicopters during the *Korean War to perform front-line evacuation of wounded soldiers. A controversy with the *Air Force over the procurement of cargo helicopters, however, delayed until December 1952 the deployment of the first of two transportation helicopter companies that eventually saw service in Korea. During this period, the Army expanded its aviation training base. In January 1953 the Department of Air Training became the Army Aviation School. It moved to Fort Rucker, Alabama, in 1954. In the aftermath of the war, the Army experimented with armed helicopters. The development of turbine-powered helicopters made possible the creation of an airmobile division, recommended by the Howze Board in 1962.

After testing the concept, the Army deployed the 1st Cavalry Division (Airmobile) to Vietnam during the summer of 1965. Helicopters gave the U.S. Army great tactical flexibility, but were not sufficient in themselves to win the war. Army pilots refined techniques of aeromedical evacuation and developed new skills in all-weather and night flying. The armed helicopter proved itself as a close fire-support weapon and in the waning stages of the *Vietnam War demonstrated an ability to kill *tanks when outfitted with anti-armor rockets.

This development and the invention of techniques that allowed helicopters to survive in areas with significant anti-aircraft defenses were among the factors that led the Army to adopt its Air-Land battle doctrine. Helicopters played a significant role in post-Vietnam operations in *Grenada, *Panama, and *Somalia.

ARMY CORPS OF ENGINEERS, U.S. With the tasks of facilitating military movement by the construction of roads, bridges, and bases, and of protecting troops or territory through fortification, military engineering has been part of warfare since ancient times. The U.S. Army Corps of Engineers has supervised most of the construction for the U.S. Army and, after 1947, for the U.S. Air Force (the navy has its own construction agencies). It has also had important, if sometimes controversial, civil works responsibilities.

The U.S. Army Corps of Engineers originated on 16

June 1775, when Gen. George *Washington appointed Col. Richard Gridley as the first chief engineer of the *Continental army. Later, Gridley was succeeded by several French officers, most notably Gen. Louis du Portail (American spelling Duportail) in 1777. A Corps of Engineers was established by Congress as a component of the Continental army in 1779.

The engineers' fortifications played an important role in many *Revolutionary War battles, such as the Battle of *Bunker Hill and the Battles of *Saratoga, and the engineers' siegecraft, including sapper and mining operations, contributed to the victory at the Battle of *Yorktown. Like most of the Continental army, they were mustered out after the war. A combined Corps of Artillerists and Engineers was created in 1794, but it was short-lived.

In 1802, recognizing the need for a national engineering capability, civil as well as military, Congress, supported by President Thomas *Jefferson, established the U.S. Military Academy at West Point, New York. For more than a quarter century, West Point remained the only engineering school in the country. Congress also established the U.S. Army Corps of Engineers, which dates its continuous origin from 1802, and stationed the Corps at West Point. Until 1866, the academy superintendent was a military engineer.

The nation repeatedly called upon the Army Engineers to perform civil works as well as military engineering projects. During the nineteenth century, the Corps supervised construction of extensive coastal fortifications and built lighthouses, piers, and jetties, as well as mapping navigation channels. After the Supreme Court's *Gibbons v. Ogden* decision that federal authority over interstate commerce included river navigation, the General Survey Act of 1824 led to the Corps of Engineers' assignment to survey routes for roads and canals. Another act the same year authorized the Corps to dredge and make other navigation improvements on the nation's waterways. This was the origin of the Corps' responsibilities in river and harbor improvements, and it eventually led to the Corps' reorganization into a series of local district and regional division offices, all under the Office of the Chief of Engineers. A Corps of Topographical Engineers, a separate unit in 1838-63, helped explore, survey, and map many regions of the West.

During the *Mexican War and *Civil War, in addition to supplying many important commanders such as Robert E. *Lee, George *McClellan, and George Gordon *Meade, the Corps of Engineers played important roles in mapping, road and bridge construction, *fortifications, and siegecraft. The 2,170-foot pontoon bridge built across the James River in June 1864 was the longest floating bridge erected before World War II.

Army Engineers continued the construction and modernization of coastal fortifications in the second half of the nineteenth century on the Pacific Coast and on the overseas territories acquired in the *Spanish-American War. They also continued river and harbor improvements. One of the Army engineers, George W. *Goethals, supervised the construction of the Panama Canal. In World War I, the Quartermaster Corps constructed training cantonments in the United States while the Corps of Engineers built bridges, roads, railroads, and buildings for the American Expeditionary Forces in France.

In the 1930s disastrous floods led Congress, through a series of measures culminating in the Flood Control Act of 1936, to declare flood control a function of the federal gov-

ernment and to authorize the Corps of Engineers to build levees, dams, and reservoirs to supervise such projects on the Mississippi, Missouri, and other rivers. The Flood Control Act of 1944, authorized the Corps to construct multipurpose dams that provided flood control, irrigation, navigation, water supply, hydroelectric power, and recreational areas.

During World War II, the Corps of Engineers was given responsibility for all U.S. Army and Army Air Forces construction, as the Quartermaster Corps concentrated on its other responsibilities. In the United States and around the world, army engineers built airfields, roads, bridges, ports, petroleum pipelines, military camps and cantonments, warehouses, hospitals, and dozens of other facilities, including the *Pentagon, the world's largest office building, completed in 1942. Among the most acclaimed of the combat engineers' achievements were the Alcan Highway to Alaska, the Ledo and Burma Roads through the mountains and jungles of Asia, and the clearing of mines and underwater obstacles from the beaches before the invasion of *Normandy. The Manhattan District of the Corps of Engineers supervised the *Manhattan Project, the construction of the atomic bomb.

During the *Cold War, the Corps of Engineers engaged in a major construction program as part of the military buildup of the early 1950s, erecting U.S. Army and U.S. Air Force bases in the United States and throughout the world, from the deserts of North Africa to the permafrost of the arctic. To protect the United States, the Corps erected extensive *radar early warning systems across northern Canada, and NIKE and other antiaircraft missile sites in the United States. In the missile age, the Corps constructed ICBM silos, ballistic missile early warning systems (BMEWs), and part of the NASA facilities at Cape Kennedy.

During the *Korean War, combat engineers destroyed bridges over the Naktong River and built fortifications that helped stop the North Korean assault at the Pusan perimeter. In the "Vietnam War, army engineers built military bases and roads in Southeast Asia. To cut through the jungle in support of U.S. "search and destroy" missions, the engineers also introduced the Rome plow, a military tractor equipped with a protective cab and a special tree-cutting blade.

The Corps of Engineers engaged in varied civil works, including construction of *Veterans Administration hospitals, post offices, and bulk mail facilities. The Corps' dam construction and other flood control work came under attack, particularly in the 1960s and 1980s, when critics accused it of being overly responsive to "pork barrel" projects of the Congress. Paradoxically, when the federal government responded to the environmental movement in the 1970s, the executive branch turned first for protection of the nation's wetlands and waterways from pollution to the Corps of Engineers, whose regulatory authority under the 1899 Rivers and Harbors Act was expanded under the Federal Water Pollution Control Act Amendments of 1972.

The change in public attitudes of the 1980s, however, led to the Water Resources Act of 1986, which signified a major change in water resources planning. The new direction was toward shifting responsibility away from the federal government, which indicated a diminished civil works role for the Corps of Engineers. But the military role of the Corps continued, as seen in its construction of army and air force facilities in the buildup of the 1980s, the Corps'

roles in Operations Desert Shield and Desert Storm in the *Persian Gulf War in 1990-91, and its erection of military facilities for *peacekeeping operations in Somalia, Haiti, and Bosnia and Kosovo throughout the 1990s.

ARMY REORGANIZATION ACT (1950). In part, the 1950 Reorganization Act was intended to regularize the new relationship provided by the National Security Act of 1947, which created an Office of the Secretary of Defense, at cabinet level, and the World War II creation of the *Joint Chiefs of Staff. The act also abolished the old statutory limits on the size of the Army General Staff, providing an undersecretary of the army and four assistant secretaries (reduced to three after 1958). Infantry, Artillery, and Armor were recognized as the component arms of the army, while the Coast Artillery, already largely defunct, was formally abolished, and the Air Defense Artillery (technically a sub-branch of the Coast Artillery) was merged with the Field Artillery in a single artillery arm. The act recognized fourteen technical services, and, as a quasi-arm, Army Aviation was authorized fixed-wing and rotary-wing aircraft for support and medical purposes.

ARMY RESERVES AND NATIONAL GUARD. The Army Reserve originated in the *National Defense Act of 1916, which established the Officers' Reserve Corps (ORC), the Reserve Officer Training Corps (*ROTC), and an Enlisted Reserve Corps (ERC). This reserve represented a federal force long sought by the army. A 1920 congressional amendment incorporated the ORC and ERC in the Organized Reserves. Finally, the * Armed Forces Reserve Act of 1952 renamed the organization the Army Reserve.

When the nation entered World War I, only 8,000 ORC officers were ready to serve; another 80,000 men earned reserve commissions during the war. From 1916 through 1941, officers dominated the reserve, with only 3,233 ERC men in a total strength of 120,000. World War I veterans, joined by ROTC graduates and civilian appointees, manned the ORC during the 1920s and 1930s. Lack of funding hampered the force, for without money or men it could not maintain units. ORC members received no drill pay and few had the opportunity to take active duty train-

ing. Reserve officers contributed significantly to the World War II effort by providing thousands of company and battalion officers to army and National Guard divisions.

From its creation in 1916 to the late 1940s, the ORC functioned as a rarely trained inactive force. Given the lack of funding, only the understrength and poorly equipped National Guard functioned as an active reserve. World War II produced an Officers' Reserve Corps of 200,000. It also created a pool of nearly 3 million enlisted men with a nominal reserve obligation. While 50 percent of demobilized officers took ORC commissions, few enlisted men signed up. The postwar years posed many problems for the armed forces. Foreign policy led to a permanent American presence overseas and probable military intervention, but defense spending forced sharp cuts in the regular forces and left little money for the reserves.

Under these conditions, the U.S. Army struggled to devise a viable reserve policy. It had a reserve force of its own, nearly 600,000 in 1949, but no policy to use it. The reserve muddle posed serious problems with the 1950 intervention in Korea. Army plans, such as they were, assumed total mobilization for a mass war. Korea was a limited war requiring only a partial reserve call-up. The army was reluctant to mobilize the National Guard. It decided instead to activate individual reservists to reinforce understrength regular units. The "mobilization fell heavily on World War II veterans, which generated much hard feeling, and led to the Armed Forces Reserve Act of 1952. Just over 241,000 reservists were called, whereas 138,000 Guardsmen, also largely veterans, served.

The army continued its quest for a viable reserve policy through the 1950s. Defense policy now provided increased spending, larger active forces, and selective service. The draft took in thousands of men annually for two years of active duty, followed by a reserve obligation. However, the army could not devise ways to compel these men to join a reserve unit. It failed to commit funds to maintain drill pay units to take them anyway. In 1956, for example, the Army Reserve manned its authorized units at a 32 percent level.

The reserve muddle persisted because army leaders realized belatedly that under the nuclear umbrella, planning for mass war and total mobilization seemed increasingly unlikely. By the end of President Dwight D. "Eisenhower's second term, the Department of "Defense began to consider reducing both the Army Reserve and the Army National Guard. Secretary of Defense Robert "McNamara continued the reassessment into the 1960s. He sought to create a genuine ready reserve by manning Guard and reserve units at near full strength while equipping and training them properly.

McNamara erred badly with his proposal to merge the Army Reserve into the National Guard. He encountered a potent lobby in the Reserve Officers Association and reserve units with strong local ties similar to those of the established National Guard. However, McNamara succeeded in reducing Guard and reserve strengths and units even while improving readiness. The 1960s reserve reorganizations may be seen as the time when the Army Reserve came of age. McNamara's reforms gave the reserve a mobilization function: to provide combat and service support. The emphasis on readiness and full manning also heightened reserve unit identity and ensured its permanent status. The Army Reserve still provided individual ready reservists

but its units would no longer be stripped of fillers for the active army.

The "Vietnam War delayed implementation of the new policy. It also distorted Army Reserve and National Guard development by flooding both with recruits eager to avoid the draft and possible duty in Vietnam. President Lyndon B. "Johnson, despite the advice of the "Joint Chiefs of Staff, refused to mobilize reserve components. Johnson relented with a limited call-up in 1968. Forty-two Army Reserve units answered the call (nearly 8,000 men), 32 of which went to Vietnam. Nearly all the units were detachments or companies providing support services.

The 1960s reserve reforms went into effect after the Vietnam War. Defense Department leaders adopted a Total Force policy that included reserve and National units. The policy eased the impact of defense cuts and ensured use of reserve components in future wars. Larger reserves fielding combat support and service support units allowed the active army to maintain more combat units. The army structured the National Guard to provide most of the combat reserve (71% of its force) and gave the bulk of service units to the Army Reserve (81% of its composition). With the end of the draft the reserve witnessed a dramatic drop in strength—from 1,294,256 men in the ready reserve in 1972 to a low of 338,847 in 1979.

Aggressive recruiting and attractive benefits brought recovery in less than a decade. In 1988, the Army Reserve boasted 600,000 ready reservists and 286,000 individual ready reservists, a dramatic rebound from the 1979 nadir. Total Force policy was designed so that the nation could not fight a war without a reserve mobilization. The "Persian Gulf War put the policy to the test. By all accounts Army Reserve support units performed their duties well in 1990-91, deploying 39,000 men and women to the gulf, 6,000 more than the National Guard. Despite the limited nature of the Gulf War and the limited call-up, this war stands as the highlight in Army Reserve history. Reservists went to war in identifiable units, received media attention, and came home to a heroes' welcome.

ARNOLD, BENEDICT (1741-1801), "Continental army general and traitor. In 1755, at sixteen, Arnold fled his dysfunctional family in Norwich, Connecticut, and joined the provincial army of New York. Arnold soon tired of militia y life and deserted, as he did after a second enlistment in 1760, anticipating a lifelong pattern of abandoning military allegiances that failed to produce wealth, status, or fame.

A prominent merchant in New Haven, Arnold in April 1775 led his militia company to Massachusetts. In May,

Massachusetts authorities commissioned him a colonel, and he helped lead the expedition that captured Fort Ticonderoga. In September, he led an army through Maine toward Quebec. The conquest of Canada failed, but Arnold's wilderness march and his later defense of Lake Champlain secured his reputation as a dashing, talented leader. After being wounded at the Battle of "Saratoga" (1777), Arnold commanded the Philadelphia garrison in 1778. Rampant corruption in Arnold's command led to his court-martial in 1779, and a reprimand from Washington. Furious, and desperate for money to support a lavish lifestyle, Arnold plotted to betray West Point to the British for £20,000. The plot was uncovered in 1780. Arnold fled to the British, who commissioned him a brigadier general and gave him command of a corps of deserters, the American Legion, which he led on raids in Virginia and Connecticut (1780-81). His name remains a symbol of treason in U.S. national history.

ARNOLD, "HAP" [HENRY HARLEY] (1886-1950), aviator and World War II general. A 1907 graduate of the U.S. Military Academy, Arnold joined the Aviation Section in 1911, receiving his flight training from Orville and Wilbur

* Wright. As an aviation pioneer, he set altitude records and won the initial Mackay Trophy in 1912. During "World War I, he served in Washington as the head of flight training. The haphazard aviation programs of the war gave him useful insight into future efforts. After the war, he continued to advance the cause of military aviation. He testified for Col. Billy "Mitchell and violated regulations in soliciting reservists for support of legislation. This action exiled him to Fort Riley, Kansas, in 1926. He persevered, however, rising to the rank of brigadier general in 1935. Arnold developed and exploited relationships with aviation entrepreneurs, scientists at the California Institute of Technology, Hollywood celebrities, and senior Army officers, and frequently served as the logistics and organization officer in air maneuvers.

In 1938, Arnold became Chief of the Air Corps. Simultaneously, President Franklin D. "Roosevelt inaugurated U.S. rearmament, with emphasis on aircraft. In the next seven years, Arnold oversaw the creation of the world's most powerful air force—243 combat groups, 2.5 million men, and 63,000 aircraft at its height—which was his most significant contribution to the Allied victory in "World War II. Although slowed by two heart attacks, he attended most of the meetings of the Combined Chiefs of Staff and

* Joint Chiefs of Staff, where he championed the interests of the U.S. Army Air Forces and demonstrated that air power required representation at the highest levels. He deferred the fight for an independent air arm until after the war, but his loyal wartime support of both Army Chief of Staff Gen. George C. "Marshall and European Theater Commander Gen. Dwight D. "Eisenhower helped to ensure postwar army support for independence. In December 1944, he achieved five-star rank and, with the creation of the U.S. "Air Force in 1947, became the only General of the Air Force.

ARTICLES OF WAR. See Justice, Military: Articles of War.

ARTILLERY. Artillery has played a critical role in providing close support to the infantry, bombarding "fortifications, defending coasts, and, in the twentieth century, attacking tanks and aircraft. Beginning with the initial settlements, English colonists in North America, like Europeans, employed smoothbore, muzzle-loading, black powder, cast-bronze cannons and howitzers. Cannons, also called guns by the nineteenth century, had powerful, flat trajectories to batter down fortification walls or to shatter troop formations, while howitzers had curved trajectories for lobbing projectiles over fortification walls or into troop formations. Colonial artillery fired several types of projectiles, among them: solid shot, an exploding shell that was detonated by a fuse; canister, which was a can filled with musket balls; and grapeshot, a cluster of iron balls grouped around a wooden spindle and covered by a heavy cloth netting.

English colonists gave their artillery colorful names, such as *falcon*, *saker*, *demiculverin*, and *culverin*, to name a few. A falcon shot a 2- to 3-pound projectile; a culverin fired a 15- to 22-pound projectile. During the seventeenth century, however, Europeans and Americans started designating their artillery by the size of the projectile that they threw. For example, a cannon that shot a 4-pound projectile was known as a 4-pounder. Besides classifying their howitzers by the size of the projectile that it shot, Europeans and Americans also labeled them by the size of the bore, such as a 5.5-inch howitzer.

Meanwhile, most European armies began to classify their artillery as field, siege, garrison, and coast artillery. Light pieces, usually 3- to 12-pounders, served as field artillery to support the infantry and cavalry, while heavier and less maneuverable pieces were employed as siege, garrison, and coast artillery where mobility was not critical.

Unlike the Europeans, colonists had little use for arranging their artillery functionally by size. First, the rugged North American terrain limited artillery to siege operations along coasts or to the defense of a fortification because even the lightest pieces were too heavy to drag across the roadless terrain. Second, Native American warfare was too mobile for artillery of any size.

Although the colonists did not employ artillery extensively or standardize it, they had a diverse assortment composed primarily of French and British pieces. At the outbreak of the "Revolutionary War in 1775, the colonists had thirteen different calibers of artillery, ranging from 3- to 24-pounder cannons and 5.5- to 8-inch howitzers. Cut off from their sources of artillery at the beginning of the war, the Americans started casting their own iron and bronze artillery in foundries in Philadelphia by 1775. Under the guidance of Henry "Knox, who commanded the Continental army's artillery throughout most of the Revolution, they developed a system of field, garrison, siege, and coast artillery of 3- to 32-pounders. Colonial field artillery could hit targets at between 500 and 1,000 yards, while garrison, siege, and coast artillery had ranges of 2,000-3,000 yards.

After the Revolution, the Americans retained their categories of artillery. For coast artillery, which also doubled as siege artillery and garrison artillery, the Americans used 18-, 24-, and 32-pounder cannons. Bronze and cast-iron field artillery armed frontier forts but seldom saw action during the "Native American wars. Later, in the 1840s, the

Americans adopted rockets with explosive and incendiary warheads for use against personnel and fortifications at ranges of around 3,000 yards. Although rockets provided greater firepower than cannon artillery, developments with more accurate rifled artillery in the 1840s and 1850s caused rocket artillery to fall out of favor.

American smoothbore bronze artillery experienced its apogee in the middle of the nineteenth century. Designed by Maj. Alfred Mordecai of the army during the 1840s, the field artillery system had 6- and 12-pounder guns to support the infantry and cavalry, and 12-, 24-, and 32-pounder howitzers to bombard temporary field and permanent fortifications. For coastal defense, the army employed Columbiad cannons of 10 to 15 inches designed by Col. George Bomford.

Improved metallurgy and advancements in machining permitted significant breakthroughs with rifled muzzle-loading and breech-loading artillery. In the 1840s, the Italian Army produced the first workable rifled fieldpiece. Ranges of rifled artillery were twice that of smoothbore artillery—sometimes up to 4,000 yards.

Although rifled artillery promised to make smoothbore artillery obsolete, Union and Confederate armies during the *Civil War of 1861-65 did not abandon their muzzle-loading smoothbores for rifled breechloaders or muzzle-loaders. Prominent siege pieces included 10-, 20-, 30-, 60-, 100-, 200-, and 300-pounder rifled artillery produced by Robert P. Parrott of the United States. Other important siege and coast artillery pieces were smoothbores developed by Capt. Thomas J. *Rodman of the army. Some of the most popular rifled fieldpieces were the muzzle-loading, wrought-iron M1861 3-inch rifle and muzzle-loading 3- to 10-inch rifled guns. The latter, again manufactured by Robert P. Parrott, were of cast iron, with a wrought-iron hoop around the breech to prevent the weapon from bursting upon being fired. Like their smoothbore counterparts, rifled artillery fired solid shot, exploding shell, canister, and occasionally grapeshot, and used black powder as a propelling and bursting charge. However, smoothbore fieldpieces, especially the M1857 12-pounder Napoleon, remained the favorite because direct fire (also called line-of-sight fire direction) and the difficult terrain of Civil War battlefields prevented gun crews from engaging targets beyond human eyesight of about one mile and forced them to fire at targets at relatively short ranges.

A surplus of Civil War artillery and engagement in wars with Native Americans stalled new ordnance developments between 1865 and 1900. Early in the 1900s, Americans adopted breech-loading, rifled steel field artillery with recoil systems that allowed the gun tube to recoil on the carriage and return into battery without moving the carriage. At the same time the Americans started using high-explosive powder as a propelling and a bursting charge for steel shell and shrapnel, a projectile that was filled with iron balls. These high-explosive powders increased ranges and diminished the amount of smoke produced when the cannon was fired; the M1903 3-inch field gun, for example, had a range of almost 7,000 yards. For coastal defense, Americans introduced steel, rifled artillery mounted on disappearing carriages. Upon being fired, the gun moved back for some distance before swinging down behind the parapet to permit the gun crew to load the weapon out of sight of enemy guns.

Coupled with these advancements, Americans adopted indirect fire for their field artillery early in the twentieth

century. This arching fire permitted concealing the field gun behind cover to protect it from counterbattery fire and small-arms fire, and engaging targets beyond human eyesight. By World War I, all combatants were using indirect fire, locating their guns several miles behind the infantry line; they acquired targets by using forward observers, who relayed target information back to the batteries by telegraphy, telephone, and even human runners.

Even though the Americans went into World War I with distinct classifications of field, siege, and coast artillery, the war obscured the differences. Requiring heavy guns to batter down elaborate German earthworks and concrete fortifications along the western front, the U.S. Army frequently employed heavy coast and siege artillery pieces; some were mounted on railroad tracks in a field artillery role to help 75mm guns, 105mm howitzers, 155mm guns and howitzers, and 240mm, 8-inch and 9.2-inch howitzers shatter enemy positions. The army also introduced antiaircraft artillery, assigning it to the Coast Artillery branch.

During World War II, multiple rocket launchers mounted on trucks were used to lay down heavy concentrations of fire rapidly. The army even employed a recoilless rifle designed to fire the same size of projectile as light fieldpieces to engage tanks, enemy bunkers, and lightly armored vehicles. Ninety mm antiaircraft guns and shells with proximity fuses were employed to shoot down aircraft detected by * radar or the human eye. The main U.S. artillery pieces in World War II were the 105mm howitzer, with a range of 12,500 yards; the 155mm howitzer, with a range of 16,350 yards; and the 155mm gun, with a range of 25,500 yards. All were later utilized in the *Korean War.

The advent of nuclear cannon artillery, rockets, and guided missiles during the 1950s and 1960s transformed the field artillery. First fired in May 1953 at Frenchman's Flat, Nevada, the 280mm cannon, known as "Atomic Annie," shot a 200-pound nuclear projectile up to 20 miles. Later, the army also developed nuclear warheads for 8-inch and 155mm artillery pieces. In the 1950s, it introduced the "Honest John," a first-generation free flight rocket with a range of about 24 miles, to carry either a conventional or a nuclear warhead; and the medium-range Redstone, Corporal, and Sergeant guided missiles, with nuclear and conventional warheads and ranges between 75 and 200 miles.

Aircraft and high-velocity naval guns made concrete coastal fortifications vulnerable and obsolete; the Coast Artillery branch was abolished in 1950, and succeeded in 1968 by the Air Defense artillery. Antiaircraft missile artillery included large, immobile surface-to-air missiles such as the radar-guided Nike Ajax with a range of 100 miles; they defended American cities. The Nike Hawk, with a range of 25 miles, was a mobile antiaircraft missile. The Redeye, with a range of 3,300 yards, was a lightweight, man-portable antiaircraft missile.

Also beginning in the 1960s, the U.S. Army introduced new field artillery for the tactical nuclear battlefield to replace World War II pieces. These new weapons included the M102 105mm howitzer, with a range of 16,500 yards; the M109 155mm self-propelled artillery with a range of 19,700 yards; and the M1 10 8-inch artillery, with a range of 18,400 yards. Although intended for the European battlefield, these field guns saw service in Vietnam.

From the mid-1970s onward, high technology improved U.S. artillery. Field and air defense artillery employed computers for fire direction and adopted *precision-guided munitions (PGMs). The highly sophisticated

Patriot air defense missile with a range of 65 miles replaced the Nike Hercules and Nike Hawk missiles, while the Redeye was replaced by the shoulder-fired Stinger, with a range of 3 miles homed in on heat emitted from the aircraft target. The army fielded the nuclear Pershing II missile with a range of 1,000 miles in Europe in the mid-1980s and the Multiple-Launch Rocket System with a range of 15 miles in the field artillery and simultaneously improved the M109 self-propelled 155mm howitzer. Both the howitzer and the rocket system were employed by some *NATO armies in the 1970s and 1980s.

In the 1990s, the U.S. Army started laying the foundations to introduce leap-ahead artillery technology. It would include digital command, control, and communication systems; fire-and-forget munitions; and new propellants to give unprecedented ranges.

Although artillery technology had changed greatly since the colonial era, the basic role of artillery on the battlefield remained constant. Field artillery still provided close support of infantry and now armor (replacing cavalry). Coastal artillery had become obsolete due to high-velocity naval ordnance and especially aircraft and missiles. Yet air defense artillery had emerged to take on a defensive mission against the new skyborne weapons.

ASPIN, LES, JR. (1938-1995), member of Congress, secretary of defense. Aspin was a loyalist critic of the U.S. defense establishment. Born in Milwaukee, the son of a British immigrant, he earned degrees at Yale, Oxford, and MIT. In 1966-68, he worked as a policy analyst for Secretary of Defense Robert *McNamara. Aspin became convinced that the * Pentagon was making many mistakes in Vietnam and in Washington.

Returning to Wisconsin, he taught briefly at Marquette University, then won election to the House of Representatives as a liberal, anti-Vietnam War Democrat. Serving in the House from 1971 to 1993, Aspin found and publicized evidence of waste, mismanagement, and fraud, exposing evidence of Pentagon cost overruns, corruption, and abuse of privileges. In 1975, he helped overthrow autocratic F. Edward Hébert as head of the House Armed Forces Committee.

Unlike most liberal, antiwar Democrats, however, Aspin was committed to strengthening the military, not diminishing it. As he became more conservative, he broke with many liberals and supported a 5 percent annual growth in military spending, as well as draft registration, and the MX missile. In 1985, Aspin became chair of the Armed Forces Committee, continuing his drive to streamline defense spending and curtail procurement abuses while encouraging modernization. He was a key supporter of President George * Bush's decision to fight Iraq in 1991.

Appointed President Clinton's first secretary of defense in 1993, Aspin was forced out after a controversial year in-

volving Somalia, gays in the military, and a "bottom up" review of U.S. defense strategy and structure. He died two years later of a stroke.

ASTRONAUTS. See Space Program, Military Involvement in the.

ATLANTA, BATTLE OF (1864). Throughout May, June, and early July 1864, the *Union army of Maj. Gen. William Tecumseh *Sherman advanced through northern Georgia toward Atlanta while the Confederate army of Gen. Joseph E. *Johnston, to the increasing alarm of the Richmond authorities, retreated in front of it. Finally, on 17 July, President Jefferson *Davis acted, replacing Johnston with the aggressive Gen. John Bell *Hood.

By this time the *Confederate army was backed into the very outskirts of Atlanta, and Hood had no choice but to fight or abandon the city. On 20 July, he attacked Federal troops under Maj. Gen. George H. *Thomas near Peachtree Creek (the Battle of Peachtree Creek). Hood's plan went awry and the result was a bloody repulse.

Two days later, Hood struck again, in what is called the Battle of Atlanta. His target this time was a Federal force under Maj. Gen. James B. McPherson. Hood's plan was a good one, a flanking maneuver of his own, and this time it was tolerably well executed. Lt. Gen. William J. Hardee led his Confederate force on a long, tiring night march to gain the Federal rear. While he attacked from that direction, Confederates under Maj. Gen. Benjamin F. Cheatham were to attack the Union front. Hood, who was hampered by a crippled arm and a missing leg, was not personally present on the battlefield, and afterward he complained that Hardee had not positioned his troops as directed. Hardee, who resented being passed over in favor of Hood, was sometimes uncooperative. Still, Confederates struck hard at McPherson's Fédérés in a fierce day-long battle. The result went against the Southerners. Two Union divisions of Maj. Gen. Grenville Dodge's corps had, the night before, taken up a position that allowed them to blunt Hardee's attack. That, along with exceptionally hard fighting on the part of McPherson's men, produced Hood's defeat, but not before McPherson himself had been killed and John A. Logan had taken his place. On the Confederate side, Maj. Gen. William H. T. Walker was killed. Just over 30,000 Fédérés were engaged against nearly 40,000 Confederates. Federal *casualties were 3,722; Confederate losses are harder to pinpoint, but the best estimate is 7,000.

Six days later, Sherman tried yet another turning maneuver, and Hood responded again, attacking the Fédérés at the Battle of Ezra Church and again suffering a bloody repulse. After that, operations settled down to a quasi-siege of Atlanta. Hood's three sorties had cost him heavily in casualties and failed to gain battlefield success. Nevertheless, they had prevented Sherman from taking the city that month and forced the Union commander to show more caution in his future operations. Though Atlanta fell to Sherman on 2 September 1864, it is likely that Hood's installation as commander had delayed that event six weeks beyond the time it would have happened had Johnston remained in command.

ATOMIC BOMB. See Nuclear Weapons; Hiroshima and Nagasaki, Bombings of (1945); Atomic Scientists; Manhattan Project.

ATOMIC SCIENTISTS. From the moment when Albert Einstein in 1940 suggested to President Franklin D. *Roosevelt, that a new and decisive military weapon, the atom bomb, might be developed from the phenomenon of the nuclear chain reaction, atomic scientists assumed a critical role in the development of weaponry that would change the nature of modern warfare. Important scientists involved at this early stage included the physicists Niels *Bohr and Leo *Szilard, and some of them opposed the use of *nuclear weapons against Japan in 1945. The scientific knowledge and skills required to create such weapons—first the atom bomb and then the hydrogen bomb—separated this small group of scientists from their fellows, initially because of the extraordinary security requirements of the *Manhattan Project, the program to design and build the first atomic bomb. Later, the weight of responsibility for creating a device that could for the first time destroy civilization led them to become involved in the most fundamental issues of international policy.

In 1953, J. Robert *Oppenheimer, the scientific leader of the Manhattan Project, had his security clearances revoked by President Dwight D. *Eisenhower, ostensibly because of admitted violations of security procedures; however, it was generally believed that the action was taken because of Oppenheimer's opposition to the development of the even more destructive hydrogen bomb, which was vigorously pressed by the chairman of the Atomic Energy Commission, Adm. Lewis Strauss. During the security proceeding before the commission, Oppenheimer's colleague and close associate, the physicist Edward *Teller, testified against him. As a result, Teller himself was ostracized by a large part of the atomic science community, symbolizing a fundamental division of opinion on nuclear weapons policy.

Other scientists prominent in the development of the atomic bomb included the physicists Hans Bethe and Enrico *Fermi, the chemist George Kistiakowsky, and the mathematician John von *Neumann, whose invention of the high-speed computer was critical in the development process.

As the nuclear policy concerns of government policymakers have moved from building a nuclear arsenal to assuring that many atomic weapons could survive an attack and then retaliate (a "secure second strike capability"), to negotiating international agreements to reduce the likelihood of a nuclear exchange and control the spread of nuclear weapons, and now to the eventual abolition of nuclear weapons, atomic scientists have been involved at every stage. They served as technical experts but also as proponents of policy options. The creation of the office of science adviser to the president, and of the presidents Science Advisory Committee, provided significant input on nuclear policy, particularly during the incumbency as science advisers of George Kistiakowsky under President Eisenhower, and Jerome Wiesner under President John F. *Kennedy.

The atomic science community has tended to support more severe constraints on the use of nuclear weapons,

somewhat in contrast to the attitudes of political scientists, who seem more willing, in Herman Kahn's phrase, to think about the unthinkable. Even before the end of the Cold War, and in the face of rigorous security arrangements, atomic scientists in the West were able to develop working relationships with Soviet colleagues concerned about avoiding nuclear holocaust. On the other hand, the scientists on the staff of the nuclear weapons laboratories have persisted, perhaps understandably, in arguing and lobbying for continued testing of nuclear weapons, even in the face of international agreement on the Comprehensive Test Ban Treaty.

With the parallel development of fissionable materials as a potential source of energy for peacetime use, atomic scientists have also been involved in discussions on how to minimize the production of weapons-grade materials, as byproducts of nuclear reactors, and how to deal with the problem of nuclear waste.

The creation of the first atom bomb called for the highest levels of scientific creativity; but it is generally acknowledged that today, many well-named scientists would be able to fabricate at least a crude nuclear device. The focus of concern within the atomic science community has therefore shifted to more sophisticated technical problems of delivery, reliability, and control, with a consequent splintering of scientific expertise. The dynamic that continues to exert most force on the community is the awareness of the destructive power that their science has unleashed.

ATROCITIES are acts of wartime violence whose cruelty or brutality exceeds martial necessity. Such acts include looting, torture, rape, and massacre—the killing of captive troops or civilians. The contentious issue of atrocity has arisen in all American wars, typically as a rallying cry against enemies, but also when American troops have committed unmerciful acts.

Beginning with the 1637 Pequot War, conflicts with eastern Native Americans were bloody. Punishing the Pequots for the death of an English trader, Massachusetts militia attacked men, women, and children at the stockaded Mystic village, setting it ablaze and shooting escapees. Celebrating their rivals' destruction, the victors set an enduring pattern in Indian-white relations. Anglo-Americans decried Mohawk, Miami, Seminole, or Creek attacks on their settlements or troops as massacres, but praised no less brutal strikes against Indian villages as just.

Distrust of English rule grew after the *Boston Massacre, in which royal soldiers fatally shot five members of a protest mob in 1770. During the *Revolutionary War, when bayonet-wielding British troops ambushed and routed sleeping colonial militia at Paoli in 1777, some Americans retaliated by denying quarter to their foe at Germantown. Frontier fighting between patriots and loyalists, especially in the South, was particularly ruthless.

Mid-nineteenth-century wars saw efforts to curb atrocity. But in 1836, Mexican troops killed all 187 defenders in the Battle of the *Alamo and executed 330 prisoners at Goliad. Thus, when vengeful Texans under Sam Houston

overran the Mexicans at the Battle of "San Jacinto, they shot, clubbed, and stabbed to death enemy soldiers (some wounded) begging for mercy. During the 1846 U.S. invasion of Mexico, newspapers reported pillage, rape, and murder of civilians by Gen. Zachary "Taylor's soldiers. Consequently, Gen. Winfield "Scott set a code of conduct enforceable by military courts.

In the "Civil War, the federal government issued General Order 100 to limit battlefield excesses. The first man executed under it was Confederate Henry C. Wirz, commandant of the most infamous of Civil War "prisoner-of-war camps—Andersonville. Public outrage over the deaths of thousands of Union soldiers by starvation, exposure, and disease overrode evidence that Wirz did everything in his power to improve conditions. In another controversial case, a Confederate brigade under Nathan Bedford "Forrest overwhelmed a Union garrison in the Battle of "Fort Pillow, Tennessee, in 1864, slaying 60 percent of the defenders. Sparing one-half of the white Fédérés but killing over four-fifths of the black soldiers, Forrest's men seemingly committed a calculated racist massacre. Congressional hearings yielded contradictory testimony, but prompted no trials.

Late nineteenth-century authorities contended that laws governing combat between "civilized" powers did not apply to irregular warfare and "uncivilized" foes. The Colorado volunteer militia's 1864 "Sand Creek Massacre of 105 Cheyenne women and children inspired Indian depredations against settlers and the dismemberment of 81 U.S. soldiers in the 1866 Fetterman Massacre. In Gen. George Armstrong "Custer's 1868 Washita raid, only 13 of 103 Cheyenne killed were warriors. Thwarting a U.S. raid at the Battle of the "Little Bighorn in 1876, Sioux and Cheyenne braves took no prisoners, killing Custer and 265 of his men. At the Battle of "Wounded Knee, 1890, the Seventh Cavalry ended the cycle of retribution by slaughtering 200 Sioux refugees.

During the 1899-1902 "Philippine War, some American commanders allegedly condoned atrocities, including denying quarter, indiscriminate burnings, and torture of prisoners and civilians. Reacting to the 1901 Balangiga massacre, in which Filipino guerrillas hacked to death thirty-nine U.S. soldiers, Gen. Jacob Smith told officers to make the island of Samar a "howling wilderness" and kill any males over the age of ten. Though not implemented as policy, his directive exonerated one subordinate who illegally executed civilians.

Reaction to atrocity contributed to U.S. involvement in both world wars and in "war crimes tribunals. In 1915, Americans shuddered at reports of Germany's ruthless Belgian occupation (made even more lurid by British reportage) and Berlin's use of "submarines—most notably the sinking of the *Lusitania*, a British passenger liner, in which 1,200 passengers (128 of them Americans) died. The 1937 "Rape of Nanjing" (260,000 Chinese civilians and POWs were killed and as many as 30,000 women sexually assaulted) helped fix the Japanese government in the American mind as a rogue regime. The attack on "Pearl Harbor and the April 1942 Bataan Death March, in which 15,000 American and Filipino prisoners died from abuse and starvation in the Philippines, seemed to confirm the perception of Japanese barbarity. Even more horrific was the genocidal policy of Nazi Germany, whose systematic liquidation of millions of civilians, including two-thirds of

European Jews, shocked global opinion into united action. After 1945, international courts convicted and executed many Axis officials for war crimes against humanity.

In the "Vietnam War, U.S. officials emphasized the Communist insurgents' campaigns of kidnapping and assassination, but downplayed atrocities of their Saigon allies. U.S. Army suppression of reports of American participation in the "My Lai Massacre inflamed national anger at the 1968 slaughter of 200 unarmed villagers, damaging public confidence in the war effort. A 1971 court-martial condemned Lt. William L. Calley to life in prison for the crime, a sentence later commuted.

Charges of atrocity justified U.S. military involvement in "Somalia, Bosnia, and Kosovo, as well as the "Persian Gulf War. Reported abuse of civilians during Iraq's 1990 occupation of Kuwait galvanized an international coalition to reverse the invasion and attempt to supervise the elimination of Saddam "Hussein's offensive arsenals. Seeking to end the deplorable famine and factional violence in Somalia, U.S. troops safeguarded relief efforts in 1992-93, but could not stop the vicious fighting. Outrages in the "Bosnian Crisis ("ethnic cleansing" and the use of "land mines, "artillery, and snipers against civilians) eventually led to 20,000 U.S. troops joining "NATO forces to police that area of the former Yugoslavia. The same occurred in the "Kosovo Crisis (1999).

AWACS AND E-3S. The AWACS—for Airborne Warning and Control System—is a specialized military aircraft intended for long-range air surveillance and control. Development of the AWACS—more specifically known as the Boeing E-3 Sentry—began in 1961, as the latest in a long line of previous "radar-equipped early warning aircraft. But unlike these earlier aircraft, intended primarily to operate over the ocean, the E-3 was to operate over land and in much more integrated fashion with supporting "fighter aircraft. These two requirements demanded refinements in radar development and "communications far beyond what had been expected of earlier airborne warning aircraft.

Airborne warning aircraft were first developed as a response to the threat of Japan's kamikaze attackers of the later Pacific War. The U.S. Navy acquired a small number of Boeing B-17 Flying Fortresses, removed the bomb bay from the aircraft, and replaced it with a belly-mounted radar, designating the new airplane the PB-1. It foreshadowed a number of subsequent aircraft, both large and small, for the early warning and air control role. One notable example was the air force Lockheed C-121 Warning Star aircraft, which helped direct air operations over North Vietnam and, in particular, warn American strike aircraft of the presence, location, and strength of opposing North Vietnamese MiG fighters.

Development of the AWACS took over a decade. Boeing flew the first AWACS testbed in 1972, based on a modified

jet transport. At the same time, Westinghouse won a competition to produce the critical airborne radar that would perch above the transport, giving it a vaguely "flying saucer" shape. The first production E-3 entered service with the U.S. Air Force in 1977. Subsequently, advanced models of the aircraft have been sold to the air force, as well as to NATO, Great Britain, France, and Saudi Arabia.

Key to the AWACS, in addition to its radar, is its comprehensive electronic equipment, including the Have Quick secure voice communications system, the Joint Tactical Information Display System (JTIDS), the Mark XV Identification Friend or Foe (IFF) radar, and the Navstar Global Position System space-based location system. Over twenty crewmen operate the AWACS systems in flight, and it is data-linked to other aircraft and to ground stations.

The value of AWACS was clearly demonstrated during the *Persian Gulf War (1991). In that conflict, AWACS aircraft operated by the U.S. Air Force and the Royal Saudi Air Force managed and controlled over 3,000 coalition aircraft sorties per day. They detected Iraqi threats, and helped pair targets with strike aircraft. They "deconflicted" the air war, preventing so-called "blue-on-blue" attacks. Further, their comprehensive control capabilities enabled the coalition to conduct the war without a single aircraft lost due to a midair collision.

AWARDS, DECORATIONS, AND HONORS. One of the oldest traditions in the profession of arms is the recognition of heroic feats of arms against an armed enemy. The ancient Greeks awarded crowns, the Romans torques and decorative discs. This ancient tradition is carried on in the U.S. awards and decorations system, which includes six medals that recognize heroism on the field of battle. To these are added two other types of awards, one recognizing meritorious service that is a response to the importance of administrative and logistical efficiency in modern warfare; the other recognizing participation in campaigns and completion of overseas tours.

The American system of decorations began in 1782, when George *Washington established the Badge of Military Merit to recognize "instances of unusual gallantry" as well as "extraordinary fidelity" and "essential service." The actual decoration was a heart-shaped piece of purple cloth that was sewn to the recipient's uniform coat. Largely forgotten after the *Revolutionary War, this decoration was revived by the War Department as the Purple Heart in 1932, the 200th anniversary of Washington's Birthday. In its new form, this decoration recognizes military personnel

wounded or killed in combat and does not in itself constitute an award for heroic action.

America's highest award for gallantry, the Medal of Honor (often mistakenly called the Congressional Medal of Honor), was established during the "Civil War. Originally, it was used to recognize both gallantry in combat and meritorious performance, but by the end of the nineteenth century the standard for awarding this medal had become "conspicuous gallantry and intrepidity at the risk of life above and beyond the call of duty."

During World War I, two more decorations for heroism were added. The Distinguished Service Cross (Army), the Navy Cross, and the Air Force Cross (added in 1960) all recognize bravery that falls short of that required for the Medal of Honor. The second medal, the Silver Star, is awarded by all service for gallantry that is less noteworthy than that required for a service cross.

Finally, there are three other decorations that recognize varying degrees of gallantry in combat: the Distinguished Flying Cross (authorized by Congress in 1926); the Bronze Star (authorized by executive order in 1944); and the Air Medal (established by executive order in 1942). All three of these medals may also be used to recognize outstanding service or special achievements that do not necessarily entail bravery in the face of an armed enemy. When the Bronze Star is awarded for heroic action, it is worn with a small bronze "V" device that stands for valor. Without the V, the Bronze Star recognizes meritorious service in support of combat operations. Multiple awards of all decorations are indicated through a system of small metallic oak clusters and stars that are affixed to medals.

In addition to medals recognizing heroism in combat, each service has a decoration for heroism and risk of life outside of combat: the Soldier's Medal, the Navy and Marine Corps Medal, and the Airman's Medal.

Modern combat units became increasingly dependent upon support forces, whose personnel came to outnumber those in combat commands by nearly ten to one. Moreover, throughout the "Cold War, crews manning strategic weapons systems endured long hours on alert or patrol with virtually no opportunity to perform a heroic feat of arms. The need to recognize the contributions of personnel serving in noncombat roles gave rise to a second set of military decorations.

The highest-ranking award in this second set is the Defense Distinguished Service Medal, bestowed by the secretary of defense. Just below this decoration are the Army Distinguished Service Medal (DSM) and the Navy DSM, established by Congress in 1918 and 1919, respectively; an air force version was added in 1960. These medals call for "specially meritorious service to the Government in a duty of great responsibility." Rounding out this set of awards are several other Department of *Defense decorations and military service medals that recognize lower levels of achievement and meritorious service. Finally, the Air Force Combat Readiness Medal was established to recognize the sacrifice of service members who spent much, if not all, of their professional careers in roles related to deterring nuclear war.

The expansion of U.S. overseas service requirements was accompanied by a steady rise in the number of decorations recognizing such factors as participation in a campaign and completion of an overseas deployment, even in peacetime. This began in 1898, when the Dewey Medal was authorized

for those who participated in the Battle of * Manila Bay. Another form of participatory award is the unit citation, which recognizes those who serve in a unit that accomplished its mission in a superior manner. An example of this type of award is the Presidential Unit Citation.

Medals are usually worn only on ceremonial occasions. For routine, daily wear, each medal comes with a small oblong swatch that matches the pattern of the suspension ribbon.

Napoleon's comment to the effect that soldiers will risk their lives for a little piece of colored ribbon indicates the extreme importance the military attaches to its decorations for combat heroism. However, the criteria for awarding medals are highly subjective. Controversies relating to U.S. military decorations can be traced back as far as the *Civil War, when the Medal of Honor was awarded under questionable circumstances on several occasions. During World War II, the number of decorations awarded raised serious questions about the significance of medals. In the course of this war, the army (which still included the Army Air Forces, AAF) gave out a total of 1,800,739 medals. Of these, 1,314,000, or 73 percent, went to personnel of the AAF although they accounted for only 28 percent of the total per-

sonnel strength of the army. Similar problems have occurred right down to the * Persian Gulf War of 1991.

As the ratio of support forces to combat forces increased dramatically in the twentieth century, new awards to recognize and motivate support personnel proliferated, skewing the awards and decorations system toward meritorious service and mere participation in military activities. By the mid-1990s, the situation had reached the point where medals recognizing heroic combat service were often lost among the multiple rows of ribbons worn by virtually every career member of the armed services, the vast majority of whom had never been subjected to enemy fire. The U.S. awards and decorations system had yielded much of its traditional function of recognizing those who demonstrated extraordinary courage in combat.

B

BACON'S REBELLION (1676). Nathaniel Bacon arrived in Virginia in 1674 with money for land and impeccable connections to the colony's elite. Two years later he died of swamp fever, the leader of a rebel army made up of former indentured servants. Bacon's transformation from gentleman planter to rebel ringleader united two potent animosities in colonial Virginia: the colonists' hatred of Indians and small freeholders' hatred of land-monopolizing gentry.

Smallholders on Virginia's frontier had long-running disputes with the Susquehannocks north of the James River and with the colony's elite. The sources of the free-men's anger converged in 1676 when Governor William Berkeley, fearing the outbreak of Indian war, discountenanced Bacon's plans to lead a frontier army against the Indians and refused him a commission. Bacon planned to exterminate the Indians in the colony, and attack those beyond its border; Berkeley reasonably insisted on distinguishing between friendly and hostile Indians. In June, Bacon and five hundred men traveled to Jamestown to confront Berkeley. The governor eventually granted the commission and authorized Bacon to raise an army; Berkeley then fled Jamestown and sent to England for troops.

While Bacon's followers sought out Indians to enslave or massacre, Berkeley and Bacon waged a recruiting war, vying for the loyalty of servants and small landowners. In October, Bacon died and his rebellion fizzled. British troops arriving in 1677 confronted a puny rebel force: eighty slaves and twenty servants.

A class brawl within an Indian conflict, Bacon's Rebellion revealed the mixed motivations and tangled outcomes of warfare in colonial America. The revolt changed little within the colony; gentlemen continued to monopolize the best land, the highest offices, and the most slaves. The Indians suffered the most. Those within the colony lost population and land; the Susquehannocks to the north were decimated by Iroquois warriors, who seized the opportunity to attack. By the 1680s, the Susquehannocks existed only as Iroquois dependents, and the Iroquois were free to sell their lands to colonial planters.

BAKER, NEWTON D. (1871-1937), urban reformer, secretary of war. The career of Newton D. Baker, Woodrow * Wilson's second secretary of war (1916-21), was paradoxical. A compassionate man, he balanced concern for justice

with commitment to order. A man of peace, he became an accomplished warmaker. A social reformer, he did little to combat wartime racial and political prejudice in the army. An antimilitarist, he supported national * conscription. A man with no experience in foreign affairs, he supervised the movement of the * American Expeditionary Forces (AEF) to France and protected their independence against the French and British who attempted to amalgamate them with their own armies. The rather unimposing, bespectacled, owlish-looking cabinet officer thus gave President Wilson a strong hand at the peace table and achieved recognition as a successful secretary of war.

A lawyer and reform Democratic mayor of Cleveland, Baker had a reputation as a pacifist as well as an efficient administrator when Wilson appointed him to succeed Lindley Garrison in March 1916 on the eve of the U.S. Punitive Expedition into Mexico. Unlike Garrison, who had been won over by the generals and the Republican-based Preparedness movement, Baker always remained loyal to Wilson. In the War Department he was a conciliator and kept congenial connections between his office, the General Staff, and the army's bureau chiefs as long as possible. Even during the war production and transportation crisis in the winter of 1917-18 he refused to act hastily; it was April 1918 before authority was adequately concentrated in the General Staff and the War Industries Board. Baker also refused to resolve command issues between the War Department and the AEF. In the struggle between Gen. John J. * Pershing and Chief of Staff Peyton C. * March for the control of military policy, Baker did not decide in March's favor until the war was nearly over. The secretary believed that most problems were resolved if left alone. After the war, he remained an outspoken Wilsonian internationalist and was a candidate for the Democratic presidential nomination in 1924.

BALCH, EMILY GREENE (1867-1961), pacifist, feminist, and Nobel Peace Prize winner. Born in Massachusetts, educated at Bryn Mawr College, Balch became an economics professor at Wellesley College until 1919, when she was fired for her antiwar activities during World War I. She was one of the founders and leaders of the Woman's Peace Party (1915-19) and the *Women's International League for Peace and Freedom (WILPF), founded in Zurich in 1919. She served as WILPF's international secretary from 1919 to 1922 and in a number of other leadership

positions until her retirement in 1950. Her belief in transnational ideals, "nonviolence, and justice, as well as her commitment to women's equality and freedom, shaped her approach to peace activism. A "practical" pacifist and feminist, Balch held that, as responsible citizens, women must work to end war by promoting just and non-violent alternatives such as disarmament and peaceful international processes for conflict resolution and for meeting human needs. Believing most strongly that cooperative international endeavors offered the first steps toward peace, Balch proposed plans for mediation of the conflicts in Manchuria and Spain during the 1930s. She was one of two recipients of the Nobel Peace Prize in 1946.

BALL, GEORGE (1909-1994), undersecretary of state. As undersecretary of state (1961-66) under Presidents Kennedy and Johnson, George W. Ball achieved his greatest prominence as the highest-ranking U.S. official to oppose, consistently but unsuccessfully, the decisions to increase the American military role during the "Vietnam War.

President Kennedy appointed him assistant secretary of state for economic affairs in 1961. After the Bay of Pigs disaster, Ball was promoted to undersecretary of state. He took issue with the Taylor-Rostow mission in 1961, which advocated the introduction of U.S. combat troops into Vietnam. Ball saw the United States becoming involved in a revolutionary war with little hope of eventual success; he argued that U.S. military resources were better deployed in Europe.

Ball's opposition to American involvement in the war continued throughout the Johnson administration, but this opposition proved futile, and he left the administration in 1966 to return to his law practice. He remained personally and publicly loyal to the president, and his determined opposition to American involvement in the war became widely known only after the publication of the

• *Pentagon Papers* in 1971. He later served as U.S. delegate to the *United Nations and as an adviser on Iran to President Jimmy "Carter.

BANCROFT, GEORGE (1800—1891), historian, secretary of the navy, diplomat. Appointed James K. Polk's first secretary of the U.S. "Navy in March 1845, Bancroft initiated a number of important reforms of the naval service during his seventeen months in office. The most important of these was the establishment of a permanent naval academy for the education and training of young officers. In a feat of administrative legerdemain, Bancroft found funds, teachers, and a site for a school without resort to Congress. It opened 10 October 1845 with lawmakers agreeing to fund the new academy the following year. Bancroft took other steps to rehabilitate an officer corps grown moribund in

the decades following the "War of 1812. He argued for promotions based on merit rather than seniority; he sought legislation for removing old and unfit officers from the ranks; and he ordered candidates for certain officers' grades to demonstrate their fitness for appointment by passing examinations. Though not all of Bancroft's attempts at reform met with success, his efforts laid the foundation for a better-trained, more professional officer corps. Bancroft also provided vigorous and able direction of the navy's initial efforts during the "Mexican War. On his orders, navy squadrons blockaded Mexico, occupied several Pacific Coast towns, and provided valuable assistance to American land forces. In September 1846, Bancroft left the secretaryship to become minister to Great Britain.

BARTON, CLARA (1821-1912), "Civil War nurse, relief worker, and founder of the American "Red Cross. Raised in a quiet New England family, Clara Barton taught, founded a public school in New Jersey, and in 1854 became a copyist in the U.S. Patent Office. In 1861, the Civil War catapulted her to national prominence. During the first two years, Barton functioned as a one-woman relief agency. Relying on the assistance of a few sympathetic politicians and friends, and shunning official channels of the U.S. "Sanitary Commission and Dorothea *Dix's nursing corps, Barton brought supplies and relief to thousands of suffering Union soldiers on fields in the Eastern theater. Her timely arrivals from "Fredericksburg to "Antietam earned her the nickname "Angel of the Battlefield." In June 1864, she agreed to serve as head nurse in the Army of the James.

As the Civil War, especially early on, afforded few official roles for women, Barton could carve out an independent niche and use her status to bypass the formidable military bureaucracy. Throughout, she sought to bring humanity and personal dignity to the war; to counteract the brutal and dehumanizing affects of modern, large-scale carnage. Although her relief activities abated somewhat later in the war, she began in February 1865 the herculean effort of identifying missing men. Much of her attention focused on the unknown dead of Andersonville Prison, securing the identification of nearly 11,000 in that infamous pen.

When the Civil War ended, Barton continued her mission of humanizing the horrors of military suffering. She worked tirelessly for U.S. ratification of the "Geneva Conventions of 1864 (conferring neutrality on wounded and hospital personnel in war), and in 1881, organized the American Association of the Red Cross. In 1898, she personally led Red Cross relief efforts in Cuba during the "Spanish-American War.

BARUCH, BERNARD M. (1870-1965), financier and political adviser. In matters of war and national security, Baruch was a major administrator during World War I, an important influence on Democratic congressional leaders from 1918 to 1948, and an intermittent consultant to

Democratic presidents. Son of a German Jewish immigrant and his southern wife, Baruch was born in Camden, South Carolina, but moved with his family to New York City, where he graduated from City College in 1889. Successful on Wall Street, he was a millionaire by the age of thirty.

Baruch became a friend of Woodrow * Wilson and many Democrats in Congress. In World War I, Wilson appointed Baruch to several *mobilization posts, most importantly (1918) chair of the War Industries Board (WIB), then designated the major civilian agency for industrial mobilization. Not the "czar" described in the press, Baruch worked largely by persuasion rather than coercion. Furthermore, there were other agencies, and the military retained independent contracting authority. Nevertheless, at the WIB and on the President's War Council, Baruch was at the center of the government's mobilization. The WIB's success established Baruch's reputation as an industrial statesman. Wilson took him as an economic adviser to the Paris peace talks.

In the interwar years, Baruch—who believed in business-government cooperation—encouraged industrial-military planning through the new Army Industrial College and through the War Department's Industrial Mobilization Plan of 1930 and its subsequent revisions.

During World War II, Baruch urged a new WIB, but President Roosevelt, concerned with his own prerogatives, ignored this advice. Denied administrative power, Baruch still maintained political influence, primarily through his influence in Congress and friendships with the heads of mobilization agencies.

In 1946, President Truman asked Baruch to formulate a postwar international policy for atomic energy. The Baruch Plan proposed guarding America's atomic secrets and its production of atomic bombs until an international agency, over which the USSR would not have a veto, established full control of manufacturing plants anywhere in the world. The Soviet Union rejected it. During the *Korean War, Baruch, fearful of inflation, tried unsuccessfully to get the Truman administration to impose price and wage controls. By then, however, Baruch had lost his great influence.

BASES, MILITARY: DEVELOPMENT OF. Providing a secure site from which to operate, military bases can be temporary wartime installations or long-term facilities. Strategic planning drives their necessity, but other considerations often determine their location, particularly in peacetime.

With the creation of a permanent U.S. *Army after the *Revolutionary War, the primary bases for the standing army and its supplies were established at West Point, New York, and at Fort Pitt (later Fort Fayette), at what is now Pittsburgh, Pennsylvania, an indication of the regular army's missions of coastal and frontier defense. Bases served as military headquarters, barracks, training fields, and storage depots. Later bases would be created in a number of the seacoast * fortifications such as Fort Jay (1794)

on Governors Island in New York Harbor and Fortress Monroe (1823) at Point Comfort on Hampton Roads, Virginia, where the Coastal Artillery School was situated.

U.S. expansion in the first half of the nineteenth century saw the establishment of a string of army outposts across the country, including Jefferson Barracks, St. Louis, Missouri (1826), where the Infantry School was established, Fort Leavenworth, Kansas (1827), which later became the site for both the military prison and the Command and General Staff College; and Carlisle Barracks, in Carlisle, Pennsylvania (1842), site of the Army War College in the twentieth century.

When the U.S. *Navy was established in 1794, permanent navy yards were soon created in Boston, Brooklyn, Philadelphia, Washington, and Norfolk, for the construction, repair, and berthing of ships and their preparation for sea duty. Mindful of the political and economic benefits of these bases, Congress made sure that the navy yards were dispersed among New England, the Mid-Atlantic, and the South.

When not serving afloat, members of the U.S. *Marine Corps, created in 1798, guarded navy yards, drilled, and maintained discipline. In 1800, the Marine Corps commandant was relocated from Philadelphia to Washington, D.C. Consequently, Marine barracks were established there and at other navy yards.

Acquisition of Florida, Texas, Oregon, and the Mexican territories led to the construction of new army posts, naval bases, and Marine barracks on the Gulf and West Coasts. Among these new bases were navy yards created at Pensacola, Florida, in 1825, and Mare Island, San Francisco Bay, in 1853 (the Marine barracks founded on Mare Island in 1862 is the oldest permanent Marine Corps installation on the West Coast).

In the *Plains Indians Wars, infantry and mounted troops were quartered in wooden and adobe forts dotting the West and Southwest. Among the most famous were Fort Bliss, Texas (established 1849); Fort Bridger, Wyoming (1857); Fort Riley, Kansas (1852); Fort Laramie, Wyoming (1849); Fort Sam Houston, Texas (1876); and Fort Sill, Oklahoma (1869). Long after the Indians had been conquered, however, the economic benefit to rural congressional districts of scores of small posts prevented the army from abandoning them until just before World War I.

America's outward thrust and acquisition of an island empire after the *Spanish-American War led to the establishment of the first permanent U.S. military bases overseas. Congress was reluctant to spend outside its constituencies, and the army and navy often disagreed over the best location (for example, in the Philippines), so the major expansion of naval bases took place within the continental United States. Nevertheless, naval installations were created in Cuba, Guam, the Philippines, Hawaii (Pearl Harbor, Oahu, was designated the navy's major forward base in the Pacific in 1911), and, after 1914, in the U.S. Panama Canal Zone. By 1916, the navy had ten major continental bases (with particularly significant facilities at Newport, Rhode Island, and Norfolk, Virginia), including two new navy yards, created largely through congressional influence, at Charleston, South Carolina, and Bremerton, Washington. After 1920, the main part of the fleet was moved from the Atlantic to the Pacific; consequently, the navy bases at San Diego, Los Angeles, and Pearl Harbor grew in importance.

World War I and the creation of massive wartime armies led to the proliferation of military training camps. Although the majority of Americans lived in the North of the country, climate and congressional influence meant that a majority of training cantonments were erected in the South. Among the most important training facilities of

1917-18 were Fort Benning, Georgia (1918), which later became the nation's largest infantry training center and home of the army's Infantry School; Fort Bragg, North Carolina (1918), later the army's main airborne training center and site of the Special Warfare School; Fort Dix, New Jersey (1917), later, in World War II, to become the largest army training center in the United States; Fort George G. Meade, Maryland (1917); and Fort Knox, Kentucky (1917), which later also served as the U.S. gold depository. The Marines established a basic training camp at Parris Island, South Carolina (1917), and an officers' training camp at Quantico, Virginia (1917).

Many of these bases remained in operation or were reactivated and modernized in World War II, but new training centers were also created for that. Among the new facilities, the largest were the army's Fort Leonard Wood, Missouri (1940), and Fort Hood, Texas (1942); and the Marines' training center at Camp Lejeune, North Carolina (1942), subsequently the largest Marine base in the eastern United States.

The Army Air Service had established Langley Field, Virginia, in 1916; today, as headquarters of the Air Combat Command, it remains the oldest continuously active air force base in the United States. Other early air bases (initially called fields) for the Army Air Corps, 1926-41, included Wright-Patterson Field, Ohio (1917); Bolling Field, Washington, D.C. (1918); and Maxwell Field, Alabama (1918). Maxwell housed the Air Corps Tactical School, a major flight training center in World War II and the Air University after the war. In the 1930s, Wheeler and Hickam Fields, Hawaii, and Clark Field, in the Philippines, were created.

The Army Air Forces, 1941-47, established a number of air bases in the United States, including Andrews Army Air Base, Maryland (1942); Dover Army Air Base, Delaware (1941); and Muroc Army Base, California (1942), a combat training and experimental test site renamed Edwards Air Force Base in 1949.

It was only during World War II and the *Cold War that the United States established a network of long-term overseas bases in foreign countries. Since sovereignty resided with the host nation, major diplomatic negotiations were required for U.S. forces to be stationed there permanently or on long-term leases. Negotiations also involved issues of military necessity and use, economic compensation, legal jurisdiction, and even social fraternization. One of the first of these was the *Destroyers-for-Bases Agreement (1940), which provided for ninety-nine-year leases for U.S. naval and air bases in Newfoundland, Bermuda, and five British islands in the Caribbean.

During the war, the United States obtained other basing rights in Iceland, the Azores, Brazil, Morocco, and Great Britain. These bases supported the antisubmarine war, the ferrying of aircraft and other supplies to Britain and the Soviet Union, and ultimately the Allied invasions of North Africa, Italy, and France. In the Pacific, after the loss of Guam and the Philippines, the U.S. military established advanced bases in Australia and New Zealand for the

war against Japan. The Army Air Forces created major bomber bases in Britain, North Africa, and Italy, as well as in China and in Pacific islands like Tinian. The logistics of training and supplying an army of more than 11 million were enormous and involved scores of bases throughout the world.

*Cold War containment of communism and global defense of U.S. interests during the *Korean War and the *Vietnam War led to a proliferation of major American bases overseas in the 1950s and 1960s. With its air-atomic offensive capability, the U.S. Air Force's Strategic Air Command (SAC), headquartered at Offutt Air Force Base, Nebraska (1948), was America's principal instrument of *deterrence and potential offensive operations against the Soviet Union. As part of the containment of the Soviet Union, Congress authorized an extensive system of overseas bases after the outbreak of the Korean War in 1950. SAC increased the deployment of its bombers from nineteen to thirty bases in the United States and from one to eleven bases overseas, including forward bases in England, Morocco, Spain, Libya, Greenland, Korea, and the Philippines. But when the Soviets developed *missiles in the late 1950s, and domestic dissent arose in many of the host countries, the overseas SAC bases became increasingly vulnerable both militarily and politically. Consequently, the SAC strike force was withdrawn, primarily to air bases and intercontinental ballistic missile bases in the western hemisphere.

The North Atlantic Treaty Organization (*NATO) had been expanded in 1951 to include rearmament and ground defense of West Germany; as a result, the United States stationed army divisions at bases in Heidelberg, Würzburg, and Bad Kreuznach, and aircraft at air bases at Ramstein and Rhein-Main Air Force Base near Frankfurt. The U.S. Navy's Sixth Fleet operated in the Mediterranean from a forward Italian base at Gaeta, north of Naples. In the Pacific, the navy took over the old Imperial Japanese naval yard at Yokosuka on Tokyo Bay as the forward base for the Seventh Fleet. The Third Fleet remained based at San Diego and the Second Fleet at Norfolk. The army and air force also retained major facilities in South Korea and in Japan, and particularly on the southernmost Japanese island of Okinawa, as well as Hickam Air Force Base and Schofield Barracks on Hawaii. The Marine Expeditionary Forces were based at Camps Lejeune, North Carolina; Pendleton, California; and Butler, Okinawa.

During the Vietnam War, Okinawa, Guam, and Subic Bay on Luzon in the Philippines became major advanced bases for supplying the U.S. military effort. In 1965, the United States established one of the largest military facilities in South Vietnam at Cam Ranh Bay.

As major U.S. military concerns shifted to the unstable, oil-rich Persian Gulf, an advanced U.S. naval base was established at Diego Garcia, a British atoll in the Indian Ocean. This was augmented by a new system of prepositioned, commercially leased supply ships loaded with heavy equipment and supplies, stationed in various regions. In the *Persian Gulf War of 1991, unlike the previous overseas buildups, adequate port and air facilities for the allied Coalition forces already existed.

At the end of the Cold War, downsizing of the armed forces was accompanied by major closing of bases and installations. Domestically, this politically difficult task was accomplished through a bipartisan commission, headed

by former member of Congress James Courter. Its recommendations were presented to Congress on an all-or-nothing basis. Overseas, often under local pressure to withdraw or renegotiate existing treaties, the United States closed some of its oldest and largest bases, including, in the Philippines, Clark Air Force Base in 1991 after it was extensively damaged by a volcanic eruption, and Subic Bay Naval Base in 1992.

In the late 1990s, the United States came under increasing pressure to withdraw from Okinawa, which had succeeded the Philippines as the largest U.S. military base in the western Pacific. At the end of the twentieth century, it remained an open question how much further the U.S. overseas and domestic base system would be reduced.

BASES, MILITARY: LIFE ON. At 0600 hours (6:00 a.m.) on most U.S. military bases around the world, people are stirred from sleep by the muffled, deep-throated boom of a cannon and a rousing wake-up Reveille. Although some residents have been on duty during the night, the majority are now beginning their day. Junior enlisted personnel and their noncommissioned officers soon head for some form of physical exercise, to be followed by showers, breakfast, and a day filled with varied training experiences.

Enter that base through one of its several, often guarded, gates and you enter a world very different from civilian life and community. Certainly, it has changed over the years, but it still represents one of the earliest and most comprehensive examples of planned communities in the United States. Just as in Reston, Virginia, or Columbia, Maryland, on a military base you can work, play, shop, give birth, and bank in the place where you live. But there are many significant differences. The military base is, in a sense, a "company town" where the employer is at once landlord, sheriff, fire department, and grocer.

The residents, clustered by rank (and indirectly by income), are all part of an institution whose mission, as statutorily defined, is to maintain the common defense and, if necessary, to wage war successfully. All of the operations and activities of the base are intended to support that mission and to increase the service members' identification with, and loyalty to, the units that comprise it. A wide and responsive array of family support services—including medical care, reasonable housing, highly competitive grocery stores (commissaries), clubs, and recreational activities—is designed to meet the needs of family members and to assure the soldier, sailor, Marine, or airman that

their spouses and children will be looked after if they have to deploy to some trouble spot in the world.

If you live on a base for even a few short weeks, you will notice that you and your neighbors in general differ in some surprising ways from civilian counterparts outside the gates. You are younger (98% under forty years of age), healthier, and better educated (99.7% have at least a high school degree and approximately 70% some college education), and you are in a relatively stable marriage (over 62% are married; 78% for the first time, 15% for the second time, 3% three or more times). Furthermore, you can expect that the incidence rates of local crime will be less and that you can still count on your neighbor to get involved should your home or family be threatened by an intruder.

If you happen to be a member of a minority racial or ethnic group on that military installation, you are not alone. Although the majority are white (69.5%), black, Hispanic, and Asian/Pacific Island members of the armed forces are often disproportionately represented compared to their numbers in the civilian population (black members comprise 27% of the army population). The racial and ethnic demographics of the military reflect the attraction it has for citizens seeking equal opportunity to advance. Although much remains to be done for race relations, life within the military neighborhood or barracks is characterized by a respect based upon performance, and by the fact that the military has had years of experience at the leading edge of integration in the United States.

Women comprise only 20 percent of the active duty force, yet their numbers, seniority, and the variety of roles they may play in the force structure have increased dramatically over the past decade. Today, women are excluded only from the most direct combat-related roles, and even there, the decision is often justified on strength considerations rather than gender or social/sexual stereotypes.

At the workplace itself, there are also a number of differences. On duty clothing considerations are circumscribed; there are prescribed "uniforms for the work to be done. Once at work, an eight-hour day is the norm, but personnel will be expected to remain on the job, with no overtime pay, for as long as it takes to complete the task assigned. A military career is still considered by many to be a vocation (versus an occupation); it calls upon its members willingly to do the extraordinary in the service of their country. In return, the tangible and intangible rewards are many, including regular recognition ceremonies and a sense of ritual; an opportunity to advance based upon performance; a family-oriented social and health care safety net; and retirement after twenty (or fewer) years of service.

At the end of the duty day, around 1700 hours (5:00 p.m.), all of the civilian workforce, and perhaps 50 percent of the uniformed personnel, head to their off-base homes; the remainder walk or ride to their quarters somewhere on the installation. Everyone, however, will stop when the cannon again roars and a bugle is heard sounding the first notes of Retreat. If you are in a car, you dismount and face the flag. If you are in uniform, you stand at attention and salute. The world comes to a stop for a few moments as the flag is lowered, folded, and put away for another day, as it has always been in the military.

In the evening, if time permits, you and your family might enjoy an on-base Little League game, a bowling tournament, a shopping expedition, or even a movie at the base theater. At the theater, you will not be surprised when

the strains of the national anthem are heard prior to the performance and everyone rises respectfully.

Although certainly reflecting the civilian society that surrounds it, life on a military base has a character and pulse of its own ... and Reveille is just a few hours away.

BATAAN AND CORREGIDOR, BATTLES OF (1942). From December 1941 to May 1942, after the entry of the United States into World War II, U.S. and Philippine forces fought desperate and ultimately doomed battles to resist the Japanese invasion of the main island of Luzon. Implementing one of the U.S. *war plans—War Plan Orange—Gen. Douglas *MacArthur, commander of all U.S. and Philippine forces, chose to make the stand against the invaders on the Bataan Peninsula and on the island fortress of Corregidor in Manila Bay. Well before the Japanese Fourteenth Army under Lt. Gen. Homma Masaharu made its main landing on 22 December at Lingayen Gulf, north of Bataan, MacArthur had suffered two major setbacks. On 8 December, Japanese air raids had destroyed over half of the U.S. B-17 bombers and P-40 fighters on the ground at Clark Field on Luzon. The subject of much subsequent controversy (MacArthur had not thought Japanese planes had such range), this disaster gave Japan local air superiority. Second, MacArthur initially dispersed his forces and supplies to try to repulse the Japanese on the beaches, but when he eventually reverted to the original plan to pull back to defend Bataan, tons of valuable materiel were abandoned.

Dangerously short of food, medicine, and ammunition, the U.S. forces still put up a furious defense of the peninsula. "The Battling Bastards of Bataan" and the defenders of "the Rock"—Corregidor—provided a tremendous morale boost after U.S. losses suffered in the attack on * Pearl Harbor, Guam, and Wake Island. Heeding direct orders from President Franklin D. * Roosevelt, MacArthur and his family escaped from Corregidor by PT boat on 11 March 1942, and upon arrival in Australia, MacArthur made his famous "I shall return" promise. By 9 April, the Japanese controlled Bataan and besieged Corregidor. On 6 May 1942, Lt. Gen. Jonathan *Wainwright, commanding an ill and starving garrison, surrendered. In the infamous Bataan Death March that followed, more than 600 American and 5,000 to 10,000 Filipino and many Australian and British prisoners of war died from disease, malnourishment, and abuse as they were taken to Japanese prisoner-of-war camps. As with Pearl Harbor, this atrocity became a powerful motivational symbol for Americans in the war against the Japanese empire.

BATTLEFIELDS, ENCAMPMENTS, AND FORTS AS PUBLIC SITES. Usually in the forefront of expansion are the sites of military posts and encampments that protected advancing explorers or soldiers. At or near many posts are the locations of battles that took place. In general, such places are called *forts*, used interchangeably with other terms, such as *camp*, *post*, *garrison*, *cantonment*, *barracks*, *presidio*, and the like. Many have been preserved for the public as symbols of American history.

Europeans usually built defensive stockades immediately upon arrival in the New World in order to protect their foothold on the shore. The earliest of these is probably Fort San Marcos and San Felipe II at the settlement of Santa Elena, established in 1566 at what is now the Marine Corps Base at Parris Island, South Carolina. James Fort, established by the settlers of Jamestown, Virginia, in 1607 was the first permanent English settlement in the New World.

The establishment of forts marked the movement westward from the eastern seaboard. The exceptions are those in the Far West, such as the Spanish presidios, and Fort Ross, north of San Francisco, the Russian trade and colonization attempt south from Alaska.

In the East, rough stockades were built to protect settlements or such strategic locations as roads or river crossings. The * French and Indian War (1754-63) resulted in a line of forts in western Pennsylvania, northern Ohio, and Indiana. The * Revolutionary War brought about the construction of numerous forts throughout the eastern United States from earthworks or stockades at many towns to major construction protecting the harbors.

Fort Stanwix in the center of Rome, New York, is a full-scale replica constructed by the National Park Service in 1977 to recognize this stockaded structure that played a role in the French and Indian War and the American Revolution.

There are a number of other preserved examples of eighteenth-century *fortifications in the East, some of them military, others nonmilitary. One of the latter is Fort Western (1754-69) at Augusta, Maine, built as part of the defenses of the Kennebec River during the French and Indian War.

Further south near Orlando, Florida, is the replica of Fort Christmas, representative of the many forts built during the *Seminoles Wars. The original post was established on Christmas Day, 1835, and abandoned in 1845. More than 135 years later, the Orange County Parks Department undertook its reconstruction. Another reproduction from the eighteenth century is Fort St. Jean Baptiste (1737), a palisaded square fort near Natchitoches, Louisiana. It was garrisoned by French troops, although in Spanish territory until the Louisiana Purchase. The U.S. *Army abandoned its use in 1819, but it has risen again in a ten-building reconstruction near Northwestern State University that opened in 1982 as part of Louisiana's tricentennial.

A most unusual reconstruction is that of Fort de Chartres (1753-56), four miles from the Mississippi River town of Prairie du Rocher, Illinois. The four-acre fort had stone walls 18 feet high and more than 2 feet thick. In 1765 it became the seat of British rule in the Illinois country un-

til it was leveled in 1772. Fort de Chartres became a state park in 1915, and most of the buildings were reconstructed on the original stone foundations.

A strategic location of French and British authority was the point between Lakes Michigan and Huron at the Straits of Mackinac, separating Upper and Lower Michigan. In 1712, Fort Michilimackinac—a palisade of pointed logs and blockhouses surrounding log buildings—was built by the French on the southern side of the straits as a fortified trading post. The British took over in 1761, but two years later the fort was attacked by Indians and most of the thirty-five-man garrison massacred. The British reoccupied the ruined fort in 1764; it remained the only British-occupied post on the Great Lakes above Detroit until near the end of the American Revolution. In 1780, the garrison moved to Mackinac Island. Here Fort Mackinac was built on the high bluff with stone ramparts and three blockhouses that remain today in a state park. At the Michilimackinac site, the trading post stockade was restored in 1959 with a full-scale replica that has 20-foot-high log walls surrounding barracks, officers' quarters, storehouse, French church, British trader cabins, and blockhouses.

Also in the Northwest is privately constructed and maintained Fort St. Charles, one of the most isolated posts in the country. Set in the political incongruity of the Northwest Angle—a tiny Minnesota peninsula on Lake of the Woods that is separated by a strip of Canadian territory—the stockade was a trading post erected in 1732 by the French explorer Pierre LaVerendrye. Twenty miles away, in 1736, Indians massacred and beheaded a twenty-one-man party led by LaVerendrye's son; parts of their mutilated bodies were buried at the fort. Abandoned in 1763, the fort was soon forgotten. But in 1951-68 it was reconstructed by the Knights of Columbus. The double-deep log palisade, with its two blockhouses, chapel, and outlined buildings, can be visited by boat from resorts in the Northwest Angle on Lake Superior.

The Great Lakes were strategically important in eighteenth-century relationships first between the French and British, then the Americans, and forts were built at important points along the shores, usually in direct opposition to each other. Thus Fort Malden at Amherstburg, Canada, faces Fort Wayne at Detroit; and Fort George, on the Niagara River and Lake Ontario, faces Fort Niagara on the opposite shore of the river.

By the mid-1790s, the federal government realized that the war in Europe might pose a threat to the United States and a plan was approved to fortify twenty ports along the Atlantic seaboard from Portland, Maine, to Savannah, Georgia. The construction that took place under this so-called First System of Fortification (1794-1804) consisted primarily of sodded earthworks over which a dozen or so guns could fire.

The appropriations for the First System totaled \$172,000 initially in 1794, with an additional \$250,000 in 1798. Increased finding made improvements possible, and masonry was introduced at some, including still-existent Fort McHenry at Baltimore and Fort Mifflin across the Delaware River from Philadelphia.

The Second System of Fortification was precipitated by growing antagonism with England, which exposed the disrepair of the early construction. In 1807, Congress began a five-year program funded by more than \$3 million in appropriations. This Second System included some open

earthen batteries, but more were of partial or full masonry construction. A design that characterized the forts of this era was the circular or elliptical masonry bastion: Fort Norfolk in Norfolk, Virginia, is one of the few remaining examples. The use of multiered masonry casemates as part of the construction permitted the firing of heavy sea-coast guns from within the forts instead of from on top of the walls. Castle Williams on Governors Island is a prime example, with four levels in a circular design mounting 102 guns.

The Third System, begun in 1817, could be accomplished systematically. Looking for a "permanent" defense of the country, a board of officers planned and supervised all aspects of a long-term program—a board that continued in existence under various names until World War II.

In 1821, the board recommended that fifty defensive works be constructed, but termed only eighteen of the first class as urgently necessary. By 1850, the plan had been expanded to recommend about 200 coastal works. In actuality, the effort concentrated on upgrading the protection of the principal harbors in the East, with Florida and the Gulf Coast the main locations for new forts of the Third System. Although most of these forts were constructed simply of brick- or stone-backed earthen uncovered parapets, some were elaborate structures. Examples still standing today include Sumter, South Carolina; Monroe, Virginia; Adams, Rhode Island; Morgan, Alabama; Pulaski, Georgia; Jackson, Louisiana; Jefferson at the tip of the Florida Keys; and Fort Point in San Francisco Bay. Most of these are now preserved and interpreted as part of the National Park Service or that of their parent states. One, Fort Monroe, is still an active army post.

Protection of the coasts of the country looked toward an enemy coming from Europe. To protect the movement of explorers, missionaries, and settlers westward, the army established forts at key locations and along trails and waterways through the frontier. Sometimes these were log cabins, surrounded by upright log stockades—the traditional design accepted by romanticists and the entertainment industry; more often they were just collections of structures built of locally available materials without stockaded walls.

Several of the early frontier forts were actually trading posts but now are preserved as replicas constructed and maintained by the National Park Service. Fort Union, North Dakota, and Bent's Fort, Colorado, both built by the National Park Service, are good examples.

South of Bismarck, North Dakota, is the site of Fort Abraham Lincoln (1872-91), the fort from which Lt. Col. George Armstrong *Custer led his Seventh Cavalry to the fatal Battle of the *Little Bighorn in 1876. Reconstruction of the buildings of the fort began in 1989 in a project that was supported from the proceeds of legalized gambling in North Dakota.

Fort Sisseton (1864-89) near Lake City, South Dakota, is one of the best preserved forts, with original buildings because of its past as a hunting club and the work of the Civilian Conservation Corps in the 1930s. It is now a state park. Fort Hartsuff (1874-81) near Ord, Nebraska, was privately owned after the army left until the state accepted it as a park.

There is no real estimate of the number of forts and camps established in the United States. That might also be said of battlefields. The * French and Indian War, the

"Revolutionary War," "War of 1812," "Mexican War," "Civil War, various Indian wars, and the Mexican border incidents of 1916 left battle sites throughout the country. World War II had a few battlesites in the United States, Pearl Harbor being the most famous.

Hundreds of battlefields are preserved as federal, state, or local historic parks around the country. They range from many Revolutionary War sites in the Northeast and South, such as those of the battles of *Bunker Hill, Massachusetts; "Monmouth, New Jersey; and the Brandywine (and encampment commemorated now at Valley Forge National Park) in Pennsylvania; to those in the Southwest in the "Texas War of Independence (the Battle of the "Alamo), and Far West in the "Plains Indian Wars (such as the Battle of the "Little Bighorn). The most visited battlefields are clearly those of the Civil War, particularly the National Battlefields and Military Parks maintained by the U.S. Park Service, especially those at Gettysburg, Pennsylvania; and in Virginia at Manassas, Chancellorsville, Spotsylvania, Fredericksburg, and Petersburg. Efforts are being made to expand additional sites and protect them from encroaching development.

The Civil War had demonstrated the inadequacy of the old coastal forts. In 1886, an army-navy study recommended vast increases in defensive works and firepower. It called for fortifications to be built at twenty-six coastal localities and three on the Great Lakes, for a total of 1,300 guns and mortars of heavy caliber; in fact, only about half ultimately were installed. These new forts were made of reinforced concrete buried in the ground so as to minimize their silhouette and blend with the landscape. Their main vulnerability was that they were open from the rear and, more so, from above. With the advent of the airplane, the army realized that the traditional coastal defense fortification had become obsolete.

Many of these structures still stand on the seacoasts of the East, the West, and the Gulf of Mexico—some because they were historic; more because of the difficulty of destroying the tons of reinforced concrete that withstand even advanced technology.

There are forts and battlefield sites in every state of the Union. Many are preserved and open to the public; many more are just sites, some marked, most forgotten. The National Park Service has 365 sites in its system, of which several hundred could be considered military in nature, either because of a fort or a battlefield, or sometimes both.

BATTLESHIPS. Descended from the wooden ship of the line in the age of sailing warships, the steel battleship in the

U.S. "Navy was usually distinguished from its foreign counterparts in the nineteenth and twentieth centuries by its heavy gun armament, sturdy protection, and relatively slow speed. Although initially ordered by Congress for coastal defense in the 1890s, battleships soon took on the mission of control of the seas, which they held until eclipsed by "aircraft carriers during World War II. De-nounced for decades as obsolete, the battleship ultimately survived in the navy until 1995 by adapting to other roles.

U.S. battleships fell into three distinct subtypes: the twenty-seven mixed-battery ships (typically with four 12-inch and eight 8-inch guns, 18 knots speed), constructed between 1888 and 1908; the twenty-two all-big-gun "dreadnoughts" (with armaments from eight 12-inch to eight 16-inch guns, 18 to 21 knots) completed between 1910 and 1923; and the ten fast "battleships (nine 16-inch guns, 27 to 33 knots) built in 1937 to 1944. In addition to these vessels, Congress authorized seven dreadnoughts in 1916 and seven fast battleships in 1940, none of which was finished.

Technically, American battleship designers pioneered the "all-or-nothing" scheme for armor protection with the *Nevada* class of 1912. Light armor plating, which would serve only to detonate armor-piercing shells, was deleted, and the weight saved used for thicker protection of vital areas. Later, the ten fast battleships were in advance of their foreign contemporaries in mounting dual-purpose secondary batteries effective against both antisurface and anti-aircraft targets.

Operationally, the early mixed-battery ships saw little combat as a type. Aside from the *Maine*, which exploded (probably accidentally) in February 1898, only five had been completed in time for the "Spanish-American War. Although not seriously tested, their performance at Santiago was judged impressive enough to justify an accelerated program of battleship construction. Sixteen of these warships flexed America's muscles during the cruise of the Great White Fleet (1907-09), but returned home already outmoded by the revolution in battleship design wrought by HMS *Dreadnought*. Dispensing with all medium-caliber guns in favor of ten 12-inch rifles, the *Dreadnought* gained weight of fire and long-range accuracy through simplified fire control. During World War I, the obsolete vessels of the Great White Fleet were relegated to training and convoy duty. By 1923, all had been retired from active duty.

The "dreadnoughts" of the World War I era played a much more active role in the nation's defense. Eight served in British waters during 1918; fifteen were on hand in 1941. Except for the *Arizona* and the *Oklahoma*, both sunk in the attack on "Pearl Harbor, all were modernized, and some were virtually reconstructed with the most modern anti-aircraft armament, "radar, and fire control equipment. Six of these veteran warships won at Surigao Strait during the Battle of "Leyte Gulf on 25 October 1944, the last action between big-gun warships; but their most significant contribution was artillery support for amphibious assaults from Attu and Tarawa to Normandy and Okinawa. So impressive were the dreadnoughts in this role that five were maintained in the U.S. Navy's reserve fleet through the 1950s.

As for the ten fast battleships completed during World War II, only two engaged their opposite numbers when, at the Battle of "Guadalcanal on the night of 14-15 November 1942, *Washington* and *South Dakota* inflicted

mortal damage on the Imperial Japanese Navy's *Kirishima*, helping prevent the Japanese from landing substantial reinforcements on the island. But the fast battleships proved themselves useful in many other roles: as logistics support ships for smaller combatants, as flagships, as anti-aircraft escorts for aircraft carriers, and especially as shore bombardment vessels. Indeed, the last four ships of the *Iowa* class would see action in five separate conflicts over a half century—an unprecedented record. Well-protected, maneuverable, carrying up to 150 anti-aircraft guns, and the fastest battleships ever with their speed of 33 knots, the *Iowas* were the finest big-gun ships built by any navy.

Despite these merits, the battleship as a type had obviously yielded pride of place by the end of World War II to the carriers as the "backbone of the fleet." In the subsequent great * demobilization, only the *Missouri* remained on active duty by 1949. The * Korean War brought back the other three *Iowa*-class ships for shore bombardment duties during which they fired many more rounds than in World War II. Their effective performance in this role kept them in the reserve fleet after their decommissioning later in the decade when all their earlier cousins had become museum ships or scrap.

With the *Vietnam War, the *New Jersey*, after an "austere" modernization, made one combat tour in 1968. Much praised by soldiers ashore for the effectiveness of her gunfire, the *New Jersey* nonetheless returned to mothballs in 1969 with the diminution of the American role in the war.

Narrowly escaping the cutter's torch during the 1970s, the four *Iowas* then became a controversial element in the Reagan administration's buildup of the navy. Recommissioned with upgraded electronics and long-range cruise *missiles, the battleships served as the centerpieces of surface warfare action groups. The debate over their reactivation flared with questions about the accuracy of the *New Jersey's* gunnery during the Lebanon crisis of 1983-84 and the reasons for the *Iowa's* lethal turret explosion in 1989.

Battleship proponents found vindication with the performance of the *Missouri* and *Wisconsin*, which fired both missiles and big guns to much effect during the *Persian Gulf War in 1991. Unfortunately, the large size of their crews told against them during the downsizing of the military; all four were once again in mothballs by 1992 and were ordered stricken from the navy's lists in January 1995.

Thus, the U.S. Navy had carried battleships on its rosters for little more than a century. For most of that time, they drew opposition, especially from airpower advocates, for their size and expense. During their first fifty years, they probably did take up too much of the navy's attention and resources at the expense of smaller vessels (such as carriers, cruisers, and "destroyers) and other missions (such as antisubmarine warfare). But wartime experience proved them tough ships—only three of the fifty-nine (*Maine*, *Oklahoma*, and *Arizona*) were permanently sunk. As ship killers, the battleships saw little action; yet they ultimately justified their existence in important subsidiary missions, the most significant being gunfire support for troops ashore.

BEAVER WARS. See Native American Wars: Warfare in Native-American Societies; Native American Wars: Wars among Native Americans.

BELLEAU WOOD, BATTLE OF (1918). Belleau Wood was a significant U.S. action of World War I, attack by a Marine brigade of the U.S. Second Division in woods west of Château Thierry, France. Having participated in stopping the German offensive on the Marne River, the Marines were eager to attack. The brigade was tasked to clear the woods and retake the nearby town of Boursches. Beginning on 6 June and attacking in linear formations, with poor artillery fire support coordination, the Marines immediately began taking heavy *casualties; they then shifted to short rushes by small groups, engaging in hand-to-hand fighting in a maze of woods, and heavy undergrowth. Several German counterattacks were beaten off, and the Marines advanced into raking machine-gun fire and well-adjusted artillery. "Come on, you sonsabitches, do you want to live forever?" shouted Sgt. Dan Daly, leading his Marines into the woods—and into U.S. "Marine Corps history. The Americans finally cleared the woods on 26 June, as much by courage and determination as by fighting skill. It was a bloody fight, the bloodiest in Marine Corps history to that date. The Marines suffered 5,200 casualties, more than half their strength. But they gained the respect of the Allies and the Germans.

BEAUREGARD, P. G. T. (1818-1893), known as the "Great Creole," became the Confederacy's first field commander. A Louisianian, he graduated second of forty-five in the U.S. Military Academy Class of 1838. An engineer, Beauregard was brevetted for gallantry in the * Mexican War, and in January 1861 became superintendent of the U.S. Military Academy. Relieved because of Southern sympathies, he accepted a commission as brigadier general in the Confederacy's Provisional army on 1 March 1861.

Beauregard commanded rebel forces at Fort Sumter and at First Manassas. Promoted to full general, he assumed command of the Southern army after Gen. Albert Sidney Johnston's death during the Battle of *Shiloh, and had to retreat. He defended Charleston brilliantly from late 1862 to 1864. In May 1864, he defeated Union Gen. Benjamin F. *Butler in front of Petersburg, then became commander of the Division of the West and fought under Gen. Joseph E. "Johnston at war's end.

After the war, Beauregard became a railroad company president and recouped his fortunes as manager of the Louisiana lottery and head of New Orleans's public works. He wrote frequently about the war and ghost-wrote a biography of himself.

Disliked by President Jefferson * Davis, Beauregard's talents were wasted and he ranks as a "first-rate second rater"—but his reputation is rising.

BERLIN AIRLIFT (1948-49). The Soviet blockade of Berlin was triggered by Allied currency reforms opposed by Josef *Stalin as a step toward unification and reindustrialization of the American, British, and French occupation zones of Germany. The blockade started on 22 June 1948, when the Soviets shut off ground access from the west to the occupation zones in Berlin. It triggered a vast airlift to supply the estimated 4,500 tons needed daily to maintain the West Berlin industry and population of 2 million.

An ad hoc effort by the USAF, using C-47 transport planes, and aided by the RAF, developed into an armada of service and civilian planes, two-thirds U.S. and one-third British. The backbone of the movement became four-engined American C-54s, and British Yorks and Hermes manned by World War II-qualified aircrews. U.S. operations began under Curtis E. *LeMay, USAF Europe commander, but he was succeeded by Maj. Gen. William N. Tunner, who had commanded the American airlift over "the Hump" between India and China in World War II. To keep the planes and supplies moving, loading was cut to 1 hour 25 minutes, while unloading in Berlin took a mere 49 minutes. Soviet fighters harassed the cargo planes, but did not shoot. Most hazardous was the weather; this was overcome by ground-controlled approaches handled by • radar operators who reduced landing gaps to three minutes rain or shine, and by the use of Rebecca/Eureka homing radar, as well as new Calvert sodium approach lights. With a roundtrip distance of 274-565 miles, depending upon the base and corridor used, planes did not have to refuel in Berlin.

By September 1948, the American effort was handled by 319 C-54 Skymasters—225 in service and the rest undergoing maintenance or repair. The British No. 46 Group operated a more mixed force, including Sunderland flying boats, from eight airfields and one water base. The Americans operated out of Frankfurt and Wiesbaden; both Gatow and Tempelhof in Berlin, as well as bases in the west, had to be rapidly expanded. By 12 May 1949, when the Soviets lifted the blockade, 1,783,000 tons had been flown with a loss of thirty-one U.S. lives in twelve fatal accidents. Flights totaling 250,000 continued on into October to build up stocks for the coming winter.

The Berlin Airlift proved the West would maintain its position in Berlin even at the risk of war. The airlift was a public relations victory for the peaceful use of airpower, heightening the reputation of the U.S. Military Airlift Command and of Generals LeMay and Tunner.

BERLIN CRISES (1958, 1962). The Berlin Crises involved mounting tension between the Soviet Union and the Western Allies over West Berlin. Since the 1948-49 blockade, West Berlin had become a symbol of U.S. guarantees for Western European security and a platform for Western intelligence operations. In November 1958, Soviet premier Nikita S. Khrushchev launched a campaign to terminate

the Allied presence in West Berlin and to prompt the West to recognize the German Democratic Republic (GDR). He hoped to reduce the GDR's isolated diplomatic position; some analysts argue that Moscow also feared U.S. plans for nuclear sharing with West Germany.

Without Western concessions, Moscow declared it would turn over its responsibilities in East Berlin to the GDR and allow East German officials to regulate civilian and Allied military traffic between West Berlin and West Germany. Khrushchev did not want to risk nuclear war; Presidents Eisenhower (1959) and Kennedy (1961-62) were willing to negotiate, but neither would grant the concessions he sought.

In the event of a military confrontation, Eisenhower and the Allies authorized U.S. Commander-in-Chief Europe (CINCEUR) Gen. Lauris Norstad to create a secret planning group—code-named "Live Oak"—to develop contingency plans. Yet Eisenhower ruled out a conventional U.S.-Soviet war over in Germany; he considered U.S. capabilities for massive nuclear strikes as sufficient both for deterring a serious crisis and for war-fighting. When the Kennedy administration came to power, however, its emphasis on nonnuclear and limited nuclear options prompted Pentagon and Live Oak planners to develop plans for conventional warfare in Central Europe. In addition, the Live Oak group was attached to *NATO, with West German membership.

The Berlin crisis became most intense after the Kennedy-Khrushchev summit at Vienna in June 1961. Khrushchev set a six-month deadline for a settlement. Kennedy authorized a U.S.-NATO conventional buildup, heightened nuclear alert, and accelerated contingency planning. To staunch a tremendous outflow of East German refugees, Khrushchev in mid-August supported GDR leader Walter Ulbricht's efforts to close the East-West Berlin sector borders, first with barbed wire, then with a concrete wall. The Western Allies condemned this new border closing.

The only military confrontation of the second Berlin crisis, the "Checkpoint Charlie" incident, occurred in late October 1961 when tank deployments on both sides of the Wall followed U.S. challenges of GDR restrictions on official travel to East Berlin. However, both sides carefully regulated this brief confrontation. Meanwhile, pressured by Britain and neutral powers, Kennedy had initiated diplomatic contacts in late September and Khrushchev withdrew his deadline. Negotiations stalemated during 1962 and U.S. officials worried about major Soviet moves, but a crisis occurred over Cuba, not Berlin. The shock of the missile crisis, however, may have lowered tensions over Berlin; also easing the situation, some scholars argue, was Bonn's signature on the * Limited Test Ban Treaty (1963), which reduced Moscow's concerns about a nuclear Germany. Nevertheless, divided Berlin remained a Cold War flash point and the Live Oak group remained in existence in the event that an access crisis occurred. Live Oak disbanded, however, in 1990, when Germany reunified and Berlin's occupation ended.

BERRIGAN, DANIEL (1921) AND PHILIP (1923). The Berrigan brothers—Daniel, a Jesuit priest, and Philip, of the Josephite order—led the antiwar and antidraft movements during the *Vietnam War. Philip served in the U.S. Army in World War II, becoming a priest in 1955. Daniel, the intellectual and theologian, ordained in 1952, complements his brother's activism, acquired in assignments to black parishes in New Orleans and Baltimore.

In May 1968, the two brothers, along with seven other Catholic protesters, burned the records of the Catonsville, Maryland, draft board with homemade napalm. Their arrest, trial, and sentence to 3 years in prison propelled the Berrigans to national prominence. They helped found the Catholic resistance movement: estimates for draft board raids range from 53 to 250. Having lost their appeals, Philip reported to jail, in April 1970, but Daniel became a fugitive. Captured by FBI agents in August, he joined his brother in Danbury Prison. In January 1971, the Nixon administration indicted the Berrigans and others for conspiracy, including bizarre charges of planning to kidnap Henry *Kissinger and blow up heating tunnels in federal buildings in Washington, D.C. After sixty hours of deliberation, the jury could not reach a verdict, forcing the judge to declare a mistrial.

After Vietnam, the brothers continued the Catholic resistance with a new focus on nuclear disarmament. In September 1980, they led a group into a GE plant in King of Prussia, Pennsylvania, that damaged the nose cones for Mark 12A nuclear warheads and poured blood on company records. They were sentenced to 3 to 10 years, but their appeal stretched across the 1980s; eventually the case was brought before a lenient judge who sentenced them to twenty-three months' probation.

The Berrigan brothers' radical antiwar activism reflected increased alienation from government and American society.

BIOLOGICAL WEAPONS AND WARFARE. See Chemical and Biological Weapons and Warfare.

BLACK HAWK (1767?-1838), Illinois Sauk Indian warrior and leader. Born at the village of Saukenuk in west-central Illinois, Black Hawk as a young man acquired a reputation for bravery, good leadership, and cultural conservatism. Although never a village chief, he was a respected leader.

During the *War of 1812, he led many Sauks to join the British. In 1813 they fought at the Battle of Frenchtown and in the sieges of Fort Meigs and Fort Stephenson. In Black Hawk's absence young Keokuk became the recognized war chief of their village, leading to long-term competition and bitterness between the two men. The warriors

returned to Illinois (1814), where they defeated U.S. forces near Rock Island twice.

After the war, the Sauks tried to resume their peacetime activities, but increasing confrontations with the pioneers occurred. By 1830, Black Hawk had become a leader for those Sauks determined to occupy their traditional Illinois lands, while Keokuk accepted the need to migrate west. Dissident Sauks, Mesquakies, and Kickapoos coalesced in early 1832 into the British Band, who considered Black Hawk an elder statesman. He encouraged them to return to Illinois, which precipitated the Black Hawk War. For his role in those events, authorities imprisoned him. He returned to Iowa in 1833 and died there in 1838.

Black Hawk's life spanned an era of transition from relative freedom for midwestern tribes to their total subjugation by the federal government. Sauk actions illustrated the limited choices Indians had in the early nineteenth century, and demonstrated how the inflexible demands Americans made of their tribal neighbors brought disaster.

[See also Black Hawk War.]

BLACK HAWK WAR (1832). This conflict was the last armed resistance in the Midwest to cause federal removal of the eastern Indians beyond the Mississippi River. It resulted from a disputed 1804 treaty signed by a few Sauks unauthorized to take such action. Though the tribe disavowed the treaty, federal officials acted upon it, opening lands in Illinois for settlement.

The conflict began in April 1832, encouraged by *Black Hawk, a Sauk leader, when nearly 2,000 Sauks and Mesquakies crossed the Mississippi River, moving into Illinois. That brought about the mobilization of the state militia and the movement of the U.S. Sixth Infantry, commanded by Col. Henry Atkinson, from Jefferson Barracks, Missouri, north into Illinois. There the troops pursued the migrating Indians up the Rock River Valley. On 14 May 1832, militiamen under Col. Isaiah Stillman attacked Indians trying to parley, triggering the actual combat. For much of the summer the troops hunted for the fleeing Indians as they moved north into Wisconsin and west toward the Mississippi. On 2 August, Atkinson's force overtook their exhausted quarry at the mouth of the Bad Axe River, killing or capturing most of the Indians.

Fighting that summer consisted of frequent small-scale raids by groups of warriors and pursuit by the militiamen. The campaign demonstrated the need for mounted troops in similar campaigns, and led to the establishment of the dragoons a few years later. The war persuaded other tribes that they must move west or face destruction.

BLEEDING KANSAS (1854-58) refers to the violent civil disturbances in Kansas over the question of whether the territory would be slave or free. Slavery was prohibited in land north of 36°, 30' under the Missouri Compromise. But in 1854, Democratic Senator Stephen Douglas of

Illinois put forward legislation to organize the Kansas-Nebraska Territory. To gain support from southern senators, the bill repealed the Missouri Compromise and called for popular sovereignty to determine the question of slavery. After a bitter struggle, the act passed in 1854, prompting many northern Democrats to defect to the newly formed Republican Party, which opposed the extension of slavery.

The Kansas-Nebraska Act injected the debate over slavery into western settlement. Emigrants quickly moved into Kansas—some primarily motivated to make the territory free, others to make it a slave state. By the end of 1855, there were two rival governments in Kansas. A pro-slavery territorial legislature recognized by President Franklin Pierce's administration was fraudulently elected through the votes of border "ruffians" from Missouri. Free Soil settlers rejected this government, wrote a free state constitution, and established a rival government in Topeka.

The calm in Kansas was shattered in May 1856 by two events that began a small civil war. On 21 May, the Free Soil town of Lawrence was sacked by an armed pro-slavery force. A few days later, the abolitionist John Brown and six followers executed five men along the Pottawatomie Creek in retaliation. May through October witnessed numerous skirmishes between armed bands of pro-slavery and Free Soil men. The U.S. Army had two garrisons in Kansas, the First Cavalry Regiment at Fort Leavenworth and the Second Dragoons and sixth Infantry at Fort Riley.

The territorial governor tried to stem the violence and maintain peace by policing Kansas with federal troops. He had small detachments sent to assist civil officers and to disperse any unauthorized armed force. The worst of the violence ended in October 1856 as neither Free Soil nor pro-slavery forces wanted to clash with the federal army. By early November, most federal troops had returned to Forts Leavenworth and Riley.

The governor's action to station federal troops across Kansas during the 1857 October elections for territory offices was the last extensive use of the army during the period of civil strife. Most of Kansas was at peace by the end of 1857, except for an area in the extreme southeast on the Missouri border. Between 1857 and 1861, small detachments of federal troops periodically went into this area for Opacification purposes. One soldier was killed in action during the domestic disorder, which claimed about 200 civilian lives.

The civil conflict in Kansas was a product of the political fight over slavery. Federal troops were not used to decide a political question, but they were used by successive territorial governors to pacify the territory so that the political question of slavery in Kansas could finally be decided by peaceful, legal, and political means.

gines. The dirigible, roughly three times larger but otherwise similar in appearance, has vanished from the skies. It had a rigid aluminum frame that embraced several gas cells, maintained the ship's shape, and anchored the control cabin and engine pods, suspended outside a fabric-covered hull.

In 1908, the U.S. Army purchased its first steerable, gasoline-powered airship; with a heavy keel attached to the cigar-shaped gas bag, it foreshadowed the blimp. The program lapsed in 1912, and during World War I the service employed only tethered observation balloons. The postwar army's Italian-built blimp *Roma*, inflated with inflammable hydrogen, exploded in 1922. The use of helium, a non-inflammable lifting gas, prevented further explosions, but the army gradually lost interest in lighter-than-air craft, except for tethered observation or barrage balloons, and in 1938 handed over its last blimps to the navy.

The U.S. Navy acquired its first blimps in 1917 and used them for coastal patrol during World War I. Navy interest soon shifted to the dirigible, a craft that seemed ideal for over-ocean reconnaissance because its lifting gas enhanced aerodynamic efficiency: it could cruise up to 6,000 miles before refueling. Some dirigibles were over 750 feet long and could launch and recover small scouting airplanes, further extending their range.

The navy's dirigible program, encouraged by Rear Adm. William A. *Moffett, began with a disaster. The first craft—modeled on a German design, built in Britain, and filled with hydrogen—exploded in 1921 while being test-flown by an Anglo-American crew. Misfortune plagued the navy's program. *Shenandoah* (1923-25) broke up in a thunderstorm, as did *Akron* (1931-33). *Macon* (1933-35) crashed because of structural failure. In effect, the destruction of *Macon* in 1935 signaled the end of the dirigible program. The navy's General Board rejected a five-year procurement plan (1937-41) that would have replaced both *Akron* and *Macon* and built a new metal-clad airship.

Navy blimps, some of them 253 feet in length, escorted coastal convoys during World War II, operating over the Pacific, the Gulf of Mexico, the Caribbean, the Atlantic, and the Mediterranean. The airships used *radar to locate surfaced "submarines and magnetic detectors to spot submerged U-boats; their number peaked in March 1944 at 119. The blimp continued maritime reconnaissance after the war, and in 1956 radar-equipped versions began guarding against possible aerial attack. Plans called for one early warning squadron on the Atlantic Coast and another on the Pacific, but only the unit based at Lakehurst, New Jersey, was actually commissioned. In October 1961, all blimp operations, including air defense missions, came to an end, though experimental flights continued until 31 August 1962. Proposals to revive the airship as a tool of war have surfaced since 1962, but none has evoked more than passing interest.

BLIMPS AND DIRIGIBLES differ in their size and construction. The blimp consists of a gas-filled inflatable bag, pressurized to retain its aerodynamic shape, and attached to a rigid keel that supports a crew compartment and en-

BLOCKADES. A blockade in its most common form—the naval blockade—is intended to prevent the passage of ships in and out of an enemy's harbors. It can be defensive, focusing on the enemy's warships; offensive, focusing on

his commercial and military supply ships; or it can be both. A blockade can restrain just traffic flying the enemy's flag, or it can halt neutral shipping as well. It can halt the passage of only specified items, or it can halt all. It can last for only a few weeks, or for years. The idea of blockade is the antithesis of the idea of freedom of the seas.

By the time of the "French and Indian War (1754-63), the blockade had become one of Britain's major instruments of war. But when the American "Revolutionary War began (1775), the Royal Navy was too weak to blockade distant colonial ports. The entry of France and Spain into the war worsened the British position. In 1781, a brief blockade of Chesapeake Bay by a French fleet played an important role in bringing about the surrender of a British army at the Battle of "Yorktown, and as a result, the end of the war.

After an arduous campaign in the southern states, Gen. Charles * Cornwallis moved his army to Yorktown, Virginia, on the Chesapeake, where the British fleet could re-supply and reinforce it easily or, if necessary, evacuate it entirely. As the colonial and French armies under George "Washington and count de Rochambeau marched south from New York and Newport to strengthen the small force besieging Cornwallis, ships bearing the French artillery and supplies sailed in convoy from Newport toward the same destination. The British fleet under Adm. Thomas Graves departed New York in order to intercept the French ships as they approached the Chesapeake. The French ships Graves found, however, were those of Adm. count de Grasse's fighting fleet recently arrived from the Caribbean. They had Cornwallis under blockade. In a long but not very bloody fight, de Grasse repulsed Graves and sent him back to New York. The convoy from Newport arrived safely, the allied armies besieged Cornwallis closely, and de Grasse forestalled any British attempt to rescue the trapped army. His situation hopeless, Cornwallis surrendered. The war petered out, and the colonies gained their collective independence. By itself de Grasse's blockade would not have led to that result, but in combination with the effective work of the allied armies, it served perfectly.

The next American experience with blockade, during the "War of 1812, was grim. By this time the British Fleet had long regained its strength and more, and it had had nearly twenty years of experience in blockading enemy ports in the wars of the French Revolution and Napoleon. Most of the famous American frigate victories in this war took place in the early months, before the British could deploy forces sufficient to lock the ships of the small U.S. Navy into whatever port they happened to be. As the blockade grew tighter and extended farther, American foreign trade dried up. So did American domestic trade, most of which went by water. Farmers could not sell their crops; merchants lost their businesses, employees their jobs. Moreover, without tariffs on imports, the government had little money. In addition, the U.S. invasion of Canada had failed; British warships sailed the Chesapeake; and British troops had burned Washington. Despite American successes on Lakes Erie and Champlain, and spectacular raids by American privateers upon British shipping, the American people were ready for peace. So were the British, who had been at war almost without a break since 1793. In December 1814, the opponents signed a treaty of peace.

Soon after the outbreak of the "Civil War, President Abraham "Lincoln, knowing that the Southern states man-

ufactured little, ordered the U.S. Navy to blockade the Southern ports so as to prevent them from importing arms and other goods from Europe. This the navy attempted, first by using armed commercial steamers and then by adding new ships built for the task. The blockaders drove sailing ships, mostly neutral, out of the trade with the South. But those ships were replaced by swift steamers, again mostly neutral, which sailed from Bermuda and the Bahamas mainly toward Charleston, South Carolina, and Wilmington, North Carolina. By war's end in 1865, the blockaders had driven ashore, sunk, or captured three-quarters of the 300 blockade-running steamers. But the latter kept the Southern armies supplied with arms until early in 1865, when Northern forces took Charleston from inland and seized the sea approaches to Wilmington. That spring, Gen. Robert E. "Lee surrendered, but not for lack of arms. It is easy to quantify the effort expended on the blockade, but difficult to judge its contribution to the North's eventual success.

Early in the twentieth century, developments in naval "mines, torpedo craft, and coast artillery made it plain to the Royal Navy that close blockade was no longer possible. Hence, when World War I broke out in 1914, the Grand Fleet took station at Scapa Flow, north of Scotland, whence, in conjunction with forces in the Channel, it kept the German High Seas Fleet locked uselessly in the North Sea. Protected by the Grand Fleet, old warships and armed merchant cruisers as well as minefields effectively carried out a commercial blockade against both belligerent and neutral merchant ships trying to enter not only Germany's ports but also those of its neighbors.

The Germans responded with a counterblockade against shipping attempting entry into or exit from Allied ports, especially those of Britain. Their instrument was the submarine, a small warship that could sail surprising distances, could hide under the water when attacking or in danger, and that carried the most deadly of naval weapons: *torpedoes and mines. By the spring of 1917, when—partly as a result of the brutality of the submarine campaign—the United States joined in the war against Germany, that campaign was driving Britain, the last strong combatant among the Allies, to defeat. The Allied decision to convoy merchant ships rather than to let them continue sailing singly, combined with the arrival of enough U.S. destroyers to make convoy possible, defeated the "submarines. The sailing of 2 million American troops to France made possible by this success gave the Allies the edge in strength to halt and then reverse the German offensives in 1918, and that in turn led directly to the end of the war.

The Allies were more vulnerable to blockade than the Germans, but although the submarines were beaten, the Allied blockaders kept their stranglehold on Germany's economy months after the war had ended.

By its nature the submarine, unable to rescue its victims, brought a new savagery to a hitherto not very bloody form of war. Aircraft, soon to join in the war at sea, suffered from the same shortcoming and the savagery worsened.

So far as blockade and counterblockade went, World War II in the Atlantic and Mediterranean followed the pattern of the preceding war. The chief difference was that both sides were better prepared than before to resist the other's blockade. In the Mediterranean and the narrow seas of Europe, aircraft took a leading part in the conduct

of blockade. In the Pacific War, the Japanese made no particular effort either to attack enemy shipping or to protect their own. In contrast, the Americans, led by their submarines, destroyed Japanese shipping. This meant that the empire's troops often perished when being moved to where they were needed. For lack of fuel, Japan's pilots could not be trained adequately, and toward the end, its fighting ships could not sail. The blockade was the primary contributor to the defeat of Japan.

In more recent conflicts, blockades have again played significant roles. But in the long struggle against North Vietnam (1965-73), because of an implied (or inferred) threat of Soviet retaliation, the United States imposed no blockade on North Vietnam during the first seven years U.S. combat forces were engaged in that war. As a result, three-quarters of the arms, ammunition, and fuel that the North used in the Vietnam War entered by sea in ships from the Soviet Union. Finally, in 1972, the United States mined the approaches to North Vietnam's harbors, and the traffic stopped. This, combined with hard fighting on the ground and in the air that used up the North's arms stocks, particularly its surface-to-air "missiles, led to a peace agreement between that country and the United States that permitted the withdrawal of U.S. forces. These events illustrate both the value of blockade under the conditions of that war and the ease by which an interested and more clever government was able to forestall for years the imposition of a blockade on the Soviet Union's client state.

In itself, blockade is not often likely to achieve much. Used wisely and unrelentingly against a foe dependent on sea traffic, however, and in tandem with vigorous action elsewhere, it can be a highly effective instrument of war.

BODY ARMOR. Protective covering and other equipment designed to guard individuals in combat dates back to early warfare. Rocks, clubs, and arrows were deflected by hand-held shields, later augmented by helmets and coverings for the chest, arms, and legs. Protective coverings were made of leather, wood, shells, or basketwork, later replaced by bronze, iron, and steel. The mounted knights of medieval Europe were clad in chain mail, armor plate, and helmets; their horses, too, were partially encased.

Some soldiers in the early North American colonies wore metal helmets and breastplates, but these proved cumbersome in the woodlands and were soon abandoned. Gunpowder cannon and small arms, and the increasing mobility of warfare, diminished the importance of personal armor, which finally disappeared by the end of the seventeenth century.

Steel helmets reappeared in the twentieth century largely to protect against shrapnel and fragments from artillery shells. In World War I, the Americans adopted the

shallow British "tin hat," but the U.S. Army developed its own deeper helmet for World War II. A new configuration, including more neck protection, was adopted in the 1980s.

The French and Germans experimented with metal cuirasses for machine gunners in World War I; the Americans did not adopt chest armor until World War II, when some bomber crews were provided with "flak jackets."

Beginning in the Vietnam War, American combat infantrymen wore protective vests made of new composite materials, such as kevlar, covered by fabric. The vests, which provided relative flexibility and low heat retention, were designed to protect against blast fragments and antipersonnel, small-arms "ball" ammunition. Crews of ground vehicles, helicopters, and other aircraft today wear heavier vests made of metal (often titanium), or ceramic tiles contained in the pockets; these prove bulkier but more efficient against small-caliber armor-piercing ammunition. —John Whiteclay Chambers II

BOHR, NIELS (1885-1962), along with Einstein, one of the two most influential physicists of the twentieth century. Bohr was born in Copenhagen, Denmark to affluent, well-educated parents (his father was a professor of philosophy at the University of Copenhagen). Bohr became a professor at the University of Copenhagen in 1916 and in 1920 established the Institute for Theoretical Physics there, which quickly became a world-recognized think tank frequented by the best scientific minds of the time. From this institute a new comprehension of the physical world emerged, which would have a profound impact on the remainder of the century and beyond: the observed and the observer were seen to interact; nature was both wave and particle; and philosophy and physics shared subject matter as issues of causality and indeterminism were raised when Bohr and others deepened their understanding of nuclear fission.

In 1939, Bohr fled Denmark, accepting an invitation from the United States to participate in the Manhattan Project in Los Alamos, New Mexico. There he was instrumental in the development of the atomic bomb but ambivalent about its use as a weapon of mass destruction. Bohr spent the remainder of his life called for international control of nuclear weapons and the peaceful use of atomic energy.

BOMBER AIRCRAFT. The generic term *bomber* can be applied to any aircraft that has as its primary role the delivery of "bombs against an enemy target. As military aircraft have evolved, attempts have been made periodically to classify bombers more precisely by adding a variety of adjectives like "night," "day," "light," "medium," "heavy," "dive," "tactical," "strategic," "conventional," or "nuclear." Time and circumstance have often proved such categories temporary or artificial, and the lines of distinction have become blurred, with "night" bombers being used in daylight, or "strategic" bombers attacking "tactical" targets. With the technological advances of the late twentieth century, it has become possible to make aircraft that are capable of per-

forming well in several different combat roles and the need for specialized *bomber aircraft has diminished. Even so, there are still aircraft in which the delivery of bombs or air-to-ground *missiles is clearly the primary role.

The U.S. Army Air Service had no combat aircraft when the United States declared war on Germany in April 1917, nor was it possible for the fragmented American aircraft industry to provide any. Arrangements were made for the Air Service to acquire British, French, and Italian aircraft, and for American industry to build selected European types. The principal bombers chosen were the French Breguet-14, the Italian Caproni CA-33, and the British Airco DH-4 and Handley Page 0/100. Plans were made to have the British and Italian aircraft built in the United States, but only the DH-4 went into quantity production before the end of the war.

American airmen gained most of their bombardment experience in World War I in Breguet-14s and DH-4s. These single-engined, two-seat biplanes were of limited range and carrying capacity, but they were used to some effect against battlefield targets, and close behind the front lines, against supply centers and troop concentrations. Most of the operations were carried out in daylight, sometimes at low level, and both enemy *fighter aircraft and ground fire caused high losses. A few Americans also experienced "strategic" bombing with the Italians, flying Capronis against targets deep inside Austrian territory. Given the primitive navigation and bombing equipment, and the fact that they were bombing from 12,000 feet or higher, in open cockpits without oxygen, it is hardly surprising that the crews had difficulty in finding, never mind hitting, their targets.

In 1917, Brig. Gen. Billy *Mitchell, who rose to command the combat aircraft of the American Expeditionary Force, met and was strongly influenced by Britain's Maj. Gen. Hugh Trenchard, one of the foremost prophets of strategic airpower. Trenchard's views on the use of large numbers of heavy bombers against targets deep inside enemy territory had a marked effect on Mitchell.

The United States began its pursuit of a strategic capability in 1917 by asking the Martin Company to develop a heavy bomber. The best of the Martin series was the MB-2, but with a top speed of only 100 mph and a range of not much more than 500 miles, it was a long way from meeting Mitchell's expectations. However, it did serve as the instrument for his dramatic airpower demonstration in 1921, during his tenure as Assistant Chief of the Air Service. Undeterred by scathing criticism, particularly from the U.S. Navy, Mitchell's MB-2s conducted several bombing trials against warships, concluding with the spectacular destruction of two *battleships, the old German *Ostfriesland* and the obsolete USS *Alabama*.

Another disappointment for Mitchell was the Barling Bomber, a massive American triplane that flew in 1923 and managed to lift over 6,000 pounds of bombs; but with such a load its top speed was just 95 mph, its range only 170 miles, and it proved incapable of climbing over the Appalachians. Technology had not caught up with ideas and the intended "superbomber" was scrapped.

The first significant steps on the road to a U.S. strategic air force were taken with the appearance of Boeing's YB-9, a single-engine, all-metal monoplane, in 1931. Within a year, the YB-9 was overshadowed by the Martin B-10, a twin-engine, all-metal monoplane with retractable under-

carriage, with the added features of internal bomb stowage, enclosed crew positions, wing flaps, wheel brakes, and variable pitch propellers. With a top speed of over 200 mph, the B-10 could outstrip most fighters of the day, it could reach 25,000 feet, and its range with 1,000 pounds of bombs was 700 miles. It was "one of the most significant advances in the history of military aircraft." Encouraged by its experience with the B-10, the Army Air Corps pursued its ideal of a truly strategic bomber. In 1934, Boeing was awarded a contract for a "superbomber" with a 5,000-mile range, a top speed of at least 200 mph, and a payload of 2,000 pounds. Produced as the XB-15, engines of sufficient power were not available for the monster bomber and the project was canceled. But information was gathered about the structural and aerodynamic problems of very large aircraft, all of which would prove valuable some years later.

Boeing also bid for a second contract, intended to provide for the aerial defense of the United States against enemy fleets. This aircraft, the Boeing Model 299, became the B-17 "Flying Fortress," the most celebrated bomber ever flown by U.S. air forces. Developed and used operationally as a strategic bomber, especially in the World War II air assault on Germany, it became the embodiment of the beliefs Billy Mitchell had promoted so fiercely until his death in 1936. In its early days, the B-17 was said to be able to fly fast and high enough to outrun most enemy fighters, and to be so heavily armed that it could defend itself even if intercepted, but these assumptions were rapidly proven false in the heat of combat. Out of over 12,000 B-17s of all models built, nearly 5,000 were lost in combat, and almost 4,000 more in accidents.

In Europe, its principal theater of operation, the B-17 was used by the U.S. 8th Air Force together with the Consolidated B-24 "Liberator" for day bombing, while RAF bombers undertook the night operations of a "round-the-clock" combined bomber offensive. Although flown in large formations to increase the firepower brought to bear on attacking fighters, the U.S. bombers suffered intolerable losses until the arrival of long-range escort fighters like the P-51D "Mustang." The B-17s and B-24s bombed in formation from above 20,000 feet, releasing together when the lead aircraft's bombs dropped. This precision bombing method was intended to ensure great accuracy and target saturation. (As opposed to the night area bombing of the RAF, in which specific aiming points were chosen for the bomber crews, but it was accepted that the targets were whole German cities.) Unfortunately, combat and the European weather combined to degrade results and some commanders later described their operations rather ruefully as "area bombing of precision targets." By the end of World War II, the combined bomber offensive had effectively destroyed most German industrial cities, with particularly catastrophic effects in Hamburg and Dresden.

At the tactical level, in operations aimed at influencing the surface campaign directly, twin-engine bombers like the North American B-25 "Mitchell," Martin B-26 "Marauder," Douglas A-20 "Havoc" and A-26 "Invader" were used at medium and low level during World War II against specific targets such as rail junctions, bridges, supply depots, and troops concentrations. A-20s and B-25s also operated to particular effect against Japanese shipping during the Pacific War, notably during the destruction of a Japanese invasion fleet in the Battle of the Bismarck Sea. By contrast, in April 1942, B-25s were used in a unique

operation that had a strategic purpose. Lt. Col. James (Jimmy) *Doolittle's B-25 squadron was launched from the deck of the aircraft carrier *Hornet* to strike a symbolic blow against Tokyo.

The technique of dive-bombing, intended for use against targets where great accuracy was essential, was promoted in the 1920s by the U.S. *Navy and * Marine Corps, and brought to fruition in combat by the German Luftwaffe in the 1930s. The Junkers 87-B Stuka was a vital part of the German *Blitzkrieg* that led to the fall of France in 1940. The devastating effects of determined dive-bombing were most graphically demonstrated by the U.S. Navy's Douglas SBD-1 "Dauntless" dive-bombers at the Battle of *Midway in 1942, when they sank four Japanese aircraft carriers to shift the balance of power in the Pacific permanently in favor of the United States.

In 1944, Boeing's B-29 "Superfortress" flew its first combat operations. Its internal bombload was 20,000 pounds, over three times that of the B-17, and its combat range of 3,000 miles plus more than doubled that of its predecessor. Equipped with a pressurized cabin, a B-29 crew could operate in comfort up to 30,000 feet. In the closing months of the war, B-29s were used in massive raids on Japan, dropping enormous quantities of incendiaries to burn Japanese cities. The most destructive raid of World War II took place on the night of 9 March 1945, when more than 300 B-29s bombed and burned Tokyo. An estimated 84,000 people died and more than 1 million were made homeless. The firebombing of Japan continued until August, when two single B-29s, named *Enola Gay* and *Bockscar*, ended World War II with the atomic bombings of Hiroshima and Nagasaki, respectively. The postwar period then saw the development of the policy of 'deterrence, in which the threatened use of *nuclear weapons was intended to deter war, and the start of the unending public debate on the morality of using strategic airpower, either conventional or nuclear, to attack enemy populations.

After World War II, the jet engine revolutionized bomber aircraft. In the late 1940s, the USAF's first truly intercontinental bomber, the massive Boeing B-36, improved performance by the addition of four jets to its six piston engines. The first U.S. bombers to usher in the pure jet age, however, were the North American B-45 and the Boeing B-47 in 1947. The B-45 was built before swept-wing theory was understood and was quickly overshadowed by the B-47, which introduced thin, swept-back wings, six axial-flow jet engines mounted in pods, and "bicycle" main landing gear. In 1952, Boeing added the eight-jet B-52 "Stratofortress," a huge bomber that has remained an impressive instrument of war since its introduction. Originally conceived for the delivery of free fall nuclear bombs, the B-52 was for many years the backbone of the twenty-four-hour-a-day alert flown by the USAF's Strategic Air Command (SAC). Progressive modifications have added the capability to carry cruise missiles and conventional high-explosive bombs in various combinations. The B-52's 5,000-mile combat radius can be extended as required by air-to-air refueling, and it has the capacity to lift a total weapon load of over 60,000 pounds, as much as the maximum weight of a loaded B-17 in World War II. During both the * Vietnam War and the *Persian Gulf War, the B-52's internal stowage of eighty-four 500-pound bombs made it a formidable offensive weapon.

In the late 1950s, the USAF acquired a supersonic strategic bomber in the Convair B-58, a delta-winged aircraft that could exceed Mach 2. Its impressive performance allowed it to set numerous international records, but its high cost of operations led to withdrawal in 1970.

Designated as fighters (F), many of the smaller USAF jets were fitted with bomb-carrying pylons under the wings and the association of aircraft types with specific roles became less certain. These multirole aircraft included the North American F-100 and the McDonnell-Douglas F-4 Phantom. The Republic F-105 and the General Dynamics F-111 were both conceived for low- and medium-altitude penetration of defenses, and were designed with internal weapons bays. All four types saw action in Vietnam with a variety of conventional ordnance, and all were capable of nuclear weapon delivery. The F-111 also later carried out a successful strike against Libya. In the 1970s, the USAF began taking delivery of the McDonnell-Douglas F-15 and the General Dynamics F-16. Both aircraft are capable of multirole operations and demonstrated the effectiveness of the new generation of "smart" weapons (guided bombs, stand-off missiles, etc.) in the Gulf War.

Naval aircraft have followed a similar path in their development since World War II. The Douglas A-3D "Skywarrior" and the North American A-5 "Vigilante" were both designed as carrier-borne strategic bombers, and the Douglas A-4, Grumman A-6, Vought A-7, and McDonnell-Douglas F-18 are all tactical aircraft with multirole capabilities. The McDonnell Douglas/British Aerospace AV-8B Harrier is a more specialized close support attack aircraft, uniquely capable of vertical takeoff and landing, which is flown by the U.S. Marine Corps and can be used to deliver a variety of bombs and missiles.

In the mid-1980s, the USAF received the first of its Rockwell International B-1Bs, a supersonic strategic aircraft with both conventional and nuclear capability in bombs and cruise missiles. Sophisticated electronics provide the defensive systems and the B-1B can achieve near sonic speeds at low level. Even further advances have been made with the introduction of "stealth" technology, which reduces both the * radar and infrared signatures of an aircraft dramatically. The Lockheed F-117A demonstrated the effectiveness of its stealth design when it penetrated Iraqi airspace at will during the Gulf War, destroying critical 'command and control facilities with "smart" bombs. One F-117A frequently accomplished what would have required several hundred B-17s in World War II.

The next page of the "stealth" story was turned with the first flight of the Northrop B-2 in 1989. The aircraft is a "flying wing" with no vertical surfaces, masked engine intakes and exhausts, and internal weapons stowage for nuclear weapons or up to eighty 500-pound bombs. In a world dominated by multirole aircraft, the USAF's futuristic B-2 is the closest approach to the classic "bomber" as Billy Mitchell would have understood the term—an aircraft of intercontinental range, which can leap over armies and navies, penetrate the defenses of an enemy nation, and strike devastating blows from the air.

BOMBING, ETHICS OF. Debate over the ethics of bombing focuses largely on strategic bombing: attacks carried out by strikes into the enemy nation for such purposes as impeding production, disrupting *transportation and *communications, and lowering civilian support for the war effort. Strategic bombing is morally problematic because by its nature it involves harm (intentional or not) to nonmilitary targets, while tactical bombing aims only at military targets. As originally conceived by Giulio *Douhet and Billy *Mitchell in the 1920s, strategic bombing was intended to target population centers so as to disrupt the social fabric of the enemy nation and thereby destroy its ability to wage war effectively. Less extreme advocates of airpower, beginning in the 1930s, argued for a conception of strategic bombing by which the actual targets were defined as military bases and means of production, transport, and communication in direct support of military activity, though these might be located in or near population centers.

In terms of ethical analysis, while tactical bombing engages only the ethical principle of proportionality (no destruction beyond that necessary for the tactical purpose), strategic bombing engages both proportion and the principle of discrimination or noncombatant immunity. Two historical contexts have largely focused the ethical debate: the experience of strategic bombing of cities in Britain, Germany, and Japan during World War II, and the development of strategic nuclear targeting in the period 1945-89. Three distinct kinds of ethical argument against such bombing have been advanced.

First is an argument framed in terms of the obligation to protect noncombatants—understood as persons not engaged in the fighting or in providing functional support of the military effort—from direct, intentional harm by acts of war. This is the classic argument from *Just War theory, applied long before the age of aerial warfare to earlier forms of attack directed against noncombatant or mixed combatant-noncombatant targets, such as the artillery bombardment of enemy cities during sieges. The influential early modern theorist Francisco de Vitoria reasoned that this argument accepted bombardment of a fortified city as a sometimes necessary part of just warfare, but insisted that only the fortifications and the combatant forces in such a city can rightly be targeted. Collateral harm to noncombatants is justified only if it is an indirect and unintentional effect of such legitimate acts of war (the “rule of double effect”). The total damage caused must, moreover, not be disproportionate to the justifiable ends achieved. In the seventeenth and eighteenth centuries, such writers as John Locke and Emmerich de Vattel extended the traditional idea of noncombatant immunity to prohibit acts of war aimed at civilian property and values of common benefit to humanity.

The codification of positive international law on war,

beginning in the late nineteenth century, incorporated this established ethical understanding of noncombatant immunity. The 1907 *Hague Convention IV on land warfare explicitly prohibited attacks or bombardment against undefended “towns, villages, dwellings, or buildings,” and required that “all necessary steps must be taken to spare” various specific kinds of noncombatant property. Similar provisions were laid out in Convention IX on naval bombardment. The 1923 Hague Rules of Aerial Warfare extended these restrictions to aerial bombardment, adding an explicit prohibition of such bombardment “for the purpose of terrorizing the civilian population, of destroying or damaging private property not of military character, or of injuring non-combatants.” These provisions remain the letter of positive international law on war, though their application has been the subject of both legal and ethical dispute.

Curiously, in the context of World War II, arguments for the need to avoid harm to noncombatants in strategic bombing appear more in debates within military circles than in ethical discussion. A prominent and influential exception was an article (1944) by Fr. John C. Ford, S.J., applying this form of moral reasoning to “obliteration bombing.” Ford’s position was essentially that of Vitoria, updated to address strategic air bombardment. In recent ethical debate, such influential thinkers as Paul Ramsey and Michael Walzer have forcefully stated the argument against strategic targeting of noncombatants, with Ramsey—drawing on Ford but giving a new basis to his argument—reasoning from the duty of nonmaleficence, as defined by the Christian ideal of love, and Walzer focusing on the inherent right of noncombatants not to be harmed directly and intentionally by acts of war. Both accept the moral “rule of double effect” that allows genuinely unintended, indirect harm to noncombatants from an otherwise justified act of war, subject to a judgement as to its proportionality. There is some question as to whether bombardment by *nuclear weapons can ever meet these tests. For example, the American Catholic bishops in their 1983 pastoral letter explicitly rejected the use of nuclear weapons as inherently causing indiscriminate and disproportionate collateral destruction even when targeted directly at military targets within populated areas. Various authors in recent moral debate have applied similar reasoning to condemn retroactively incendiary and atomic bombing in World War II.

The second line of argument over the ethics of bombing is posed in terms of a proportional calculus of the goods achieved versus those lost and the evils done versus those averted. In contrast to the first line, which depends on an ethical distinction between combatants and noncombatants, this second argument generally assumes that in modern warfare every member of a belligerent society is in some sense complicit and thus may be targeted by acts of war. With the combatant-noncombatant distinction sharply diminished, or denied altogether, whether and how far to target civilians depends on the relative utility of doing so in prosecuting the war. In practice, this argument typically has reduced the ethical calculus to a counting of the actual or potential lives lost and casualties inflicted by strategic bombing versus the cost in lives and casualties of other military means without such bombing. Such an argument, reflecting Douhet and Mitchell, was widely used in

the British and American debate over the strategic bombing of Germany and Japan in World War II (including the use of atomic bombs against Japan, where the decision was explicitly to choose targets of a mixed civilian-military nature), and it carried over into early debates about American strategic nuclear targeting. Generally, the moral force of this argument lies in the claim that strategic bombing shortens the conflict and therefore saves lives. Thus President Truman justified the atomic bombing of *Hiroshima and Nagasaki by its inducing Japan to end the war, reasoning echoed by such recent authors as Paul Fussell and given wide popular voice in the debate over the *Enola Gay* exhibit at the Smithsonian Institution. In the context of strategic nuclear targeting, deterrence theorists extended this reasoning into the concept that the threat of such bombing by nuclear weapons can prevent the beginning of war.

The third type of argument has been named "supreme emergency" by Walzer. It holds in principle to the morality of the combatant-noncombatant distinction and other forms of restraint in war, but maintains that a particular threat may be so grave that if the enemy won, these and all other forms of moral order upheld by the vanquished society would be lost. Under such extreme circumstances, it is seen as justifiable to use means that temporarily violate the accepted ethical restraints in order to protect and preserve them for the future. Walzer identifies this as the argument used in justifying the indiscriminate bombing of German cities by British Bomber Command in World War II. However, overtones of similar reasoning can be found in debates over the ethics of nuclear targeting, for example, in early postwar arguments justifying atomic counter-city strikes to punish the "crime" of aggression, and later arguments over nuclear strategy that took as their premise the moral superiority of the United States over the Soviet Union.

In World War II and during much of the *Cold War, the technology of aerial bombardment did not allow for close operational discrimination between combatant and non-combatant targets. In this context, the moral argument based on the combatant-noncombatant distinction was dismissed by advocates of the second line of argument as an unattainable ideal and thus irrelevant to the actual conduct of war, leaving only moral reasoning based in proportionality. At the same time, so-called modern war pacifists attacked the first line of argument from another direction, criticizing the rule of double effect as leading in practice to removing the protection of noncombatants living or working close to military targets. For these, too, the critical moral test of targeting doctrine was proportionality.

In contrast to these positions, both international law and contemporary American military doctrine explicitly hold to the combatant-noncombatant distinction that is central to the first form of ethical reasoning about strategic bombing. The present context, however, has changed significantly as targeting and delivery technology for "smart" bombs and both cruise and ballistic *missiles have greatly improved in accuracy, allowing targeting decisions that can realistically discriminate between combatants and noncombatants even when the two are in close proximity. Though on the face of the matter this means that ethical argument depending on a combatant-noncombatant distinction can no longer be criticized as setting an impossibly high ethical standard for warfare, it is also true that such increased accuracy allows for less destructive war-

heads, so that the ethical criterion of proportionality is also more likely to be satisfied when such weapons are employed for strategic bombardment.

In the final analysis, the three ethical arguments defined above are not divided by what is operationally possible in any given context, but by sharply differing normative concepts of what matters in the conduct of war. A conception of war in which discrimination between combatants and noncombatants is a binding moral obligation differs fundamentally from one in which all the citizens of the enemy nation may equally be targeted, subject only to concerns of proportionality, and both differ from a conception in which "supreme emergency" may justify temporary suspension of all moral rules for fighting. Thus, ethical debate over strategic bombing may be expected to continue so long as these differing conceptions of war persist.

BOMBING OF CIVILIANS. The practice of attacking civilians is as old as warfare itself. Shelling cities by naval or land artillery, for example, long has been commonplace; it continued in the modern-day sieges of Leningrad and Berlin during World War II and of Sarajevo in the 1990s. Aerial bombardment of civilians—widely predicted even before it began, eagerly by pundits who saw it as a way to avert protracted wars—extended that practice. In the 1930s, Fascists in Spain, Italians in Ethiopia, and Japanese in China offered notable examples, ones condemned by American leaders. Imperial powers also bombed civilians in efforts to curb challenges to their rule. In World War I and at the start of World War II, Germany and Great Britain were primarily responsible for initiating deliberate bombing of cities. As embodied in agreements like the *Hague Conventions of 1899 and 1907, legal prohibitions of such practices were clear but unenforceable. The constraints instead were political (fear of condemnation), strategic (fear of retaliation), or operational (lack of resources or bases).

Although a latecomer to the practice, the United States had the history, resources, and attitudes to employ it with unmatched vigor. In operations against Indians, fellow Americans in the *Civil War, and Filipino insurgents, earlier American forces often attacked noncombatants. Before and during World War II, the Army Air Corps's doctrine of precision bombing, and widespread media celebration of it, disguised the nation's ability and willingness to bomb enemy civilians, a practice that President Franklin D. *Roosevelt supported vigorously, if mostly in private. Though hardly peculiar to Americans, notions of total war obliterated distinctions between enemy soldiers and non-combatants. With bombers like the B-17 and the B-29, the United States was technologically supreme in bombing cities and invulnerable to retaliation in kind. Most Ameri-

cans understood Axis atrocities to provide moral sanction for such actions, which presumably would punish the enemy, forestall his further misdeeds, or hasten war's end. Racial fury against the Japanese further loosened restraints on American forces in the Pacific. Bad weather and technological limitations undercut efforts to strike more limited targets. Some army and navy leaders criticized the bombing that ensued but lacked the power or keen desire to stop it. With notable exceptions, Air Corps leaders, eager for the air force to win the war, worried only when bombing civilians threatened their public image.

As a result, American bombing of civilians escalated during World War II, although British forces attacked cities more zealously in Europe, largely unleashing the famous firestorms at Hamburg (1943) and Dresden (1945). The American contribution came in destroying some sixty Japanese cities, first by incendiary raids and then by two atomic attacks. Over 80,000 Japanese—most civilians—died in one great fire raid on Tokyo in March 1945, with similar death tolls in the August atomic attacks. To the end, official policy maintained the fiction that American forces sought only industrial and military targets: firebombing simply continued the “basic policy of... pin-point bombing,” the Air Corps insisted; “the first atomic bomb was dropped on Hiroshima, a military base,” claimed President Harry S. Truman’s public statement, as if no city were there at all. The majority of Americans accepted the bombing of civilians as an act of justifiable revenge or regrettable necessity, and bombing Japan’s cities did hasten its surrender, though by how much historians disagree.

After World War II, U.S. ability to bomb civilians swelled, but the practice of doing so diminished. *Nuclear weapons supremely suited that purpose, as American war plans made clear, but in part because Soviet forces presumably could reply in kind, deterring rather than waging nuclear war dominated American doctrine. In the Korean War, American forces again firebombed enemy cities, but in Vietnam, America’s bombs struck civilians of its ally, South Vietnam, more often than North Vietnamese. Congress’s decision in 1973 to bar further bombing of Cambodia was a reminder that in the United States, the primary legal restraint on attacking civilians was Congress’s power of the purse (the House considered but set aside an article of impeachment against President Richard Nixon for his secret bombing of Cambodia). Technological improvements in the design and delivery of aerial ordnance also diminished attacks on civilians, though less so than American leaders often claimed. Above all, such attacks diminished because no new world war—with all the ferocity, unlimited stakes, and sense of necessity such a war entails—erupted. Perhaps one reason it did not was the chilling record of bombing civilians in earlier wars.

BOMBS. In aerial warfare, the term *bomb* is applied to a wide range of containers filled with explosive, incendiary, or fissile material, or with chemical/biological agents, and designed for use as air-delivered offensive weapons. Fusing and detonating devices are included, and external fins are usually fitted for directional stability. In the late twentieth century, particular attention has been given to the aerodynamics of bombs, and to devising methods of delivering them accurately.

When World War I began in 1914, little thought had been given by the military of Britain, France, or the United States to an air offensive. Most airplane bombs weighed about 20 pounds and were hand-held. German airships, however, were equipped with racks that carried bombs of 110 pounds, and both Russia and Italy had built large aircraft capable of carrying total loads of over 1,000 pounds of bombs. From 1915 on, the first strategic bombing offensive was conducted by Germany against Britain, using airships and later large aircraft carrying bombs of up to 2,200 pounds. The material damage suffered was random and relatively slight, but the morale of the civil population was badly affected. As a result, assumptions were made about the drastic effects of strategic bombing on civilian morale, which proved unjustified in World War II.

At the tactical level, both on the battlefield and immediately behind it, aircraft carrying bombs typically of 112 or 230 pounds were, by 1918, providing effective support to the Allied armies. The U.S. Air Service became heavily involved in the air offensive after 1917, but lacked American equipment and had to rely upon aircraft and weapons of British or French design.

Between the wars, minimal defense budgets precluded significant weapons development, but the impetus of World War II produced remarkable advances. By 1945, the U.S. services were using bombs ranging from 100 to 4,000 pounds. (An experimental bomb weighing 42,000 pounds existed.) Also in the inventory were fragmentation, incendiary, and chemical bombs, some equipped with retarding parachutes for low-level delivery. Armor-piercing bombs were available, particularly for use against warships, and work had been done on fuel/air explosive weapons, which produced catastrophic blast effects by scattering and then detonating large clouds of combustible material. Dramatic demonstrations of the destructive capacity of conventional bombs were given by the Allied air forces in such cities as Hamburg (45,000 dead, 40,000 wounded), Dresden (approximately 60,000 dead), and Tokyo (over 80,000 dead), where firestorms were started by the combined effects of high explosive and incendiaries, killing people by the tens of thousands and effectively destroying the area bombed. Contrary to the interwar predictions, such destruction did not, by itself, bring about the collapse of the attacked state.

High degrees of accuracy were seldom achieved, despite the use of advanced bombsights, * radar, and radio bombing aids, and a host of target-marking techniques. Even the U.S. Army Air Force, which was committed to a policy of “precision” bombing, needed to drop very large numbers of bombs to ensure the destruction of a target. This was not true of bombs delivered at low level from a dive. The destruction of the Japanese carrier force at the Battle of *Midway, for example, was accomplished by a relatively small number of bombs dropped by U.S. Navy dive-bombers.

In August 1945, World War II was brought to an end when USAAF B-29 bombers dropped two atomic bombs on Japan. The first ("Little Boy," Uranium 235) fell on Hiroshima, and the second ("Fat Man," Plutonium 239) on Nagasaki. Each target city was destroyed by a release of nuclear energy that was the equivalent of 20 kilotons of TNT. With this vast increase in the destructive capacity of single bombs, strategic bombing finally reached a point that matched the dire predictions of the interwar strategists. Subsequently, new theories of *deterrence evolved to take account of the awesome power of nuclear weapons and to portray war at the highest level as an unacceptable risk for any nation.

Since World War II, high-yield nuclear bombs have diminished in size while rising in destructive capacity into the multimegaton range, and smaller yield "tactical" nuclear weapons have been introduced. The range of conventional bombs now includes containers filled with napalm (petroleum jelly) and others carrying numerous small bomblets that can be used against vehicles and personnel, or to deny an area like an airfield to enemy use. Technological advances, including *lasers, television, and radar guidance, allow guided—or "smart"—bombs to be delivered at a distance from the target and with great accuracy, hugely magnifying the effectiveness of conventional bombs. During the *Persian Gulf War between the United Nations' forces and Iraq in 1991, the U.S. forces and their allies used guided bombs to great effect in crippling Iraqi command and control systems, one bomb often achieving the same damage as hundreds would have done in World War II.

BOSNIAN CRISIS (1990s). As the *Cold War ended, the disintegration of the former Yugoslavia, contributing to bloody civil war in Bosnia (1991-95), ultimately led to a *NATO-led peacekeeping mission that constituted the largest military operation in Europe since World War II.

Created from several Balkan states in 1918, Serbian-dominated Yugoslavia began to unravel after the death of Communist leader Tito (Josip Broz) in 1980. In June 1991, the Yugoslav republics of Slovenia and Croatia declared their independence, which was quickly recognized in an extraordinary unilateral move by the newly unified Germany, an old ally. Germany pressured the European Union, including Britain and France, old allies of Serbia, to recognize the breakaway republics.

On 15 October 1991, the parliament of the Yugoslav republic of Bosnia-Herzegovina adopted a declaration of sovereignty, and a majority of the voters opted for independence in a referendum held on 29 February 1992. The Bosnian population was approximately 44 percent Mus-

lim, 31 percent Serb, 17 percent Croat, 8 percent other; and in general, the Muslims and Croats supported secession (although many Croats favored joining Croatia), while Bosnian Serbs objected.

The Bosnian Serbs began to carve out enclaves for themselves, and with the help of the largely Serbian Yugoslav army, the Bosnian Serbs, led by Radovan Karadzic and Gen. Ratko Mladic, took the offensive, laying siege to a number of cities, most prominently the Bosnian capital of Sarajevo. Their shelling and sniping resulted in many civilian deaths. By the end of August 1992, the ethnic Serbs had extended their control from 60 to approximately 70 percent of Bosnia. Reports of massacres, mass rapes, and "ethnic cleansing" (the expulsion of Muslims and other non-Serbs from areas under Bosnian Serb control) led to public demands for Western intervention. In 1991, the *United Nations Security Council imposed an arms embargo on all the republics; and in 1992, it ordered economic sanctions against Yugoslavia, holding the Belgrade government of President Slobodan Milosevic responsible for actions of the Bosnian Serbs.

Fueled by media coverage, public pressure mounted in the West, but the major European governments were reluctant to act. President Bill *Clinton's administration condemned Belgrade and the Bosnian Serbs as the aggressors and supported an arms embargo but declined to commit U.S. forces. The military feared a Vietnam-like quagmire in the mountains of Bosnia, and much of the public and Congress believed that the Europeans should resolve the matter.

But the only effective multinational military force in Europe was NATO, and any NATO action required U.S. leadership. That began haltingly with NATO's agreement in July 1992 to monitor a UN arms embargo to stop Belgrade from supplying the Bosnian Serbs. Britain, France, and several other countries sent some soldiers as UN monitors. In March 1994, the Bosnian Muslims and Croats linked their territories into a single federation, and an international peace plan proposed dividing control of Bosnia in half between the federation and the Bosnian Serbs. But it was rejected by the Bosnian Serbs, and the fighting continued.

A Bosnian Serb offensive in 1995—especially the capture of the alleged "safe havens" of Srebrenica and Zepa—together with more reports of large-scale atrocities, led the Clinton administration to commit NATO airpower against the Bosnian Serbs. A rebuilt Croatian army, joined by Bosnian Muslim forces armed by Iran and other Muslim nations, launched major ground attacks and successfully pushed back the Bosnian Serbs. In combination with a NATO air campaign, this gain changed the balance of power and forced the Bosnian Serbs to reduce their territorial ambitions.

The Clinton administration now took the lead, obtaining a cease-fire on 5 October 1995, and a month later bringing the three Balkan presidents—Alija Izetbegovic of Bosnia-Herzegovina, Slobodan Milosevic of Serbia, and Franjo Tudjman of Croatia—to Wright-Patterson Air Force Base in Dayton, Ohio, for peace talks. Three weeks of negotiations resulted in the three presidents initialing the Dayton peace agreements on 21 November. This was followed by a lifting of the UN economic sanctions against Yugoslavia. Signed in Paris on 14 December 1995, the peace treaty ended the four-year civil war. It also sought to

establish a Bosnian republic of two "entities" divided 49 percent for the Bosnian Serbs and 51 percent for the Muslim-Croat federation. The 42 months of warfare had left 250,000 people dead and driven more than 1 million from their homes.

A 60,000-strong international Implementation Force (I-For), under command of NATO, would replace the UN monitoring force to provide for implementation of the agreement. The largest contingents included the United States with 20,000 troops, Britain with 13,000, and France with 8,000; but more than two dozen countries sent soldiers, including Russia with 2,000 troops. Congress gave basic approval on 13 December 1995, and the United States ended its arms embargo and began to upgrade the Bosnian Army. The U.S. occupation sector was in eastern Bosnia, around Tuzla. The soldiers deployed in late December and early January 1996, and quickly established a 2.5-mile-wide buffer zone between the opposing forces. The American soldiers lived in newly constructed army camps, staffed checkpoints, and went out on heavily protected patrols.

The U.S.-instituted Dayton Accords envisioned a sovereign, multi-ethnic Bosnian republic composed of Croats, Muslims, and Serbs. Thus the peacekeeping force's mission was not simply to prevent the resumption of the civil war, which it did, but also to protect the return of refugees and the conduct of free local elections as important steps in rebuilding the new republic. This was a lofty goal, which the peacekeeping force was unable to achieve because of feuding among Bosnian Serbs, Muslims, and Croats. The Western governments and the international stabilization force were reluctant to act as local police or to try to arrest persons for *war crimes. Indeed, the West was divided, as Britain and France differed with the United States by offering greater support for Serbia as a continuing power in the region and allowing partitioning of Bosnia into Serb, Croat, and Muslim sectors.

Under the Dayton agreements, the NATO-led implementation force was to be in Bosnia for one year. But in December 1996, this deadline was extended, although I-For was succeeded by a "follow-on" force (the International Stabilization Force) and reduced to 30,000. The United States still had 6,000 troops in Bosnia in 1999. It remained far from certain whether the internally secure, multiethnic Bosnian republic envisioned by the United States in the Dayton agreements would be sustained or whether the country would fragment along hostile ethnic lines, leading to a partitioning of Bosnia into Muslim, Serb, and Croat sectors. In 1998-99, when the Yugoslavian government's increased control of Kosovo province was challenged by ethnic Albanian rebels and bloody fighting resulted, NATO agreed to send a peacekeeping contingent of nearly 30,000 troops, to which President Clinton contributed 4,000 U.S. peacekeepers, if the warring Serbs and ethnic Albanians could not reach a peace agreement.

BOSTON MASSACRE (1770). The Boston Massacre, a pivotal event of the Revolutionary era, emerged from Britain's attempts to assert greater control over its North American colonies after the *French and Indian War. When customs officials complained about abusive Bostonians, the British government assigned four regiments to garrison the town.

The troops' arrival in October 1768 heightened political conflict and exacerbated local economic pressures, as off-duty soldiers competed for jobs on the docks; but the situation eventually stabilized sufficiently that two regiments could be withdrawn. Soldiers and civilians maintained a strained but generally peaceful relationship until 5 March 1770, when nervous redcoats fired into a crowd taunting them and throwing iceballs at them. Five townspeople died, instantly becoming martyrs to British "tyranny." Even though Gen. Thomas *Gage removed the troops from Boston and a local jury acquitted all but two redcoats involved, the consequences were significant.

The so-called massacre embarrassed the British ministry and fed anti-British sentiment in the American colonies. It also, more than any other event, galvanized a growing anti-standing army sentiment among Americans.

BOXER REBELLION. See China Relief Expedition (1900).

BRADDOCK, EDWARD (1695-1755). British Maj. Gen. Edward Braddock had served in Flanders and commanded at Gibraltar, but had no battle command experience when sent with two understrength regiments to repel French "encroachments" in North America. From his arrival in Hampton Roads, Virginia, on 20 February 1755, this gruff but humane disciplinarian led the colonial governors in organizing an unexpectedly ambitious campaign involving four independent expeditions against Fort Beauséjour, Fort St. Frédéric, Fort Niagara, and Fort Duquesne.

Braddock personally, and efficiently, commanded the expedition to Fort Duquesne in western Pennsylvania in the face of major transport shortages, minimal Indian support, and mountainous terrain that hindered movement of his heavy artillery. His army advanced 150 miles from Alexandria to Little Meadows; then Braddock led a force of 1,450 that reached the Monongahela River on 8 July. The next day, this column was surprised, completely disorganized, and defeated by a force of 783 French, Canadians, and Indians. Severely wounded after having several horses killed under him, Braddock died four days later. Although not personally culpable for the defeat, he came to bear the opprobrium that accompanied this disaster.

• Lee McCordell, *Ill-Starred General*, 1958. j_m k Steele

BRADDOCK'S DEFEAT (1755). At the outset of the *French and Indian War, a 1,450-man advance column of Gen. Edward *Braddock's army of British and American soldiers had, by July 1755, marched for three weeks without incident, to within seven miles of Fort Duquesne. The advance party, apparently lulled into overlooking routine

precautions, failed to detect an approaching force of 783 French, Canadians, and Indians.

The equally surprised French *troupes de la marine* blocked the twelve-foot-wide forest roadway with effective musketry. Braddock's column did not receive—or did not hear—the order to halt, and infantry, artillery, and baggage train telescoped into each other in confusion. Indians and Canadians immediately used Indian tactics of “moving fire” along both flanks of the disrupted column. The British lost 977 wounded and killed, while their opponents sustained only 39 casualties.

The British sought revenge, committing unprecedented funds and regulars to the war. Indian victors, gathering rich booty, encouraged dozens of tribes to assist in the successful French campaigns of 1756 and 1757. Braddock's defeat also provoked Indian raids that disrupted the Pennsylvania and Virginia frontiers. In American mythology, “Braddock's Defeat” became a convenient synonym for the superiority of frontiersmen over European regulars.

—Ian K. Steele

BRADLEY, OMAR N. (1893-1981), World War II commander and first chairman of the *Joint Chiefs of Staff (JCS). Born in Clark, Missouri, and graduating from West Point, Bradley served in World War I, then spent most of the interwar years as student or instructor. In 1942, he trained the 28th and 82nd Divisions and took combat command in spring 1943 of II Corps in the *North Africa campaign and the subsequent invasion of *Sicily. Bradley led the First Army in the invasion of *Normandy and on 1 August 1944 took charge of 12th Army Group, which by V-E Day included four U.S. armies with forty-three divisions. Gen. Dwight D. *Eisenhower rated Bradley as a battle-line commander without peer, but controversies continue about his approval of close-in carpet bombing to facilitate the breakout at *St. Lô in Normandy; his failure to close the Falaise-Argentan gap; his advocacy of a broad-front approach to the battle for *Germany; his failure to foresee the Germans' surprise counteroffensive in the Battle of the * Bulge; as well as his tense relations with the British field marshal, Bernard Law * Montgomery.

Bradley served as head of the *Veterans Administration (1945-47), then became army chief of staff in February 1948, and served as first permanent chairman of the JCS (1949-53). He was made four-star General of the Army in September 1950. As JCS chairman, Bradley supported President Harry S. *Truman's rejection of the navy's supercarrier in 1949 and helped oversee the *Cold War defense buildup after 1950. In the *Korean War, Bradley recommended sending troops to oppose North Korea's invasion in 1950, favored confining hostilities after the Chinese intervention in November, and supported Truman's decision to relieve Gen. Douglas *MacArthur in 1951. Speaking for the JCS that year, he testified that the Soviet Union posed the main threat and that conflict with China—which MacArthur seemed willing to widen—would be “the wrong war, at the wrong place, at the wrong time, and with the wrong enemy.” Bradley retired in 1953; he died in 1981.

West Point in 1837. He fought in the *Seminole Wars and the *Mexican War and was a Louisiana sugar planter from 1856 until 1861. Appointed a Confederate brigadier during the Civil War by his friend Jefferson *Davis in March 1861, Bragg trained volunteers at Pensacola and became a major general in September. Sent to aid A. S. Johnston's army in February 1862, Bragg fought well at the Battle of *Shiloh.

A full general commanding the western department in April 1862, Bragg invaded Kentucky but gained little. He fought the indecisive Battle of *Perryville, 8 October 1862, then retreated to Tennessee. On 31 December, he fought Gen. W. S. *Rosecrans at Murfreesboro, with initial success. Persistent Union resistance drained Bragg's confidence, and on 2 January 1863 he retreated to Tullahoma. Rosecrans flanked him from Chattanooga on 9 September 1863.

Doubting subordinates foiled Bragg's plans to attack below Chattanooga, but on 19 and 20 September—reinforced by Gen. James *Longstreet's corps from the Army of Northern Virginia—he attacked successfully at the Battle of *Chickamauga and besieged the beaten Fédéraux in Chattanooga.

Bragg quarreled with his subordinates while Gen. Ulysses S. *Grant replaced Rosecrans. Grant routed Bragg's Army of the Tennessee from *Missionary Ridge on 23-25 November.

Davis accepted Bragg's resignation, but in February 1864 called him to Richmond as military adviser—a job he performed well because of administrative skills. Bragg, though, used malign influence to get Joseph E. * Johnston removed from command of the army at Atlanta—with dire results.

In October 1864, Bragg's command indecision lost the Confederacy's last blockade-running port, Wilmington, North Carolina. He served under Joseph Johnston at the end of the war, was captured on 9 May 1865, paroled, and died in Galveston, Texas.

Probably the most controversial Confederate general, his abilities thwarted by a thorny personality and odd moments of dereliction, Bragg did much to defeat his cause.

BRANDY STATION, BATTLE OF (1863). This battle, fought just south of the Rappahannock River in Culpeper County, Virginia, stands as the largest clash of cavalry in North America. While not strategically important, the battle had long-range consequences for cavalry operations during the second half of the Civil War.

Robert E. *Lee intended to launch his Gettysburg campaign from Culpeper County on the morning of 9 June 1863. Gen. James E. B. *Stuart, commanding five cavalry brigades and five artillery batteries (9,700 men), had orders to screen the infantry's line of march northward from Union forces under Gen. Joseph *Hooker. Stuart had encamped his men on a north-south line ten miles long and midway between Lee's infantry at Culpeper Courthouse and the Rappahannock River. The approximate center of his line was Brandy Station, on the Orange &c Alexandria Railroad.

Gen. Alfred Pleasonton, cavalry chief of the Army of the

BRAGG, BRAXTON (1817-1876), Confederate general. Bragg was born in North Carolina and graduated from

Potomac, moved first. Benefiting from reforms enacted the previous February by Hooker, Federal cavalry was beginning to take a more aggressive role in the war. Pleasonton on this day had orders to cross the Rappahannock with three cavalry divisions, two infantry brigades, and six artillery batteries, and destroy whatever Confederate forces he found in Culpeper. Unfortunately, Pleasonton did not know the precise location or size of those forces, which he erroneously assumed would be encamped around Culpeper Courthouse, eleven miles west of the river.

Following instructions from Hooker, Pleasonton divided his force on 9 June. The right wing (5,418 men) under Gen. John Buford crossed the river at Beverly's Ford around 5:00 a.m. The left wing (5,563 men) under Gen. David M. Gregg crossed at Kelly's Ford, six miles below Beverly's Ford, an hour later. The two wings were to rendezvous at Brandy Station and move west toward the courthouse. Buford was surprised to encounter rebel resistance near the river, but he advanced swiftly toward the brigade camp of Gen. William E. "Grumble" Jones, near St. James's Church and two miles north of Brandy Station. Jones established a strong defensive line, composed largely of artillery and dismounted cavalry, that repulsed repeated assaults by Buford. The line was soon reinforced and extended in the shape of a crescent by the arrival of Gen. Wade Hampton's brigade on Jones's right flank and Gen. W. H. F. "Rooney" Lee's brigade on his left, along the base of Yew Ridge.

By that time, however, around 11:00 a.m., the Federal left wing was approaching Stuart's rear. Gregg's command, consisting primarily of his own cavalry division and a cavalry division under Col. Alfred N. A. Duffie, had overwhelmed pickets at Kelly's Ford. Gregg's division circumvented Gen. Beverly Robertson's brigade and was poised to seize Fleetwood Hill, just north of Brandy and the site of Stuart's headquarters, before Stuart appreciated the danger. In this second and most famous phase of the battle, thousands of mounted cavalry launched charge after countercharge seeking to control the heights of Fleetwood. At the same time, a third phase of the fight unfolded near Stevensburg, four miles south of Brandy, where Duffie, who had been dispatched toward Culpeper Courthouse, battled two Confederate regiments. Duffie, with nearly 2,000 horsemen, outnumbered his opponents four to one, but his overly cautious nature prohibited him from breaking through to join Buford and Gregg.

By 4:00 p.m., Pleasonton, who had accompanied Buford's wing, had ordered his command to recross the Rappahannock. Federal retreat was accelerated by a final Confederate attack. As troops were withdrawn from the fighting around St. James's to engage on Fleetwood, Buford had slowly pushed back Rooney Lee. Now the brigades of Rooney Lee and Fitzhugh Lee rallied to slam into the Union right flank as Pleasonton's entire line faded back toward the river.

Stuart would never admit to being taken by surprise at Brandy Station, and he could, in fact, claim a tactical victory. He had held his ground, and Confederate casualties amounted to only 485, compared to Federal losses of 866. The heaviest fighting and the lion's share of the casualties came around St. James's. But Federal cavalymen believed they had earned a stalemate deep in rebel territory. This sense of accomplishment, combined with the new Federal strategy that gave them a larger combat role, enhanced their confidence and morale. Stuart, say some authorities,

stung by public criticism of his performance at Brandy Station, tried to atone with an ill-conceived raid during the Gettysburg campaign, a raid that left Robert E. Lee blind during the early, critical stages of that campaign and battle.

BRANT, JOSEPH (1742-1807), British army officer and Mohawk leader. Brant was the son of a Mohawk chief and a woman of mixed English and Indian descent. After his father's death, Brant lived with his sister's husband, William Johnson, superintendent of Indian affairs north of the Ohio River from 1755 to 1774. This experience, combined with attendance at a Christian school in Connecticut, prepared him for work as a bicultural mediator between the English and Iroquois in the years leading up to the American Revolution.

When the * Revolutionary War broke out, Brant traveled to England, and was commissioned captain, and expressed his allegiance to the British crown. He returned to the Hudson River Valley and rallied the Iroquois to the loyalist cause, leading highly effective expeditions against Americans living in the region. These brought harsh retaliation from American forces under Gen. John Sullivan in 1779. Brant continued to resist even after British troops ceased hostilities. The English rewarded him and a number of Mohawks for their services with a tract of land in Ontario, where Brant eventually died. Brant's leadership and skills as a mediator enabled him and his followers to carve out a degree of autonomy while facing Anglo-American expansionist pressures.

BREED'S HILL, BATTLE OF. See Bunker Hill, Battle of (1776).

BROWN, GEORGE (1918-1978), chairman of the *Joint Chiefs of Staff, 1974-78. George Brown served on the Joint Chiefs of Staff (JCS) for five years: one year as air force chief of staff (1973-74), and four years as chairman. Although General Brown fought in three wars and served with distinction in high-level positions in the *Pentagon, he is best known for a series of myopic and offensive public remarks made during his tenure as chairman. Brown complained about Israel's undue influence on Congress, and ascribed that influence to the "fact" that the Jewish people in the United States control the banks and newspapers. He also said that the American commitment to Israel was a burden on the United States, and vigorously defended the right of the government to spy on American citizens in order to protect national security. Normally, such statements by a high government official would have resulted in dismissal by the president.

Brown was not relieved by either President Ford or Carter simply because he was too valuable as chairman of the JCS. Brown's value came from three sources. First, he was a superb military strategist with great expertise on the complex issues involved in the *Strategic Arms Limitation Talks (SALT) with the Soviet Union. Second, Brown held a balanced analytical view of the military situation between the United States and the USSR. Unlike some of his contemporaries, he was inclined neither to overstate the Soviet military threat nor to understate America's military capabilities. Third, Brown was held in high regard by his military colleagues for his honesty and expertise. He was also highly regarded for helping the U.S. military adjust to the post-Vietnam draw down.

BROWN, HAROLD (1927-), nuclear physicist and weapons designer; secretary of the air force and secretary of defense; defense consultant. The first scientist to become secretary of defense, Harold Brown's career epitomizes the linkages between scientific, educational, and military institutions that developed during the *Cold War. A high school graduate at age fifteen, Brown received his Ph.D. in physics from Columbia University in 1949, at twenty-one. After working at the Lawrence Radiation Laboratory at the University of California, Berkeley, in 1952 Brown joined the newly created Lawrence Livermore Laboratory, where he worked on controlled fusion and nuclear explosives. Before becoming laboratory director (1960), he had played a leading role in the design of the Polaris missile warhead and taken part in discussions on Project Plowshare (peaceful uses of *nuclear weapons). Brown joined the Kennedy administration in May 1961 as director of the Division of Research and Engineering (DDR&E) within the Department of *Defense. As DDR&E, he scrutinized service proposals for new weapons systems, rejecting some, such as the Skybolt missile and the B-70 bomber, while backing others, such as highly accurate multiple independently targetable reentry vehicles (MIRVs) and the TFX fighter-bomber.

From 1965 to 1968, Brown was secretary of the air force. Initially a supporter of the * Vietnam War, he was an architect of the bombing program, but became a supporter of deescalation. Appointed president of California Institute of Technology (1969), Brown served the Nixon administration as a member of the SALT I delegation. When Jimmy *Carter was elected president in 1976, he appointed Brown secretary of defense. A strong secretary, who was committed to sustaining a strategic nuclear edge over the Soviet Union, Brown left his stamp upon the administration's defense programs, including the MX missile, SALT II, and nuclear strategy (Presidential Directive 59). Brown also presided over defense budget increases, especially after the invasion of Afghanistan (1979), although his rationale—a purportedly increased rate of Soviet military investment—remains contested. To bolster containment of the Soviet Union, Brown promoted military and intelligence cooperation with China, an initiative that he cemented with a major trip to Beijing (1980). During the 1980s, Brown became an investment banker but also held posts at Johns Hopkins University and the Center for International Strategic Studies.

BROWNING AUTOMATIC RIFLE. Responding to the need to counter massed German *machine guns in World War I, renowned American arms inventor John M. Browning developed his Browning Automatic Rifle (BAR) in 1918. This was a 16-pound, gas-operated weapon that fired .30-caliber bullets from a twenty-round detachable box magazine. The BAR had a selector switch that allowed the user to fire individual shots or in a fully automatic mode that would empty the magazine in about two seconds. The muzzle tended to rise during automatic fire, making it difficult to stay on target. Sustained automatic fire also tended to overheat the barrel.

Various firms produced some 85,000 BARs during World War I. By World War II, modifications had increased its weight to almost 20 pounds, but it remained in use as the principal squad automatic weapon of the U.S. Army during World War II and Korea. Some indigenous forces on both sides during the *Vietnam War also used these weapons.

BRYAN, WILLIAM JENNINGS (1860-1925), politician and secretary of state. Reared in Illinois, Bryan attended Illinois College and Chicago's Union College of Law. In 1887 he moved to Nebraska, entering Democratic politics as a champion of agrarian reform. Elected to Congress in 1890, defeated in a Senate bid four years later, he won the Democratic presidential nomination in 1896 but lost to Republican William *McKinley. He ran again in 1900 and 1908—both times unsuccessfully.

Having supported Woodrow *Wilson in 1912, Bryan became his secretary of state. A pacifist and anti-imperialist with no diplomatic experience, Bryan negotiated conciliation treaties with some thirty nations providing for the submission of disputes to investigative commissions.

The outbreak of war in 1914 tested Bryan's *pacifism. Embracing Wilson's call for U.S. *neutrality, he opposed loans to the Allies and travel on belligerent ships by U.S. citizens; he also called on U.S. vessels to observe Germany's U-boat blockade of Great Britain. President Wilson, by contrast, saw the German blockade as a violation of neutral rights.

In May 1915, a German U-boat sank the British liner *Lusitania* (heavily loaded with munitions), killing 1,198 people, including 128 Americans. Wilson repeatedly demanded that Germany pay reparations, disavow U-boat warfare, and accept his interpretation of neutral rights. Bryan resigned, believing Wilson was treating the German and British maritime *blockades unequally; he also deplored the president's preempting of his role. He was succeeded by the colorless Robert Lansing, who proved highly favorable to the Allies.

Out of office, Bryan opposed the militaristic "Preparedness" campaign but endorsed Wilson in 1916. Personally

opposed to U.S. entry into the war in 1917, he refused to speak out.

As a diplomat, Bryan shared Wilson's moralistic approach to world affairs, but the two men's basic principles differed: Bryan valued peace above all; Wilson insisted that Germany accept his view of neutral rights. Bryan's resignation reflected the conflict of wills that often ensues when a president seeks to conduct his own foreign policy—a conflict that has more than once upset the course of U.S. diplomacy.

BUDGETING FOR WAR. See Public Financing and Budgeting for War.

BUENA VISTA, BATTLE OF (1847). Maj. Gen. Zachary *Taylor's small army had been victorious in all three of its *Mexican War battles by the end of 1846. After the Battle of Monterrey in September, many of his troops were assigned to Maj. Gen. Winfield *Scott for a proposed attack on the Mexican coastal town of Veracruz.

Antonio Lopez de *Santa Anna commanded Mexican forces, and he knew from captured dispatches that Scott had siphoned off Taylor's best troops. In late January 1847, therefore, he led 21,000 troops northward to attack Taylor's weakened force of about 5,000. The U.S. forces positioned themselves near the Hacienda San Juan de la Buena Vista, where the road passed between mountains.

The Mexican Army, reduced to about 15,000 men by death, disease, and desertion, reached the U.S. position on 22 February. After Taylor refused Santa Anna's invitation to surrender, the Mexicans attacked. The fighting was brisk but inconclusive. It ended at sunset.

Santa Anna reopened the battle the next morning. Mexican cavalry rode around the U.S. position and toward its supply base at the hacienda. Col. Jefferson *Davis formed his Mississippi volunteers and an Indiana regiment into a large V. When the Mexican horsemen rode into the mouth of this V, they were shot to pieces. Meanwhile, superbly handled U.S. artillery held off Mexican infantry advancing straight up the valley.

Nightfall again ended the fighting, but this time Santa Anna used the darkness to mask his retreat. He had lost over 3,500 men in the two-day fight. U.S. *casualties were also heavy; over 600 had fallen.

The Battle of Buena Vista was the last major battle of the war in northern Mexico. Within two weeks, General Scott landed at Veracruz, and Santa Anna hastened southward to try to protect his nation's capital city from this new threat. Had the Mexicans won at Buena Vista, Scott's attack probably would have been postponed or even canceled.

"BUFFALO" SOLDIERS. In the post-*Civil War regular army, Congress set aside six regiments for black enlisted men in the reorganization act of 28 July 1866. These were the 9th and 10th Cavalry and the 38th, 39th, 40th, and 41st

Infantry Regiments. The act marked the first inclusion of black units in the regular army. It was seen as recognition of the contribution black units of the *Union army had made in the *Civil War. In the spring of 1869, the 38th and 41st were merged into the 24th Infantry Regiment; the 39th and 40th became the 25th. Commissioned officers of the black units were white (the only exceptions before 1901 were Henry Flipper, Charles *Young, and John Alexander).

Until the 1890s, the black regiments served almost entirely at remote western frontier posts. Comprised initially of mostly illiterate former slaves, they overcame their shortcomings and the army's initial tendency to supply them with cast-off equipment. They also faced considerable racial hostility and occasional violence from white civilians throughout their frontier service.

All saw action against hostile Indians. Sergeant Emanuel Stance of the Ninth Cavalry was the first of eighteen black soldiers to receive the Medal of Honor during the Indian Wars between 1870 and 1890. Both cavalry regiments played prominent roles in the brutal Apache wars of 1877-81; they suffered more *casualties than all the other frontier campaigns. They also fought in Cuba, in the *Philippine War (1899-1902), and in Mexican border skirmishes (1915-16).

The sobriquet "Buffalo" Soldiers was applied first to the 10th Regiment around 1870. The term apparently originated with the Cheyenne Indians, who may have seen a similarity between the curly hair and the dark skin of the soldiers and the buffalo. Soon the Ninth's troopers also became known as buffalo soldiers, and ultimately the infantrymen too came to be considered buffalo soldiers. Many writers contend that the name reflected the Indians' respect for the soldiers, but Native American commentators disagree.

BULGE, BATTLE OF THE (1944-45). Also known as the Ardennes Campaign of World War II, this was Adolf *Hitler's last counteroffensive in the West, an attempt to break the Allied lines at the Ardennes Forest, drive a wedge between the American and British armies, capture the Belgian port of Antwerp, disrupt logistics, trap Allied forces, and perhaps achieve a negotiated peace in the West.

Spearheading the thrust were two German Panzer (armored) armies—the Sixth SS Panzer Army and Fifth Panzer Army—plus the Seventh Army composed primarily of *volkgrenadier* replacement units, plus paratroopers who were to be dropped ahead to capture bridges and block reinforcements. The total German strike force included 38 divisions with perhaps 250,000 troops, supported by nearly 1,000 aircraft.

Surprise was crucial to Hitler's plan, so the German used deceptive techniques; even Field Marshal Gerd von Rundstedt, the German theater commander, was initially misled about the concentration of troops, which he and the Allies (listening through *ULTRA since the Germans used landlines rather than radio transmissions within Germany) thought were for defensive purposes to block

the next Allied offensive north and south of the Ardennes. Tactically, the Germans also imposed strict radio silence. They were aided by the inclement winter weather, which prevented aerial reconnaissance.

The Germans achieved complete surprise when they launched the massive offensive on 16 December 1944. Facing them were some 83,000 American troops in five divisions from Gen. Courtney H. Hodges's First U.S. Army, largely new or recuperating divisions, since Hodges's main force was north near Aachen preparing to attack the Roer Dams. In fog and then snow, the Germans tanks and infantry, most of them armed with automatic weapons, pushed forward, their artillery severing communication lines. A handful of English-speaking German soldiers in American uniforms and vehicles sowed confusion and apprehension.

The Germans achieved breakthroughs in half a dozen places, and for two weeks, it appeared that they might reach at least the Meuse River (a penetration of more than seventy miles). Although the Americans continued to hold the shoulders of the growing salient (the "bulge"), the 58th Panzer Corps and the 47th Corps poured through the gap created by the collapse of the U.S. 28th and the newly arrived and untested 106th Infantry Divisions.

At his headquarters in Paris, Supreme Allied Commander Gen. Dwight D. *Eisenhower conferred with Gen. Omar N. *Bradley, head of the 12th Army Group. Bradley believed it a spoiling attack, but Eisenhower sensed its scope. Yet Eisenhower's broad-front strategy denied him the reserves to meet such an attack. Thus on 19 December, he ordered General Hodges on the north and Gen. George S. *Patton on the south of the salient to pivot the First and Third U.S. Armies and redirect their offensives to cut off the German salient at its base. He also ordered the 82nd and 101st U.S. Airborne Division sent in by truck, and all available U.S. reserves in Europe to be put into action. This meant that black platoons went into combat at the company level with white units, fighting their mutual enmity.

The vital road center of Bastogne was soon surrounded by the advancing Germans. But calling themselves the "Battered Bastards of Bastogne," the 101st U.S. Airborne Division refused to surrender—Brig. Gen. Anthony C. McAuliffe's answer to a German delegation was "Nuts"—and held down five German divisions. The 82nd Airborne Division also thwarted the Germans at Houffalize, and Americans put up major resistance at St. Vith. Many were angered by true reports that the SS had executed captured G.I.s at Malmédy.

On 24 December, the German Panzers reached their limit, blocked three miles from the Meuse by Gen. James "Lightning" Collins's 2nd Armored Division. The previous day, clearing skies enabled 2,000 Allied planes to begin attacking enemy columns and supply lines. The Luftwaffe counterattacked, destroying more than 150 Allied planes, but lost 300 themselves and never recovered. U.S. and British airplanes shattered the German offensive, which was already running short of fuel and ammunition.

The Army Air Force also began on 23 December to resupply the besieged American paratroopers. The first reinforcements reached Bastogne the day after Christmas.

With the German offensive blunted, the U.S. First and Third Armies began their pincer movements on 3 January 1944, but deep snow prevented their closing on Houffalize until 16 January. By then many of the Germans had escaped.

Although the German counteroffensive had been defeated, it was a costly victory. Allied *casualties totaled 77,000 men, which included 8,000 killed in action, 48,000 wounded in action, and 21,000 as prisoners of war or missing in action. Exact figures for German casualties are impossible to determine, but estimates suggest that the Germans lost over 200,000 men, including 110,000 as prisoners of war. In addition, they lost 1,400 tanks and 600 other vehicles.

Hitler's decision for the massive counteroffensive, rather than the traditional delaying actions and defense, also cost the Germans their last reserves in veteran troops, *tanks, and mechanized artillery and vehicles. Despite some desperate moments, the "Battle of the Bulge" ultimately proved to be the beginning of the invasion of the Third Reich from the West.

BULL RUN, FIRST BATTLE OF (1861). The first major land battle of the Civil War occurred at Bull Run Creek (near the town of Manassas, Virginia) Virginia, on 21 July 1861. Brig. Gen. P. G. T. *Beauregard, the hero of Fort Sumter, commanded the *Confederate army. His force of 20,000 protected a rail link that led to Brig. Gen. Joseph E. *Johnston's army in the lower Shenandoah Valley. Johnston's 12,000 men faced a Federal force of 18,000 commanded by the aged Robert Patterson, a veteran of the *War of 1812.

Beauregard deployed his force along a stream called Bull Run; it was crossable only at a number of fords and one stone bridge. Henry Hill commanded the bridge and the fords around it, thus forming the key to the Confederate position. Believing the Fédérés would attack his right, Beauregard posted most of his force there. Meanwhile, on 18 July, Johnston was ordered to join Beauregard at Manassas; for the first time in the history of warfare, the Confederates used railroads operationally, over the next two days sending Johnston's men sixty miles from the Shenandoah Valley to reach Beauregard's army.

Under intense public pressure to capture Richmond, Union Brig. Gen. Irvin McDowell planned to move from Centreville with 30,000 men to turn the Confederate left flank, isolating Beauregard from Johnston and making his strong defensive line along Bull Run untenable.

On the morning of 21 July, the Fédérés attacked the stone bridge. Confederate Capt. Nathan G. "Shanks" Evans perceived that the Federal attack in his front was merely a feint; in the first battlefield use of the wigwag telegraph system, Capt. E. P. Alexander signaled to Evans that his left flank was turned. With his left threatened, Beauregard rushed his forces toward Henry Hill to support Evans.

That afternoon, the Fédérés launched several piecemeal assaults against Henry House Hill. At one intense moment of fighting Brig. Gen. Barnard E. Bee rallied his Alabamians by declaring, "There is Jackson standing like a stone

wall.” His comment gave Brig. Gen. “Stonewall” *Jackson his immortal nickname. The attacks on Henry House Hill continued for about two hours, with neither side gaining a decisive advantage.

At around 4:00 p.m., fresh troops from Beauregard’s army under Col. Jubal A. Early and Brig. Gen. E. Kirby Smith arrived on the field and began to roll up the Federal right. The Union units withdrew, and some panic ensued—it was impossible to rally the army, which began a retreat all the way back to Washington, D.C. Similar confusion reigned on the Confederate side, allowing the Fédéraux to escape unmolested.

The losses in the largest battle yet fought in North America were considered heavy, though by the following year they would be eclipsed frequently: the Confederates suffered 1,982 *casualties, while the Union suffered 2,896. In the humiliation of defeat Northerners realized that blind enthusiasm was not enough to win the war; many felt a renewed sense of purpose in the Union’s war effort. The victory reinforced Southern views of their martial superiority.

[See also Civil War: Military and Diplomatic Course.]

BULL RUN, SECOND BATTLE OF (1862). On 26 June 1862, Civil War Union Maj. Gen. John Pope assumed command of the Army of Virginia, a collection of three formerly independent armies that had recently suffered humiliating defeats at the hands of Maj. Gen. “Stonewall”

* Jackson in the Shenandoah Valley. Pope brashly assured his troops that they would no longer be concerned with lines of retreat. He planned to attack Richmond from the north after receiving reinforcements from the Army of the Potomac, which was still on the Virginia Peninsula following an unsuccessful campaign.

The Federal plan put Confederate Gen. Robert E. *Lee in a tough position. If the Federal armies united, he would be outnumbered two to one. With this in mind, he devised one of the most daring campaigns of the war: Leaving a small force to defend Richmond, Lee moved the rest of his army to join Jackson, who had clashed with an isolated Union corps at Cedar Mountain on 9 August. Lee hoped to destroy Pope’s army before it could be reinforced.

Once in front of Pope, Lee divided his army. While Maj. Gen. James *Longstreet faced Pope across the Rappahannock River, 24,000 men under Jackson would march around Pope’s right and cut the Federal supply line along the Orange & Alexandria Railroad. Once Jackson accomplished his objective, Longstreet would march to join him. In two days, Jackson marched fifty miles and captured several hundred Fédéraux and massive amounts of supplies at Manassas Junction. As Pope ordered his 66,000 men back and forth to find the Confederates, Jackson moved north of the old Bull Run battlefield and hid his men in an abandoned railroad cut.

On 28 August, Jackson revealed his position by fighting a Federal division to a stalemate at Groveton. The Fédéraux converged on Jackson, determined to destroy his force. The next day, Jackson held his ground with great difficulty against several uncoordinated Federal attacks.

Unbeknownst to Pope, Longstreet had established contact with Jackson on the afternoon of 29 August. The next day Maj. Gen. Fitz John Porter launched an unsuccessful attack that featured part of the Confederate line tossing

rocks at the Fédéraux after running out of ammunition. At 4:00 p.m., Longstreet began a massive attack on the lightly defended Federal left flank. His successful assault assured Confederate victory; a Federal attack at Chantilly on 1 September ended Jackson’s attempt to cut off the Union retreat, but also resulted in the death of Maj. Gen. Philip Kearney.

The Second Bull Run campaign marked the emergence of Lee as an army commander. He inflicted 14,500 *casualties on the Fédéraux while suffering about 9,500 of his own. Although the campaign demonstrated Lee’s operational brilliance, it did not reflect well on his Union counterpart. Often indecisive, Pope could not envision the campaign from his opponent’s perspective. He blamed his failure on Porter, who was court-martialed for disobeying orders. His cashiering inaugurated a battle of ink—before 1890, probably no battle, including Gettysburg, would receive more attention.

BUNDY, McGEORGE (1919-1996), historian, educator, U.S. government official. Though associated with academic affairs and philanthropic enterprises for most of his career, McGeorge Bundy is best remembered for his years (1961-66) as special assistant for national security affairs to Presidents John F. *Kennedy and Lyndon B. *Johnson. During that time Bundy participated in many crucial foreign policy episodes, and effectively transformed the role of national security assistant from that of a behind-the-scenes coordinator, as it had developed in the 1950s, into a policy adviser operating on a par with cabinet officials.

Born into Boston Brahmin society, Bundy was educated at Groton School, Yale College, and Harvard University. Deemed unfit for military service because of nearsightedness, he memorized the eye chart in order to join the army as a private and rose to become a captain by the end of World War II. In 1949 he joined the Harvard government department, teaching a popular world affairs course, and in 1953, at age thirty-four, he became dean of Harvard’s Faculty of Arts and Sciences. He was a foreign policy consultant to Kennedy’s 1960 presidential campaign, and afterwards accepted Kennedy’s invitation to come to Washington to reorganize and oversee the *National Security Council (NSC).

At Kennedy’s request, Bundy adopted a broad view of his responsibilities at the NSC, and came to enjoy a close working relationship with the president and other senior officials. As a result, Bundy was at the center of practically all major foreign policy deliberations, including Kennedy’s decision to launch the ill-fated Bay of Pigs invasion of Cuba, the Berlin Wall episode, the *Cuban Missile Crisis, and the escalation of U.S. involvement in Southeast Asia.

As the United States became involved in *Vietnam War, Bundy emerged as a leading advocate of “sustained reprisals” against North Vietnam. When in January 1965 it appeared that the South Vietnamese were nearing collapse, he joined with Secretary of Defense Robert S. *McNamara in urging President Johnson to step up the use of U.S. military power and to expand the air war against the North. Many historians have since come to see this as a major

turning point, setting the stage for the large-scale U.S. intervention later that year. Much criticized for his role in Vietnam policy, Bundy left government in 1966 to become president of the Ford Foundation. In later years, Bundy devoted himself to research and writing on the threat of nuclear war and ways of curbing it.

BUNKER, ELLSWORTH (1894-1984), U.S. diplomat and businessman. Born into a well-to-do family, Ellsworth Bunker looked after his family's sugar interests after graduating from Yale University in 1916, and served as director (1927-66) and chairman of the board (1948-51) of the National Sugar Refining Company. Throughout his long, productive life, Bunker balanced accomplishments in business with a distinguished record of public service.

He made his mark on American history in two key assignments. As American representative to the Organization of American States, Bunker was instrumental in resolving the 1965 Dominican Republic crisis. He persuaded two political rivals, Juan Bosch and Joaquin Balaquer, to agree to compete in open democratic elections, which averted the threat of rule by a military junta or a Communist regime. As ambassador to South Vietnam from 1967 to 1973, Bunker gave stronger direction to the nonmilitary side of the "Vietnam War and worked to integrate American civil and military programs there. He helped arrange a compromise between South Vietnamese political rivals Nguyen Van Thieu and Nguyen Cao Ky. Bunker also played a key role in helping mobilize South Vietnam's post-*Tet Offensive recovery effort of 1968. Before leaving Saigon, he presided over the U.S. mission during the *Paris peace agreements, the withdrawal of American military forces from Vietnam, and North Vietnam's 1972 Easter invasion against South Vietnam.

BUNKER HILL, BATTLE OF (1775). Two months after the * Revolutionary War began, on the night of 16-17 June 1775, about 1,200 Massachusetts soldiers set out to fortify Bunker Hill on the Charlestown peninsula, across the Charles River from Boston; by fortifying a position overlooking Boston, they intended to force the British to evacuate the town. In the dark, they mistakenly erected a redoubt on Breed's Hill, closer to Boston than planned. Later in the day, about 2,000 men from New Hampshire and Connecticut reinforced them. Shocked by this display of audacity, Maj. Gen. Thomas *Gage, the British commander in Boston, sent Maj. Gen. Sir William *Howe with 1,500 men (later reinforced to 2,500) to oust the Rebels. Howe planned to feign an attack on the redoubt while sending a strong force around its northeast flank on the low land along the Mystic River.

Howe underestimated the military capacity of his opponent. Thanks to the leadership of *French and Indian War veterans, the Americans blunted his plan. John Stark and his New Hampshire men destroyed the outflanking force

on the Mystic River beach, forcing Howe to convert the feint in front of the redoubt into a full attack. Three times he led his troops up the slope, and twice from behind their earthwork William Prescott's soldiers forced the British to retreat. With the Americans running out of ammunition, the third British attack overran the redoubt and forced the Rebels off the peninsula.

Victory cost the British over 1000 *casualties, 40 percent, a loss, Gage wrote, "greater than we can bear." The New Englanders suffered over 400 casualties, heaviest among the defenders of the redoubt. Their skill and tenacity reassured colonists everywhere that the Revolution would not be strangled in its cradle.

BURGOYNE, JOHN (1723-1792), British Revolutionary War general. Burgoyne was rumored to be the natural son of Lord Bingley. His Seven Years' War exploits in France and Portugal (and his marriage to the Earl of Derby's daughter) propelled him to major general by 1772. Assigned to help Gen. Thomas *Gage put down the New England rebellion in 1775, he directed artillery fire from Boston at the Battle of *Bunker Hill; he then intrigued against Gage and politicked for command of an army to invade from Canada, isolating New England from the Middle Colonies.

In spring 1777, Burgoyne took command of an expeditionary force of about 8,000, planning to meet a force that was to march north from New York City at Albany. He captured Fort Ticonderoga, but failed to seize supplies at Bennington and lost contact with his Canadian base of supply when he crossed the Hudson (13 September) dismantling the bridge of boats behind him. Burgoyne marched on, hoping to join the forces of Maj. Gen. Sir Henry *Clinton. Instead, he confronted Horatio *Gates's army at the two Battles of *Saratoga, and surrendered on 17 October 1777. Burgoyne was allowed to return to England, where he resumed his seat in Parliament and blamed Secretary of State for the colonies Lord George Germain for his defeat. A commander of unusual humanity, Burgoyne pioneered the employment of light cavalry; as a strategist, he (like many British officers) unwisely underestimated American determination.

BURKE, ARLEIGH (1901-1996), legendary World War II destroyer skipper and Cold War naval strategist.

Born on a farm near Boulder, Colorado, Arleigh Burke never completed high school but won appointment to the U.S. Naval Academy. Graduating 7 June 1923, he married Roberta "Bobbie" Gorsuch the same day. After five years in battleship *Arizona*, Burke chose an ordnance specialty. He earned a master's degree in chemical engineering from the University of Michigan in 1931. A skilled pre-World War II and wartime commander and tactical innovator, Burke received national attention and the nickname "31 Knot Burke" in November 1943 when his Destroyer Squadron

23 decisively defeated a Japanese force in the Battle of Cape St. George in the Solomon Islands. Burke subsequently served as Vice Adm. Marc A. Mitscher's chief of staff in Fast Carrier Task Force 58/38 during the Marianas, Philippines, Iwo Jima, and Okinawa operations.

After the war, Burke prepared the navy's first postwar long-range plan, helped coordinate the service's testimony before Congress during the 1949 "Admirals' Revolt" hearings on defense unification and strategy, and served on the first *United Nations Truce Negotiation Team during the *Korean War. Eisenhower appointed Rear Admiral Burke in 1955 over ninety-two more senior admirals to become chief of naval operations (CNO). He served an unprecedented three terms through August 1961.

As CNO, Burke fought against increased unification and restriction of command authority in the armed forces, and for maintenance of a balanced, flexible fleet capable of responding quickly and effectively to crises and limited wars. He also accelerated the development of innovative weapons systems, championing development of the Polaris submarine-based ballistic missile, deployed in 1960, as a national nuclear deterrent system. Burke overruled advisers concerned about Polaris's cost and feasibility because he believed that a small, relatively invulnerable force of missile *submarines could deter war and ensure a controlled response to Soviet attack. Burke linked the navy's strategy of "finite deterrence, controlled retaliation" to the need to prepare for limited as well as general war. He led one of the few serious challenges to massive retaliation and nuclear buildup during the first decades of the Cold War.

BURNSIDE, AMBROSE (1824-1881), Civil War general. Burnside graduated from West Point in 1847 and served as an artillery officer in the *Mexican War. He resigned in 1853 to manufacture the breech-loading rifle he had invented. After this venture failed, George B. *McClellan hired him to work for the Illinois Central Railroad.

At the beginning of the *Civil War, Burnside organized the First Rhode Island Infantry Regiment. Quickly promoted to brigadier general, he led the Federal campaign against Roanoke Island (February 1862) and became a major general. Joining the Army of the Potomac in July, Burnside fought at the Battle of *Antietam, where his slow crossing of Antietam Creek has caused historical controversy. After McClellan's removal that November, Burnside reluctantly assumed command of the Army of the Potomac. The unsuccessful Fredericksburg campaign gave Burnside the reputation of a man unsuited to command an army. His move to Fredericksburg had merit, but a bureaucratic snarl over pontoon bridges, uncooperative subordinates, and his own fuzzy battle orders contributed to a stunning defeat. He was relieved from command after the unsuccessful "Mud March" up the Rappahannock River. He later successfully defended Knoxville, Tennessee, against a Confederate attack. Returning east, Burnside commanded the Ninth Corps in the Overland Campaign. His role in the Battle of the Crater near Petersburg provoked more controversy. Resigning near the end of the

war, Burnside remained active in business and Rhode Island politics.

BUSH, GEORGE (1924-), forty-first president of the United States. Born into a wealthy, privileged family, Bush accepted his father's belief that such people have an obligation to give something back to society. On his eighteenth birthday in June 1942, he enlisted in the U.S. Navy, becoming its youngest pilot. During wartime service in the Pacific, he flew fifty-eight combat missions.

Elected as a Texas Republican congressman in 1966, he supported the *Vietnam War. Thereafter, he served as ambassador to the United Nations (1971-73), director of the *Central Intelligence Agency (1976-77), and vice president under Ronald *Reagan (1981—89). He won the presidency in 1988. Ill at ease in the contentious environment of domestic politics, Bush relished foreign policy. In response to the harassment of American military personnel, he committed U.S. forces to the 20 December 1989 invasion of Panama. The four-day campaign ended successfully with the capture of the Panamanian dictator Gen. Manuel *Noriega. Following communism's collapse in Russia, Bush and Soviet leader Mikhail Gorbachev signed a historic accord in November 1990 that marked the end of the Cold War. Bush claimed that the treaty signaled "the new world order."

That order received a profound challenge when Iraq invaded Kuwait on 2 August 1990. After declaring that the invasion "shall not stand," Bush skillfully cobbled together an international coalition to resist Iraq. He proved less interested and able to explain to the American public why war was necessary. After an economic embargo failed, Bush launched Operation Desert Storm on 17 January 1991. Ten days later, with Iraqi forces in full rout, he suspended hostilities. Pleased, he claimed the quick victory had "licked the Vietnam syndrome." The national perception that the war had been halted too soon contributed to Bush's electoral defeat in 1992. As war leader, he developed strategy and then left its implementation in military hands. He failed clearly to articulate the objective, namely, what constituted "victory" against Iraq.

BUSH, VANNEVAR (1890-1974), engineer, developer of military technology, and defense analyst. Bush graduated from Tufts University in 1913 and later taught electrical engineering at the Massachusetts Institute of Technology. While still at MIT, he cofounded a successful radio tube company: Raytheon. Over the next decade, Bush designed a series of mechanical calculators, termed *differential analyzers*, that were initially useful for simulating the operations of electric power grids, but by the mid-thirties became widely seen as the world's most powerful computers. He was named president (1939) of the Carnegie Institution.

In June 1940, Bush persuaded President Franklin D. *Roosevelt to name him chief of a new federal agency

charged with coordinating civilian research on military problems. As chief of the National Defense Research Council (and later its parent agency, the Organization for Scientific Research and Development), Bush oversaw the creation of hundreds of military technologies, most notably *radar and the proximity fuse. He neutralized skeptics within the Army and Navy Departments by relying on his direct line to Roosevelt. And he relied on experts to set technical priorities.

Bush at first thought atomic weapons might not play a part in World War II. But he changed his mind in the fall of 1941 and set in motion creation of the * Manhattan Project, choosing the army to direct the crash program because he mistrusted the navy for disparaging him and other scientists. Among the first in government to foresee the darker implications of atomic weapons, Bush warned Secretary of War Henry L. *Stimson in September 1944 of the possibility of "a secret arms race" that might result in the United States losing its "temporary advantage" in atomic weapons. Such race might be avoided, he suggested, "by complete international scientific and technical interchange on this subject." Yet in summer 1945, Bush recommended that atomic bombs be dropped on Japan.

From 1945 through 1948, Bush sought to create a civilian-dominated directorate within the U.S. military establishment that would rationalize research, setting priorities for the individual branches and limiting duplication. The services, by then intent on building their own research organizations, resisted centralized planning, but Bush succeeded in creating a Research and Development Board (RDB) within the Pentagon whose chairman (initially Bush) reported directly to the secretary of defense. The RDB laid a foundation for later, more effective coordination of military research.

BUTLER, BENJAMIN F. (1818-1893), *Civil War general and politician. A prominent Democratic lawyer in Lowell, Massachusetts, militia Brigadier General Butler was given command of the state's troops in 1861 in order to rally Democrats to the Union cause. After relieving Washington by way of Annapolis, he secured Baltimore, was promoted to major general in command at Fortress Monroe, and won popularity by declaring fugitive slaves used by the enemy against the United States contraband of war. He lost the Battle of Big Bethel, only to recoup his fortunes by participating in the navy's seizure of Fort Hatteras.

In April 1862, Butler accompanied Flag Officer David *Farragut in the seizure of New Orleans, a city where he proved his agility as an administrator. Although he maintained order and prevented an outbreak of yellow fever, Southerners called him "Beast" because he hanged a Confederate who had torn down the American flag and issued

General Order No. 28 threatening to treat females who insulted his soldiers as "women of the town plying their avocation." Rumors of corruption and controversies with foreign consuls caused him to be recalled in December. In

1863, he was given command of the Department of Virginia and North Carolina, which he exercised in his usual controversial manner.

In 1864, leading the Army of the James against Richmond from the coast, Butler found himself "bottled up" at Bermuda Hundred and suffered a defeat at Drury's Bluff. After failing to take Fort Fisher (Wilmington, North Carolina) in December, he was finally recalled.

After the war, Butler proved an arch-radical congressman during * Reconstruction and a firm supporter of President Ulysses S. *Grant. He was a sharp critic of West Point. Elected Democratic governor of Massachusetts in 1882, he ran as an unsuccessful third-party candidate for the presidency in 1884. His military career furnishes a good example of the strengths and weaknesses of political generals, while his championship of black troops deserves to be remembered.

BUTLER, SMEDLEY (1881-1940), Marine officer, antiwar crusader. Born into an old Pennsylvania Quaker family, Butler nevertheless joined the Marines as a lieutenant when the *Spanish-American War broke out in 1898. The campaigned in expeditions and military occupations from 1898 onward, spanning the transition from colonial punitive warfare to mediatory peacekeeping: Cuba, the Philippines (1899, 1905-07), China (1900), Honduras (1903), Panama (1903, 1909-14), Nicaragua (1910-12), Mexico (1914), Haiti (1915-18), France (1917-18), and finally China again as commander of the Marine peacekeeping force (1927-29). Winner of two Congressional Medals of Honor, "Old Gimlet-Eye," as he was called, promoted a warrior-style Marine Corps mystique of physical stridency and anti-intellectual egalitarianism, contrary to contemporary trends toward elitist, bookish professionalism.

Drawing upon his experience organizing colonial constabularies, Butler attempted to militarize Philadelphia's police force as its director (1924-25) during the Prohibition era, and became a leading proponent of national paramilitary police reform in the late twenties and early thirties. After premature retirement from the Marines as a major general in 1931, he renounced war and imperialism, becoming the most prominent leader of the formidable veterans' antiwar movement during the isolationist era of the mid- and late 1930s.

CALHOUN, JOHN C. (1782-1850), congressman, secretary of war, vice president, senator, and secretary of state. When James Monroe appointed Congressman John C. Calhoun secretary of war in 1817, the South Carolinian discovered a department mired in financial irresponsibility and managerial incompetence. Calhoun eliminated economic waste, initiated a series of coastal defenses, tightened the army command structure, and improved the curriculum at West Point. He continued the standing policy of negotiating treaties for Indian land and Indian removal, and sent out expeditions to explore the country's vast western expanse. Calhoun, however, struggled to get along with his generals, especially the headstrong Andrew Jackson.

Government retrenchment due to the Panic of 1819 sidetracked many of his initiatives, eliminating his improved transportation system. In 1820 to avoid the disastrous impact of a huge cut in the army, Calhoun proposed his ingenious Expandable Army Plan. The reduction would come among privates; officer and noncommissioned officer strength would remain. In crisis, the army could expand by recruiting privates to serve under experienced leadership. A penurious Congress rejected the scheme. The South Carolinian was, however, able to implement another of his plans, the prohibition of the recruitment of blacks into the U.S. Army, an order that remained in effect from 1820 until the Civil War.

When Calhoun left office in 1825, he had accomplished much less than he had desired. However, he had restored some fiscal responsibility and some order to a department found in chaos. Though better known for his later political career, Calhoun was an influential secretary of war.

CAMP DAVID ACCORDS (1978). The Camp David Accords, which outlined a framework for a comprehensive Middle East peace, were initiated on 17 September 1978 by U.S. president Jimmy Carter, Israeli prime minister Menachem Begin, and Egyptian president Anwar Sadat following a two-week conference at Camp David, the presidential retreat in Maryland's Catoctin Mountains. The Camp David process began in November 1977, when Sadat made an unprecedented visit to Israel, where he told Israeli leaders that Egypt was willing to make a lasting peace if they were willing to withdraw from Arab territory occupied during the 1967 and 1973 wars. Despite encouragement from Washington, the Israeli-Egyptian negotiations stalled

during the spring of 1978, prompting Carter to invite Sadat and Begin to Camp David in September.

Adopting a low-key approach, Carter was able to make surprising progress on the bilateral Israeli-Egyptian front. The Israelis indicated that, in return for a formal peace treaty with Egypt, they would pull their troops out of the Sinai Desert and would also dismantle the handful of Jewish settlements recently established in the troubled isthmus. The major sticking point was the fate of the Israeli-occupied West Bank, an oblong bulge of Jordanian territory that 800,000 Palestinians called home. Fearing that he would be branded a traitor who had sold out the Arab cause if he agreed to a bilateral Egyptian-Israeli peace treaty without resolving the Palestinian dilemma, Sadat insisted that Begin agree to autonomy for the West Bank Arabs. Unwilling to abandon territory that had been part of ancient Israel and that was now also home to several thousand Jewish settlers, Begin adamantly refused to accept the principle of Palestinian self-determination on the West Bank. With the two sides deadlocked and the Camp David conference on the verge of collapse, Carter brokered an eleventh-hour compromise by arranging two parallel but separate agreements, one on the Sinai and the other on the West Bank. Sadat pledged to recognize Israel and to sign a formal peace treaty with Begin in return for an Israeli promise to withdraw from the Sinai. Begin agreed temporarily to suspend Israeli settlements on the West Bank and promised to negotiate "new arrangements" with "representatives of the Palestinian people."

Implementing the Camp David Accords, however, proved more difficult than Carter and his advisers had imagined. To be sure, the lure of a multi-billion-dollar U.S. aid package and the promise that several hundred American troops would monitor the Sinai frontier helped persuade Sadat and Begin to sign a peace treaty in Washington on 26 March 1979, and within three years all Israeli troops and settlers had departed from Egyptian soil. But the West Bank negotiations were stillborn, largely because the Palestinian clauses in the Camp David agreements were subject to radically different interpretations by the Israelis, the Arabs, and the Americans. During the next decade, Begin and his successor, Yitzhak Shamir, expanded the number of Israeli settlements on the West Bank dramatically; the Palestinians responded by launching an uprising—the *Intifada*—in late 1987, and the peace process stalemated, resuming in earnest only after Yitzhak Rabin was elected prime minister in 1992. The Oslo peace accords hammered out between 1993 to 1995, whereby the Israelis agreed ultimately to grant self-government to the Palestinians on the West Bank, had their roots in the Camp David Accords of 1978.

"CAMP FOLLOWERS." Although this expression has been corrupted into a synonym for prostitutes who follow army camps, it historically referred to all civilians, male and female, associated with the military. Followers accompanied military units to pursue profit, find employment, or remain with loved ones. American military forces have always had such followers; their number, kind, activities, and administration, however, have changed over time.

Camp followers helped the *Continental army during the * Revolutionary War. Sutlers—those merchants authorized to peddle provisions in camp—sold such merchandise as soap, thread, and liquor. They served both morale and supply functions. Family followers also affected a soldier's welfare and his will to fight. Finally, an assortment of civilians served the army in key staff and logistics positions, releasing soldiers and officers for combat.

Followers continued to be important to the maintenance and morale of military forces in the nineteenth and twentieth centuries. Authorized merchants smuggled goods at posts established across the continent; in the twentieth century, smuggling became big business in the form of base exchanges. Spouses and children endured hardships to maintain their families, and in so doing provided a civilian—some might say civilized—context to military life.

Civilian employees also continued their labors in the military. During the * Civil War, they clerked, drove teams, nursed, spied, and operated telegraphs; since then the services have experimented with the civilian-military mix in attempts to find the most efficient, cost-effective formula.

As camp followers could hinder as well as help the military, they had to be controlled. Although not subject to military law, these civilians did have to conform to regulations and were liable for punishment—generally revocation of privileges or banishment—if they did not. The legal basis for such control was established via a clause in the first American Articles of War and maintained in subsequent revisions, including, in a modified form, the Uniform Code of Military Justice that replaced the articles in 1950.

CANADA, U.S. MILITARY INVOLVEMENT IN. "The undefended border" is the cliché that still governs Canada-United States military relations. Most clichés are true, but for most of North American history not this one. Before American independence, the French and their native allies in Québec warred against New York and New England from the early seventeenth century to the fall of New France in 1760 in the * French and Indian War. Congress's project for 1775, during the * Revolutionary War, was an attack on Canada and, though Montreal fell, the venture failed. Again in the *War of 1812, American forces attacked Canada, the fighting especially fierce along the

Niagara frontier. The resulting stalemate meant Canadian survival. The *Rush-Bagot Agreement of 1817 put limits on the number of naval vessels Britain and the United States could station on the Great Lakes and Lake Champlain, but land fortifications proceeded apace. Then, after the 1837-38 Canadian rebellions against British authoritarianism, there were supportive "Patriot" incursions from the United States, but these were no more successful than U.S. calls for "54 40 or Fight" in the Oregon Territory border dispute or the 1860s Fenian raids that sped Canadian Confederation. During the *Civil War, some 40,000 Canadians served in Union blue, while U.S. draft evaders hid in Canada.

After Canadian Confederation in 1867, the frequently aggressive-sounding United States continued to be perceived as a military threat to the new dominion. Repeated war scares in the 1870s and 1890s produced bursts of Canadian martial enthusiasm, but economic and social intercourse made such talk increasingly unreal.

The two countries cooperated militarily in 1917-18. Each provided pilot training to the other's nationals; the U.S. Navy lent materiel for the Canadian antisubmarine war; and military-industrial cooperation flourished. President Roosevelt was close to Prime Minister Mackenzie King, and in 1940 they created the Permanent Joint Board on Defense. Agreements to maximize war production followed; there were joint operations in the Aleutians, and U.S. troops built and manned air and other installations in northern Canada. After 1945, these were purchased by sovereignty-conscious Ottawa.

During the Cold War, the new Soviet threat forced continued cooperation. U.S. bases in Newfoundland, acquired in 1941, remained a sore point, and joint northern *radar lines were contentious projects, especially when the Dew Line (distant early warning) bases forbade entry to members of the Canadian Parliament. Nonetheless, air defenses were combined in the NORAD (North American Air Defense) Agreement (1957-58). The Conservative government of Prime Minister John Diefenbaker undertook to acquire nuclear weapons for its NORAD and *NATO forces, but it delayed and was toppled in Parliament in 1963. Some charged that the administration of President John F. *Kennedy had connived at its downfall; certainly, the successor Canadian government under Prime Minister Lester B. Pearson accepted the weapons. Ottawa was less accommodating during the *Vietnam War, when Canada provided haven to perhaps 100,000 American deserters or draft evaders and Prime Minister Pearson was occasionally critical of U.S. policy. Nonetheless, military cooperation between the two nations remained close in North America, Europe, and the Middle East. Canadian forces relied on U.S. equipment, they trained with American forces, and Canada's *United Nations peacekeeping frequently served U.S. interests, as in Haiti in the 1990s. Not without domestic opposition, Canada permitted cruise missile testing over its territory, and it participated in the U.S.-led coalition in the * Persian Gulf War. The myth of the undefended border had been replaced by close defense cooperation.

CAREERS IN THE MILITARY. Since the early 1780s, careers in the American military have been varied and demanding. Over the last 200 years, the requirements of the military to be variously a constabulary, combatant, occupational force, diplomatic corps, and deterrent have ensured that both the officer and the enlisted person master several skills to carry out their different missions. Particularly in the twentieth century, the rate of technological change has frequently resulted in highly specialized training early in a military person's career and more generalist education later.

During the nineteenth century, army, navy, and Marine officers entered a career either through a direct commission or from one of the service *academies (West Point or Annapolis). At the service academy, cadets were taught the rudiments of mathematics, history, and engineering, and were thoroughly immersed in military culture. Following this experience, officers were often delayed from entering active duty until older officers retired, resigned, or were cashiered. Once on active duty, junior officers were sent for further training to a regiment (the army) or to a ship (the navy or Marines). Because of a stiflingly slow promotion rate, these apprenticeships could last well over a decade. None of the military jobs was particularly challenging once mastered. Thus, it was not unusual for men to become thoroughly proficient as an infantry, cavalry, or deck officer in a short time and then languish in some isolated frontier post or ship of the line. One bright spot was that an officer could take extended leave of absence to visit family, pursue advanced civilian education, or even talk personally to the secretary of war or navy about future assignments. Ultimately, however, an officer's career was one of classical and technical education, followed by apprenticeship or a frontier, seagoing, or staff assignment, while waiting for senior officers to retire in order to be promoted.

By 1885, a series of educational reforms added additional requirements during an officer's career. The creation of branch schools for the infantry and artillery, along with the formation of professional lyceums at army posts and the establishment of a Naval War College, set a precedent for advanced professional education. Citing technological advances in weapon systems, the professional militaries of European powers, and a growing desire on behalf of many Americans to establish the United States as a world power, many officers argued that they were members of a modern profession whose responsibility it was to protect the country's interests. It followed that if the military was a profession that called for an inordinate amount of expertise in warmaking, then it was incumbent upon the military officer to study war throughout his or her life. By the turn of the century, the expectation that officers required professional education throughout their careers shaped what a military career would mean in the modern world. After World War II, all branches of service had established professional schools to teach leadership, military strategy and tactics, and personnel management.

The increasing pace of technological advancement continued to shape military careers in the late nineteenth and twentieth centuries. The emergence of steam-driven, steel-plated warships created the need for specialized engineering officers in the navy. The early twentieth-century army developed motorized transportation and developed new weapons such as *tanks and aircraft. These innovations created new career paths for officers. The airplane would

eventually form the basis of a completely new military service (the air force), while advances in landing craft provided a new amphibious mission for the Marines.

By the 1950s, an officer who planned to serve a twenty- to thirty-year career initially received a service college education or a Reserve Officer Training Corps (*ROTC) commission through a civilian university. After commissioning, he or she attended a military specialty school to receive training for a combat, combat support, engineering, aviation, or surface warfare career. Thereafter, the young lieutenant or ensign was sent to a regiment or sea assignment to gain practical and leadership experience. At the fourth to sixth year in service, the newly promoted captain might be selected to attend an advanced course at the Amphibious Warfare School at Quantico, Virginia, or a more generalized professional military course such as the air force's Squadron Officer School at Montgomery, Alabama. Such training prepared officers for further specialization or tours as instructors or staff officers at higher echelons. After a series of operational and staff assignments, officers distanced themselves from technical specialties as they moved toward positions of command. This movement toward becoming a "generalist" meant additional school assignments at postgraduate service *schools and war colleges, as well as broadening assignments overseas or to joint commands and schools within the United States. Thus, military education throughout periods of an officer's career, combined with the need for technical specialization, formalized the career path for the rest of this century.

Evolving since 1861, officer non-disability retirement legislation for all services was combined for the first time in the Officer Personnel Act of 1947. This act specified the length of an officers's career (between twenty and thirty years based on time-in-service and time-in-grade requirements) as well as when the individual must leave the service due to inadequate performance. Officers serving for twenty years or more would receive a minimum of 50 percent and a maximum of 75 percent (thirty years' service) of their base pay for life upon retirement.

Military careers for enlisted personnel are a product of the mid-twentieth century. In earlier times, the enlisted person's life was a physically arduous, dirty, and thankless job. People who were willing to put up with the hardships of military life were accepted for duty; there was little training and few opportunities for improvement below decks or at isolated forts. For much of the nineteenth and early twentieth century, the enlisted men of the regular forces had a significant number of illiterates, alcoholics, and foreign-born immigrants in their ranks. Duties during peacetime were routine and required little talent. The classic portrait of an enlisted person during this time was that of an outcast who needed to be kept on the margins of society. Many refused to remain in the service for more than a few years, others were promoted to noncommissioned officer (NCO) ranks and served as specialist-craftsmen in a variety of jobs from saddler to sailmaker to boatswain's mate. Without such skills, some stayed in the ranks as "career" privates.

The rapid pace of technological innovation during the twentieth century caused significant changes in all this. By the end of World War I, the military identified many enlisted personnel as occupational specialists who operated or repaired the newer weapons systems—airplanes, tanks, *submarines—or the new *communications devices. By

the end of World War II, the need for technicians and maintenance personnel exceeded the need for enlisted combatants. In 1942, there were only two army enlisted specializations in the *radar and fire control field; by 1958, there were twenty-seven, plus seventy-two specializations in guided *missiles and nine in atomic weapons.

The need to separate traditional military specialties from technicians began before World War I and would climax in the 1950s. Even as early as 1918, the army established specialist grades to separate technicians from NCO grades and combat career fields. However, during World War II, the army integrated technical specialists into the NCO grades. After the war, the army again separated the technical specialists from the NCO grades and combat specialties. The more technically oriented navy and air force did not distinguish between technical specialist and traditional military specialties. An enlisted person was expected to be a specialist and a noncommissioned officer. Eventually, all the services opted to pattern an enlisted career much like that for officers: enlisted personnel obtained specialty training, became proficient in it, were promoted on the basis of technical skill and military bearing, and gradually moved toward supervisory positions during the course of a career.

Congress passed enlisted retirement legislation for the first time in 1885. The act authorized voluntary retirement at thirty years and a retirement pay of 75 percent of the active duty pay. By 1948, all the military branches adopted the twenty year voluntary retirement as legislated in the Army and Air Force Vitalization and Retirement Equalization Act (1948). Like their officer counterparts, enlisted personnel could now retire at twenty years with 50 percent active duty pay for life to reach a maximum of 75 percent for thirty years' service. Changes in the percentage of retirement pay an officer or enlisted person receives has undergone several revisions since its establishment and is a continual source of congressional scrutiny.

In the early 1950s, the services established separate professional military education schools for NCOs. These schools offered subjects formerly reserved for officers such as leadership, world affairs, and management. Like commissioned officers, NCOs were now expected to attend professional schools throughout their careers. Promotions eventually became dependent on the amount of technical training and professional education an enlisted person received and demonstrated.

Fortunately, a career in the military can mean a variety of work experiences and responsible positions. Upon retirement after twenty or thirty years, some find that their training proves useful and rewarding in civilian life; others, especially those in combat roles, may find it difficult to move to a second career. Typically, officers have skills that translate into the realms of consulting, business, engineering, and politics. Enlisted personnel often pursue a college degree, teach in public or vocational schools, work in skilled trades, or manage small businesses. Officer and enlisted personnel who do not remain on active duty for a full career may choose to go into a civilian occupation and remain in the reserves. Given America's dependence on a well-trained reserve for wartime augmentation of the regular force, reservists can continue in a part-time military career that closely resembles their active duty counterpart. Retirement from the reserves is similar to active duty—twenty to thirty years' service. Unlike the active duty re-

tiree, who will receive remuneration for the rest of his or her life from the date of retirement, the reservist will not receive such compensation until at least age sixty-two.

CARIBBEAN AND LATIN AMERICA, U.S. MILITARY INVOLVEMENT IN THE. Since the enunciation of the *Monroe Doctrine (1823), U.S. policy towards the countries to the south has reflected the tensions between a self-interested appraisal of North American economic and military interests and an idealistic declaration of commitment to democracy. As the Monroe Doctrine indicates, the United States has viewed the New World as superior to the Old World, and the United States itself as the leader and protector of the Western Hemisphere. Yet the ideas of a common moral, political, and economic superiority in the New World and U.S. responsibility for the region have often produced impatience with the pace and direction of development in the Caribbean and Latin America. When impatience led to U.S. military intervention, the use of force was sometimes aimed at advancing the economic interests or national security of the United States and sometimes directed at keeping European influence out of the region.

As part of its *expansionism, the United States government caused the *Mexican War (1846-1848) and annexed the northern third of Mexico. In the middle of the nineteenth century, adventurers or "filibusters" like William Walker led privately armed groups into Nicaragua and other Central American and Caribbean countries with the hope of luring the United States government into annexing them. They were blocked, however, by local resistance as well as northern opposition to the expansion of the slave South before the Civil War.

For most of the nineteenth century, the United States viewed the newly independent Latin American countries as struggling underdeveloped nations. Projecting their own biases, North Americans believed that this economic underdevelopment was a result of what they considered to be racial inferiority, enervating tropical climate, and a restrictive Spanish cultural heritage in Latin America.

Although there were a few incidents that might have served as pretexts for war, such as the *Chilean Crisis (1891) and the Venezuelan Crisis (1895), it was not until 1898 that the United States joined the European race for formal colonies. As a result of the *Spanish-American-Cuban War (1898) and the *Philippine War (1899-1902), the United States conquered and annexed the former

Spanish colonies of Puerto Rico, Guam, and the Philippines. It also made Cuba a protectorate, administering it directly through U.S. military governors from 1898 to 1902.

It was not primarily through formal colonies, however, but through economic, cultural, and strategic influence backed up when deemed necessary by military force that the United States exercised its hegemony in the region. President Theodore *Roosevelt encouraged and protected the Panamanian revolt against Colombia with a U.S. warship. With the construction of the Panama Canal (1904-14), the Caribbean and Central America came to be seen as vital to U.S. national security. The U.S. Army directly governed the U.S. Canal Zone. The goal of U.S. hegemony had been announced in the *Roosevelt Corollary to the Monroe Doctrine (1904), authorizing U.S. intervention ostensibly to prevent European intervention. The Panama Canal and Roosevelt's doctrine provided the reason and the rationale for the United States's "protectorate policy" toward the region. On nearly twenty occasions in the first three decades of the twentieth century, U.S. presidents sent troops into Caribbean and Central American countries, most often the Dominican Republic, Haiti, Nicaragua, and Mexico. Historians differ over whether the primary motive of Roosevelt, William Howard Taft, and Woodrow *Wilson was to make the area safe for U.S. business, preclude European competition and intervention, or to maintain stability to protect U.S. strategic interests.

In the first half of the twentieth century, North Americans came to believe that economic underdevelopment in Latin America was less a result of indigenous factors than exploitative control of agriculture, mining, and transportation by European nations. This attitude and World War I helped North Americans replace Europeans as the major investors in the region. After the war, as the United States reduced its military role overseas, the Marines were withdrawn from the Caribbean basin, but they often left behind a U.S.-trained national guard to help maintain order and governments favorable to the United States. In his Good Neighbor policy, announced in 1933, President Franklin D. *Roosevelt formally ended the "protectorate policy" and accepted the principle of nonintervention. His emphasis on mutual respect built on reciprocal trade agreements helped to build a healthy new relationship that produced hemispheric solidarity against Germany and Japan in World War II.

The United States leadership continued after World War II through new organizations. These included global institutions such as the General Agreement on Tariffs and Trade (GATT), the International Monetary Fund (IMF) and the World Bank, and the *United Nations. They also included strictly regional bodies and agreements, most importantly the *Organization of American States (OAS) and the mutual defense agreement, the *Inter-American Treaty of Reciprocal Assistance (1947), which, like the 1949 North Atlantic Treaty (NATO), declared an attack against one to be an attack against all.

During the *Cold War, from 1947 until the collapse of the Soviet Union in 1991, U.S. national security policy toward Latin America was directed against the spread of communism. At the Caracas meeting in 1954, a majority of the OAS foreign ministers supported a U.S. resolution declaring communism incompatible with the inter-American system. President Dwight D. *Eisenhower

authorized a covert action program run by the *Central Intelligence Agency, which later that year overthrew the leftist, Guatemalan democratic regime of President Jacobo Arbenz, whose land reform had threatened the United Fruit Company and who was believed to be closely associated with communists. With the support of Eisenhower and his successor, President John F. *Kennedy, the CIA developed a plan to overthrow Fidel Castro, who had led a successful takeover in Cuba in 1959 and had then launched a sweeping socialist revolution under his own rule with increasingly close ties with the Soviet Union. The CIA-sponsored invasion by Cuban exiles at the Bay of Pigs in 1961 proved a disastrous failure.

As a result of the Soviet-Cuban threat of expanding communism in the Western Hemisphere, the United States developed major economic and security measures. The Alliance for Progress was designed to promote economic development and democracy (the "modernization" theory that undergirded it was, however, criticized by many Latin Americans as controlled "dependency"). Although it stimulated some economic development, it did not promote either democracy or social reform. The United States also engaged in increased anti-communist military activities.

In the *Cuban Missile Crisis (1962-63), triggered by the Soviet introduction of nuclear weapons to the island, Kennedy imposed a successful naval *blockade of Cuba, and the missiles were withdrawn in exchange for a U.S. pledge not to invade. Although ending the blockade, the United States continued to use some covert means but primarily economic embargos to undermine Castro, who, nevertheless, continued to rule one of the few remaining communist nations at the end of the century.

During the Cold War, fear of communism had led to considerable U.S. military involvement in the region. In part this involved the training of Latin American military officers in counterinsurgency techniques at schools on U.S. Army installations in the Panama Canal Zone and in the United States. Sometimes it involved direct use of U.S. forces, as in 1966, when President Lyndon B. *Johnson sent troops into the Dominican Republic, fearing, inaccurately most scholars agree, that instability there might lead to a communist takeover. Sometimes it was CIA activity rather than direct U.S. military involvement, as in 1973, when President Richard M. *Nixon authorized covert operations to help topple the Marxist president of Chile, Salvador Allende Gossens, who was overthrown by Gen. Augusto Pinochet in a bloody coup. Emphasizing human rights, President Jimmy *Carter reduced aid to authoritarian governments such as those in Argentina, Brazil, and Chile and refused to use military force to defend the Somoza regime in Nicaragua against leftist rebels. Following Panamanian riots, Carter also negotiated the treaties (1978) transferring control of the U.S.-built and -defended canal to Panama in 2000.

In 1979-80, leftist revolutions in Nicaragua, Grenada, and El Salvador raised the possibility of expanded communist influence and led to increased U.S. military involvement. President Ronald *Reagan built up the U.S. armed forces and often threatened force, but although he provided Army advisers and military and economic assistance to hard-line, anti-communists in Nicaragua and El Salvador, he sent troops into battle in the region only once, in the liberation of the island of Grenada in 1983 following a left-wing coup there.

The end of the Cold War enabled President George *Bush to depoliticize the North American perceptions of threats to U.S. security in Nicaragua and El Salvador and to join with other nations in negotiating peace and free elections there. He and his successor President Bill *Clinton reduced Latin American debt and encouraged trade liberalization through the creation of a North American Free Trade Agreement (1993) among the United States, Canada, and Mexico. However, direct U.S. military force was used by Bush in 1989 to capture Panamanian strongman General Manuel *Noriega, who was connected with Colombian drug traffickers. In 1994, Clinton dispatched U.S. troops to overthrow the military junta which had overthrown the president of Haiti, but a last-minute settlement led U.S. forces to arrive as transition peacekeepers rather than an invading force.

At the end of the twentieth century, although the U.S. provided aid against leftist guerrillas in Colombia, the main involvement of the U.S. military in Caribbean and Latin American countries focused on a relatively new role for the armed forces: trying to prevent the flow of illegal drugs into the United States. This mission was performed directly through the protection of U.S. borders and approaching air corridors and indirectly through the provision of U.S. equipment and military advisers to countries believed to be sources or transit routes for illegal drugs bound for the United States..

CARNEGIE, ANDREW (1835-1919), steel magnate, philanthropist, and pacifist. Born in Dunfermline, Scotland, Carnegie was indoctrinated in the democratic, pacifistic tenets of his father, a Chartist radical. The Carnegies emigrated to Pittsburgh in 1848, where the boy became a telegrapher for Thomas Scott of the Pennsylvania Railroad. He accompanied Scott to Washington at the outbreak of the * Civil War to supervise the extension of telegraph lines to the Union forces. In 1865, Carnegie left the Pennsylvania Railroad to enter a variety of business activities before devoting his full attention to the manufacture of steel. By the 1880s, he was America's king of steel.

Although opposed to militarism, Carnegie justified his providing armor plate for the naval expansion program of the 1890s as defensive, not offensive, in purpose. He supported the *Spanish-American War for Cuban independence, but became a leader in opposing the acquisition of the Philippines, even offering to pay Spain a higher sum

than that proposed by the United States in order to give the islands their independence.

Carnegie sold his steel empire in 1901 for \$400 million. He funded a variety of philanthropic enterprises, but after 1904 largely concentrated upon securing world peace through the establishment of foundations to promote this goal: the Carnegie Hero Fund; the *Carnegie Endowment for International Peace; and the Church Peace Union. He also funded the building of three "Temples of Peace": the International Court of Justice at the Hague; the Pan American Union Building in Washington, D.C.; and the Central American Court of Justice in Costa Rica. In the naive belief that peace could be purchased, he authorized the trustees of his foundations to eradicate other social ills after world peace had been secured. Not even World War I could crush his hopes. Carnegie died believing that Woodrow *Wilson's *League of Nations and his money would soon render war as morally unacceptable as cannibalism.

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. In 1910, retired steelmaker and philanthropist Andrew *Carnegie, a longtime supporter of peace societies, established the Carnegie Endowment for International Peace with a donation of \$10 million, making it the wealthiest organization in the resurgent American peace movement of the early twentieth century. Like other peace advocates, Carnegie wanted America to be a world leader in promoting international arbitration to settle disputes among nations.

Carnegie's most influential advisers, elder statesman Elihu *Root, and the president of Columbia University, Nicholas Murray Butler, chose as trustees leading businessmen, influential members of Congress, and notable educators, bypassing longtime, more outspoken peace advocates. The politically conservative Endowment leaders, Root and Butler, thus created an organization for "scientific research" rather than active advocacy of peace. In World War I, the endowment curtailed its activities instead of advocating U.S. mediation or nonintervention.

The endowment's accomplishments in the areas of research and publication during the interwar period were impressive. Its projects included a monumental study, *Economic and Social History of the World War* (more than 100 volumes); many other studies of economics and international law; financing of overseas exchange visits by educators and journalists; creation of "International Mind" alcoves in libraries; and the endowing of university chairs in International Relations. The endowment published the scholarly journal *International Conciliation* until 1972, when the organization became associated with *Foreign Policy* magazine. After World War II, the endowment gave support and encouragement to the work of the *United Nations.

The endowment's trustees were always careful to avoid controversy. At its founding, many in the peace movement hoped Carnegie's gift would establish a powerful advocacy organization; instead, it became an early prototype of the policy research institute.

CARRIER WARFARE. The U.S. Navy has dominated aircraft carrier warfare since the 1920s. Conceived to provide scouting "eyes" for the fleet, the carrier evolved an attack capability that rivaled that of the *battleships during the interwar period. Offensive tactics were developed during annual "fleet problems" by innovative admirals, notably Joseph Mason Reeves, and a small cadre of younger naval aviators led by John H. Towers. In World War II, the carrier became the major arbiter of American seapower, a role more or less perpetuated during and after the *Cold War.

U.S. carrier forces have engaged in five principal roles and missions of varying priority according to operational objectives: (1) *fleet support*, using scouting planes for reconnaissance and fighter planes as defensive interceptors; (2) *destruction of the enemy fleet*, especially opposing carriers, with attack planes (bombers); (3) *protection of merchant shipping* as defensive convoy escorts or offensively in hunter-killer groups, against *submarines; (4) *destruction of enemy merchant shipping* at sea or at anchor; and (5) *projecting aerial firepower inland*. The function of the latter objective has been twofold: *supporting amphibious assaults* with close air support of infantry over the beach, protective fighter cover against enemy planes, and interdiction of enemy transportation systems (bridges, roads, rail lines) in order to isolate the beachhead; and *striking strategic targets*—airfields, army installations, port facilities, and industrial plants.

The sine qua non of carrier warfare is fleet support. The symbiotic interrelationship between carriers and gun ships exists in their mutual defense against enemy air, submarine, and surface ship attacks. The carriers provide combat air patrol fighters and antisubmarine and antiship patrol searches; the escorting gun ships (*destroyers, *cruisers, battleships) supply antiair, antisub, and antiship guns and missiles.

Tactically, the vulnerability of World War II carrier forces exposed to air attack caused them to disperse in order to split enemy attacks—during 1942-43 against Japan in the Pacific when U.S. carrier strength was weak, and again during the Cold War due to the threat of nuclear attack by Soviet submarines. Nevertheless, several carriers were temporarily concentrated during the 1942 naval battles at the Coral Sea, Midway, and around Guadalcanal. In overwhelming strength, carriers were concentrated permanently for the Central Pacific War campaign of 1943-45 and in the limited wars thereafter.

At the Battle of *Midway, three U.S. carriers, superbly coordinated by Adm. Raymond A. *Spruance, sank all four Japanese carriers to the loss of one American "flattop." Otherwise, carrier strength on both sides was whittled down while supporting amphibious and island struggles in the Coral Sea-Guadalcanal region. When a powerful Fast Carrier Attack Force was created late in 1943 for the offensive, it was organized into three or four task groups, each made up of three or four carriers plus escorting gun ships in a circular screen. The carriers' simultaneous but conflicting missions of supporting amphibious forces and seeking out the Japanese fleet led to confusion and missed

opportunities during invasions of the Gilbert Islands, the Marianas, and Leyte. Nevertheless, under the brilliant tactical command of Adm. Marc A. Mitscher, the fast carriers neutralized Japan's air and naval bases at Rabaul and Truk, annihilated its carrier planes in the Battle of the *Philippine Sea, and sank its last operational carriers at the Battle of *Leyte Gulf.

In all subsequent amphibious campaigns—Luzon, Iwo Jima, Okinawa—the carriers battled land-based Japanese kamikazes, striking their airfields and other strategic targets. Most close air support in the Pacific, and North Africa and the Mediterranean as well, was provided by the small, slower escort carriers.

U.S. carriers helped defeat Germany's U-boats in the Battle of the Atlantic by utilizing antisubmarine hunter-killer groups, each an independent force of one escort carrier and a screen of destroyers. Similarly, from the mid-1950s to the mid-1970s, specially designated antisubmarine carriers patrolled against Soviet submarines until this mission was reassigned to the attack carriers. During the limited wars and crises of Korea, Vietnam, and the Middle East, American carriers operated virtually free from enemy interference. Carriers also played a Cold War deterrent role by carrying *nuclear weapons. The emergence of a large Soviet surface fleet and carriers by the 1970s led to a revived doctrine for fighting naval battles, including the projected use of carriers against the Russian fleet in the North Atlantic according to the unofficial "Maritime Strategy" of the 1980s. But the Soviet collapse nullified it.

The major controversies over carrier warfare have been caused by opponents within the U.S. Navy, the U.S. Air Force, and Congress claiming the carrier to be vulnerable to air and submarine attacks and thus a waste of defense expenditures. These arguments have yet to be proven.

CARTER, JIMMY (1924-), naval officer, farm business operator, governor, president of the United States. Born in Plains, Georgia, Carter graduated from the U.S. Naval Academy in 1946 and became a nuclear submarine officer. After his father's death (1953), he returned to manage the family's farming enterprises. Active in the local Baptist church and state politics, Carter was a state senator (1963-67) and governor of Georgia (1971-75). In 1974, he narrowly defeated President Gerald *Ford.

As president, Carter characterized himself as nonideological, a social liberal and fiscal conservative. He had a strong sense of morality and equity. A rational and diligent manager, Carter proved a technician rather than a logrolling politician or a highly inspiring leader. He experienced only a mixed success in foreign and defense matters, a result of circumstances and of Carter himself.

Diplomatically, the Carter administration negotiated and secured a divided Senate's ratification of the Panama

Canal treaties, completed normalization of relations with the People's Republic of China, and spectacularly achieved a peace treaty, the *Camp David Accords (1978), between Israel and Egypt.

Carter was also confronted with major challenges over which he had little control, although he was criticized for lurching between weak and hard-line policies. Soviet intervention in Cuba and the Horn of Africa and Russian military occupation of Afghanistan led the administration to support a military buildup. Carter ended his opposition to increases in the military budget, approved construction of the MX missile, abandoned his SALT II Treaty, canceled U.S. participation in the Summer Olympics in Moscow, and resumed compulsory draft registration. In the "Carter Doctrine," he pledged protection of the oil-rich Persian Gulf region and established a rapid deployment force to enforce it.

Seizure of U.S. Embassy hostages in November 1979 by successful Iranian revolutionaries led Carter to impose diplomatic and economic sanctions against Iran. In April 1980, an ill-fated military rescue attempt was aborted at the "Desert One" site south of Tehran after three of the eight helicopters malfunctioned. Another helicopter and a C-130 transport plane collided in the nighttime lift-off. Government released the hostages in January 1981 when Ronald *Reagan became president.

Out of office, Carter pursued his own agenda, involving human rights, social welfare, and international mediation. He played particularly important, if often controversial, roles in easing later conflicts with Nicaragua, North Korea, and Haiti.

CARTER DOCTRINE (1980). Announced by President Jimmy *Carter on 24 January 1980, the "Carter Doctrine" extended U.S. containment policy to the Persian Gulf region. Under pressure from containment advocates, Carter concluded that the 1979 Soviet invasion of Afghanistan might be the first step in a threat to the Persian Gulf oil resources. Furthermore, with the overthrow of the shah of Iran (and seizure of American hostages) by militant Islamic revolutionaries earlier in 1979, the United States had lost its primary military ally in the gulf.

To ensure protection of Middle East oil, Carter declared that the United States would consider any attempt by an outside force (the Soviet Union) to gain control of the gulf region an assault on U.S. vital interests that would be repelled by military force if necessary. Consequently, Carter expanded military aid to Saudi Arabia, Egypt, Israel, and Pakistan, and went beyond surrogate forces to create a U.S. Rapid Deployment Joint Task Force (RDF).

From its new headquarters, the RDF could call upon 200,000 troops from all services to meet emergencies in the gulf. It also acquired air and naval basing rights at Diego Garcia, a British atoll in the Indian Ocean, for positioning more than a dozen preloaded merchant ships to support any initial deployment. Additional basing rights were sought in several East African countries. Many of these were later used in the *Persian Gulf War of 1991.

CASE-CHURCH AMENDMENT (1973). The signing of the *Paris Peace Agreement in January 1973 brought a final withdrawal of American military forces from Vietnam following the *Vietnam War. Many believed, however, that the peace agreement only marked a temporary respite in the fighting. The question was what would the administration of President Richard M. *Nixon do once the inevitable renewal of hostilities between the North and South Vietnamese forces began? In order to prevent a re-introduction of United States forces into the conflict, Senators Clifford Case (R-NJ) and Frank Church (D-ID) introduced on 26 January 1973 a bill that barred any future use of American forces in Vietnam, Laos, and Cambodia without the authorization of the Congress. The inclusion of Cambodia was crucial because the Paris agreement did not cover the continued fighting there, and American air power continued to be employed in bombing the Khmer Rouge.

The Senate passed the amendment for the first time on 14 June. While awaiting action in the House of Representatives, Nixon vetoed separate legislation that would have ended the bombing in Cambodia. Finally, a modified Case-Church amendment was passed by the Senate on 29 June by a 63-26 vote. It allowed the bombing in Cambodia to continue until 15 August. After that date, all use of the American military was prohibited in Southeast Asia unless the president secured Congressional approval in advance. The proponents of the ban did not know that Nixon had, in fact, secretly promised South Vietnam's president Nguyen Van Thieu that the United States would resume bombing in North and South Vietnam if he determined it necessary to enforce the peace settlement. The Case-Church amendment, therefore, marked the final end to direct American military involvement in Southeast Asia.

CASUALTIES. Casualties—soldiers killed or rendered unable to fight by enemy weapons, disease, or accident—reduce combat strength and sap the morale of those personnel who remain fit for service. The outcomes of battles, campaigns, and even wars have often been determined by the casualties suffered by one side or the other.

Casualties may be classified as either battle or nonbattle. Battle casualties include personnel killed in action, wounded in action, captured, or missing in action; nonbattle casualties include those killed or disabled by disease or accident, as well as those incapacitated by psychiatric illnesses (known variously as shell shock, battle fatigue, or Post-Traumatic Stress Disorder) induced by the stresses of military service.

Since 1775, weapons have become more lethal, and with increased lethality has come an increase in both the number of casualties and the severity of wounds. Before 1850, about half of all battle casualties were caused by artillery. The introduction of the conoidal bullet in the mid-nineteenth century greatly increased the range, accuracy, and striking power of small-arms fire, and in the *Civil

War rifle fire accounted for most battle casualties. By World War I, better recoil mechanisms (which improved the rapidity and accuracy of fire), the introduction of indirect firing techniques, and advances in high explosives and shell design made artillery once again the most destructive force on the battlefield. More recently, landmines and aerial attack (bombardment, strafing, and napalm) have produced significant casualties. The huge number of weapons systems on the modern battlefield and their more rapid rate of fire has also increased casualties, and chemical, nuclear, and biological weapons pose even greater threats to survival.

Prevailing tactical doctrines and practices significantly influence the proportion of soldiers who become casualties. Until the end of the nineteenth century, the dominant tactical methods involved close-packed linear formations and frontal assaults, both of which exposed attackers to the full effect of defenders' weapons. Since World War I, the wider dispersion of forces on the battlefield and the increased use of cover and concealment have reduced exposure to enemy fire. On the other hand, modern battles involve continuous combat over extended periods, and thus the number of casualties, particularly those due to fatigue and combat stress, has tended to increase.

The assurance of rapid evacuation and effective treatment of the wounded is a major factor in maintaining military morale and the willingness to endure combat. The speed at which the wounded soldier reaches medical treatment is the key element in his chances of surviving his wounds and avoiding permanent disability. Few soldiers who suffer severe wounds will survive unless they receive adequate medical care within six hours.

The principles of military medical evacuation employed by most modern armies were devised by U.S. Army Maj. Jonathan Letterman during the Civil War. Letterman reorganized the existing system of field hospitals, established an ambulance corps, and laid down the principle that rear echelons should be responsible for sending forward the men and transport to evacuate casualties to medical facilities well behind the battle line. Letterman's system reduced both the confusion attendant to the handling of battle casualties and the time required to get the wounded to definitive medical care.

Refinement of Letterman's system and more rapid means of transport further reduced the time required for evacuation in World Wars I and II, but the helicopter dramatically transformed battlefield evacuation. A few primitive helicopters were used in World War II for evacuating sick and wounded soldiers from remote locations. Such use was expanded during the * Korean War, and in Vietnam the medical evacuation helicopter all but replaced ground evacuation. The result was a significant reduction in the time required to get a battle casualty to life-saving treatment. In Vietnam, for example, the average time required for the evacuation of a casualty by helicopter was only 35 minutes. Consequently, the number of wounded soldiers who died was substantially reduced and the chances of avoiding permanent disability or disfigurement improved considerably.

Major improvements in battlefield evacuation since 1860 have been accompanied by equally striking advances in diagnostic techniques, surgery, drugs, and preventive medicine. Before the Civil War, some advances were made in surgical techniques, the use of anesthetics (chloroform),

and camp sanitation. However, the half century between the Civil War and World War I saw astounding progress in medical science. Louis Pasteur's germ theory, Jacob Lister's concept of antiseptis, and Wilhelm Roentgen's X-ray process enabled major steps forward. Surgical techniques improved greatly, and the use of more effective anesthetics became general, as did more potent painkillers such as morphine. Inoculation against infectious diseases, particularly those (typhoid, for example) that severely threatened massed military forces operating under poor sanitary conditions, also became routine.

American military physicians made major contributions to the advance of medical science in the late nineteenth and early twentieth century. Antiseptic surgery was practiced in U.S. Army hospitals as early as 1883, well before Lister's theories were generally accepted. George Miller Sternberg, army surgeon general in 1893-1902, was a recognized pioneer in the field of bacteriology and promoted the work of other military physicians who sought the causes of communicable diseases such as cholera, typhoid, and typhus. Under Sternberg's patronage, Maj. Walter *Reed identified the mosquito as the vector for yellow fever, and the subsequent efforts of Col. William C. *Gorgas to control malaria and yellow fever made possible the construction of the Panama Canal and the reduction of those diseases worldwide.

The frightful casualties resulting from more destructive weapons in World War I spurred the development of improved surgical techniques and better management of infection. Further advances significantly reduced mortality in World War II and set the pace for even greater progress in medical science after 1945. Effective new drugs, such as sulfa and penicillin, were introduced; X-ray techniques and equipment were improved; and the use of blood plasma to prevent shock and replace blood volume saved thousands of lives, military and civilian. The global deployment of American forces also prompted research into the causes, prevention, and treatment of a variety of diseases until then little known or understood. Malaria and other endemic diseases were eradicated in certain areas as part of the American military public health efforts.

Medical science has continued to advance since 1945, and the resources now available to the military physician far surpass anything available in World War II. The surgical laser, greatly improved diagnostic technology, and modern antibiotics make diagnosis and treatment more efficient and effective. Recent advances in bioelectronic and biomechanical devices have also substantially improved the chances of restoring to wounded soldiers the nearly full use of damaged limbs and organs.

The rate of death from wounds has fallen significantly in the last 150 years. In the *Mexican War (1846-48), 14.9 percent of all battle casualties died from their wounds. The rate fell slightly—to 14.1 percent—in the Civil War, and then declined sharply to only 6.7 percent in the *Spanish-American War. Mortality rose to 8.1 percent in World War I (exclusive of gas casualties), due to the greater destructiveness of modern weapons, but subsequently fell even more sharply. The rate of deaths from wounds after reaching medical treatment was 4.5 percent in World War II and 2.4 percent in Korea. In the * Vietnam War, 97.5 percent of the wounded survived, and 80 percent of those later returned to duty.

Until well into the twentieth century, disease, rather

than the effects of enemy weapons, was the single most important producer of casualties. In the * Revolutionary War, 90 out of every 100 deaths were due to disease. As late as 1865, more soldiers died from disease, shock, or secondary infection of wounds than died from the direct effects of weapons. Even in Vietnam, 75 percent of all hospital admissions were for the treatment of disease rather than wounds. However, the effect of progress in preventive medicine and the treatment of disease on the survival rates of sick and wounded soldiers was profound. In the Mexican War, the rate of death from disease was 103.9 per 1,000 men. The rate fell to 71.4 per 1,000 in the Civil War and then to 34.0 per 1,000 in the Spanish-American War. In World War I, the rate was only 16.5 per 1,000, and in World War II it fell to just 0.6 per 1,000.

Although the weapons of war continue to grow more destructive, improved tactical doctrine, more efficient evacuation, and advances in medical technology and techniques promise continued reduction in the number of casualties and continued increase in the rate of survival for the sick and wounded. Today, military personnel are healthier and less likely to die from their wounds or from disease than ever before.

CAVALRY. See Army Combat Branches: Cavalry.

CEMETERIES, MILITARY. Few provisions were made prior to the *Civil War for the maintenance of permanent cemeteries for Americans who died in military service. After battle, the dead were buried in hastily dug graves on the site or at nearby civilian cemeteries. In peacetime, commanders at many forts and outposts, such as Fort Leavenworth, Kansas, in the 1840s, established burial grounds for soldiers who died. In the aftermath of the * Mexican War, the United States established a cemetery in Mexico City for U.S. soldiers killed during the capture of that city.

During the Civil War, the U.S. government established a permanent national cemetery system in 1862 for uniformed personnel. Most of these army-maintained cemeteries were located near a military hospital or major battlefield, although the battle dead were still frequently buried in scores of smaller, scattered plots, and the dead of losing sides were often interred in mass graves. After 1865, the Quartermaster Corps removed the bodies of Union soldiers from many of these smaller burial sites and placed them in large, more centralized cemeteries with standard markers for officers and enlisted men. It was at the dedication of the national military cemetery at Gettysburg (later *Gettysburg National Military Park), only weeks

after the battle, that President Abraham *Lincoln gave his famous Gettysburg Address defining the nature of American democracy.

In the aftermath of the Civil War, the national military cemetery system for the Union dead served as an important site of both individual and collective mourning, especially on Memorial Day—a national day of mourning for the Union dead designated by the *Grand Army of the Republic in 1868 and by Congress in 1887. In these national military cemeteries, state governments, veterans' groups, and other organizations erected memorials commemorating particular units, states, or other entities. By the late nineteenth century, Civil War cemeteries at Antietam, Gettysburg, and Shiloh served as the nucleus of a system of national military parks. In 1872, Congress extended the right of burial in national military cemeteries to all Union Veterans of the Civil War. To foster sectional reconciliation, the federal government in 1912 allowed burial rights to Confederate veterans in Arlington National Cemetery (originally established in 1864).

There still remained, however, strong local and regional patterns of mourning that militated against having all the war dead buried in national cemeteries. Families retained the right to reclaim bodies. The bodies of service members who had died in most subsequent foreign wars were returned by the federal government to the United States. During the *Spanish-American War and the *Philippine War, the army created the Quartermaster Burial Corps to disinter those who died overseas and to return their bodies to the United States.

In contrast, World War I brought significant support among internationalists to create permanent U.S. military cemeteries overseas to symbolize the American commitment to Europe. This proposal aroused considerable opposition from families who wanted the fallen buried in home-town cemeteries and from isolationists who feared that the European cemeteries would commit America to defend those countries in the future. In response to such disagreements, Congress and the War Department affirmed the right of each family to decide where a soldier would be buried. In 1923, Congress created the American Battle Monuments Commission to build and maintain permanent cemeteries abroad to cover U.S. participation in World War I. After World War II, this authority would be extended to cemeteries in battle grounds in Europe, North Africa, and Asia.

No overseas cemeteries were established for either the * Korean War or the * Vietnam War. Initially* Americans killed in the Korean War were buried in overseas cemeteries in Korea, but even before the war ended, Washington decided to bring all the bodies back to the United States. This practice differed from that of almost all other major nations, such as Great Britain, which buried soldiers on or near the battlefield. During the Vietnam War, the bodies of the American dead were flown immediately to the United States for burial in either national or private cemeteries.

In the twentieth century, Veterans' groups like the * American Legion were active in ensuring that veterans and their spouses were accorded the option of burial in the national military cemeteries, especially Arlington National Cemetery. Since many of the cemeteries were established near the sites of Civil War battlefields or hospitals, they were widely dispersed. With some success—often over the opposition of funeral directors, private cemetery man-

agers, and the national government—veterans' organizations pressured Congress to create smaller military cemeteries nearer to major population centers. The army finally agreed. Only a limited number of new cemeteries were added in the immediate post-World War II period, generally after sufficient pressure was placed on Congress by veterans' groups and local leadership. In 1962, during John F.

* Kennedy's administration, the army officially abandoned any plans for a new system of military cemeteries for 16 million veterans and their eligible dependents.

The army had held full control over the national cemeteries until 1933, when eleven Civil War battlefields near national military parks were transferred to the control of the National Park Service. Veterans' groups opposed to the policy of nonexpansion lobbied Congress to transfer jurisdiction of the national cemetery system away from the army and place it with the more sympathetic *Veterans Administration (VA). In 1973, the VA gained control of most national cemeteries—except for Arlington.

National cemeteries have served as important sites for * commemoration and public ritual, especially during Memorial and Veterans Days. American presidents have visited overseas national cemeteries to underscore U.S. commitments abroad. In the twentieth century, Arlington National Cemetery evolved into a powerful site of national collective memory with the creation of the Tomb of the Unknowns, the Memorial Amphitheater, and the burial of a number of prominent civilian leaders, most notably John F. and Robert Kennedy.

The CENTRAL INTELLIGENCE AGENCY, (CIA) was created by Congress in the *National Security Act of 1947, recognizing strategic intelligence as a first line of defense and a crucial instrument in warfare. The attack on *Pearl Harbor in 1941 had demonstrated the need to gather and coordinate intelligence information. Significantly, the CIA was created the year President Harry S. *Truman announced the containment doctrine at the beginning of the *Cold War.

Truman abolished the wartime Office of Strategic Services (OSS) in 1945, transferring some of its intelligence-gathering functions to the State Department and the army and some to a new Central Intelligence Group, created in January 1946. The CIA was established by Congress, not the president, and as an independent agency; the director (DCI) would report directly to the president. It operated under the *National Security Council (NSC), a newly established presidential advisory board, and had legal access to the intelligence information of all other civilian and military agencies.

Concerns about an all-powerful secret police spying on Americans led Congress to prohibit the CIA from "police, subpoena, law enforcement powers or internal-security" functions. Domestic counterintelligence was to remain the preserve of the FBI.

The CIA's leaders, many of them former OSS officers, quickly became involved in bureaucratic struggles over ju-

risdiction and resources with nearly a dozen other military and civilian agencies, and the State Department required that the CIA's overseas personnel come under the jurisdiction of the U.S. ambassador in that country. The first DCI, Rear Adm. Roscoe H. Hillenkoetter (1947-50), lacked influence. Under his successors, Army Gen. Walter Bedell Smith (1950-53) and Allen Welsh *Dulles (1953-61), the CIA became a powerful agency. Yet it never achieved anywhere near total control over U.S. intelligence policy because too many other departments retained their own sources of intelligence, especially those under the secretary of defense.

The 1947 National Security Act authorized the CIA to collect, correlate, and evaluate intelligence relating to national security, and to disseminate that information to appropriate agencies within the government. It was also authorized to perform "other functions and duties related to intelligence affecting the national security." Although the agency's charter did not mention "espionage," "counterespionage," or "covert action," the broad language became the source for later expansion of the CIA's activities.

Within a year, the agency—often called "the company" by its personnel—had expanded its roles under NSC directives to include covert activities. These included secret *psychological warfare as well as undercover political, economic, and paramilitary operations overseas. Originally, most of these anti-Communist operations were in Europe, designed to be secret and planned and executed in such a way that the U.S. government could "plausibly disclaim any responsibility for them."

In large part because of such clandestine operations Congress amended the statute (1949) to permit the CIA to receive funds secretly under budget cover of other federal agencies. Under the so-called black budget, the director was given extraordinary authority to spend money and to impose absolute secrecy for sources and methods. The justification was to prevent foreign governments from learning the scope of the CIA's activities, but this secrecy also protected the CIA from domestic budgetary and accounting agencies.

The *Korean War, and the massive national security buildup that accompanied it, led to a huge expansion of the CIA. The U.S. intelligence community's failure to anticipate the North Korean invasion of South Korea, like the Pearl Harbor attack, demonstrated the failure of intelligence gathering and coordination of information. The CIA was finally given access to military signals intelligence, and Truman replaced Hillenkoetter with Smith (1953), who had been Eisenhower's chief of staff during World War II. With increased funding and mandate, Smith largely created the CIA in its modern form. By 1953, the agency had more than 10,000 employees, including nearly 3,000 in the Office of Policy Coordination (which ran the covert operations), and more than 3,000 additional personnel serving overseas. Headquarters were moved to Langley, Virginia, in 1963.

Allen Dulles, former OSS officer, deputy director, and brother of Secretary of State John Foster *Dulles, was the first civilian to head the CIA; under his leadership, the agency reached a peak strength of 18,000. The CIA created and ran Radio Liberty and Radio Free Europe as propaganda services beamed at Eastern Europe and the USSR.

NSC directives in the 1950s expanded the agency's

*covert operations, which came to overshadow information-gathering functions. While covert actions by definition remained secret and presidents were given plausible deniability, secrecy was undermined in major cases when its coups achieved success, for example, Iran (1953) and Guatemala (1954). Most of the public controversy about the CIA involved covert foreign interventions where policy as well as secrecy failed, especially the Bay of Pigs invasion (1961). Although photo reconnaissance increased dramatically in the 1950s with the high-flying U-2 "spy" planes, the agency and the Eisenhower administration were publicly embarrassed when a plane was shot down over the USSR in May 1960 and the pilot captured. The public came to know of many intelligence failures, too, most dramatically the failure to predict the onset of the Korean War.

Dulles was replaced by John A. McCone (1961-65), a former chair of the Atomic Energy Commission, who shifted emphasis from covert operations to intelligence gathering and analysis. Through human intelligence gathering (HUMINT) by a Soviet military officer, Col. Oleg Penkovsky, and photoimage intelligence (IMINT) U-2 flights over Cuba, the CIA learned in 1962 about Soviet missile technology and the deployment of nuclear-tipped, medium-range *missiles in Cuba. The agency continued its covert operations, for example in a successful coup in Guyana in the early 1960s.

The CIA was hard hit during the *Vietnam War. Pessimistic about conventional forces winning a guerrilla war, its own covert and counterintelligence operations in Southeast Asia became increasingly controversial. President Lyndon B. *Johnson appointed Vice Adm. William F. Raborn, Jr. (ret.) as DCI, but he was soon replaced by Richard M. Helms (1966-73), the first career intelligence officer to head the agency. Neither Johnson nor President Richard M. *Nixon paid much attention to intelligence reports that contradicted their views, and Nixon and his NSC adviser, Henry *Kissinger, tended to fashion their own intelligence estimates.

In the 1970s, in the wake of Watergate and Vietnam, the media and Congress launched major investigations into illegal or inappropriate activities by the CIA. These revealed that under orders from the Johnson and Nixon administrations, the CIA had violated its charter through surveillance (Operation Chaos) of domestic opponents of the Vietnam War, and that some U.S. intelligence officials had been involved in programs since the early 1960s to assassinate Communist leaders, most prominently Fidel Castro and the Congo's Patrice Lumumba.

Such revelations, especially by the investigating committee headed by Senator Frank Church, contributed to calls for abolition of the agency. Instead, the investigation precipitated reforms begun under DCIs James R. Schlesinger, William E. Colby, and George *Bush. Assassination plots in peacetime were prohibited by executive order (1975) by President Gerald *Ford, who also created an Intelligence Oversight Board and reinvigorated the President's Foreign Intelligence Advisory Board. In 1976-77, Congress created permanent intelligence committees in both houses to oversee all aspect of intelligence. President Jimmy *Carter appointed Adm. Stanfield Turner, an active duty naval officer, as DCI (1977-81); under Turner, the agency shrank by more than one-third of its peak size.

With the U.S. defense buildup that began in 1980, and

especially under President Ronald *Reagan and his first director, William J. Casey (1981-87)—a former OSS station chief, successful lawyer, and Reagan's 1980 campaign manager—the CIA was "unleashed," its budget increased and clandestine operations reemphasized, especially in Afghanistan, Angola, and Nicaragua. The Intelligence Reform Act (1980) freed the CIA from earlier restraints: although presidential approval of covert operations was required, in "extraordinary circumstances" congressional oversight committees might be notified only later. New photo and satellite imagery and signals/communications intelligence (SIGINT) increased U.S. information on Soviet military capability. But tensions over covert operations grew between the Republican president and the Democratic Congress, culminating in the *Iran-Contra Affair (1986), which revealed that the CIA had violated congressional restraints. Following Casey's death, FBI director William H. Webster became DCI (1987-91). The Intelligence Authorization Acts (1991, 1992) tightened legislative oversight and required prior notice for all covert actions.

With the dissolution of the Soviet Union, which the agency had failed to predict, fundamental questions were raised about the future of the CIA, widely perceived as a Cold War institution. The agency's reputation was further hurt when CIA officer Aldrich H. Ames was exposed (1994) as a "mole" who had sold secrets to the Soviets for nearly a decade, causing the deaths of a dozen foreign agents. In 1997 a former CIA station chief, Harold Nicholson, was convicted of spying for Russia.

Robert Gates, R. James Woolsey, Jr., John M. Deutch, and George J. Tenet sought to find new roles for the CIA, especially technological surveillance for economic and ecological as well as security purposes, and monitoring drug traffic and terrorist threats. At century's end the future of the CIA remained uncertain.

CFE TREATY. The Treaty on Conventional Armed Forces in Europe (CFE) was signed in Paris on 19 November 1990 by the heads of state of the then-members of *NATO and the Warsaw Treaty Organization (WTO, or *Warsaw Pact). The treaty's system of equal and verified quantitative ceilings on conventional weaponry (main battle * tanks, *artillery, *armored vehicles, strike aircraft, and attack *helicopters) was designed to impose a stable military balance on the *Cold War's two opposing alliances. In practice, however, the most pronounced effect of the CFE Treaty was to mandate steep reductions in the overall size and forward deployment of the Soviet armed forces; NATO forces were little affected. Such an outcome would have been incon-

ceivable if the Cold War were not already well near its close by the time the CFE Treaty was ready for signature.

The origins of the treaty lie in a perception that was widely shared by the strategists of the NATO Alliance after the 1960s, when the alliance adopted a strategy of * Flexible Response: the Warsaw Pact's gross preponderance of conventional military equipment in Central Europe meant that NATO would quickly be forced to resort to tactical *nuclear weapons to halt a conventional offensive by the Warsaw Pact. Though possibly exaggerated, the belief that NATO's conventional inferiority to the Warsaw Pact had lowered the nuclear threshold in Europe gave rise to great interest in conventional arms control, especially in NATO's front-line states, such as Germany. The first practical manifestation of this interest was the Mutual and Balanced Force Reduction (MBFR) talks, which ground on inconclusively between 1973 and 1987. By the time the Intermediate Nuclear Forces (*INF) Treaty was signed in December 1987, righting the conventional balance in Europe had become one of the alliance's highest strategic priorities.

The CFE Treaty was made possible principally by the foreign policy reforms of Soviet president Mikhail Gorbachev, whose willingness to overrule the Soviet General Staff in the course of the negotiations attested to his determination to end the costly military standoff in Central Europe as quickly as possible.

The mandate talks, which began in Vienna on 17 February 1987, concluded on 14 January 1989, five weeks after Gorbachev had announced sweeping unilateral reductions in Soviet forces before the *United Nations General Assembly. The negotiations themselves, beginning 9 March 1989, coincided with the fall of the Communist regimes in Eastern Europe (mid-1988 through December 1989), the fall of the Berlin Wall (9 November 1989), full German unification (3 October 1990), the effective collapse of the Warsaw Pact as a military alliance, and Moscow's decision to withdraw all Soviet forces from Eastern Europe. Thus, the CFE Treaty codified a new political-military reality in Europe that probably would have emerged in any case, albeit without solemn treaty-based undertakings.

The treaty entered into force on 9 November 1992, after a difficult ratification process that was complicated by the collapse of the Soviet Union in December 1991. Eight of the former Soviet republics acceded to the treaty as the Soviet Union's successor states. When the treaty's numerical ceilings became binding on 19 November 1995, most of the thirty states-parties were in compliance with its provisions. However, the Russian Federation, while in overall compliance with the treaty's ceilings, was in violation of the regional ceiling on the "flank zone," an area that encompassed the Caucasus. This issue was resolved at the May 1996 CFE Treaty Review Conference, at which the parties to the treaty agreed to remove four Russian military districts (Pskov, Volgograd, Rostov, and Astrakhan) from the flank zone, thereby allowing Russia to meet the zone's original numerical ceilings on tanks, armored combat vehicles, and artillery pieces. According to this agreement, which entered into force in May 1997, Russia had until May 1999 to comply with the numerical limits on the reduced flank zone.

At the Lisbon summit of the Organization for Security and Cooperation in Europe in December 1996, the parties to the CFE Treaty agreed to begin a new round of negotiations aimed to "adapt" the CFE Treaty to new geopolitical

realities of post-Cold War Europe. These negotiations were motivated in large part by NATO enlargement and sought to eliminate the treaty's bloc-to-bloc character. CFE adaptation talks began in Vienna in January 1997 and were expected to run at least until 1999.

CHANCELLORSVILLE, BATTLE OF (1863). After the *Civil War Battle of *Fredericksburg, President Abraham *Lincoln gave Gen. Joseph * Hooker command of the Army of the Potomac. Hooker planned an aggressive spring campaign to turn the left flank of Gen. Robert E. *Lee's Army of Northern Virginia. On 29 April 1863, Hooker left Gen. John Sedgwick with 40,000 men to hold Lee at Fredericksburg and took 90,000 across the Rappahannock River into the densely wooded Virginia Wilderness.

With only 60,000 men, Lee left Gen. Jubal Early at Fredericksburg with 10,000, and sent Gen. "Stonewall" * Jackson's Corps to meet Hooker. When Union and Confederate troops clashed in the woods, Hooker faltered, ordered a halt, and later confessed that "for once I lost confidence in Hooker."

While Hooker pondered at Chancellorsville, Jackson, at 8:00 a.m. on 1 May, attacked Fédérals in the Wilderness; noting weak resistance, he concluded Hooker would retreat. Lee disagreed, and wanted to hit the Yankees tangled in the woodland. Frontal attacks were unfeasible. If Hooker's right flank could be turned, Lee would divide his force yet again and attack the enemy front and rear. Scouts sought a screened flanking route.

Rumors of Rebels on the right bothered the Fédérals throughout that day. Hooker convinced himself that the rumored Rebels proved Lee was retreating. Gen. Oliver O. *Howard's XI Corps held Hooker's right and its own flank was unprotected. Many warnings of a flanking attack were ignored at Hooker's headquarters—Lee was retreating.

Early on 2 May, a usable road was reported and Lee agreed to let Jackson take 28,000 men on a flank march, leaving 14,000 to pin Hooker down. About 8:00 a.m., Jackson started a fifteen-mile trek. His columns crossed part of Hooker's front, were once attacked, but by late afternoon were deployed athwart the Old Turnpike that ran into Chancellorsville behind the Union lines. At 5:15 p.m., Jackson's men attacked, overwhelmed hapless XI Corps outposts, and began "rolling up" Hooker's front. Hooker, occupied by Lee's heavy skirmishing during the afternoon, desperately tried to regroup.

Nightfall and confusion stalled the Confederates and Jackson rode ahead of his lines to find the enemy. Locating the fiercely entrenching Fédérals, Jackson and aides turned back and, mistaken for Union cavalry, were fired on by a North Carolina regiment. Jackson, mortally wounded, fell from his horse and was carried from the field. Gen. J. E. B. *Stuart took command, and hoped to join Lee in a crushing attack on 3 May.

On the 3rd, Sedgwick drove Early from Fredericksburg and tried to reach Chancellorsville. Judging Hooker inert,

Lee took 25,000 men to join Early and perhaps capture Sedgwick's corps. Sedgwick barely escaped back across the Rappahannock on 4 May.

With 17,000 * casualties, Hooker still outnumbered Lee by two to one; but, psychologically beaten, he retreated across the Rappahannock on 5 May. Lincoln anguished: "My God What will the country say?"

Chancellorsville was Lee's greatest and costliest triumph. Thirteen thousand Confederates fell, and on 10 May 1863, Stonewall Jackson died.

CHAPULTEPEC, BATTLE OF, AND CAPTURE OF MEXICO CITY (1847). By 12 September 1847, the *Mexican War was almost over; the Americans had been victorious in every major engagement, New Mexico had surrendered, U.S. forces had subdued Upper California, and Maj. Gen. Winfield *Scott and 7,000 U.S. troops were camped outside Mexico City.

The Mexican capital was built in an ancient lakebed and could only be approached on raised causeways that passed through sizable gateways into the walled city. Just southwest of the city, on a 200-foot-high hill, the castle of Chapultepec commanded key causeways and was the site of a military college. Scott decided to storm Chapultepec first. On 12 September, in order to keep Mexican commander Gen. Antonio López de *Santa Anna and his 15,000 troops unsure of his ultimate plans, Scott ordered part of his force to demonstrate south and southeast of the capital while his artillery began to hammer at Chapultepec. U.S. infantry attacked, scaling the rocky summit with ladders and pickaxes early the next morning. Within two hours, Scott's troops had overrun the castle. Among the 1,000 defenders were 100 boy cadets who died defending their college and Mexican honor. "Los Ninos" became Mexican national heroes.

From Chapultepec, some of the victorious U.S. soldiers swarmed onto the causeway leading to the gates at the southwest corner of Mexico City, and others attacked the gateway near the northwest corner. The soldiers and a battalion of U.S. Marines broke through the walls. Mexican resistance was fierce. When nightfall stopped the fighting for the day, U.S. troops were inside the Mexico City, but only barely. Luckily, Mexican authorities decided not to contest further the U.S. attempt to capture the city, and Santa Anna withdrew his army during the night. The next day, General Scott triumphantly entered the city. U.S. troops suffered over 860 "casualties; Mexican losses are estimated to have been at least twice that many.

The capture of Mexico City did not immediately end the war. Santa Anna led his army eastward and helped lay siege to the U.S. garrison at Puebla, but within a month U.S. reinforcements had lifted the siege and the fighting was over.

CHARLESTON, SIEGE OF (1780). In June 1776, early in the *Revolutionary War, a British expedition under Sir Henry *Clinton failed to seize Charleston, South Carolina's

principal port and the largest city in the South. Less than four years later, Clinton returned with overwhelming force and a plan to make the South the centerpiece of British strategy to subdue the colonies. France's recognition of American independence and its declaration of war on Britain in May 1778 altered the character of the war, turning a colonial revolt into a worldwide war. Britain, seeking to maximize results on its now over-stretched resources, intended to use the army to eliminate rebel activity and reestablish royal authority, then turn control over to the loyalists and move on to repeat the process against rebels further north.

This southern strategy began well. Leaving 10,000 men to defend New York, Clinton sailed south with about 8,700 men. Despite damage caused by a storm en route, he landed 6,000 men thirty miles south of Charleston on 12 February 1780. The remaining troops rejoined him in late March, and another 2,500 men arrived from New York in late April. Benjamin Lincoln initially defended Charleston with 1,600 South Carolina and Virginia Continentals and 2,000 militia; 1,500 North Carolina and Virginia Continentals soon reinforced them. Conserving his army, Clinton moved methodically to lay siege, giving Lincoln time to withdraw; political considerations, however, dictated that Lincoln defend the city. The British began investing Charleston on 1 April, and cut off the last escape route on 14 April. With no hope of timely relief and local civilian leaders clamoring to save their city from further damage, Lincoln surrendered on 12 May. It was the largest disaster suffered by any American army during the war.

Clinton followed up his success by defeating the remaining American forces at the battles of the Waxhaws and Camden, ending organized military resistance in South Carolina. Politically, he was less successful. The loyalists, restored to power by a British army they hoped would never leave, refused to treat defeated rebels leniently in return for a renewal of their allegiance. Loyalist abuses rekindled the civil war that nullified Britain's southern strategy and dissipated the fruits of Clinton's greatest victory.

CHATEAU THIERRY, BATTLE OF (1918). See Marne, Second Battle of the (1918).

CHEMICAL AND BIOLOGICAL WEAPONS AND WARFARE. *Chemical warfare* is the military use of lethal, harassing, or incapacitating chemicals specifically designed to harm or to kill; *biological warfare* is the use of disease-causing bacteria, viruses, rickettsia, or fungi; *toxin warfare* is the use of poisonous chemical substances naturally produced by living organisms, such as the highly lethal cobra toxin. These agents can be used to target humans, animals, and plants. The use of all such weapons has been condemned in customary and international law. Although allegations are numerous, confirmed or extensive use has been limited to a few conflicts in the twentieth century: notably World War I (1914-18), the Ethiopian-Italian War (1935-36), and the Iran-Iraq War (1980-88).

In World War I, lethal chemical warfare began on 22 April 1915 with the German release of chlorine gas at

Ypres on the Flanders front. By the time U.S. troops entered combat, its technology was fully developed. New agents, notably phosgene (an asphyxiating agent) and mustard (a blister agent called a *vesicant*), had been developed and used. Cylinders, projectors, and shells were the means of delivery. Gas masks protected soldiers against asphyxiating agents, but no adequate protection had yet been found against mustard gas, which attacked the skin.

After the war, widespread revulsion against gas, combined with the fear that in future conflicts it would be used against civilian populations, led to attempts to ban it. Notable success came with the *Geneva Protocol on chemical and bacteriological (1925), which prohibited the use in war of "asphyxiating, poisonous or other gases and of bacteriological methods of warfare." Most major powers hedged their accession, reserving the right of retaliation, thereby rendering the Geneva Protocol a "no first use" treaty. In the United States, the ratification debate dramatized the division between proponents and opponents of chemical warfare. The proponents, led by Gen. Amos Fries, chief of the Chemical Warfare Service, argued that gas was a relatively humane weapon and that ratification of the Geneva Protocol would seriously affect national security. Their opponents argued that gas was an indiscriminate, immoral, and inhumane weapon. The national security argument prevailed in the Senate. The United States did not ratify the protocol until 1975.

During the opening phases of World War II, it was widely expected that chemical weapons would be used. The use of mustard gas by the Italian Air Force against Ethiopian soldiers and civilians was regarded as an anticipatory prelude to massive aerial gas attacks against Western cities. However, except for Japanese operations against the Chinese, gas was not used in combat during World War II. Most of the belligerents were initially unprepared to use it and reluctant to expose their civilian populations to a gas attack from the air. Strategic restraint dictated tactical restraint. President Franklin D. *Roosevelt, who had an abhorrence for gas warfare, committed the United States to a policy of retaliation, throwing a deterrent shield around his more vulnerable allies. During the war, although it undertook a biological warfare program, the United States did not mass-produce lethal antipersonnel agents.

The wisdom of Allied restraint was confirmed by the discovery in Germany (1945) of stocks of nerve gases (tabun, sarin, and soman), which kill by attacking the nervous system. These agents, far more lethal than any in the Allies' arsenal, went undetected by Allied intelligence during the course of the war. Chemical weapons now could be considered "weapons of mass destruction," especially if the new agents were wedded to *missiles. Moreover, the potential development of an operational capability for biological weapons posed an even greater threat to the security of the United States.

American policy in the postwar period was characterized by cyclical shifts determined largely by the political rhythms of the *Cold War. In periods of confrontation, intensified by mutual suspicion, emphasis fell upon chemical and biological warfare preparedness. In periods of detente, emphasis fell upon the furthering of security through arms control and disarmament. These two trends, however, were not mutually exclusive. From 1946 to the early 1950s, when the policy of retaliation only was being reexamined by government committees, American preparedness efforts

lagged. In 1956, the *National Security Council reversed its policy: in the future, the decision on chemical and biological weapons would be based on "military effectiveness." During the Kennedy and Johnson administrations, funding increased significantly, reaching its maximum in fiscal year 1965: the nerve agents sarin and VX; mustard gas; irritant, incapacitating, and defoliant agents all were stockpiled, and approximately thirteen biological and toxin agents (including anthrax and botulin) were produced. The United States developed a multitude of delivery systems, ranging from multiple rocket launchers to missiles.

U.S. use of defoliants and riot control agents during the *Vietnam War led to condemnation by the international community and by scientists who saw the use of these "nonlethal" agents as a contravention of the Geneva Protocol, posing a danger of escalation to the use of lethal agents. This political backlash, along with expert consensus that biological weapons capability was militarily unreliable and not essential to national security, led President Richard M. *Nixon in 1969 to renounce that option and to order the destruction of the American stockpile. In 1970, he also ordered the destruction of toxin stocks. This unilateral renunciation of biological and toxin warfare by the United States spurred the completion of the 1972 Convention on the Prohibition of the Development, Production and Stockpiling of Bacteriological (Biological) and Toxin Weapons (BTWC), which entered into force in 1975.

The period of detente that characterized the Nixon and Carter administrations was ended by the Soviet invasion of Afghanistan (1979). Subsequently, the United States charged that the Soviet Union operated a biological weapons facility at Sverdlovsk in violation of the BTWC, and that Communist forces were waging chemical and biological warfare in Kampuchea, Laos, and Afghanistan: the so-called Yellow Rain allegations, which centered on the aerial dispersion of tricothecenes—fungal toxin agents. These allegations were hotly debated. Matthew Meselson and other leading scientists argued convincingly that the government had mistaken bee feces for toxin agents. However, alarmed by the possibility that the Soviet Union was contemplating the development of new biological agents through genetic engineering, and convinced that the Soviets enjoyed overwhelming superiority in chemical weapons, the administration secured additional funding for defensive research, which rose steeply in the 1980s, peaking in fiscal year 1985, and won congressional approval in 1985 for a new binary chemical weapons production program. (Binary munitions, which are far safer to store than unitary munitions, combine two chemicals that mix upon firing.)

The second Reagan administration and the Bush administration saw a return toward disarmament. The thaw in Soviet-American relations, concern on both sides regarding the dangers of proliferation, accentuated by the use of chemical weapons in the Iran-Iraq War, led to bilateral agreements between the United States and the USSR on the mutual reduction of chemical weapons stockpiles. Multinational negotiations in the Conference on Disarmament led to the conclusion in 1992 of the Chemical Weapons Convention, which, unlike the Biological and Toxin Convention, contained strict provisions for verification and challenge inspections. The convention entered into force in 1997; it has been ratified by the United States and Russia.

Across these favorable developments in arms control and disarmament falls the shadow of the *Persian Gulf War (1991). The war was preceded by fears, fueled by the precedent of the Iran-Iraq War, that the Iraqis would use chemical agents against Coalition forces. Those fears were not realized. The stern American warnings to the regime about the consequences of such use, the folly of using these weapons against nuclear-armed powers, and the blitzkrieg conduct of the coalition land operations militated against their use. The defeat of Iraq by Coalition forces, led by the United States, and the subsequent investigation of Iraq's facilities and capabilities by the UN Special Commission, revealed the extensive nature of Iraq's biological and chemical weapons programs, highlighting the continuing dangers of proliferation.

Despite the elimination of Iraq's weapons of mass destruction and the completion of the Chemical Weapons Convention, major problems remain in implementing any regime banning chemical and biological warfare: intelligence and verification, proliferation, terrorism, destruction, *deterrence, and enforcement. If the Chemical Weapons Convention is successfully implemented, intelligence problems will be eased; however, the Biological and Toxin Convention, despite recent efforts to strengthen it, is still based on trust, and the task of verifying compliance, given the number of laboratories throughout the world, remains formidable. The list of potential proliferators in the Third World stands at approximately fifteen. The use of sarin in the Tokyo subway by the Aum Shinrikyo terrorists (1995) highlighted the vulnerability of modern societies to state-sponsored or cult terrorism. The destruction of chemical agents is proving difficult, especially in Russia, because of its cost and environmental concerns. A new Chemical Weapons Convention, prohibiting the production, storage, and use of poison gas, and providing for monitoring of the civilian chemical industry with systematic and surprise inspections was signed by President George *Bush in January 1993 after ten years of negotiations. Pressed by President Bill *Clinton and Senate Majority Leader Trent Lott (R-Miss.), the U.S. Senate overrode concerns from the chemical industry and conservatives worried about North Korea, Iran, Iraq, and Syria, and ratified the treaty 74-26 on 24 April 1997. With seventy-five nations approving the treaty it went into effect on 29 April 1997. By adhering to the Chemical Weapons Convention, the parties to the treaty are renouncing retaliation in kind. Deterrence therefore will depend upon the threat to punish violators by other means—nuclear or conventional. Relying on the former will threaten the developing structure of nuclear arms control. Finally, no treaty is stronger than the willingness of its adherents to enforce it.

CHENEY, RICHARD (1941-), member of Congress, secretary of defense. Born in Lincoln, Nebraska, the son of a federal soil conservation agent, Cheney grew up in Casper, Wyoming, and attended Yale and the Universities of Wyoming and Wisconsin. Appointed a congressional fellow in 1968, he served as assistant to Donald Rumsfeld in various positions in the Nixon and Ford administrations. In 1975-77, Cheney was President Gerald *Ford's chief of staff. Then, in 1979-89, Cheney served in the House of Representatives as a staunch but pragmatic conservative Republican from Wyoming. As minority whip, he actively supported President Ronald *Reagan's defense buildup and aid to the Nicaraguan Contras.

President George *Bush appointed Cheney secretary of defense after the Senate rejected John Tower. Cheney had no military service, having obtained deferments during the *Vietnam War, but as defense secretary (1989-93), despite his skepticism about reformist Soviet leader Mikhail Gorbachev, Cheney followed Bush's instructions to downsize the U.S. military. A Washington insider, he challenged the *Pentagon's lobbying, reformed procurement, and curtailed a number of weapons programs. But the new chairman of the *Joint Chiefs of Staff, Gen. Colin *Powell, on his own authority devised the plan for the post-Cold War U.S. military.

Although General Powell kept tightly in his own hands operational planning and control of the U.S. military response to the Iraqi invasion of Kuwait in August 1990, Cheney helped persuade the Saudi government to accept U.S. military forces and to join the Allied Coalition that achieved successful liberation of Kuwait from control of Saddam *Hussein.

CHENNAULT, CLAIRE (1893-1958), aviator. Chennault grew up in Louisiana, joined the army in April 1917, earned a reserve commission, and completed pilot training in 1919. After a taste of civilian life, he obtained a regular commission in 1920. Until his retirement as a captain in 1937 because of physical disability, he specialized in tactical pursuit aviation at a time when the army air arm emphasized strategic bombardment instead.

Chennault became aviation adviser to the Chinese government in 1937, and in 1941 organized the American Volunteer Group, the "Flying Tigers," to fight for China against the Japanese invaders. After the Japanese attack on *Pearl Harbor, Chennault rejoined the U.S. Army Air Forces, became a major general in February 1943, and took command of the new Fourteenth Air Force in China. Communicating with President Franklin D. *Roosevelt, he undercut his superior, Lieut. Gen. Joseph W. *Stilwell, with whom he disagreed about strategy and the apportionment of scarce supplies. An inspirational leader as well as a diffi-

cult subordinate, Chennault won aerial victories but could not achieve his ambition of defeating the Japanese in China exclusively through airpower.

Having retired again in 1945, he helped launch Civil Air Transport, China's national airline. The airline moved to Taiwan when the Communists conquered the mainland, and by the time of Chennault's death had undertaken numerous missions for the *Central Intelligence Agency.

CHEROKEE WAR (1759-61). The Cherokee War consisted of three campaigns from South Carolina against the Cherokee Indian nations. Colonial ambitions, back-country misunderstandings that caused killings on both sides, and the undertow of *French and Indian War hostilities to the north, all tangled, leading South Carolina to act against its neighbor and trading partner in the southern Appalachian Mountains. The first campaign saw colonial regiments march resistantly under an arrogant royal governor, only to be turned back by an outbreak of smallpox. The second and third, in 1760 and 1761, saw British regulars lead resentful militiamen. The Cherokees successfully rebuffed attack in 1760; this was followed by an equivocal concession in 1761. Meanwhile, the Cherokees fought sporadic engagements against other native peoples on their western and northern mountain flanks. The campaigns left deep scars and provoked anxieties with the young generation of both colonists and Cherokees alike.

The Cherokee War, on the colonial side, was a revolt against the idea of the Cherokees as the "key" to westward expansion, and a response to Carolinians' own weak place within the empire. For the Cherokees, the scorched-earth campaigns and disease besieged their economy, destabilized conventional intertribal politics, and split their towns. The "Indian War" of 1775, led by South Carolina, ended over a decade of trouble between the Cherokee War and the *Revolutionary War. The Cherokee War and its decade marked the removal of the Cherokees from the pivot of regional geopolitics, and the beginning of a revolutionary era of change for both peoples.

CHICKAMAUGA, BATTLE OF (1863). After maneuvering Confederate Gen. Braxton *Bragg's Army of Tennessee from its namesake state in midsummer 1863, U.S. Gen. William S. *Rosecrans and the Army of the Cumberland paused only briefly before resuming their drive upon Chattanooga, Tennessee. In late August, Rosecrans feinted upstream while crossing the Tennessee River unopposed in four places below Chattanooga; subsequently he began an advance south and east of the city to threaten Bragg's line of communication to Atlanta. In response, Bragg on 8 September evacuated Chattanooga and concentrated his army, now reinforced by James *Longstreet's corps from the Army of Northern Virginia, around LaFayette, Georgia. Supremely overconfident, Rosecrans imprudently ordered a general pursuit by his widely separated forces. Only after

the XIV Corps barely escaped a trap in McLemore's Cove on 11 September did Rosecrans order a consolidation of his army near Chattanooga.

For the next week, Rosecrans scrambled to gather his command while Bragg struggled to defeat the Fédéraux in detail. Late on 18 September, when the two armies stumbled together by accident along Chickamauga Creek, Rosecrans had almost completed his concentration. In heavy but confused fighting the following day, neither side gained any significant advantage. A coordinated Confederate attack on 20 September made little progress until an exhausted Rosecrans mistakenly ordered a Federal division out of line, permitting a massive Confederate column to rush through the gap. In the resulting debacle, Rosecrans and one-third of his army fled ignominiously. However, Gen. George H. *Thomas rallied the remaining Fédéraux around Snodgrass Hill. After nightfall, Thomas withdrew safely without Confederate pursuit. In this, the largest *Civil War battle in the western theater, the opposing forces were nearly equal: approximately 62,000 Fédéraux to 65,000 Confederates. Over 16,000 Fédéraux and 18,000 Confederates became *casualties. Although a major Confederate success, Chickamauga was a barren victory because the Union Army of the Cumberland was neither destroyed nor forced to relinquish Chattanooga.

CHILEAN CRISIS (1891). The Chilean Crisis (or *Baltimore* Affair) was one in a string of late nineteenth-century naval crises. Despite U.S. efforts to support the old regime, a Chilean revolution succeeded in the summer of 1891. U.S. antipathy to the new regime notwithstanding, the new, light (protected) cruiser USS *Baltimore* remained in the Chilean port of Valparaíso, near Santiago. On 16 October, Cdr. Winfield S. Schley permitted some of his crew long-overdue leave, and several became involved in a saloon brawl. An ensuing riot left two U.S. sailors dead and seventeen injured.

The Navy Department ordered the *Baltimore* replaced by the *Yorktown* under Robley D. "Fighting Bob" Evans, who waited impatiently for negotiations on restitution—or war. Secretary of State James Blaine and Timothy Egan, U.S. minister in Santiago, evinced little interest in peaceful reconciliation. President Benjamin Harrison increased pressure on the Chilean government, issuing a virtual ultimatum on 25 January 1892.

Some North Americans were concerned, noting that the Chilean Navy was technically larger than that of the United States and might threaten West Coast cities. Nonetheless, the Chilean government quickly offered a complete apology and \$75,000 in restitution. At the last minute, war had been averted.

Other naval crises continued apace: Honolulu in 1893, Guiana in 1895, and Havana in 1898. After a decade of naval buildup, the United States was quickly and frequently involved in the type of disputes other great powers knew well. North Americans soon forgot an event that Chileans would long remember.

CHINA, U.S. MILITARY INVOLVEMENT IN. The United States maintained a military presence in China or its territorial waters from 1835, when it established the East Indies Squadron, through the 1950s, when it actively supported the defense of the Republic of China on Taiwan against an attack from the Communist-led People's Republic of China (PRC).

From the 1830s to 1911, American forces came into contact with a declining empire, dispatching Marines ashore to protect American missionaries and businesspeople, establishing in 1891 the Yangtze River patrol, and during the Boxer Uprising in 1900 contributing three regiments to a multinational force to relieve foreign legations in Peking (now Beijing). When in 1911 a revolution overthrew the Manchus and ended imperial rule in China, the United States between 1911 and 1914 used two infantry regiments and units of Marines to defend U.S. treaty rights and protect American lives and property.

Following World War I, the U.S. Asiatic Squadron was upgraded to a fleet, and the army increased its interest in China. American forces faced a grave challenge in 1927 when the Nationalists (Kuomintang), led by Chiang Kai-shek, marched north from Canton to unify the country. Fearing antiforeign attacks, the United States eventually put 5,000 American soldiers and Marines in China. The Japanese Army seized Manchuria in 1931 and invaded China south of the Great Wall in 1937. As conditions in China worsened, the U.S. Army's 15th Infantry Regiment, in China since 1912, left Tientsin in 1938. After the **Panay* incident, American gunboats ceased patrolling the Yangtze River in late 1940. The 4th Marines, which had become a symbol of the American commitment to the "open door" in China since 1927, left Shanghai in November 1941.

During World War II, U.S. Army officers like Gen. Joseph **Stilwell* pushed their Chinese allies to build and use the army to repulse the Japanese. Stilwell's first priority was the opening of the Burma Supply Road into China. U.S. Gen. Claire **Chennault*, commander of the Fourteenth Air Force, touted airpower as the key to victory in China. Chiang preferred Chennault's strategy for political reasons. As Stilwell predicted, the Japanese responded to Chennault's attacks by overrunning the poorly defended airfields. Stilwell was mistaken, however, in believing that the Pacific War would be won in China. By 1944, American advances in the Pacific made China a strategic backwater. Gen. Albert C. **Wedemeyer* replaced Stilwell later the same year.

In September 1945, after Japan's surrender, approximately 46,000 Marines occupied Tientsin and Tsingtao in northern China to repatriate Japanese troops and civilians and to prevent the Chinese Communists from seizing North China until Kuomintang troops could arrive from the southwest, transported by American planes and ships. Following **V-J Day*, the U.S. Army and Navy created the Military Advisory Group in China to continue the modernization of Nationalist forces. To avert full-scale civil war between Nationalists and Communists, President Truman dispatched retired Gen. George C. **Marshall*, who negotiated an uneasy truce.

In early 1947, the truce broke down. Chiang believed that American support would be unstinting. The Communists, led by Mao Zedong, distrusted the Americans. As the Communists overwhelmed Kuomintang forces, the Truman administration concluded that the Nationalists were

beyond help. Most of the Marines left China in 1948, and Chiang, defeated, fled to Taiwan in 1949.

The third phase of American involvement began with the outbreak of the ** Korean War* in June 1950 and lasted until the early 1970s. After the North Korean invasion of the South, President Truman ordered the Seventh Fleet to "neutralize" the Taiwan Strait to prevent the capture by the Communists of Chiang's Republic of China (ROC) on Taiwan. In December 1950, after U.S.-led UN forces drove the North Koreans back to the Chinese border, Chinese Communist "volunteers" intervened, driving back American troops and freezing Sino-American relations in a state of implacable hostility for nearly two decades. Subsequently, the United States resumed its advisory mission on Taiwan. In 1954, in the midst of the first offshore islands crisis, the two governments concluded a mutual defense treaty. In 1958, during the second attempt by the PRC to seize the Nationalist-held islands of Quemoy and Matsu, the Seventh Fleet alerted 140 ships for possible action in the strait. But Nationalist pilots, flying F-86 Saber jets armed with modern sidewinder **missiles*, eliminated any possibility of a Communist attack.

During the 1960s, the looming presence of the PRC, which exploded its first nuclear device in 1964, led the U.S. government to restrict its operations in the **Vietnam War*. The process of detente, begun in 1972 by President Nixon, was completed with U.S. recognition of the PRC in 1979. During the 1980s, the United States sold the PRC military equipment to help modernize its forces. The Chinese also began building a "blue-water" navy, augmented after 1991 by purchases from the former Soviet Union. The Soviet Union's collapse, growing trade friction with China, and Beijing's ambitious military program reawakened U.S. fears of PRC dominance in Asia.

In 1995, renewed U.S. arms sales to the ROC and political developments on Taiwan led the PRC to hold threatening military exercises in the Taiwan Strait. Although the U.S. defense commitment to Taiwan had ended in 1979, Washington placed the Seventh Fleet on alert for possible action in the strait. By early 1996, tensions had decreased. But the nettlesome Taiwan problem and the PRC's expanding military power raised troubling questions.

CHINA-BURMA-INDIA THEATER (1941*5). The China-Burma-India (CBI) theater has been dubbed "the forgotten theater" of World War II. Once the United States entered the war, American strategy called for building up China as a source of manpower, as a base for bombers and the eventual invasion of Japan, and as a pro-American regional power in the postwar era.

After Japanese occupation of Burma and the April 1942 closure of the Burma Road, China's last overland link with its allies, two years passed before the Allies could make a

major effort to reopen the route. Vast distances, rugged terrain, few roads, heavy rainfall, and diseases made Burma a horrendous place for a campaign. Given the "Germany First" strategy, the CBI theater lay far down the Allies' list of priorities. Although the British wanted to recover Burma and their other Far Eastern colonies, they shared little of the American sense of urgency for aiding China. The Nationalist leader Chiang Kai-shek, anxious to conserve his forces for the postwar showdown with Mao Zedong's Chinese Communists, was wary of major commitments. Consequently, the Americans built up their logistical structure and examined alternative strategies. From airbases near Dinjan in Assam Province (northeastern India), C-46 and C-47 transport planes flew supplies 500 miles through the Himalayas over "the Hump" to Kunming, China. In December 1942, the U.S. Army Corps of Engineers took over construction of a road from Ledo to join the Burma Road. Searching for alternatives, Roosevelt and Chiang were drawn to Maj. Gen. Claire *Chennault's extravagant promise that with 150 planes and priority on "Hump" tonnage, he could defeat Japan. The Allies also tied intelligence gathering to Kachin guerrillas rescuing downed Allied fliers by Detachment 101 of the U.S. Office of Strategic Services (OSS) and deep raids by British Brig. Orde C. Wingate's "Chindits."

At the Cairo Conference in November and December 1943, Allied leaders could not agree on a major 1944 offensive into Burma by Adm. Lord Louis Mountbatten's new Southeast Asia Command, but Lt. Gen. Joseph *Stilwell had his own ideas. The able but acerbic Stilwell was American theater commander, Mountbatten's deputy, Chiang's chief of staff, and commander of the Chinese Army in India. Determined to proceed with his three U.S.-trained Chinese divisions and "Merrill's Marauders"—3,000 air-supplied, American light infantrymen originally assigned to Wingate—Stilwell sent the Marauders on deep flanking marches into the rear of the Japanese 18th Division while the Chinese attacked in front. By mid-April 1944, Stilwell's forces had advanced to sixty-five miles from Myitkyina, a key transportation center and air base in North Burma. To the south, a drive by three Japanese divisions into Assam threatened Stilwell's communications; but in June, Lt. Gen. William J. Slim's British Fourteenth Army badly defeated the Japanese at Imphal. Meanwhile, the Marauders seized the airfield at Myitkyina in a surprise attack on 17 May. Worn down by "casualties and disease, they and the Chinese could not take the city, which held out until 3 August. In October, the Allies resumed their offensive. The Fourteenth Army advanced to the Chindwin River, and the Chinese and Mars Task Force, including the revived Marauders, pushed on Bhamo and Lashio. On 20 January 1945, patrols of the 38th Chinese Division from India linked up with Chinese troops from Yunnan on the Burma Road, and on 29 January the first convoy from Ledo passed the linkup en route to Kunming.

By then, the war had passed by CBI. Since the Cairo Conference, Roosevelt and his advisers had become increasingly disillusioned with Chiang and his inability or unwillingness to drive back the Japanese. American strategy became oriented toward the Pacific, limiting CBI's role largely to diverting Japanese divisions. In June 1944, the Twentieth U.S. Air Force had launched B-29 raids from Chengtu, China, against Japan, but after ten months of disappointing results and logistical problems, the B-29s were

shifted to the Mariana Islands in the Pacific. Chennault's strategy also proved a disappointment, as the Japanese Army, fulfilling Stilwell's predictions, seized the Fourteenth Air Force's bases once its operations began to affect them. Stilwell could take little satisfaction, for on 18 October 1944, Roosevelt, bowing to increased pressure from Chiang, relieved him. CBI split into an India-Burma theater with about 184,000 U.S. forces under Lt. Gen. Daniel I. Sultan and a China theater with about 28,000 Americans under Gen. Albert C. *Wedemeyer, who prepared ambitious plans for a rejuvenated Chinese Army to drive to the China coast by 1946. To coordinate a Chinese offensive against the Japanese, an OSS delegation, the "Dixie Mission," even visited Mao in Yenan Province, Northwest China, but U.S. Ambassador Patrick Hurley, fearing the impact on Communist-Nationalist negotiations, vetoed cooperation with the Communist forces. Wedemeyer's offensive in July 1945 came too late to affect the war's outcome.

CBI produced some of the most impressive feats of engineering and logistics in American military history. Yet, despite the best efforts of numerous Americans, it contributed little to Japan's defeat, except perhaps to keep China in the war and thereby tie up sizable Japanese forces on the Asian mainland.

CHINA RELIEF EXPEDITION (1900). In summer 1900, a multinational expeditionary force including U.S. troops under overall British command arrived in northern China to suppress the Nationalist, antifeign Boxer Rebellion and break the siege of the foreign Legation Quarter, Peking (now Beijing).

In May 1900, responding to escalating violence, 450 foreign troops—including about 115 Americans—reinforced the legations in Peking. As the Ch'ing government of the Manchu dynasty moved to support the Boxers and the legations came under siege, a relief force of 2,080 troops under British Vice Adm. Edward Seymour (including a small force of American sailors and Marines) set out from Tientsin on the coast. However, it was held at bay. A larger relief force of troops from Britain, France, Germany, Japan, Russia, and America was then organized under British Gen. Alfred Gaselee. On 16 June, the United States diverted substantial forces from the Philippines to participate in this effort, including the 9th and 14th Infantry Regiments, 1st Marines, and an army artillery unit. The Sixth Cavalry Regiment came directly from America. U.S. forces, eventually numbering about 2,500 out of 18,000, were commanded by Maj. Gen. Adna Chaffee. On 3 July, Secretary of State John Hay reiterated the U.S. "open door" policy of preserving China's territorial entity.

The Battle of Peking, 14-16 August 1900—in which "Reilly's Battalion" gave covering fire to British troops advancing on the Legation Quarter—broke the 55-day siege

of the legations. The defeat of the Boxers led to the signing of the Boxer Protocols in September 1901, providing a \$332 million indemnity. Most of the U.S. share was remitted to educate Chinese students in the United States.

CHINESE CIVIL WAR, U.S. INVOLVEMENT IN THE (1945-49). Beginning with the ambiguous *Yalta Conference (1945), the United States and the Soviet Union failed to agree on the future political shape of Asia or to control their Asian allies and clients (as they did in postwar Europe). Manchuria, which Yalta had effectively awarded to the USSR, played the pebble that starts an avalanche.

After the Japanese surrender, the U.S. transport moved Chinese government armies from the southwest to key cities such as Peking, Tientsin, and Shanghai, and 50,000 U.S. troops landed in China proper. The Soviets who arrived in Manchuria in August 1945 excluded Nationalist forces and helped bring Chinese Communist main forces there from Northwest China.

Fearing deep involvement in China, the United States attempted to deal with this and other issues primarily by negotiations between Nationalists and Communists, sponsored first by Ambassador Patrick Hurley (1945) and then by Gen. George C. * Marshall (1945-47). Unrealistic to begin with, this approach was further undermined by a clear American tilt toward the Nationalists, made worse by the abandonment of the direct U.S. contact with the Communists that had been provided, for example, by the military "Dixie Mission" of 1944.

The Chinese Communists' concentration on civil administration rather than military preparation in Manchuria suggests that they expected an East European-style outcome: a stable partition and the establishment of a "Red China" in Manchuria under Soviet tutelage. Their calculations were upset by Soviet withdrawal and by the unexpected initiation, in early 1946, of a massive Nationalist offensive that saw American-equipped elite Nationalist divisions quickly throw the Communists into full retreat. The Communists in Manchuria were saved when Marshall evidently pressured Chinese Nationalist leader Chiang Kai-shek to stop the offensive, in June 1946, just short of Harbin.

Thereafter the tide of war shifted toward the Communists, and American public opinion became increasingly concerned. In October 1947, an Army Advisory Group was formed to counsel Chiang and \$27.7 million in aid was supplied. The Nationalists requested far more and eventually another \$400 million was paid, but only in 1948, long after the Truman administration had lost faith in Chiang's Nationalist government. In 1949, after Truman won reelection, he refused further aid and ordered the U.S. ambassador not to follow the retreating Nationalists to Taiwan but rather to remain in Nanking to establish contact with the Communists.

CHOSIN RESERVOIR, BATTLE OF THE (1950). After the liberation of Seoul in September 1950, Gen. Douglas *MacArthur opened an offensive aimed at ending the *Korean War. The independent U.S. X Corps, separated from the Eighth Army by a mountain range, was stretched out on Korea's east coast. At the midway point, the First Marine Division was echeloned from Hungnam to the northwest along a mountain road to the Chosin Reservoir, an important hydroelectric plant.

On 24 November, MacArthur began an "end-the-war" attack to the Yalu. Days later, a massive Chinese counteroffensive erupted. The First Marine Division, its 5th and 7th Regiments now at Yudam-ni north of the reservoir, was ordered to shift its attack to the west to shore up the collapsed right flank of the Eighth Army. Overwhelming Chinese forces quickly brought the Marine advance to a halt. Temperatures had dropped to -25° Fahrenheit.

The 1st Marines, the division's third infantry regiment, held positions in battalion strength at Hagaru-ri, Koto-ri, and Chinhung-ni along the only road leading south from Yudam-ni. Maj. Gen. Oliver P. Smith, the division commander, pulled the 5th and 7th Marines back to Hagaru-ri. The breakout from there began on 6 December. Immeasurably helped by close air support and aerial resupply, the division reached Hungnam six days later. Of the some 15,000 Marines engaged, 4,400 were battle *casualties. Almost all the Marines suffered some degree of frostbite. The Chinese had lost perhaps 25,000 dead and did not oppose the evacuation of Hungnam by X Corps, which was accomplished by Christmas.

CHURCH, BENJAMIN (1639-1718), colonial soldier. A farmer in Plymouth-Colony, Benjamin Church soldiered in three wars. The son of a veteran of the Pequot War, he served as a provincial captain during *King Philip's War. In December 1675, Church was a member of a New England army which struck a fortified Narragansett settlement in the Great Swamp in Rhode Island. The surprise attack succeeded, killing more than 600 Indians and destroying the village. Church was wounded in the engagement. The following summer, he led a force into the Mount Hope swamp in Rhode Island, where the Wampanoag chieftain, Metacom, dwelled. The raid caught Metacom by surprise, and he was killed in the brief battle. Church emerged as a New England hero for having destroyed the settlers' adversary. He additionally achieved a reputation as a skilled Indian fighter, a soldier who learned from the tactics of his foe and who refused to be bound by European-style warfare. In King William's War in the 1690s, Church led expeditions against the Abenaki in Maine and the French in Acadia. In 1704, during Queen Anne's War, he commanded a Massachusetts invasion of Acadia, which failed in absence of naval assistance.

CHURCHILL, WINSTON S. (1874-1965), British soldier, politician, and prime minister. Son of an English statesman, Lord Randolph Churchill, and an American, Jennie

Jerome, Winston Churchill served as a cavalry officer and worked as a war correspondent before entering Parliament. A conservative, he joined the cabinet in 1908, and, at the start of World War I as first lord of the Admiralty, was in charge of the Royal Navy, with general oversight of the policy of searching neutral, including American, ships. Blamed for the ill-fated Gallipoli expedition, he left government to serve on the western front. In 1919, back as minister of war, he was an advocate of military intervention in the Russian civil war. Falling out with his party leaders, Churchill spent most of the 1930s as a backbench member of Parliament, but he made his name once more as an opponent of appeasement of Nazi Germany, and again took charge of the navy in 1939. With his great experience of war and government, he was a natural choice as war leader in May 1940.

As prime minister, Churchill's rousing oratory and determination embodied Britain's will to win, but he could also be impatient and arrogant, overworking himself and others. He believed it vital to work closely with the United States, to forge a personal link to President Franklin D. *Roosevelt, and to create a long-term "special relationship" between the two countries. Taking an active part in military planning with U.S. and British commanders, he especially advocated a "Mediterranean Strategy," designed to attack Germany through what he called the "soft underbelly" of Europe while preserving British Imperial interests. Defeated by the Labour Party in the July 1945 election, and replaced at the *Potsdam Conference by Clement Attlee, Churchill nonetheless urged resistance to Soviet communism with the 1946 "Iron Curtain" speech at Fulton, Missouri. As prime minister once more in 1951-55, he visited America three times and took a great interest in nuclear developments, reaching an agreement in January 1952 on the use of British air bases by American nuclear bombers. His aim was always to maintain Britain as a great power.

SOCIETY OF THE CINCINNATI. In 1783, at the end of the *Revolutionary War and before the *Continental army disbanded, Gen. Henry *Knox and other officers founded the Society of the Cincinnati at Newburgh, New York, to continue the ties of comradeship among the officer corps in peacetime and to press their pension claims before the national government. Named after Cincinnatus, venerated statesmen in the ancient Roman Republic, the society excluded enlisted men, and membership could be passed to the eldest male descendant. In the 1780s, Thomas *Jefferson and other civilian leaders feared that the nationalistic fraternal organization represented an attempt to establish an aristocratic order posing a potential threat to republican values.

With chapters in all thirteen states, the Cincinnati was one of the young republic's earliest national institutions. Most state chapters met annually on the Fourth of July, holding banquets for members and sponsoring public orations. After the death of the Revolutionary generation by

the 1830s, many state chapters lapsed into inactivity. The Centennial of 1876 and renewed public interest in the Revolution led to the revival of several dormant state chapters in the East and the founding of new chapters in the West. The society continued to restrict membership to the eldest male descendants of Continental army officers, contributing to the founding of the Sons of the American Revolution in 1877 by the descendants of enlisted personnel and the *Daughters of the American Revolution in 1890 by female descendants of those who served in the War for Independence.

CITIZEN-SOLDIER. The concept of the "citizen-soldier" is based on the notion that citizens have the obligation to arm themselves to defend their communities or nations from foreign invaders and from domestic tyrants. Usually associated with republicanism, it is best understood in opposition to other forms of military organization, particularly the practices of hiring mercenaries or establishing professional standing armies of the state. In the latter two cases, soldiers and officers are isolated from society and can represent a praetorian challenge to legitimate rule. By contrast, the citizen-soldiers embody the will of the people directly because they are the people. They have a stake in preserving liberties and rights in a society, hence supplying a check on tyranny and corruption of governments.

In American history, the concept gained widespread popularity in the decade before the *Revolutionary War and became associated with colonial militia. Philosophically grounded in more than a century of Whig antimilitarism brought over from England, calls for citizen-soldiering spread throughout the colonies, especially after the *Boston Massacre in 1770 (in which regular soldiers in the British army killed five civilians in the streets). Pamphleteers whipped up American hatred of the British "standing army," which became a catch phrase associated with all colonial grievances. The Declaration of Independence repeatedly charged King George II with abusing his power through the use of his standing army of non-citizen-soldiers: "He has kept among us ... standing armies"; "He has affected to render the military independent of and superior to the civil power...."

In the early years after independence, the concepts of the citizen-soldier and the standing army also became identified with the larger struggle for political power between the states and the central government. Federalist politicians, many of whom had fought in the *Continental army in the Revolutionary War and had firsthand experience with the indiscipline and inefficiency of militia soldiers, pressed for the establishment of a strong, standing army under the direct command of the central government. However, Anti-Federalists claimed that such an army could be used by a national government to oppress the citizenry and argued for the continued maintenance of state-raised and state-commanded militias of citizen-soldiers; their concern was that in a nation as large as the United States, the central government could become dislocated from its citizens and enforce its authority only by use of its army. A compromise emerged in which the Constitution allows Congress "to raise and support armies" as

necessary, but the Second Amendment also allows states to maintain militias.

Throughout history, the problem of the "citizen-soldier" has been that it represented an ideal abstraction rather than an operationally efficient strategy in anything but the most local kinds of community defense. In the United States, the concept evolved through the militia and the U.S. "Volunteers, and lives on in the form of the National Guard.

CIVIL DEFENSE. Even after the advent of "nuclear weapons, the civil defense program did not begin in earnest in the United States until 1951, reaching an initial peak of federal interest in the early 1960s, and a second peak in the early 1980s. In both periods, a nuclear civil defense program, whenever it moved beyond mere rhetoric to be seriously supported by high federal officials, immediately elicited general hostility, set the scientific and political elite to arguing in public, and energized peace groups into successful action to discredit the program and return it to its usual marginal status in American life.

President Truman resisted significant funding for civil defense, preferring to save money for weapons, but the beginning of the *Korean War and the Soviet Union's development of an atomic bomb led to the creation of the Federal Civil Defense Administration (FCDA) in 1951. Congress continually cut FCDA funding requests by at least half. The agency concentrated on producing propaganda, which it termed "educational material." A flood of booklets, films, television shows, and media stories sought to convince the American public they could survive a nuclear attack with minor preparations. Meanwhile, many public schools initiated atomic air-raid drills, teaching children to "Duck and Cover!" in case of nuclear war.

In the Eisenhower era, a series of nuclear bomb tests, in both the Pacific and the American West, dramatized the danger of blast and radioactive fallout. The creation of the H-bomb convinced many Americans that civil defense was useless. The FCDA shifted from a shelter program to a policy of evacuation of the cities, which was met with public ridicule. From 1955 to 1962, national air-raid drills called "Operation Alert" were held each year in dozens of major cities. These drills set off major protests nationwide, especially in New York City, where between 1955 and 1961 thousands of people participated in well-organized civil disobedience efforts to discredit civil defense as a solution to the threat of nuclear annihilation. Several large cities refused to participate in Operation Alert drills, and millions of citizens simply ignored them. In 1958, President Eisenhower, who fully understood the horrific effect of nuclear exchange, ignored a call for a hugely expensive civil defense program issued by his FCDA director and supported by Cold War conservatives. He cut civil defense funds and shut down the FCDA. Despite lack of government financial support, a brief shelter craze occurred in the late fifties and early sixties, largely stimulated by the press and construction firms.

Presidential support for civil defense peaked in the Kennedy administration. Partly because of Kennedy's desire for a "macho" stand, but mostly because of his rivalry with Nelson Rockefeller—a strong supporter of civil defense and Kennedy's expected rival in the election of 1964—Kennedy transferred responsibility for civil defense to the *Pentagon and called for an expanded shelter program. Congress appropriated the largest amount ever, \$208 million in 1961, for marking and stocking existing shelter spaces such as basements and subways. Unnerved by the dissent and public excitement, Kennedy downplayed civil defense in 1962, especially after Governor Rockefeller's civil defense program was defeated in New York State. The growing peace movement argued effectively that civil defense offered no protection against nuclear "missiles and fueled the "arms race and the threat of nuclear war. Critics of civil defense also noted the chief function of civil defense propaganda—to legitimate both deterrence policy and the hugely expensive underground shelters reserved for the political, military, and economic elite.

After the "Ximited Test Ban Treaty of 1963, civil defense all but disappeared, not to be resurrected until 1979 when President Carter, apparently motivated by a false report that the USSR was building a large civil defense program, combined all civil defense actions, including protection against natural disasters, into a new organization called the Federal Emergency Management Agency (FEMA). In the 1980s, during the Reagan years, high federal officials again called for a large civil defense program that would sponsor a mass evacuation of people into rural areas if war seemed imminent. As in the early 1960s, the plan quickly faded in the wake of massive public resistance.

CIVIL LIBERTIES AND WAR. From the outset of the new American government under the Articles of Confederation, the need for striking a delicate balance between authority and liberty was essential. Fear of powerful central control was stated clearly regarding the English king in the U.S. Declaration of Independence. It remained an ongoing concern under the Constitution. Indeed, a Bill of Rights limiting the new central government was adopted, which from its First Amendment assumed that the main enemy of liberty was Congress, which was admonished to "make no law abridging freedom of speech and of the press." Further, the amendment went on to protect freedom of assembly and the right to petition, along with its initial statement of religious freedom.

The very nature of republican government, James "Madison stated in 1792, required that "the censorial power be in the people over the government, and not in

the government over the people.” Actual war intensified the issue, and the early Federalists felt its dangers required national security legislation. Hence the * Alien and Sedition Acts, which sought to sharply curtail freedom of speech and press as long as the Undeclared Naval War with * France of 1798-1800 was underway. With all three branches of the national government controlled by the Federalists, the libertarian Jeffersonians found their voices silenced, as most Anti-Federalist editors were jailed. This produced negative backlash and Jefferson’s election to the presidency in 1800. It also resulted in a movement headed by political writers to define more precisely the permissible limits of free speech and press. The *War of 1812 with England, highly unpopular in Federalist New England, not only elicited bitter criticism of Republican president James Madison but produced discussions by some Federalists at the Hartford Convention regarding secession. Madison prosecuted none, but deplored many.

The *Mexican War of the 1840s carried with it so many subtle moral and political issues that formal legalistic civil liberties issues took a backseat. Congressmen, including Abraham *Lincoln, worried aloud how slavery could be further curtailed so as not to destroy the union. Henry David *Thoreau denounced the war and refused to pay taxes to support it, but also called for civil disobedience and noncompliance with wartime actions that might result in obtaining more slave territory. Gen. Winfield *Scott appeased some critics by seeking to protect Mexican property rights by setting up military commissions that would develop a form of due process of law for citizens subjected to unruly behavior by occupying U.S. soldiers. Even though this did not restrain the U.S. Army, it brought a new technique of controlling the more extreme abuses of the military in its dealing with civilian populations.

The *Civil War saw important crises in civil liberties developed ultimately out of the White House as President Abraham *Lincoln claimed a body of Presidential War Powers which had the force of law and which frequently sublimated civil liberties to national security. This sprang from presidential initiative, but was then followed by congressional approval or acquiescence. Lincoln consolidated state militias into one force, summoned volunteers for active service, increased the size of the army and navy without legislative authority, paid money from the Treasury without an appropriation, and closed the Post Office to “treasonable correspondence.”

In addition, Lincoln and his generals in the field were not reluctant to use censorship to protect wartime secrecy considered necessary to assure victory. Translated informally, this led to various orders for control of the press and curtailment of disloyal utterances. The army was to control reporters and take action against incorrect reports and inadvertent leaking of strategic and military secrets. Feeling that more control was needed, an effort was made to exclude from the mails printed material that was calculated to interfere with the war policy. Dissenters were threatened with arrest and trial before a court-martial.

Congress’s * conscription legislation (1863, 1864) penalized those who counseled resistance to the draft. This followed its 1862 Treason Act, which was never held to cover the expression of disloyal sentiments. But through the temporary wartime suspension of the writ of habeas corpus, the government found ways of striking at those who might interfere with the president’s duty to ensure that the

laws were faithfully executed. These actions, plus the use of martial law against critical civilians, constituted a kind of prior restraint and drew strong negative public reaction.

It was not until the war was over that the Supreme Court ruled on such restrictions of constitutional liberties. In an 1866 case, *Ex Parte *Milligan*, the Court struck hard at the suspension of the writ of habeas corpus and further proclaimed that martial law could not be justified by a threatened invasion.

Lincoln’s pattern was repeated in World War I, when President Woodrow Wilson initially closed German wireless stations and later created a host of administrative boards and agencies to monitor war criticism. Yet the Civil War experience had not provided the federal government with the kind of legal weapons, such as statutory instruments of suppression, that it needed to control public discourse on a massive scale in wartime. With the formal declaration of war in April 1917, Congress passed an Espionage Act, and a Trading with the Enemies Act, which created a Censorship Board to coordinate and make recommendations about censorship. It condoned censorship of mail or any other kind of communication with foreign countries and gave the Postmaster General almost absolute censorship power over the American foreign-language press. Included also was a Sedition Act, 1918, which sought to repress anarchists, socialists, pacifists, agrarian radicals, and especially the Non-Partisan League, which had taken over North Dakota at the time. The Alien Act of 1918 empowered the government to deport “any alien who, at the time of entering the United States was found to have been a member of an anarchist organization.”

Other forms of war restriction raised civil liberties concerns. The Selective Service Act (1917) elicited legal challenge. In the 1918 *Selective Draft Cases, a unanimous Supreme Court found the constitutional authority to impose compulsory military service in Congress’s power to declare war and to “raise and support armies.”

Critics complained that much of this legislation was a threat to freedom. But except for conscription, the Supreme Court did not pass judgment on the constitutionality of any of it pending the end of the war itself. In the 1919 **Schenck and Abrams* cases, wartime prosecutions were upheld, much to the distress of a number of loyal Americans who feared this was laying the basis for a surveillance state. From these decisions arose the “clear and present danger” test, and also the * American Civil Liberties Union in 1920, to preserve the Bill of Rights.

But there were those who found the strong new federal government a blessing in disguise. Private power groups, which had greatly distrusted burgeoning regulatory authority in the economic field, now seemed pleased to accept such federal authority when applied to stifling the ideas and expression of their critics. In fact, they were delighted to have the national government play this role since federal authorities could rationalize such actions as essential to victory in a war to preserve international liberal capitalism without incurring the criticism and stigma that private groups would have elicited had they attempted to crush their enemies in such a fashion.

This new role of the state, however, produced strong negative reactions. It seemed to be progressivism gone wrong. Its critics rejected the war emergency rationalization as a dubious justification for such a radical departure in governmental policy. Critics particularly questioned the

grounds for giving new federal agencies—from the Committee on Public Information and the Federal Bureau of Investigation to the newly swollen Justice and Post Office Departments—discretionary power to limit Americans' use of their individual freedom. Further, they deplored the absence of legal remedies for innocent citizens whose rights were violated by the excessive zeal of agents of these organizations.

Civil liberties in World War II took a different form. President Franklin D. *Roosevelt had been in the Wilson government, and vowed that should war come, his administration would not repeat the repression of the World War I years. But Roosevelt was also aware that domestic groups and individuals had ties with Germany and the Axis powers, and in the late 1930s he alerted the FBI to begin domestic surveillance in the name of national security and the avoidance of sabotage. Meanwhile, conservatives in Congress set up the Dies Committee to investigate the loyalty of the Roosevelt administration. The result was that the World War I Espionage Act was reenacted, and Congress also passed the Smith Alien Registration Act (1940), instructing the government to search out and expose disloyal Americans, and to begin the practice of denaturalizing citizens who expressed sympathy with Nazi Germany. Attorney General Francis Biddle disagreed with both policies and took cases to the Supreme Court (*Hartzel v. U.S.*, 1944; *Baumgartner v. U.S.*, 1944) sharply curtailing both measures. The previous year, 1943, had seen the Court reverse a 1940 ruling by granting First Amendment protection to Jehovah's Witness children freeing them from compulsory flag salute policies on the ground that the state laws violated the free exercise of religion clause. The wartime period also saw a rare use of the treason clause (*Hauptv. U.S.*, 1947), with the government facilitating several treason prosecutions of U.S. nationals for allegedly assisting the Germans and the Japanese during the war.

The most flagrant wartime violation of civil liberties in American history involved the Japanese Americans living on the West Coast, the majority of whom—70,000 of 112,000—were American citizens. Rounded up by the military after Pearl Harbor, they were first subjected to a curfew, then banned from coastal areas, and subsequently shipped to inland detention camps, known as relocation centers. In the process they were punished without indictment or trial, and since this action was called for by the military in the name of national security, the Supreme Court in the "Japanese American Internment Cases" hesitated to interfere. In the *Hirabayashi* case (1943), the Court ruled the curfew constitutional on the excuse that it was wartime. A year later, the Court did uphold the right of loyal Americans to leave the camps through a writ of habeas corpus. It was never willing to examine the constitutionality of the relocation program itself, thereby leaving future wartime restraint unresolved.

The war in Korea was technically not a war, but a * United Nations "police action" without a formal declaration. Coming during the McCarthy era, when the Truman administration was being criticized for being "soft on communism," little was done to curtail negative expression for fear of right-wing backlash. However, in the *Dennis* case (1951), the Supreme Court sustained the Smith Act, jailing and silencing leaders of the American Communist Party with an extremely narrow interpretation of the clear and present danger test.

The "Vietnam War was a sharp contrast. Again, there was no formal war declaration. But a half million American troops eventually fought with meager success and mounting domestic protest, particularly from student organizations such as the * Students for a Democratic Society, and angered civil rights leaders, questioning national priorities. Some criminal prosecutions and conspiracy trials were launched against war resisters, but with limited success. The Supreme Court was reluctant to curtail such expression. It expanded the right of "conscientious objection." It struck down the Nixon administration's attempt to halt the publication of the *Pentagon Papers (*New York Times v. U.S.*, 1971) a critical study of the origins and early history of the Vietnam conflict. Significantly, it was in this period that the Court finally clarified the true permissible limits of freedom of expression. In the landmark case of *Brandenburg v. Ohio* (1969), a unanimous Court held that the government in order to limit free expression was required to prove that its danger was real and immediate, not imaginary. Even threatening speech was now guaranteed, said the Court, unless the state could prove that the advocacy was directed to inciting or producing imminent lawless action and was likely to incite or produce such action.

Some Americans blamed the defeat in Vietnam on the war critics, who critics said should have been silenced, or at the least denied access to certain information. This questionable view was embraced by the military and applied during the Reagan and Bush administrations, especially regarding paramilitary operations in Central America and the Caribbean, and particularly during the "Persian Gulf War of 1991. Tight control was placed on "strategic" information, and also on reporters attempting to cover the hostilities. Information was to come only through military briefings. Later information, available following investigations of the health of military personnel and civilians, raised questions about such limited briefings and denial of access to contemporary data that the public had a right to know.

CIVIL-MILITARY RELATIONS: CIVILIAN CONTROL OF THE MILITARY. By the time that the United States became an independent nation, civilian control of the military was already firmly established as an axiom of government. On the basis of history and political theory, Americans considered standing armies to be instruments of despotism as well as defense. With their weapons and discipline, soldiers possessed the means to overthrow a government and destroy liberty. In the state constitutions written after independence, in the Articles of Confederation, and in the Constitution of 1787, the generation that founded the United States explicitly subordinated military forces to elected officials so that all the great decisions

relating to *war and *peace, to raising and organizing armies and navies, to governing them internally, and to their use and support, rested in the hands of the representatives of the people, or those appointed by them to administer military affairs.

The system adopted at the end of the eighteenth century derived from English practice and American colonial experience. At the time of settlement in the early 1600s, military forces belonged to the crown. During and after the English Civil War of the 1640s, when Parliament sought control of the armed forces, executed the king who resisted this claim, and was then replaced by a military dictatorship under Oliver Cromwell, civilian control broke down. The Stuart monarchs who were restored to the throne after 1660 reasserted military command, but seemed to threaten arbitrary rule by using the new standing army as their instrument. In the constitutional settlement of the Glorious Revolution of 1688-89, Parliament took control of military finance and discipline in what proved to be a watershed for English liberty. Henceforth, civilian control rested on dividing authority over the military between Crown and Commons so that neither could rule by force: Parliament would approve the existence of a military establishment through its power of the purse (appropriating money annually) and by passage of a mutiny act to govern the internal order of the forces. The monarchy retained command, deployed the regiments and ships, and raised and administered them in peace and in war.

In the century before independence, the colonies experienced a similar struggle between legislative and executive. Legislatures created militias or authorized the raising of "volunteers or conscripts, voting the funds and setting the conditions of service by law, while command and administration rested with the governors. Gradually, using mostly the power of appropriation, the assemblies increased their influence when governors, desperate for forces for defense against European and Native American foes, compromised their authority in return for money, supplies, and permission to raise men. The governors, many of whom were military officers, wielded great influence, but fear of military rule was muted because local defense depended on militia or citizen volunteers—the adult white male population, officered by members of the local elite who rarely had reason to attempt to overturn the established order. During the struggles with France beginning in 1689, however, conflict with the British army, friction with the population, and the regulars' disdain for provincial forces all reinforced colonial antipathy to royal forces. By the time of the Revolution, the standing army had become a symbol of repressive authority and arbitrary rule. The *Boston Massacre in 1770, when redcoats fired into a threatening mob, killing five civilians, and the imposition of military government in Massachusetts under the Coercive Acts in 1774, engraved a century's concern with controlling military force into the American political tradition, confirming the belief that the safest way to defend a free people was to rely on citizen-soldiers.

During the *Revolutionary War, military and civilian leaders took care to ensure civilian control of the forces raised. As commander of the *Continental army, George "Washington conspicuously deferred to Congress's authority. Throughout the war, he treated state and local officials with respect, working to minimize conflict. Even during the most desperate periods, there was no serious

consideration of suspending civilian rule. And at the end, in spite of intense bitterness over the prospect of "demobilization without back pay or promised pensions, the officers at the main cantonment near Newburgh, New York, rejected a call to revolt or resign en masse in the so-called *Newburgh "Conspiracy." Washington's intervention in the crisis, the refusal of the officers to defy civilian authority, and Washington's solemn return of his commission to Congress a few months later, began a national tradition of loyalty and subordination that has characterized American military forces ever since.

The Constitution of 1787, following English and American custom, provided for civilian control by distributing authority over the military to the three branches of government and to the states, so that none could use force to seize power. Congress could "raise and support Armies," "provide and maintain a Navy," and specify their organization and governance, but appropriations for the army were limited to two years, forcing every new Congress to consent to land forces. As commander in chief, the president would command and deploy the nation's armed forces and conduct war once Congress declared it, but Congress must approve all the president's nominations of officers and even, if desired, their assignments to duty. While Congress could "provide for organizing, arming, and disciplining, the Militia," the states appointed officers and retained authority over the forces unless called into federal service. Because the military operated under law, and the national government acted directly on the citizenry rather than on the states as under the Articles of Confederation, the judiciary could hold members of the military personally accountable. Finally, supposing that an armed citizenry provided the ultimate safeguard against an army overthrowing republicanism, the Second Amendment guaranteed "the right... to keep and bear Arms," preventing the government from destroying the militia by disarming the population.

For the next century and a half under this constitutional arrangement, the nation's military forces remained subordinate to civilian authority in spite of frequent tension and occasional conflict. Geographic separation from Europe and disentanglement from great power rivalry allowed the United States to keep its regular military forces very small, and devoted largely to exploration, patrolling against Indians and pirates, and other constabulary activities. Defense rested upon mobilizing the population behind a shield of coast artillery and naval forces, with the regulars providing training, leadership, and weapons for the citizen forces raised. Congress exercised its powers under the Constitution in laws specifying the size, shape, organization, character, funding, and function of the armed forces (including in part the state militias), periodically expanding and contracting the forces, authorizing new installations and weapons, investigating problems, and generally dictating the broader policies and procedures under which the military operated. On a day-to-day basis, civilian control became an administrative matter, carried out by the secretaries of war and of the navy, who directed the armed services with the help (and sometimes over the resistance) of senior military officers commanding forces or managing bureaus in the two cabinet departments.

Most important, civilian control functioned successfully because it was assumed by the public and internalized within the armed forces. Belief in the rule of law, combined

with reverence for the Constitution as the legitimate foundation of civic society, meant that any open disobedience would fail and invoke punishment—or plunge the country into crisis. As part of their professionalization during the first half of the nineteenth century, the officer corps of the navy and army began to disassociate themselves from partisan politics, viewing the armed services as the neutral instruments of the state and themselves as soldiers or sailors loyal to the government regardless of which party held sway. During the political upheavals of *Reconstruction and the labor disorders of the last quarter of the nineteenth century, when the army ruled the South and was dragged into riot duty and law enforcement, Congress (with officers' blessing) in the *Posse Comitatus Act (1878) prohibited the use of the regular army to execute the laws or to act under the command of local or federal officials other than the military chain of command as specified in the Constitution or law. The willing subordination of a nonpartisan military establishment has assured civilian supremacy down to the present day.

Yet beneath a seemingly placid surface, the peacetime relationship between the military and civilian leadership was filled with discord and struggles for influence that sometimes flared into open conflict. After the *War of 1812, strong secretaries of war and of the navy had to establish the supremacy of their offices in confrontations with uniformed leaders. Top army generals fought with cabinet secretaries and with Congress over issues as personal as rank and as significant as their own authority, or the organization and funding of their armed service. Occasionally, the senior general and secretary were not even on speaking terms. Agitation by naval officers in the 1880s, by reform-minded army officers in the 1890s, and by army airpower advocates in the 1920s and 1930s were catalysts in the modernization of both services, but at the same time provoked schisms inside the officer corps and in Congress and the executive branch. In the case of Billy *Mitchell, the controversy led to a spectacular trial for insubordination.

Between the *Civil War and World War II, officers grew gradually more estranged from American society, which they viewed as undisciplined, unprincipled, and preoccupied with commercialism. In peacetime, the armed forces suffered lean budgets, pork barrel expenditures, skeletal forces, deteriorating equipment, and low combat readiness. But at the same time the increasing participation of the United States in world politics, and the growing complexity of warmaking, particularly logistics and operations, gave professional officers greater influence in military affairs. And the maturation of the armed services into cohesive institutions, configured on the basis of doctrines of war fighting and attuned to their own organizational needs, gave their advice—now institutionalized in staffs and agencies in Washington—more authority.

War tended to mute the friction, but it never disappeared. After a weak beginning in the War of 1812, the dominance of the president in wartime was established by Presidents James K. *Polk and Abraham *Lincoln: managing "mobilization, overseeing "strategy, negotiating with allies and enemies, and even on occasion ordering operations. Except for a brief effort to oversee the conduct of the *Civil War, Congress deferred to presidents, supporting requests for larger forces, new weapons, increased appropriations, and expanded executive authority. Disagreement between military and civilian leaders, largely over strategy,

generally remained out of public view. Except for rare instances, such as the struggle between Lincoln and Gen. George B. *McClellan over taking the offensive during the Civil War, military commanders acceded to presidential wishes even when opposed to a particular policy or course of action. Presidents understood how quickly wartime heroes could become presidential aspirants (as numerous generals' from Andrew *Jackson through Dwight D.

*Eisenhower have done) and how difficult they could be to manage, which contributed to the tension. Polk, Lincoln, William *McKinley, and Woodrow *Wilson kept a tight rein over the direction of their conflicts, Wilson personally making overall policy while leaving the details of implementation, tactics, and fighting to the military.

The mobilization for World War II that began in 1940 spread the influence of the military more deeply into the fabric of American society than ever before. When the government, applying its World War I experience and plans readied during the interwar years, took control of society by drafting men into the armed forces, converting production to munitions, controlling raw materials and wages and prices, and harnessing virtually all activity to achieving "victory over the Axis, the military became powerful arbiters in American life. Franklin D. *Roosevelt never ceded any authority; he directed the war effort in broad outline and sometimes in small detail. But the needs of the military forces and the judgments of the uniformed leadership framed many choices, and extended deeply into foreign policy and economic life. In ways both obvious and subtle, the power and prestige of the professional military reached a zenith in the American experience.

The creation of a permanent military establishment in the 1950s to contain the Soviet Union and deter nuclear war overloaded the traditional procedures by which civilian control functioned. The military institutions were simply too large, their activities too diverse, and their influence too pervasive for effective oversight by the legislative and bureaucratic procedures historically used by civilians on Capitol Hill and in the executive branch. Vicious struggles broke out between the armed services over roles, missions, strategy, and budgets, which the civilians, struggling to balance military needs with finite financial resources and lacking any consensus about how to meet the threat, could not contain, even under the new, more unified organizational structure of the Department of *Defense (DoD). The need to control atomic weapons and to harmonize military operations with broad national objectives, particularly to keep limited wars from escalating into a general conflagration, drove civilians to invade what had become the customary prerogatives of military commanders in the field. In 1951, in the most public civil-military confrontation in American history, President Harry S. *Truman relieved Douglas *MacArthur, one of the century's most celebrated commanders, for openly opposing the administration's effort to keep the war in Korea limited to the peninsula and to conventional weapons. By 1961, the century's only professional soldier-president, Dwight D. Eisenhower, had become so concerned about restraining defense spending and conflicts with (and between) the armed services that he left office warning about a "military-industrial complex" whose "influence, whether sought or unsought," had the "potential for the disastrous rise of misplaced power."

The Kennedy and Johnson administrations reasserted

civilian control by installing new bureaucratic procedures in the *Pentagon to unite strategy and policy with force structure and budgets, and by imposing special instructions or operational restrictions on commanders, notably during the *Cuban Missile Crisis and the fighting in Southeast Asia. But over the next three decades—partly in reaction to the disaster in Vietnam, partly in response to Secretary of Defense Robert S. *McNamara's peremptory rule, and partly because the Republicans, dominating the presidency, became such vocal champions of national defense—influence over military affairs began gradually to shift back toward the uniformed leadership. Congress, controlled for most of the period by the Democrats, added staff and began to exert more power through appropriations and directives in legislation. But the *Goldwater-Nichols Act (1986), a defense reorganization law, gave the chairman of the *Joint Chiefs of Staff (JCS) and senior commanders in the field more weight inside the DoD. Successful interventions abroad, especially the *Persian Gulf War, restored the military's prestige. And a new generation of officers—more determined to resist policies that would damage military effectiveness or involve U.S. forces in quagmires abroad, less sensitive to the historical restraints involved in subordination to civilian authority, and more adept at political maneuvering inside the bureaucracy and on Capitol Hill—gained greater success in promulgating their views in policy and decision making, even after the end of the *Cold War. During the 1990s, after losing a public battle with the military and Congress over permitting homosexuals to serve openly in the armed forces, President Bill *Clinton's administration relinquished much of its power over the military establishment in the areas of budget, organization, and strategy. Only in foreign interventions did the president assert his authority, and then within limits negotiated with a military leadership wary of deploying American forces abroad.

Thus, at the close of the century, civilian control remained the same sometimes smooth, sometimes awkward, but always situational process it had been throughout American history: shaped by the issues and personalities of the moment; characterized by consultation but also negotiation, tension, and conflict; and measured by the relative influence of the professional military and civilian authorities in policy and decision making. Congress and the president continued to pass the laws and decide upon war and peace, and the military to operate under law and civilian authority. At the same time, military and civilian leaders struggled in uneasy partnership to reconcile frequently diverging perspectives in pursuit of the common defense, in an increasingly uncertain world.

CIVIL-MILITARY RELATIONS: MILITARY GOVERNMENT AND OCCUPATION. Americans have traditionally been suspicious of military governance, a distrust that stems from their belief in individual liberty, representative government, and civilian control of the military. That view was reinforced during the * Revolutionary War when the British army occupied and established military rule in a number of American cities. As the new republic expanded westward, the U.S. government's policy was to put new territory under civilian administration as rapidly as possible. Nevertheless, the U.S. military has often acted as an occupying and governing force.

As the U.S. Army marched through Mexico during the * Mexican War (1846-48), Gen. Winfield *Scott, faced with the need to deal with Mexican civilians, issued General Order No. 20 on 19 February 1847, providing a code of conduct that emphasized respect for the rights and property of innocent civilians. In his sensible and humanitarian guidelines, Scott ordered U.S. military governors to rule through local officials where possible.

During the *Civil War, as it occupied increasing areas of the Confederacy, the *Union army had to control a hostile civilian population, protect freed slaves and friendly Unionists, and ensure essential services. The broad aim of military government was to restore the Union by suppressing the secession and establishing loyal state governments. To guide the army, the War Department issued General Order No. 100, 23 April 1863, later published as an army manual, *Instructions for the Government of Armies of the United States in the Field*, the first formal attempt by a national government to codify the "laws of war."

The Union army became the major instrument of the U.S. government in the occupied South during the war and through most of * Reconstruction. In 1867, the Republican Congress divided the conquered South into five military districts. Each state had to guarantee suffrage to adult black males and ratify the Fourteenth Amendment before military rule was ended in 1870.

Following the * Spanish-American War, the far-flung empire obtained by the United States was initially governed by the military occupation forces. The army governed Cuba, 1898-1903 (again in 1906-09); Puerto Rico 1898-1900; and the Philippine Islands, 1899-1901. The U.S. Navy governed Guam, 1899-1950; and American Samoa, 1899-1951. In the Caribbean, naval and Marine forces governed—sometimes directly, sometimes through local leaders—in Haiti, 1915-34; the Dominican Republic, 1916-24; Honduras, 1924-25; and Nicaragua, 1909-10, 1912-25, and 1926-33. The army's governance of the Panama Canal Zone began in 1903 and was scheduled to end in 2000.

World War I led to the first U.S. military occupation in Europe: after the armistice in 1918, the U.S. Army was assigned an Allied occupation sector in the Rhineland. Despite French pleas to remain, the U.S. force was rapidly reduced and its role ended in 1923.

America's world role during and after World War II was accompanied by unprecedented responsibilities in military occupation and governance. Before U.S. entry into the war, the army prepared two field manuals on the subject: *The Rules of Land Warfare* (1939) and *Military Government* (1940). Because of the initial wartime experience, another manual, *Army-Navy Manual of Military Government and Civil Affairs* (1943), emphasized assisting military operations rather than winning over the population. U.S. policy, however, continued to insist on "just and reasonable" treatment of civilians and prompt rehabilitation of the civilian economy.

In Europe, Gen. Dwight D. *Eisenhower allowed considerable independence to his field commanders over occupation and governance policies. In Italy, the policy favored rapid reconstruction of local and regional governments and the civil service, drawing upon all except original and clearly committed Fascists. In Germany and Austria, the U.S. Army played a role in aiding millions of refugees, in arranging for reparations, in conducting a denazification program, and in prosecuting war crimes.

Because of the *Cold War, U.S. military government continued in Europe long after the German surrender in May 1945. Although the Allied military occupation of Italy ended in 1947 with the signing of a peace treaty there, Germany remained divided into separate military occupation zones. The U.S. Zone was in the south, plus part of jointly occupied Berlin; in 1945-49, it was governed by Gen. Lucius *Clay. With the containment policy beginning in 1947, the United States and Britain merged their two zones, first economically, and then, along with the French, entirely in order to create the Federal Republic of Germany in 1949. (In East Germany, West Berlin remained an Allied occupation zone.) However, U.S. occupation and governance, under High Commissioner John J. McCloy, did not end until the Federal Republic rearmend and joined *NATO in 1955; the occupation of Austria ended the same year.

In contrast to General Eisenhower's decentralized occupation policy, Gen. Douglas *MacArthur established highly centralized control of occupied Japan in 1945. The United States was also the sole occupying force in Micronesia (the Carolines, Marianas, and Marshalls), Okinawa, and Iwo Jima.

Supported by President Harry S. *Truman, MacArthur planned to "reform" Japan and replace its militaristic roots with centrist Western liberalism. MacArthur's military government expanded civil rights, broadened the franchise, officially emancipated women, established new political parties and labor unions, created land reform, and began antitrust proceedings against giant Japanese conglomerates. Furthermore, an International Military Tribunal tried Japanese war criminals. After the Communists gained power in China in 1949, however, the emphasis shifted to building up Japan as a bastion against communism. A formal peace treaty in 1951 ended U.S. military occupation and governance, although not American military bases.

U.S. military government in Korea south of the 38th parallel (1945-46) was followed by a staunch anti-Communist civilian government headed by Syngman Rhee. The United States had removed most of its forces by the time of the North Korean invasion in 1950.

The active global role pursued by the United States after World War II led to a number of military interventions, some followed by occupation and governance, and some-

times serious attempts at remolding local government or creating entirely new political institutions. Such attempts in South Vietnam ultimately failed with the North's victory. However, the U.S. military was successful in its intervention and occupations in Grenada (1983) and Panama (1989-90).

Although the United States did not set up a military government during the *Persian Gulf War of 1991, the army did mount its largest military-civil affairs operation since World War II in Kuwait, seeking to restore the shattered country.

Results were mixed in other missions involving U.S. occupation and direct or assisted military governance. As part of a *United Nations force in Somalia (1992-93), the U.S. military expanded areas of humanitarian relief and order; but the overall effort to end the civil war was a failure.

Much more effective, at least initially, was the U.S. military involvement in *Haiti, beginning in 1994. After the resignation of the military junta, Haiti's elected president, Jean-Bertrand Aristide, was reinstalled and order restored.

In the *Bosnian Crisis, a U.S. force joined a *peacekeeping occupation in Bosnia in December 1995, and in early 1999, President Bill *Clinton prepared to send another to the Yugoslavian province of Kosovo. It was not clear to what extent the American military would also engage in forms of governance and state building in that region of the former Yugoslavia.

Over the past century, American military occupation, reflecting military and foreign policy goals, has emphasized restrained use of force, and the reliance instead upon local elites, using political, economic, and cultural means to shift occupied populations toward U.S. policies. From the Civil War to the Cold War and beyond, occupation and governance have thus reflected dominant American attitudes and values as well as civil and military policy.

CIVIL WAR (1861-65): CAUSES

The election of the Republican Abraham *Lincoln to the presidency in November 1860 triggered a chain of events

that within six months shattered the Union and culminated in the outbreak of the Civil War. The coming to power of a Republican and Northern administration committed to prohibiting the expansion of slavery struck at the vital interests of the slave South; it was the signal eagerly awaited by the proponents of Southern independence to launch a secession movement. Tensions over slavery and the struggles to perpetuate or end the institution that dated back to the incomplete American Revolution of 1776 had now become so polarized along sectional lines that the North and South lacked common ground on which to compromise the issue.

The Roots of Sectional Conflict. The democratic revolution in which the United States gained its independence from Britain rested on a profound paradox. The Revolution produced both the world's leading model of political democracy and one of its greatest slaveholding powers. Freedom for whites coexisted uneasily with bondage for African Americans, some 20 percent of the population. The federal Union crafted at the Constitutional Convention in 1787 also embodied this contradiction when the U.S. Constitution recognized the right of a state to regulate slavery within its jurisdiction. Indeed, without this express acknowledgment of their sovereign power over slavery, the slave states would never have joined the proposed Union. Thus, white liberty and black slavery were constitutionally joined in the very creation of the federal Union.

Within a generation of the Revolution, all the states north of Maryland embarked on programs of gradual emancipation. By the early nineteenth century, slavery was almost exclusively a sectional institution confined to the South, home to over 90 percent of American blacks. At the same time as the North was moving away from slavery, the invention of the cotton gin and rising demand in English textile factories for raw cotton were stimulating the westward expansion of slavery throughout the southeastern United States.

As social and economic patterns of development diverged sharply along sectional lines, the South's national share of political power began to slip. From a rough balance of power with the North in 1790, the South held only 42 percent of the votes in the House of Representatives by 1820. Worried over their growing minority status, and enraged over the attempt of the North to force emancipation upon Missouri when it applied for admission as a slave state in 1819, white southerners for the first time threatened secession during the debates that resulted in the Missouri Compromise of 1820. The heart of the compromise was the drawing of a line through the Louisiana Purchase territory that prohibited slavery north of the latitude 36°30' and allowed it to the south.

In addition to proclaiming their right to an equal share of the expanding West, southern proponents of slavery protested protective tariffs that they insisted sacrificed the agricultural export economy of the South on behalf of northern manufacturers. This issue precipitated the sectional crisis of 1832-33 in which South Carolina planters, led by John C. Calhoun, held that a state could constitutionally nullify federal legislation that it determined violated its interests.

President Andrew Jackson forced the Nullifiers to back down, but of greater concern in the 1830s to southerners anxious over the future of slavery was the sudden emergence of an abolitionist movement in the North. Inspired by northern evangelical Protestantism and a belief in the

right of African Americans to freedom and self-betterment, the abolitionists denounced slavery as the nation's greatest moral abomination and urged all Americans to begin immediately the work of emancipation. Skillful at spreading their message, the abolitionists launched a major propaganda campaign in the mid-1830s and deluged Congress with antislavery petitions.

The agitation of the slavery issue by the abolitionists predisposed many northerners to see in the admission of the slave republic of Texas in 1845 and the outbreak of the Mexican War in 1846 the fearful designs of a conspiracy of slaveholders—the “slave power”—to expand slavery throughout new regions in the West and thereby deprive northern farmers and workers of the opportunity to settle the West for their social and economic advancement. When northern congressmen rallied behind the Wilmot Proviso in 1846 in an effort to bar slavery from any territories gained in the Mexican War, southerners formed their own sectional bloc and forced the ultimate defeat of the proviso. The divisive issue of the expansion of slavery had moved to center stage in American politics and would continue to dominate it through the 1850s.

Rising Sectional Tensions in the 1850s. Whether measured by rates of industrialization, urbanization, and immigration, or the cultural willingness to embrace reforms such as public education aimed at promoting social improvement, the free and slave states were set apart far more significantly by the mid-nineteenth century than at the birth of the Union. The North was growing and evolving at a more rapid pace than the predominantly agrarian South. Most ominously for slaveholders, a northern majority was forming that viewed slavery as a moral wrong that should be set on the road to extinction. Northerners also now saw slavery as a barbaric relic from the past, a barrier to secular and Christian progress that contradicted the ideals of the Declaration of Independence and degraded the free labor aspirations of northern society.

Since slavery within the states was protected by the Constitution, antislavery sentiment focused on keeping it out of the territories. Southerners, arguing that the territories were the common property of all the states, insisted on what they deemed their constitutional right to carry slaves into the territories. Furthermore, slaves and land were the major sources of wealth in the South, particularly with the cotton boom. The result was a decade of sectional strife.

A complex sectional agreement, the congressional Compromise of 1850, permitted California to enter the Union as a free state. The remaining land won in the Mexican War was divided into the territories of Utah and New Mexico with no conditions placed on the status of slavery. In 1854, the Kansas-Nebraska Act reopened the entire controversy. In order to gain essential southern support for his bill organizing the remaining Louisiana Purchase territory north of 36°30', Democratic senator Stephen A. Douglas of Illinois had to revoke the Missouri Compromise restriction on slavery. Northerners reacted by charging that the Slave Power was moving to monopolize the territories for slavery at the expense of free labor.

The Whig Party split and collapsed in the storm of northern protest over the Kansas-Nebraska Act, and a sectionalized Republican Party quickly formed around the core principle of blocking the expansion of slavery. The major Protestant denominations had already split into sectional wings over the slavery issue, and only the Democratic Party now remained as an important national

institution that represented northern and southern interests. Democratic unity, however, shattered during the administration of James Buchanan (1857-61). The ruling of the Supreme Court in the *Dred Scott* decision of 1857 that Congress had no constitutional authority to prohibit slavery in the territory further polarized sectional attitudes, and northern Democrats led by Douglas lost the trust of the southern wing of the party when they joined Republicans in blocking the admission of Kansas as a slave state.

The decade came to a close with abolitionist John Brown's raid against the federal arsenal at Harpers Ferry, Virginia, in October 1859. Brown's unsuccessful attempt to incite a slave rebellion sent paroxysms of fear and anger through the South and touched off rumors of conspiracies and slave uprisings. Brown was hanged, and although the Republicans denounced him as a wild-eyed fanatic, many white southerners were convinced that the Republican Party was dominated by abolitionists and plotting with them to unleash a bloodbath in the slave states.

Lincoln's Election and the Secession Crisis. Vowing to use federal power both to keep slavery in check and to promote the free labor economy of the North through protective tariffs, subsidies for railroads, and free homesteads in the West, the Republicans ran Abraham Lincoln of Illinois for the presidency in 1860. His victory over three rivals—Stephen Douglas for the Northern Democrats, John C. Breckinridge for the Southern Democrats, and John Bell, the candidate of former Whigs in the Upper South—was achieved with no basis of support in the South. Rather than accept Republican rule, Southern radicals immediately provoked a crisis by organizing a campaign for secession.

Pushing the constitutional doctrine of states' rights to its logical extreme, the secessionists held that individual states retained ultimate sovereignty within the Union and could peacefully leave the Union the same way they had entered it through special state conventions. Rejecting any plan of prior cooperation among the slave states, they pursued a strategy of separate state action, accurately predicting that the momentum of secession would force wavering states to join those that had already gone out.

South Carolina took the lead on 20 December 1860, and within six weeks seven states from the Lower South left the Union. Delegates from these states set up the provisional government of the Confederate States of America at Montgomery, Alabama, in February 1861. This original Confederacy represented those states with the heaviest concentration of slaves and the highest percentage of white families owning slaves. Planters were in the forefront of secession. What opposition they encountered from the majority of nonslaveholding farmers took the form of cooperationism, the argument that secession should be delayed until a united bloc of Southern states agreed to go out together. The cooperationists polled about 40 percent of the vote in the secession elections, but in the end they followed the leadership of the secessionist planters.

Fort Sumter and the Outbreak of War. Northerners rejected the doctrine of secession. Believing that the Union was sovereign and perpetual, they viewed secession as illegal, indeed, revolutionary. They equated secession with anarchy and feared that it would lead quickly to a fragmentation of the United States and an end to America's mission of serving as a beacon of free government to the rest of the world. Still, no consensus existed on using coercion to force the seceded states back into the Union. In particu-

lar, Democrats were against coercion and favored negotiations to heal the sectional rift, even with the continuation of slavery. At the same time, the Unionists in the Upper South who had turned back secession in their slave states had hedged their Unionism by proclaiming that they would resist any Republican use of military force against a seceded state.

When inaugurated on 4 March 1861, Lincoln thus faced a dilemma. If he took no action against the Confederacy, he risked demoralizing his party and subjecting his administration to the same derision that had pilloried the outgoing Buchanan Democrats for standing by while the secessionists broke up the Union. On the other hand, any forceful step against the seceded states threatened to divide the North and drive the Upper South into the Confederacy.

Realizing that he could not afford to be locked into an endless policy of drift and delay, Lincoln decided to take a stand for the Union over Fort Sumter in Charleston Harbor, the most visible installation in the Confederacy that was still under federal control. Aware that the garrison at Fort Sumter would be forced to surrender for lack of supplies sometime in early April, he ordered a relief expedition to the fort on 6 April. He stressed that the relief would be supplied "with provisions only; and that, if such attempt be not resisted, no effort to throw in men, arms, or ammunition, will be made, without further notice, or in case of an attack upon the Fort."

Lincoln in effect placed the decision for war in the hands of Confederate authorities. The government of Confederate president Jefferson Davis accepted that burden as the price it had to pay to establish the Confederacy as a sovereign power. On 9 April, Davis ordered Gen. P. G. T. Beauregard to demand the immediate surrender of Fort Sumter. Fearful of Union duplicity and anxious to avoid any possibility of having to fight two Union forces at the same time, Davis wanted Sumter in Confederate hands before the relief expedition arrived.

In the predawn hours of 12 April 1861, Confederate batteries opened fire on Fort Sumter. The capture of Fort Sumter occurred on April 13 and Maj. Robert Anderson surrendered the fort on 14 April. The next day, Lincoln issued a call for 75,000 state militia to put down what he defined as an insurrection. Virginia, Arkansas, Tennessee, and North Carolina scornfully rejected Lincoln's call for troops and joined the Confederacy in the next five weeks. Still, Lincoln now had a Northern majority behind the goal of preserving the Union with force. The Confederacy was cast as the aggressor that had fired the first shot of the Civil War, and the Northern crusade to save the Union persisted through four agonizing years of war.

CIVIL WAR (1861-65): MILITARY AND DIPLOMATIC COURSE

The war between the North and South that followed Abraham Lincoln's election to the presidency in 1860 claimed over 600,000 American lives and seriously threatened the

balance of power in the Western Hemisphere. When Lincoln called for 75,000 troops to suppress the southern rebellion after the fall of *Fort Sumter in April 1861, the federal government possessed overwhelming superiority in manpower and the material resources needed to conduct war in an industrial age. The Confederacy had a number of factors in its favor, however. To win, the North had to conquer vast territories and break the will of the Southern people. Furthermore, the railroads that made it possible to supply the large military forces it would take to occupy and conquer the South restricted the strategic flexibility of Union commanders. Finally, Southern armies enjoyed the advantage of operating in sympathetic and supportive territory.

The South also benefitted, although not to a crucial extent, from a generally superior level of military leadership. The traditional notion that a Southern dominance prevailed at West Point and the antebellum army has an element of truth to it, but should not be exaggerated. On the whole, Northern students tended to perform better at the technically oriented Military Academy. Consequently, after graduation they were assigned to the more prestigious artillery and engineering units, rather than the cavalry and infantry branches. There lesser-performing Southern graduates tended to dominate, and the Civil War would be an infantryman's war.

The status of the West Point-trained military officer would be a source of friction for both sides throughout the war. The Union and the Confederacy benefitted immeasurably from the professional knowledge and expertise of the West Pointers. Yet neither society completely appreciated nor understood the specialized skills and standards the professionals deemed essential for conducting a modern war. In the North, suspicion of professional officers was further inflamed by the number of Southern officers who joined the *Confederate army; in the South, by the clear preference President Jefferson *Davis accorded West Pointers. For their part, professional officers often let their contempt for politics and civilians manifest itself in a haughty cliquishness and were at times unduly harsh in their efforts to impose military discipline.

Even the professionals were inadequately prepared for the revolution in warfare brought about by innovations in military technology. They did not appreciate how the dramatic enhancement of firepower provided by the widespread use of rifled *muskets gave an overwhelming advantage to forces operating on the tactical defensive and rendered traditional assault tactics obsolete. And although West Pointers recognized the importance of field fortifications, none really anticipated the extent to which Civil War armies would employ them.

Both sides also encountered significant strategic problems. In the western theater (primarily the area between the Mississippi River and the Appalachian Mountains), three major rivers, the Cumberland, Tennessee, and Mississippi, provided Northern armies with excellent invasion routes. However, they would be vulnerable to raids and turning movements any time they operated away from river supply lines. In the east, Union and Confederate armies, for the most part, focused on the direct overland route between the two capitals, Washington and Richmond, through Fredericksburg Virginia. Yet both sides were capable of conducting strategic turning movements. The North, with its overwhelming naval superiority, could operate from the lower Chesapeake Bay along the rivers

that reached into the Virginia heartland, which it did with some success in 1862 and 1864. The Shenandoah Valley could be used for the same purpose by the Confederate armies, and was in 1862, 1863, and 1864.

Although the war was ultimately decided on the battlefield, the diplomatic contest was no less important. By 1860 a state of detente prevailed between the United States and the European powers. The most important of these, Great Britain and France, valued the United States as a check against the ambitions of other European powers in the Western Hemisphere. Both countries also had strong ties of economic interdependence with North and South. Not only did both Britain and France need southern cotton to feed their textile industries, they also had heavy investments in northern land, railroads, and public securities.

Southerners nonetheless went to war confident of success in the diplomatic arena. The European powers, they surmised, would find it difficult to resist the opportunity presented by the rebellion to diminish U.S. power in the hemisphere. To assuage European fears of an overweening Confederacy, southern diplomats and statesmen continually emphasized their limited war aims, and portrayed themselves as a people merely seeking freedom from Yankee tyranny. British freetraders were also expected to resent protectionist trade policies a Republican administration was certain to implement.

However, the Confederate cause overseas was compromised during the early months of the war, when the European powers were establishing their initial policies, by overconfidence in their ability to achieve military success and a lack of a seasoned diplomatic corps. The South also underestimated Europe's determination to avoid involvement. Although sympathetic to the Southern struggle for self-determination, and confident that the Union cause would ultimately fail, Europe was unwilling to recognize the Confederacy without some demonstration of its viability as a nation. Yet if the South could meet this test, why, European statesmen could fairly ask, antagonize the North by getting involved if the Confederacy was going to win anyway?

The North had the advantage of merely advocating preservation of the status quo, which the European powers, especially Great Britain, had a powerful interest in maintaining. If sufficiently aroused, British statesmen feared the North might attempt to seize Canada. There was also the danger that diminution of American power might promote instability in the Americas, and compel a diversion of energy, resources, and attention away from affairs on the European Continent. Finally, British statesmen had to take into account the fact that their constituents were highly dubious of foreign adventures in the wake of the Crimean War.

This did not mean the North would have an easy time diplomatically. The British prime minister, Lord Viscount Palmerston, held a deep antipathy toward republican government in general, and Americans in particular. Furthermore, Palmerston viewed the war as a pointless one. Secession was in his mind an irrevocable fait accompli, and he doubted the Lincoln administration had either the means or the will necessary to restore the Union. To Palmerston, the question was not whether the South would win her independence, but whether the North would give up the fight before too much death and destruction had occurred. Britain's role, as he saw it, was to keep a pointless war from

threatening the peace and stability upon which British imperial interests depended.

Responsibility for the North's diplomatic efforts rested with Secretary of State William H. *Seward, a crafty and pragmatic politician who recognized the value of bluster in diplomacy. His sincere advocacy of a war against European intrusions in the Caribbean during the Fort Sumter crisis to revitalize southern Unionism shocked the diplomatic corps in Washington. Although Lincoln rejected the idea of a foreign war, Seward's actions during this critical period successfully fostered an image of American bellicosity that reinforced British and French caution in their dealings with the South.

The Union also benefitted immensely from the skill of the American Minister in Great Britain, Charles Francis Adams. His handling of affairs played a major role in settling a number of crises that threatened the Union war effort. The issue of slavery helped the North. Although European statesmen consistently approached the "American question" from a purely pragmatic standpoint, they and their constituents were unenthusiastic about supporting a nation founded in part to protect the institution of slavery.

In April 1861, however, Lincoln committed a grave blunder by declaring a *blockade, which, according to international law, implied the existence of a conflict between two independent states. Britain responded with a proclamation of neutrality—in effect implying belligerent status on the Confederacy. Seward responded with a harsh warning that further steps in favor of the South would lead to a serious breach in U.S.-British relations. In London, Adams toned down Seward's message without losing its essence, and obtained assurances from Palmerston that he had no present intention of recognizing the Confederacy. Although both the proclamations of neutrality and the blockade would remain sources of friction, the North, by fixing the British and French into noninterventionist positions at the outset, had won a major diplomatic victory.

When Lincoln issued his call for volunteers after Fort Sumter, he made it clear that the North was fighting solely for the Union. No effort would be made to molest Southern civilians, their property or institutions, nor would any attempt be made to abolish slavery where it then existed. The president adopted this position for two reasons. First, he realized he needed a broad coalition of support in the North for the war. Adopting radical war aims might alienate more conservative elements of public opinion, particularly in those slave states that remained loyal. Lincoln also believed that the vast majority of Southerners were lukewarm about independence and had been forced to accept secession by irresponsible political leaders. To declare war on Southern institutions would, Lincoln and most northerners feared in 1861, unite the white South behind secession.

The task of developing a military strategy to achieve these political goals fell upon Gen. Winfield *Scott, commander of all the Union armies. Scott put forth a two-part plan, dubbed the "Anaconda" by the press, after the strangling snake, that represented both his and Lincoln's desire for an easy reconciliation between the sections. First, the Union navy would establish a complete blockade of the Southern states. Second, a combined army-navy force of 80,000 men would capture the Mississippi Valley. Cut off from the outside world, Scott believed economic pressure would lead Southerners to reassert their natural loyalty to

the Union with a minimum of bloodshed. Lincoln, however, felt Scott's plan would take too much time to implement and perhaps years to produce desirable results. Despite vigorous protests from many of his professional military advisers, Lincoln ordered an advance on the Confederate position near Manassas Junction, Virginia.

On 26 July 1861, the South won a close, but decisive, victory at the First Battle of *Bull Run (Manassas). A chastened Lincoln called Gen. George B. *McClellan to Washington and appointed him commander of Union forces around the capital. McClellan's magnetic personality, success building the Army of the Potomac, and record of military victories in western Virginia impressed the president. On 1 November 1861, McClellan replaced Scott as general-in-chief of the *Union army.

Rejecting the idea that large-scale fighting could be avoided, McClellan advocated taking the time to assemble, organize, and train an overwhelming military force to render Southern resistance futile. At the same time, he championed a lenient policy toward the South and slavery to make returning to the Union as attractive as possible. McClellan's operational strategy called for the main land offensive to be made in Virginia against Richmond, the Southern capital and industrial center. Supporting operations would be undertaken into East Tennessee to liberate the loyal population there and break the railroad that connected the eastern Confederacy with the west, and along the Mississippi River. Finally, McClellan wanted the navy to establish enclaves along the Southern coastline to support the blockade and pin down Confederate troops that might otherwise be sent to resist Union operations in Virginia.

In November 1861, however, only McClellan's Army was anywhere near ready to commence operations. To give Gen. Henry W. Halleck in Missouri and Gen. Don Carlos Buell in Kentucky time to organize their forces, McClellan decided to postpone offensive operations until the spring of 1862. By the time spring came, however, dissatisfaction with military delay had dramatically eroded McClellan's personal prestige with the Northern public and his relations with the President.

Among the sources of discontent with military inactivity in the winter of 1861-62 was a crisis in U.S.-British relations. In November 1861, a British mail steamer, the *Trent*, was stopped by a Union warship that took into custody two Confederate emissaries, James Mason and John Slidell. The Palmerston government was enraged, and quickly made it clear that if the Lincoln administration did not apologize and release Mason and Slidell, there would be serious consequences. To bolster the threat, the British began active military preparations in Canada. After several tense weeks the Lincoln administration backed down and surrendered the two emissaries in late December.

Responsibility for the formation of Southern military strategy fell upon President Davis, a West Pointer, Mexican War hero, and former secretary of war. On the surface, the Confederacy's strategic problem appeared much simpler: Southerners merely had to offer sufficient resistance to convince the North it could not be conquered. However, geography and political factors imposed serious limitations on strategic planning. The location of the Confederacy's small industrial base and vital agricultural areas in the upper South ruled out the adoption of a Fabian strategy. Such a strategy would also have placed the institution of slavery at risk, as the sight of Union armies marching

through the South would have undermined the moral authority of the master class and served as a haven for runaway slaves. Perhaps even more important than these material considerations in shaping Southern strategy was a too widely espoused belief that as a point of honor the Confederacy should defend every inch of its soil.

Also widely espoused was a belief that Europe's voracious appetite for cotton would compel intervention. Although not officially sanctioned by the Confederate government, Southerners imposed an effective embargo on cotton exports to increase demand for the crop overseas. "King Cotton diplomacy" proved a disastrous failure, however. Bumper crops in 1857-60 had left British mills with more than enough cotton to process for an already satiated market. By the time the lack of cotton might have seriously affected the British economy, alternative sources in Egypt and India had been developed, and they more than made up the difference. Furthermore, poor harvests during the first two years of the war increased European demand for Northern food crops, making King Corn as important to European statesmen as King Cotton.

In January 1862, Confederate forces west of the Mississippi, under the command of Gen. Albert S. Johnston, held a badly overextended line that stretched from Columbus, Kentucky, on the Mississippi River to Mill Springs in eastern Kentucky. At the center of the line stood Fort Henry on the Tennessee River and Fort Donelson on the Cumberland. In February, both fell to a joint army-navy force commanded by Gen. Ulysses S. Grant. This opened the Confederate heartland to invasion. With his flanks exposed by the penetration of his center, Johnston abandoned Kentucky and most of Tennessee. The industrial center of Nashville fell, and Union forces moved quickly up the Tennessee and Cumberland Rivers.

Political pressure and a belief that the burden of simultaneously serving as field commander and general in chief was too much led Lincoln to remove McClellan from the latter post in March 1862. Lincoln named no replacement, and instead intended to perform the functions of general in chief himself. He did, however, combine the western departments and appoint Henry Halleck as their overall commander. Upon assuming this position, Halleck decided to concentrate his forces for an operation against the strategic rail point at Corinth, Mississippi. Before Halleck could complete his concentration, Johnston, on 6 April 1862, attacked unprepared Union forces under Grant near Shiloh Church by the Tennessee River. Grant's army managed to hold on despite extremely heavy losses, and, reinforced by forces under Buell, launched a successful counterattack the next day. The Confederates retreated to Corinth, having lost the Battle of *Shiloh; Johnston, who had been mortally wounded; and their bid to reverse Southern fortunes in western Tennessee.

In March, McClellan launched a combined navy-army campaign from the lower Chesapeake Bay. After a month-long siege before Yorktown, McClellan commenced a steady advance toward Richmond in the Peninsular Campaign. By early June, the Army of the Potomac was within ten miles of the Confederate capital, and the end of the rebellion appeared at hand.

But then two men emerged who would transform the war in Virginia, Gen. Robert E. *Lee and his lieutenant, "Stonewall" * Jackson. They recognized that if the Confederacy remained wholly on the defensive and continued to

concede the strategic initiative, it would inevitably be crushed by superior numbers. To prevent this, they decided to seize the initiative by assuming the strategic and tactical offensive while attempting to defend the South.

It has been argued that Lee's aggressive strategy led him into tactical blunders and high casualties that bled the Confederacy white. Clearly, in retrospect, the ultimate objective of an offensive strategy, the destruction of the opposing army in battle, was a practical impossibility given the size and firepower of Civil War armies. Yet Lee recognized that if the South could only frustrate Northern military operations until the 1864 elections, the Northern public might replace the Lincoln administration with one more amenable to Southern independence. In May and June 1862, Jackson, with Lee's active support and encouragement, conducted a brilliant campaign in the Shenandoah Valley that induced the Lincoln administration to hold back reinforcements from McClellan's army. Lee then called Jackson's force to Richmond, and took the offensive. In the *Seven Days' Battle of 25 June-1 July 1862, McClellan responded to Lee's and Jackson's attack by conducting a successful fighting retreat to a new position on the James River.

The setback on the Peninsula and the tremendous casualties suffered by McClellan and by Grant at Shiloh had a profound effect on Northern opinion. Until the Seven Days' Battle, Lincoln had resisted calls for a more radical approach out of fear that it would stimulate Southern resistance. In July 1862, however, Lincoln saw little evidence that the conservative policy was convincing many southerners to lay down their arms. Lincoln also perceived a hardening of Northern public opinion, and began moving toward a more radical position on the war. In July, he read to his cabinet a draft of a proclamation emancipating the slaves in the Confederacy, but was persuaded to await a military victory before issuing it.

To achieve that victory, Lincoln organized a new army in Virginia and placed it under the command of John Pope, who issued a series of orders promulgating a tougher policy toward Southern property and civilians. Next, Lincoln restored the position of general in chief and appointed Halleck to the post. Finally, Lincoln then, through Halleck, ordered McClellan's army back to Washington to unite with Pope's forces. But Pope proved no match for Lee. In a brilliant campaign, Lee forced Pope back to the old battlefield of Bull Run before all of McClellan's army could join him, and, on 29-30 August 1862, won a crushing victory at the Second Battle of *Bull Run.

Lee then decided to cross the Potomac River into Maryland. Lee did this hoping to feed his army in Maryland rather than Virginia, recruit Marylanders into his army, and win a decisive victory on Union soil that would bring the North to the peace table. Lincoln reluctantly restored McClellan to command. The speed with which McClellan got his army reorganized and on the march surprised Lee, who had divided his army, and allowed the Federal commander to seize the strategic initiative. Compelled to abandon his plan of pushing into Pennsylvania, Lee reconcentrated his army near Sharpsburg, Maryland. There, on 17 September 1862, the two armies fought the battle of *Antietam, the bloodiest single day of combat in American military history. Although McClellan and his subordinates mismanaged the battle and failed fully to commit their superior forces, Lee was forced to return to Virginia.

While Lee was in Maryland, Confederates under Gen. Braxton *Bragg were on the offensive in the West. After the capture of Corinth, a force under Buell was pushed east toward Chattanooga and East Tennessee. To counter this, Bragg decided to seize the strategic initiative by invading Kentucky. The invasion began well, but a drought that had plagued Buell's advance on Chattanooga also took a severe toll on Bragg's army and slowed its advance, giving Buell time to return to Kentucky. The two armies met in the Battle of *Perryville, Kentucky, on 8 October 1862. Neither side gained a decisive victory, but Bragg, with his supply line overextended, was compelled to retreat to Tennessee.

Confederate victories in the summer of 1862 reinforced the Palmerston government's conviction that the Union could not be restored. Furthermore, suffering among British textile workers was increasing as the lack of cotton started to pinch. Consequently, after Second Bull Run, Palmerston began to seriously ponder an effort to bring the North and South to the negotiating table. It was hoped that an offer of mediation that did not explicitly recognize Confederate independence, would be amenable to the North now that the impossibility of the task of conquering the South had been proven. To facilitate the process of bringing the combatants to the table, the British sought partners in the venture abroad. France, although facing a crisis in Italy, had long been sympathetic to the Southern cause. But Russia, a staunch supporter of the north, was much cooler to the proposal for mediation.

On 22 September 1862, Lincoln finally issued his Preliminary *Emancipation Proclamation expecting that it, in combination with the victory at Antietam, would demonstrate both the Union's ability to achieve success on the battlefield and, by making the war one between slavery and freedom, destroy British interest in intervention. He was wrong on both counts, at least in the short term. The stalemated condition of the war after Antietam seemed only to demonstrate that even if the North could win battles, it could never do so in so overwhelming a fashion as to conquer the South, and that some form of outside intervention was necessary to stop the war. More importantly, the Palmerston government feared the Emancipation Proclamation would incite slave insurrections in the South and make restoration of a stable political, social, and economic environment in North America impossible. Consequently, Palmerston allowed members of his government to seriously discuss an armistice plan put forward by France.

Republican defeats in the 1862 congressional elections, however, were not significant enough to suggest the North's commitment to military victory had eroded to the point where an offer of mediation would be accepted. If Britain was to bring the North to the negotiating table, clearly there would have to be some coercion involved. At this point Secretary of War George Lewis brought a memorandum before the cabinet. Lewis shared Palmerston's view that the Union could not be restored by force of arms, and that the purpose of the Emancipation Proclamation was to foment servile insurrection in the South. Yet in his memorandum, Lewis concluded that the South had yet to earn recognition. More importantly, Lewis gave a pessimistic assessment of Britain's ability to compel the North to accept an armistice or develop a workable solution that both sides would accept. Lewis's arguments carried the day. The British pulled back, and the crisis ended.

After Antietam and Perryville the Union high command

attempted to impose an element of coordination among its main armies. In December, major operations were undertaken by Union armies at *Fredericksburg in Virginia, Chickasaw Bayou in Mississippi, and Murfreesboro in Tennessee. Neither side achieved a decisive success, however, and as 1862 ended, the war settled into a stalemate.

The armies went into winter quarters and the Union high command adjusted its overall strategy. In Halleck, Lincoln had a man who would carry out his wishes without the acrimony and conflict that had characterized his relationship with McClellan. Halleck helped shape Lincoln's strategic thought and translated the president's wishes into military strategy. Both agreed that in making the Confederate capital the main target of strategic planning, McClellan had given insufficient priority to the security of Washington. They decided the Army of the Potomac would operate along the overland route with its focus more on defending Washington and neutralizing Lee's army than capturing Richmond. As long as it did not uncover Washington, the Army of the Potomac was to keep Lee's army busy to prevent it from detaching forces to reinforce Confederate armies in the west, and, if possible, catch Lee in a tactical or strategical mistake. Although willing to accept the prospect of stalemate in Virginia, Lincoln understood that Lee's aggressive generalship had offered an opportunity in Maryland to achieve a decisive *victory. Such an opportunity might come again.

With the shift to a defensive strategy in the east and the change in Northern war aims, operations in the west took on greater importance and received greater priority. Halleck and Lincoln recognized that the adoption of emancipation as a war aim raised the stakes for the Confederacy, and dramatically reduced the chances for a quick end to the war. Despite its political, psychological, and material importance to the Confederacy, simply capturing Richmond would not end the rebellion. The entire South would have to be conquered. Halleck and Lincoln gambled that the Union armies could either win the war by 1864, or at least gain enough victories in the west to sustain popular support for the Lincoln administration and ensure its reelection that year.

By 1863, the Union had established control of the entire Mississippi Valley except for a stretch between Vicksburg, Mississippi, and Port Hudson, Louisiana. A Union army-navy expedition in 1862 had reached Vicksburg, but had been unable to take the town. In the summer of 1863, Grant, in a brilliant campaign, captured that fortified city commanding the Mississippi. Marching overland on the Louisiana side, and crossing the Mississippi below town, Grant moved quickly inland, drove off a force sent to assist the army defending Vicksburg, then turned back toward the town. After victories at Champion's Hill on 16 May and the Big Black River on 17 May, Grant drove the Confederate army back into the defenses of Vicksburg. On 4 July 1863, after a month-long siege, Vicksburg surrendered, followed by Port Hudson less than a week later; thus allowing the Mississippi, in Lincoln's words, to flow "unvexed to the sea." The Confederacy was divided in two.

After the Union defeat at the Battle of Fredericksburg, Lincoln appointed Gen. Joseph *Hooker commander of the Army of the Potomac. Hooker did a magnificent job reinvigorating the army, but in the field he proved no match for Lee and Jackson. In his tactical masterpiece, although outnumbered two-to-one, Lee won a brilliant vic-

tory at the *Chancellorsville, Virginia in May 1863. The victory came at a tremendous cost, however. Jackson died after being accidentally shot by his own men.

Lee then embarked on another invasion of the North, this time into Pennsylvania. Lincoln recognized that Lee's action provided a second opportunity to catch the rebel army far from its base and administer the crippling blow McClellan had failed to deliver at Antietam. Having lost faith in Hooker, Lincoln replaced him with Gen. George Gordon *Meade on 30 June 1863. Two days later the armies came into contact near Gettysburg, Pennsylvania. For three days—1-3 July 1863—Lee attacked the Union army in quest of decisive victory. Meade held his ground and the rebel army was compelled to return to Virginia. It had suffered such severe losses at the Battle of *Gettysburg that it would never be the same again. The war in the east returned to a state of stalemate, with the two armies engaging in a war of maneuver that produced no major results.

Gettysburg and Vicksburg greatly diminished Southern prospects overseas. Beginning in 1863, the North's campaign to prevent intervention also benefitted from Great Britain and France's preoccupation with events in Europe, including the Polish insurrection of 1863 and the controversy over Schleswig-Holstein in 1864. Yet in violation of the *Monroe Doctrine, the French government of Napoleon III, in 1863, took advantage of the U.S. Civil War to install a puppet regime in Mexico under Emperor Ferdinand Maximilian. Confederate agents offered to recognize the new Mexican government in exchange for French recognition of Southern independence. Napoleon, however, remained unwilling to do this without Britain.

The French enterprise in Mexico did not go unnoticed by the Lincoln administration. After the capture of Vicksburg and Port Hudson, Nathaniel Banks was directed to conduct operations in the Trans-Mississippi West, in part to capture cotton in that region, but also to show the flag. Although a campaign along the Red River in Louisiana failed, Banks was able to occupy Brownsville, Texas. After Lee's surrender at Appomattox in April 1865, the federal government sent 50,000 soldiers to the Mexican border. But by then Napoleon had already begun scaling back his enterprise. In 1867, the French misadventure collapsed, and Maximilian was executed by the Mexicans.

The most serious controversy on the diplomatic front during the last two years of the war was prompted by the efforts of Confederate Secretary of the Navy Stephen Mallory to obtain ironclad ships in Europe to break the Union blockade. The British government facilitated this enterprise by applying a narrow interpretation of a law that prohibited the construction and arming of warships in British territory. The Southern agent, James D. Bulloch, exploited this loophole by arranging for ships to be built unarmed in Britain, whence they would be sent to the Bahamas to complete construction. In 1862, Bulloch was able to acquire the steam and sail "cruisers *Florida* and *Alabama*"; both would enjoy productive careers as commerce raiders.

Bulloch then contracted with the Laird firm in Britain for two new vessels with rams to break the blockade. As they neared completion in the summer of 1863, Union minister Adams issued a series of hotly worded protests to the British Foreign Office warning of the consequences of allowing the ships to be released. Palmerston resented the tone of Adams's protests, but, with the Polish insurrection threatening the peace of Europe, could not afford a conflict

with the United States. In September, his government ordered the detention of the ships.

In addition to its diplomatic triumphs, the Union achieved a second major military objective in 1863, the occupation of East Tennessee. That summer Union Gen. William S. Rosecrans conducted a brilliant campaign of maneuver and seized East Tennessee without a fight. After pausing briefly at Chattanooga, Rosecrans pushed on into Georgia. In September Bragg brought the Confederate retreat to a halt, and, his force augmented by reinforcements from Virginia, prepared a counterstroke to crush one of Rosecrans's three widely separated wings. Rosecrans awakened to the danger in the nick of time and quickly re-concentrated his army near Chickamauga Creek. However, a blunder by one of Rosecrans's subordinates allowed the Confederate army to win a smashing victory on 20 September 1863. Instead of following up his victory at the Battle of *Chickamauga with a vigorous attack, Bragg decided to lay siege to the Union army in Chattanooga. Washington reacted to the crisis by placing Grant in command of all Union forces west of the Appalachian Mountains, and sent him two corps from the Army of the Potomac. After reestablishing a secure line of supplies, Grant smashed the Confederate line at Lookout Mountain and *Missionary Ridge near Chattanooga on 24-25 November 1863.

In early 1864, Grant was called to Washington and promoted to general-in-chief. Grant appointed Gen. William Tecumseh *Sherman to replace him as overall commander in the western theater, and assigned him the task of bringing Bragg's army, now under the command of Gen. Joseph E. *Johnston, to battle by campaigning against Atlanta. Grant would accompany Meade's army as it campaigned against Lee. Supporting movements would be made in the Shenandoah Valley and along the James River. To prevent the Confederacy, as it had at Chickamauga, from exploiting its interior lines, the Union armies would all begin their campaigns at the same time.

On 4 May 1864, the Army of the Potomac began its sixth campaign against Richmond. Over the next few weeks the Virginia theater endured the bloodiest month of the war, as the two armies fought the Battle of the "Wilderness and the battles at *Spotsylvania, the North Anna River, and *Cold Harbor. Grant continually maneuvered in an effort to force Lee out of his entrenchments. Lee successfully countered all of Grant's moves, leading the Union commander to adopt a strategy of attrition. Willing to accept tremendous casualties, Grant, by pinning Lee in his entrenchments, made it impossible for the rebel commander to attempt another of the brilliant counteroffensives that had disrupted earlier Union campaigns.

After a futile attempt to break Lee's lines at Cold Harbor, Grant crossed the James River in June 1864, bypassing Richmond in hopes of seizing Petersburg and the railroads supplying Lee's army. When commanders on the scene failed vigorously to attack the lightly guarded town, Lee was able to bring his army down to defend Petersburg. The armies then settled into the Siege of *Petersburg, a campaign of siegecraft that presaged the trench warfare of World War I. Throughout the fall and winter of 1864-65, Grant continually extended his left flank to the west, one by one seizing the railroads leading into Petersburg and inexorably forcing Lee to stretch his lines ever more thin.

Meanwhile, after a several-weeks campaign of maneuver, Sherman's army reached the outskirts of Atlanta in

July 1864. However, he had not “bagged” Johnston’s army, nor did the town’s capitulation appear in any way certain. Northern morale plummeted as Grant and Sherman’s grand offensive, which had begun with such promise, bogged down in frustrating and bloody stalemate before Petersburg and Atlanta.

But Confederate leaders were not encouraged by the situation. Uncomfortable with the idea of allowing Grant and Sherman to maintain their grip on Petersburg and Atlanta, they decided to take the offensive. Realizing Grant’s army was too strong for them to attack directly, Confederate leaders sent a force under Gen. Jubal Early on a raid in the Shenandoah Valley. In the west, the cautious and defensive-minded Johnston was replaced on President Davis’s orders by Gen. John Bell *Hood, an aggressive young corps commander. Early reached the outskirts of Washington, but, after Grant sent back a full army corps to defend the capital, Early was forced to return to the valley. The Union forces around the capital and in the valley were then organized into a single force under the command of Gen. Philip H. *Sheridan. Sheridan then pursued Early into the Shenandoah Valley, winning battles at Winchester, Fisher’s Hill, and Cedar Creek in September and October 1864. Sheridan then undertook a campaign to destroy the valley, burning crops and any other resources that could be of use to the Confederate war effort.

In Georgia, Hood launched a series of costly and unsuccessful attacks on the Union army during the last week of July 1864. Afterwards, the Confederate army retreated to the defenses of Atlanta, but was forced to abandon the town in September 1864. The fall of Atlanta, combined with Sheridan’s victories in the Shenandoah Valley, and a victory by naval forces under David *Farragut at *Mobile Bay in August, reinvigorated Northern morale and set the stage for Lincoln’s reelection that November.

Sherman then obtained Grant’s approval for a type of operation the two had been experimenting with for some time—large-scale raids using army-size forces. Recognizing that Southern civilians and their resources were as important as Southern armies in sustaining the rebellion, Sherman made them the objective of his campaign. The famous (or infamous, depending on one’s viewpoint) *Sherman’s March to the Sea cut a sixty-mile wide trail of destruction through Georgia. Not only was severe damage inflicted on Southern resources, but the fact that the North could morally and materially undertake such an operation had a severe impact on Confederate morale.

After reaching the coast at Savannah, Georgia, in December 1864, Sherman turned northward to join Grant for the final battle of the war. That same month, a desperate attempt by Hood to invade Tennessee ended with the destruction of his army at the Battles of *Franklin and *Nashville. Johnston was restored to command to resist Sherman’s movement through the Carolinas, but lacked the resources or manpower to be effective. Before Sherman could reach Virginia, Grant captured the last Confederate supply line at the Battle of Five Forks on 1 April 1865. Lee evacuated Richmond and Petersburg and made a bold attempt to link up with Johnston. Grant cut off Lee’s retreat near a small crossroads town called Appomattox, Virginia. There Lee surrendered on 9 April. A few days later, Johnston surrendered to Sherman at Raleigh, North Carolina. With the surrender of the two major field armies resistance throughout the South ended despite the pleas of President

Davis. The war was over, and with the sectional conflict finally settled, the United States was free to complete the task of conquering the continent and move toward realizing its destiny as one of the great nations of the world.

CIVIL WAR (1861-65): DOMESTIC COURSE

In the days following the capture of *Fort Sumter, few Americans anticipated a lengthy conflict. President Abraham *Lincoln responded to the crisis by calling for 75,000 90-day volunteers, reflecting his confidence that the war would not last the summer. But, of course, such optimism proved ill-founded. By any measure, the next four years would be the bloodiest in American history. How did the men and women on the home front respond to the war’s enormous challenges?

In some fundamental ways, the North and the South faced very similar situations in April 1861. The outbreak of open hostilities, after months of uncertainty and division, prompted most citizens above and below the border states to “rally round” their flag. Town dignitaries delivered bellicose speeches with puffed chests; editorials urged readers to new patriotic heights; bands blared. Military recruiters had no trouble obtaining volunteers in such an atmosphere; those who persisted in dissent generally maintained a judicious silence.

The Union and the Confederacy also faced comparable obstacles. Neither side was remotely prepared to fight a major war. The federal army only numbered about 16,000 men. The Confederacy had to start with nothing, although it did have the advantage of a more military-oriented population, including compulsory military service and a disproportionate share of the nation’s *Mexican War veterans. And despite all the excitement, mid-nineteenth-century Americans had little familiarity with—and less enthusiasm for—the sort of activist central government a long war might require. These similarities notwithstanding, both sides went to war with dissimilar material and human resources. Moreover, the Confederate government was constructed in a society committed to states’ rights and lacking a functioning two-party system. Such differences helped

mold distinctive patterns of wartime * mobilization, and as the war dragged on, they created quite different home front experiences.

Manpower. At the outset, mobilization in both North and South took on an almost carnival air. Young men rushed to volunteer for hastily organized companies, anxious to get in on the glory while there was still time. Before long, both sides discovered that they could no longer rely on such unfettered passion, and thus they turned—in stages—to various strategies initially to coax young men into *uniform in the *Union army or the *Confederate army. The North enjoyed a huge numerical advantage. The free Union states had a total population of 19 million; the slaves states that stayed with the Union—Delaware, Kentucky, Maryland, and Missouri—added another 3.2 million, although that number included many Southern sympathizers. The eleven Confederate states totaled just over 9 million people. These numbers understate the Union's numerical superiority by including the Confederacy's 3.5 million black slaves, who were central to the Southern economy and war effort but not deemed fit for military service. Furthermore, roughly 800,000 foreign immigrants arrived in the North during the war.

Both central governments initially relied on the states and localities to orchestrate recruiting. When Abraham Lincoln and Jefferson *Davis called for volunteers, each state received a quota to fill. By the time the three-month recruits were returning home in late summer 1861, the North had issued calls for three-year volunteers that yielded more than 700,000 men. The infant Confederacy had already requested 100,000 men before the capture of *Fort Sumter in April and added another 400,000 the following month.

With winter approaching and the most willing recruits already in uniform, the Confederate Congress offered bounties and furloughs to convince volunteers to reenlist. In April 1862, the Confederacy passed the first national draft legislation, making white men between ages eighteen and thirty-five eligible for *conscription. The North was not too far behind. In June 1862, Lincoln called for 300,000 more three-year volunteers. When the citizenry responded slowly, Congress passed the Militia Act giving state governors the power to draft men. That August, the Union implemented this new legislation by requisitioning 300,000 nine-month militiamen, with the provision that states failing to meet their quota would be subject to a draft. In March 1863, the North replaced the controversial state militia drafts with federal conscription measures that were more on a par with the Confederacy's system.

The initial conscription legislation in both the Union and the Confederacy provided military-aged men with ample opportunities for avoiding service. In addition to excluding men with certain disabilities, the Confederate legislation exempted a long list of professions, ranging from political and judicial officers to teachers and clergymen to workers in war-related occupations. A later act exempted one white man from every plantation with twenty or more slaves. Each of these provisions could be defended in the name of military necessity or domestic stability, but together they triggered angry complaints of class legislation from nonslave owning Southern whites. The North's federal draft act had no occupational exemptions, but it did exclude men with numerous medical ailments or certain family obligations, as well as unnatural-

ized aliens. Most controversial were the provisions enabling wealthier conscripts simply to buy their way out of service. Following long-standing European tradition, both sides allowed draftees to send substitutes in their place, the North permitting conscripts to pay a commutation fee of \$300 (an amount equal to a worker's annual wages) rather than serving.

As the war dragged on, the Confederacy was forced to widen its conscription net. The list of exemptions gradually shrank; the Southern Congress repealed the substitute clause and made all those who had furnished substitutes eligible for the draft; and the age parameters expanded to include white males between seventeen and fifty. The more populous North tinkered with its rules but made fewer substantial revisions other than restricting the controversial commutation clause to members of certain religious groups. (As many had feared, this resulted in a steady increase in the market price for substitutes.)

Despite the superficially similar rules, conscription played different roles in the two nations. Only about eight percent of Union soldiers were conscripts or substitutes. The four federal drafts were really designed to encourage enthusiastic local recruiting rather than to put conscripts into uniform. The Union army's provost marshal general announced draft days long in advance, giving communities every opportunity to fill their quotas and avoid a draft. Cities and towns responded by raising large bounty funds—which supplemented existing federal and state bounties—to encourage enlistment. The poorer South soon exhausted funds available for enlistment bounties, limiting the effectiveness of pre-draft recruiting. Roughly one in five Confederate soldiers was either a draftee or a substitute.

In 1863, the North tapped a further manpower advantage when it decided to accept * African Americans in the military. Blacks had served in both the * Revolutionary War and the *War of 1812, but black enlistment was prohibited in 1820. Many Northern blacks offered their services to the Union, but for long months racist assumptions about the ability of African American troops and political qualms about the costs of arming black volunteers conspired to keep black men out of uniform (although thousands did serve in the navy). The 1862 Militia Act allowed Lincoln to accept black volunteers, but it was not until after the 1 January 1863 *Emancipation Proclamation that the North aggressively recruited black volunteers. By the end of the Civil War, 179,000 African American men had served in 166 black regiments of the U.S. *Colored Troops. The North commissioned few black officers and persisted in giving black regiments inferior wages, equipment, and assignments. In the war's waning months the Confederate Congress voted to accept black soldiers, but this legislation was passed too late to be tested in practice.

By the end of the war, roughly half of the North's military-aged white men had served in uniform, as compared with nearly four-fifths of Southern white males of military age. Some critics at the time and some later historians charged that the war became "A Rich Man's War But a Poor Man's Fight," yet comparisons of the occupational distribution of sampled soldiers with data from the 1860 census indicate that both armies were surprisingly representative of the white male populations. The Northern army was also not, as sometimes suggested, dominated by foreign

mercenaries; immigrants were actually underrepresented in the Union ranks.

Economic Mobilization and Its Effects. The North enjoyed enormous economic advantages over its weaker adversary. In 1860, roughly 90 percent of the nation's manufacturing output was from the Northern states. The Union's economic superiority was particularly pronounced in key war-related sectors, such as textiles, boots and shoes, iron, and firearms. Moreover, the North had a near monopoly in railroads and shipping. The agrarian South was even behind its Northern neighbor in some critical foodstuffs. In 1860, Northern agriculture was producing half the nation's corn and four-fifths of its wheat.

With a few key exceptions, the Union was able to outfit its armies through private contracting rather than establishing federally owned factories. Unlike modern conflicts, this war did not call for the vast production of uniquely military goods. Most of the items needed to feed, outfit, and arm a soldier could be provided by existing farms and factories; a few government arsenals produced the rest. Lacking an established industrial base, the Confederacy found itself in far more challenging circumstances.

Here was one of the war's many ironies. Whereas the Union could rely on private enterprise, the states' rights-oriented Confederacy was forced to build nationally owned factories, subsidize private enterprises, regulate prices, and impress goods and services (including slave labor) to meet the war's economic needs. With the passage of time, the South's economic deficiencies became more glaring. The Union blockade limited Confederate access to foreign ports, and the North's military successes destabilized portions of the Southern economy. Above all, Southerners learned to reuse materials where they could and to manage with less wherever possible.

The Northern war effort cost an estimated \$2.3 billion; the smaller Confederacy spent roughly \$1 billion. As he developed strategies to fund the war, U.S. Secretary of the Treasury Salmon R. Chase had a host of advantages over his Confederate counterpart, Christopher G. Memminger. In many senses, the fiscal history of the war runs parallel to the mobilization of the armies, with both sides employing similar strategies tailored in distinctive ways to meet their individual needs. The wealthier North funded most of its costs through the sale of interest-bearing bonds. These bonds, sold largely under the enthusiastic direction of Philadelphia banker Jay Cooke, enabled the Union, effectively, to "borrow" roughly two-thirds of its military expenses from its own citizens or from foreign investors. The North covered an additional 20 percent of its expenses through a assortment of import duties and taxes, including a modest federal income tax. It paid for the war's remaining costs by issuing "greenbacks," printed notes not backed by specie or any precious metal.

This new currency, which was authorized by the Legal Tender Act of 1862, proved crucial to the smooth functioning of the wartime economy while passing on part of the war's costs to consumers in the form of relatively high inflation. The South, with less disposable wealth and a poorly developed financial structure, could fund only about 40 percent of its costs through taxation and the sale of bonds. Instead, the Confederacy had to rely on massive issues of paper money, triggering a disastrously high inflation.

The war's economic strains fell unevenly on different groups across the home front. The booming Northern

economy assured low unemployment, but soon wage earners chafed at the burden of rising prices. The more skilled urban artisans managed to organize and negotiate comfortable raises; the less skilled, including scores of women who worked for unscrupulous military subcontractors, for example, in the manufacture of "uniforms," suffered through declining real wages. Federal forces only intervened in a handful of labor conflicts, and then only under the guise of claimed military necessity. Heavy wartime demands for food, poor European harvests, and disproportionately high enlistment rates among agricultural workers combined to produce a variety of results: unusually high profits for farm owners; increased wages for the agricultural workers who remained at home; and unprecedented investment in agricultural machinery. Women and men on the Confederate home front felt the war's economic pains even more acutely. By mid-1863, the combination of high prices and food shortages had driven many Southerners into open dissent. In April, an angry mob composed largely of women destroyed much of Richmond's shopping district after their appeals for relief from inflated food prices had gone unanswered.

Richmond's "bread riots" underscored the war's effect on women and children on the home front. In the prosperous North, some benevolent institutions reported proportionally greater demands from women, perhaps reflecting the combined weight of more economic opportunities for male workers and soldiers and the loss of family income when men fell on the battlefield. Cities and towns across the North collected special funds for the "families of volunteers," providing much needed relief while adding further incentives to reluctant enlistees. Southern women bore the brunt of the Confederacy's economic ills without much opportunity for relief. When private charities ran dry, Southerners turned to unprecedented public welfare measures, at the local, state, and national levels. But inflation, inefficiency, and overwhelming numbers conspired to limit the effectiveness of these initiatives.

For some women, the Civil War's economic challenges brought new opportunities. Although the Union's military demands did not produce an army of nineteenth-century factory women, the war did accelerate the movement of Northern women into positions as clerks, teachers, and nurses. In both the North and the South, white women took on expanded agricultural roles when white men left for the front. This was particularly true in the Confederacy, where women often acted independently of any male influence. Wartime necessity also forced Southern women into new positions, but they continued to run up against cultural barriers. The North, for instance, proved more receptive to the use of female nurses.

For Southern blacks, there was no such ambiguity. Long before the war ended, hundreds of thousands of slaves had won their freedom. The story of wartime emancipation reflects the complexity of national, local, and individual forces. As official Northern policy slowly inched its way toward Lincoln's Emancipation Proclamation, which took effect 1 January 1863, individual slaves responded to their own circumstances, pursuing freedom when absent masters or approaching Union troops provided the best opportunities. Many of these freed slaves remained in the South, finding refuge behind Union lines, while others fled to the North. The process of piecemeal emancipation left much of the Southern agricultural economy in disarray

while laying the groundwork for various wartime experiments with the ramifications of free labor.

Politics and Dissent. Four years of war produced serious strains on domestic politics in both the Union and the Confederacy. In most fundamental ways the Confederate leaders modeled their new constitution and government after the nation that they had abandoned. After all, the seceding states had insisted that they were the true heirs to the founders of the republic. Beneath the structural similarities, however, lay important political differences. Whereas Lincoln entered a political arena with a strong two-party system, Davis presided over a nation that would be torn by factionalism but without any party mechanisms to register (and control) dissent. Moreover, many of the Confederacy's leaders had worked during the antebellum decades as political dissenters, resisting perceived challenges to states' rights.

From his first days in office, Lincoln had to navigate between the radical Republicans in his own party, such as Thaddeus *Stevens, and an increasingly vocal array of dissenting Peace Democrats. The relative unanimity that followed the outbreak of hostilities quickly dissolved as Northerners debated a series of controversial war measures including the *Habeas Corpus Act, conscription, greenbacks, and, above all, emancipation. Even Unionist War Democrats in Washington and across the North criticized policies that they claimed enacted an unconstitutional Republican agenda.

The administration countered with aggressive measures to silence the most dangerous dissent, the Peace Democrats. Soon after the capture of *Fort Sumter, Lincoln ordered the suspension of the writ of habeas corpus in the border states. This set in motion a critical series of events in Maryland: military authorities threw several prominent local figures, including wealthy secessionist John Merryman, in jail; in *Ex Parte *Merryman* (1861), U.S. Supreme Court Chief Justice Roger Taney of Maryland responded by ordering Merryman's release; and Lincoln refused to yield, leaving it to history to judge his actions. The following year, with the state militia drafts underway, federal officials arrested several hundred vocal draft resisters and five dissenting newspaper editors while suspending publication of several opposition newspapers. By 1863, the Northern "Copperheads"—the antiwar wing of the Democratic Party—had won important strongholds across the Midwest and in some areas of the East. In May, Maj. Gen. Ambrose *Burnside ordered the arrest of dissenting Ohio congressman Clement L. *Vallandigham, triggering another round of angry outbursts.

As the election of 1864 approached, Lincoln had every reason to fear that he would lose to the Democratic challenger, Maj. Gen. George B. *McClellan. McClellan, long a thorn in the president's side, had repeatedly criticized emancipation, the loss of civil liberties, and Lincoln's overall handling of the war. When the votes were counted, Lincoln had managed to garner 55 percent, aided by Gen. William Tecumseh *Sherman's recent successes in the South and the overwhelming support of absentee ballots from the Union Army.

Historians have often compared Lincoln with Jefferson Davis, generally finding the Confederate president lacking. The South's material disadvantages forced Davis into a series of measures that dramatically expanded the central government while placing him in the center of controversy.

This process of central government growth, which Emory Thomas (1979) has termed a "political revolution," included the continent's first draft legislation, impressment of goods and labor, the suspension of civil liberties, and a wide range of ventures into economic control. Davis faced heated opposition from strong-minded state governors as well as attacks from much closer to home, often led by his vice president, the surly Georgian Alexander Stephens. Davis, like Lincoln, used his authority to declare martial law in sensitive areas, but civil liberties for whites may have in fact fared better in the Confederacy (for instance, freedom of the press survived unscathed in the South).

Much of the most rigorous wartime dissent was voiced beyond the boundaries of normal political discourse. Northerners fretted over secret societies, such as the notorious Knights of the Golden Circle, which reputedly conspired against the Union. Portions of the nonslave hill country and mountain region in the South remained bastions of pro-Union sympathy throughout the conflict. The North's worst internal violence followed tension-filled conscription days, but often reflected broader tensions. In July 1863, disgruntled conscripts attacked a draft office, triggering four days of *New York City antidraft riots, which led to much carnage. Many of the rioters were Irish immigrants who took out their hostilities on African Americans.

In addition to periodic food riots, portions of the Confederacy experienced violence at the hands of roving companies of guerrillas. Some of these groups had at least passing connections to formal military bodies, but others were little more than desperate bands of hungry deserters. Even where the South did not divide into open warfare, declining *troop morale eventually took a tremendous toll, inciting soldiers to flee the army and accelerating the demise of the Confederacy.

Supporting the War Effort. For most people on the home front, the "citizens' war" provided a wealth of opportunities to assist the war effort. In the North, women and men labored in a wide variety of voluntary societies designed to fill the gaps in the official governmental machinery. Local women's groups sewed clothing, rolled bandages, visited hospitals, fed traveling soldiers, and provided refuge for escaped slaves. Fund-raising concerts and fairs, modeled on antebellum practices, enabled the volunteers to mail packages off to distant soldiers. Two national bodies—the U.S. *Sanitary Commission and the U.S. Christian Commission—emerged to organize and direct some of these benevolent efforts. Confederate women threw themselves into war work with equal vigor. White women of all classes gathered at sewing circles to produce all manner of goods for the men in gray. As the Confederacy faced financial ruin, Southern women demonstrated their *patriotism by staging fund-raisers or sacrificing heirlooms. Even in its heyday, Southern voluntarism did not spawn bodies comparable to the North's national commissions, and long before the war had ended the South had exhausted whatever funds the volunteers could raise.

Civil War voluntarism raises important questions of gender for historians. Women in both the North and South earned widespread notice and praise for their "noble" wartime sacrifices. Sacrifice for larger benevolent causes was nothing new for American women, but the scale of wartime activities and the paucity of civilian men (at least white men in the South) enabled some women to go

beyond established practices. Southern historians—weighing the economic, political, and voluntaristic experiences of Confederate women—remain divided over how much, and for how long, the war opened the door to changing gender roles.

A few Northern women such as Clara *Barton rose to positions of national prominence, but the Sanitary Commission and the Christian Commission remained largely under male direction. Nevertheless, women in some communities (Chicago, for instance) took on unfamiliar authority, and the organizational skills and theories that scores of volunteers developed at the grassroots level proved crucial in molding the postwar activities of a key cohort of female activists. Overall, the conflict helped expand the range of experiences for many women while probably doing little to alter commonly held assumptions about "gender and war."

In addition to providing material and emotional assistance to the soldiers, home front volunteers sought to affect public opinion and otherwise contribute to wartime discourse. Most of the organized Civil War "propaganda" emerged from a handful of Northern publication societies. The first few years of the war saw the occasional printing of partisan pamphlets by interested individuals, a practice that had a long American tradition. In 1863, the Democrats raised the stakes with the establishment of the Society for the Diffusion of Useful Political Knowledge. Soon Philadelphia's Union League had countered with its own Board of Publications while the equally partisan Loyal Publication Society began operations in New York City. These, and a few other smaller bodies, flooded the North with millions of copies of several hundred political publications, many of which aimed to sway the electorate in 1864. Some authors wrote extremely sophisticated pamphlets, examining esoteric constitutional issues; others aimed their rhetoric at a broader, less educated, audience. Taken together, these Northern pamphlets provided members of the Union League and their antagonists with a crucial vehicle for reaching a broad audience outside formal party politics. So did patriotic songs such as "Dixie" and "Battle Hymn of the Republic."

Conclusions. The Civil War home front offers a host of perspectives. The military historian can find seeds of success and failure in the goings-on behind the lines. For instance, although the South was outmanned and outgunned, a strong case can be made that the Confederacy's fall owed much to the loss of civilian morale. Scholars of race, gender, and class have mined the war years for evidence of both changing relationships and stubborn continuities. Emancipation forever reshaped American race relations, but racial inequalities persisted in both the North and South. Although wartime women earned approval for their highly public patriotic efforts, suffragists had to wait three more generations for the vote. Economic historians have dismissed the notion that the war launched a "takeoff" into postwar industrial growth, while stressing the importance of emancipation in reducing Southern agriculture.

The political and institutional history of the home front is full of interesting ironies. Focusing on the North, it is tempting to tell a tale of Lincoln and the Republican Party using the pressures of war to promote sweeping national reform. After all, the legislative litany includes taxation, greenbacks, banking reform, conscription, and emancipa-

tion. But if we widen our lens to include the Confederacy—the bastion of militant individualism and states' rights—we find far more evidence of an expanded national state, including more aggressive conscription and a much greater federal role in economic affairs. In truth, both regions remained devoted to tradition and localism throughout the war. Jefferson Davis and the Confederacy went further than the Union in using the machinery of a central government to support the war effort, but only because conditions required it.

CIVIL WAR (1861-65): POSTWAR IMPACT

By their very nature, civil wars leave open wounds and unsettled scores behind. Despite the recently rejuvenated notion that the Civil War of 1861-65 created modern America, the legacy is far more ambiguous and complex. The war stifled the Confederacy's bid for national independence and destroyed the institution of slavery upon which it rested. The ensuing peace—specifically, the Radical *Reconstruction crafted by the Republican Party—reunited the nation economically and politically, yet did so on terms that not just the defeated Confederates came to resent. Small wonder that each generation has assessed the war through the prism of its own central political concerns.

The veterans from both sides were the first and probably the most partisan revisionists. On some points they found near unanimity: Northern "veterans believed they had saved the Union and given a new birth to freedom; Confederate veterans believed they had fought nobly for independence and might well have prevailed had their resources not given out. But both argued endlessly over the specifics.

The legions of popular and academic authors who have studied the war have discerned no clearer pattern of grand truths from the clutter of documented facts. Moreover, today, thousands of ordinary citizens not only retrace the soldiers' steps literally across preserved battlefields but claim expertise about the war as they do for no other event in U.S. history. Partly because of and partly in spite of this interest, attempting to understand the long-term impact of the Civil War has produced as much conflict as consensus.

From a strictly military standpoint, the war appears to many historians as the first modern war. A technological explosion around midcentury accounted for such innova-

tions as rifled small arms and ordnance, armor-plated steam vessels, and primitive "machine guns and *submarines. Corresponding changes in *transportation and "communications helped make the Civil War more like World War I than *Napoleonic warfare. Yet old-fashioned tactics retained grisly currency, and both armies depended upon animal power—mules for supply and horses for tactical mobility—to the very end. Clearly, this was a transitional time wherein elements of the old and the new were mixed.

In its unprecedented requirements for men and goods, the Civil War called forth novel administrative skills and structures. The Confederate central government took a commanding role in these affairs, largely due to the comparatively underdeveloped industrial and transportation infrastructure in the plantation states before the war. Although the U.S. government in Washington increased dramatically in size, and expenditures during Abraham *Lincoln's presidency surpassed those of all his predecessors combined, Northern officials relied upon conventional market mechanisms and the lure of profits rather than coercion to meet their need for supplies. Whereas early in the war, bureaucrats with extensive administrative experience—such as Edwin M. *Stanton, whom Lincoln appointed secretary of war—were in short supply, the crucible of war quickly changed that.

From the standpoint of manpower, both sides departed sharply from precedent in resorting to "conscription to replenish their ranks. Precisely because conscription was so European a practice, Americans had abhorred it from the time of the * Revolutionary War. Citizens of the Confederate states, who endured the draft a year before their Yankee counterparts did, also suffered levies upon food, wagons, work animals, and other militarily useful supplies. Although Northerners escaped such material tolls and their demoralizing consequences, they found much to criticize in the draft of men. The *New York City anti-draft riots of July 1863 epitomized the opposition. Even apart from the disturbances that it produced, the Union's draft worked poorly. As a result, the military-run, undemocratic conscription served largely as a negative example for the future.

The North's other major overture toward filling the ranks, the recruitment of * African Americans in the military, left a much more significant legacy. This policy reflected the North's commitment to destroying slavery, as best expressed in the *Emancipation Proclamation of 1 January 1863. Besides its grant of freedom to slaves in the Confederate states, the proclamation also provided for the wholesale incorporation of black men into the *Union army.

Like most other innovations of the Civil War years, the legacy of this "mobilization was mixed. On the negative side of the ledger, African American soldiers endured separate and unequal treatment to the end. When the demographics of * demobilization dictated that they would play a major role in occupying the defeated South, Washington forestalled that opportunity by assigning black regulars to positions along the Atlantic coast and the border with Mexico, far removed from possible contact with former slaves. And for their part, black sailors soon found themselves again subjected to the prewar quota system (5% of total enlistments) and consigned systematically to the ratings of cook and steward.

On the positive side of the ledger, African Americans won a permanent—though neither undisputed nor unchecked—place in the armed forces of the reunited nation. The all-black 24th and 25th Infantry and 9th and 10th Cavalry Regiments (the fabled "Buffalo" Soldiers) created a legacy of loyalty and sacrifice that persisted well into the twentieth century. Even more important, the service of nearly 200,000 black soldiers and sailors—the overwhelming majority of whom were former slaves—established a claim for citizenship rights that the nation attempted to satisfy in the Thirteenth, Fourteenth, and Fifteenth Amendments to the U.S. Constitution. Participation by former slaves in the political life of the ex-Confederate states followed. Affiliation with the Republican Party, the party of Lincoln, persisted among black voters until the 1930s. Union army veterans played an important part in this allegiance.

The war conferred a similarly mixed legacy upon the officer corps of the army and the navy. Although most volunteer officers returned to civilian life after the war, men who opted for continued service encountered considerable frustration. Reduced from their inflated if temporary (brevet) rank to the more prosaic regular rank in the shrunken regular army, officers faced an abundance of boredom and danger but little glory on the western frontier. Naval officers likewise languished in the smaller postwar navy, often spending years at the same grade with little hope of promotion in a fleet a mere shadow of its wartime counterpart. In part because of their isolation from civilian life, officers in both branches cultivated a strong sense of professionalism. Postwar military school systems helped the officer corps regain the collective confidence it had enjoyed at the end of the Civil War.

Scholars have assessed the impact of the war on the national government variously over the years. Early studies stressed the transformation of the prewar state of limited constitutional authority into a powerful centralized government, which the metamorphosis of "the United States" from a plural to a singular construction neatly captures. During the past generation, social scientists from various disciplines have examined the Civil War from the standpoint of state formation. Often they employ a comparative method that likens the process of national consolidation in the United States with that in late nineteenth-century Germany, Italy, Japan, and Brazil. Whereas some scholars take the approach that centralized bureaucratic states are the functional byproducts of industrial society, most insist that historically specific considerations determine the evolution of the state in relation to society. From the latter perspective, the Civil War presents a treasure trove of insights.

With nearly monopolistic control over the wartime government in Washington, the Republican Party enacted pivotal measures regarding homesteads, banking and the currency, education, railroads, and the freed slaves. But even in such circumstances, policymakers found it easier to prosecute military victory than to secure the peace. Amid increasingly rancorous debate, congressional Republicans seized the Reconstruction process from President Andrew *Johnson, guaranteed the freedom and citizenship of the former slaves, and imposed temporary military rule on the South. Obstinate opposition from white southerners coupled with growing disenchantment among white northerners soon fragmented the Republican

coalition. Party moderates backed away from guaranteeing citizenship rights, from supporting the elected Republican governments in the former Confederate states, and from radically transforming the southern economy. Content in the knowledge that the South (like the West) was subject to the economic dominion of the Northeast, Washington acquiesced in southern "home rule." Former Confederate soldiers led the way in forcibly removing freedmen from public life.

If students of the late nineteenth-century South tend to view the consequences of the war as devastating to the regional economy, students of the national economy show far less unanimity over the effects of the Civil War. Some seventy years ago, historians Charles R. and Mary A. Beard (1927) declared that the war constituted "The Second American Revolution," which removed southern agrarians from national power and thereby made possible the industrial transformation of the nation after 1865. Historians who have examined this thesis using assorted interpretive frameworks and techniques have reached no firm consensus. Whereas some would confirm the Beards' assertion that the war ushered in the industrial transformation, others perceive it as a retardant force. Given the accelerating pace of industrialization before the war, the critics argue, the war in fact slowed development, largely due to the diversion of human and material resources. Yet statistics of economic performance do not tell the whole tale.

The true measure of the war's economic impact lies in its consolidation of federal dominion over the North American landmass the United States had accumulated during the first half of the nineteenth century. Just as reconstructing the South was key to this objective—even if remaking the southern economy along demonstrably northern lines was of secondary importance—controlling the Indians of the Great Plains figured prominently in the larger scheme. Although the wartime and postwar conflicts between Anglo-Americans and Native Americans grew out of grievances present in such encounters from the seventeenth century onward, there were many new factors in the equation.

Aside from the growing desire of white homesteaders and prospectors for access to Indian lands, railroad interests laden with federal land grants increased the demand. Missionaries and officials of the Bureau of Indian Affairs made strong overtures on behalf of "civilizing the savages," all of which strengthened the federal commitment to confining each tribe to a specific reservation (and by 1887 produced the Dawes Severalty Act and the fixation with individual land allotments). Civil War politics further complicated the mix, the most famous instances being the "disloyalty" of the Five Civilized Tribes in the Indian Territory and the violent rebellions undertaken by the Sioux on the northern plains and the Comanches in the southwest desert. When in the late 1860s, Gen. William Tecumseh Sherman and Gen. Philip H. Sheridan set out to subdue the Indians' resistance to federal authority, they took full advantage of the new weaponry and means of transportation that the Civil War had proven. Their use of the new tactics of unconditional surrender—winter campaigns, making war on women and children, and destroying villages and crops in the Plains Indians Wars forced the Native Americans to succumb.

In sum, the Civil War has left a mixed, even contentious, legacy in the different sections of the nation and among

the different sectors of the population. Moreover, as each generation born since the war has found—alternately to its delight and its dismay—that legacy is not fixed and immutable. Instead, it is subject to reinterpretation. Perhaps the recurrent controversy that surrounds the public display of the Confederate battle flag best illustrates a key interpretive insight: though struggles over the legacy of the war may degenerate into mere skirmishes or escalate into full-scale wars, their guns, unlike those of 1861-65, will never fall completely silent.

CIVIL WAR (1861-65): CHANGING INTERPRETATIONS

The Civil War had not even ended before it was being interpreted, although in many cases, the earliest interpretations of the war sprang directly out of the justifications Northerners and Southerners had offered for beginning and sustaining it. Resentful Southerners like Edward Pollard in *The Lost Cause* (1867) announced that the South had waged the war in defense of a genteel, noncompetitive agrarian society, and only the brute force of Northern numbers and weapons had defeated it. Confederate leaders like Jefferson Davis and Alexander H. Stephens defined the "Lost Cause" as a political one, in which the Confederacy stood for a strict reading of the federal Constitution and resistance to the centralization of power in the national government. The place of slavery in these Southern interpretations was reduced to a pretext Northerners had seized upon for provoking the war.

By contrast, Northerners in the first two decades after the war interpreted it primarily as a moral crusade against slavery. Isaac N. Arnold in his *History of Abraham Lincoln and the Overthrow of Slavery* (1866), John W. Draper in his *History of the American Civil War* (1868-70), and former Senator Henry Wilson in his *History of the Rise and Fall of the Slave Power* (1872-77) all insisted that the war had been caused by the wicked ambitions of a "slave power" conspiracy to subvert American republican virtue.

By the end of the century, as Americans were faced with the problems of industrialization, immigration, and labor unrest, it became easier to downplay the divisiveness of the war and recast it as the painful but necessary forge in which a single, unshakable American national identity was created. Academic historians, from James Ford Rhodes—*History of the United States from the Compromise of 1850* (1893-1919) to Arthur C. Cole—*The Irrepressible Conflict, 1850-1865* (1934), urged that slavery be seen as an institutional problem which the war removed in the interest of achieving national unification, rather than as the basis for a conspiratorial "slave power." However, professional histo-

rians who were shaped by the economic Progressive tradition and the horrors of World War I took this as evidence that the moral rhetoric of the war, whether for abolitionism or the "Lost Cause," had been hollow from the start. In Avery Craven's *The Repressible Conflict, 1830-1861* (1939) and James G. Randall's multivolume history of the Lincoln administration and his long-lived textbook, *The Civil War and Reconstruction* (1937), the war became a needless conflict, triggered by a generation of blundering politicians, since slavery would have eventually proven economically unprofitable, they argued. Or worse than that, Charles and Mary Beard, in *The Rise of American Civilization* (1927), declared that the real agenda of the war had been the dominance of the national economy by Northern industry and finance. Southern historians like Charles Ramsdell and Frank L. Owsley, who were inspired by the unrepentant anticapitalism of the Southern agrarian movement of the 1930s, converted the Beards's thesis into an unintended echo of the "Lost Cause" myth, in which the South appeared as a helpless victim of Northern cultural and economic aggression.

The economic emphasis of the Progressive historians was itself challenged by the moral commitments of World War II. The defeat of totalitarian ideologies abroad, and later the power of the civil rights movement to shake the conscience of the nation, once again made it possible to see the Civil War as a moral moment. Kenneth Stampp's *And the War Came: The North and the Secession Crisis, 1860-1861* (1950) defiantly insisted that the moral argument over slavery was, after all, the vital element in the making of the war. Allan Nevius, over the course of his multivolume *Ordeal of the Union* (1947-50) and *The War for the Union* (1959-60), also gradually moved slavery back to the center of the war's meaning. James M. McPherson's two single-volume histories, *Ordeal by Fire: The Civil War and Reconstruction* (1982) and *Battle Cry of Freedom: The Civil War Era* (1988), similarly shifted from treating the war as a Beardian conflict between a "modernizing" North and an underdeveloped South to describing it as the solution to the ideological contradiction of slavery in a liberal republic.

The tremendous upsurge in Civil War literature which began shortly before the centennial of the war in 1961, and which was renewed in the late 1970s and 1980s, encouraged the exploration of a number of new interpretations of specific aspects of the war. Grady McWhiney and Perry D. Jamieson resurrected the older arguments about the South's cultural uniqueness and applied them controversially to Southern military tactics, arguing that the South's "Celtic" culture explained the Confederacy's propensity for costly head-on offensives. By contrast, political and intellectual historians argued that the Confederacy had not been unique enough: David Donald, Drew Faust, Paul Escott, Emory Thomas, and the authors of *Why the South Lost the Civil War* (Richard Beringer, Herman Hattaway, Archer Jones, and William N. Still) inverted the old nationalist argument and claimed that the Confederacy was as much an example as the North of an experiment in nation-building. George Rable, in *The Confederate Republic: A Revolution Against Politics* (1994), argued that the Confederacy actually saw its political experiment in the war as a struggle to resist ideological uniqueness and reassert the pristine virtues of eighteenth-century republicanism.

The question of the Civil War's significance in military

terms has taken on particularly new force in recent studies. The impact of British military social historians like John Keegan in the 1970s set off calls for the application of a "face of battle" interpretation to Civil War combat studies, and helped produce innovative studies of Civil War soldier behavior from Reid Mitchell and Gerald Linderman. Much more subject to debate were challenges to two cherished notions about the overall strategic significance of the war. One of these, beginning with David Donald and T. Harry Williams, claimed that Civil War field strategy had been dominated by the ideological lessons of Antoine Henri

* Jomini and Dennis Hart Mahan, both of which fostered a passion for Napoleonic-style headlong offensive that had been rendered out-of-date by the rifled "musket. Both Williams and Donald believed that a handful of federal generals, headed by Ulysses S. *Grant, learned to ignore Jomini and Mahan, and to master the new lessons of industrial technology and "communications sufficiently to lead the North to victory.

A second and related interpretation of Civil War strategy located the center of the Civil War's "modernity" in its development into a "total" war. From T. Harry Williams in *Lincoln and His Generals* (1952) up through McPherson's *Battle Cry of Freedom* and Philip S. Paludan's *A People's Contest: The Union and the Civil War* (1988), the Civil War was repeatedly portrayed as the first example of warfare consciously directed at civilian as well as military targets.

Both of these views, however, came under strenuous criticism during the late 1980s: Edward Hagerman's *The American Civil War and the Origins of Modern Warfare* (1988) and the authors of the massive 1983 study *How the North Won: A Military History of the Civil War* (Herman Hattaway and Archer Jones) downplayed the extent of Jomini's influence on Civil War strategy. Paddy Griffith, a British military historian, argued that technology, whether in the form of the rifled "musket or the railroads, could have made little difference on the small-scale battlefields of North America, where, he said, the decisive factor was the sheer amateurism of Union and Confederate officers and volunteers. Above all, Mark Neely sharply criticized the notion that the Civil War had involved "total" warfare by questioning whether the Civil War had ever involved in any significant way the targeted destruction of enemy civilian lives and property or the curtailment of domestic civilian civil rights by the military.

One last major debate has concerned the quality and substance of Civil War military leadership. Robert E. *Lee and Grant had been held up in many popular histories as antitheses in Civil War leadership, with Lee cast in Douglas S. Freeman's four-volume *R. E. Lee* (1934-35) as a defensive patrician who carefully hoarded the Confederacy's limited human resources, and Grant portrayed in biographies like William S. McFeely's *Grant: A Biography* (1981) as an unimaginative "butcher," willing to achieve victory by using the North's numerical superiority to grind down the Confederate armies through attrition. Lee's image, however, began to crumble in 1977 with Thomas Connelly's *The Marble Man: Robert E. Lee and His Image in American Society*, which portrayed Lee as a fatalist always willing to yield to aggressive and costly impulses for the offensive. Grant, by comparison, was defended by biographers as diverse as Bruce Catton and Brooks Simpson as a swift-moving strategic thinker, whose triumph over Lee in

1865 was a demonstration of superior management and operational skill.

Similarly, comparative evaluations of Presidents Jefferson Davis and Abraham * Lincoln as commanders in chief have usually favored Lincoln as the better overall strategist, with David Potter and T. Harry Williams holding up Lincoln as a model of strategic wisdom and even the head of the first "modern" staff system. But throughout the 1980s, Jefferson Davis's star rose considerably, with Ludwell Johnson, Hattaway and Jones, and Steven E. Woodworth all underscoring that Davis was an intelligent risk taker who ably managed and cooperated with his generals.

The controlling factor in these interpretations, apart from the debates over the merits of certain commanders or the details of specific battles, has been the place and understanding accorded slavery. The weight given to the motives of leaders, the role of economic conflict, and even the significance of civilian and troop morale, have all in the end contained judgments about the role of slavery. In the interpretation of a war so charged with political meaning, and which so clearly involved political direction-giving, this not likely to change.

CLARK, MARK (1896-1984), general, and one of five top U.S. Army commanders in World War II. A third-generation soldier, Clark was born in Madison Barracks, New York, the son of an army colonel. Graduating from West Point in 1917, Clark became an infantry captain and was wounded in France. During the interwar period he served at various military posts, and graduated from the Command and General Staff School and the Army War College.

In World War II, General Clark played a major role in preparing the invasion of North Africa, including leading a successful secret mission by submarine to gain the cooperation of Vichy French officials. Such collaboration drew criticism, but it was defended as military expediency, and resistance to the invasion in November 1942 proved minimal.

Clark then trained and led the U.S. Fifth Army in the invasion and conquest of Italy in 1943-45. The Allied campaign up the mountainous Italian Peninsula was arduous, and its tactics drew some serious criticism. As U.S. commander and, after December 1944, Allied commander in Italy, Clark bore much of the controversy, including that over the Battle of Anzio, the bombing of the abbey on Monte Cassino, and the bloody defeat of the 36th (Texas) Division, which lost 2,100 men in 24 hours attempting to cross the Rapido River.

In June 1944, Clark led his forces into Rome. Some

postwar critics, including Dan Kurzman in *The Race for Rome* (1975), argued that Clark's desire to be the first to seize an Axis capital took precedence over the more important objective of cutting off and entrapping retreating German forces. The Germans built a new line that held until April 1945.

After the war, Clark as a four-star general, commanded U.S. occupation forces in Austria (1945-47). During the *Korean War, he succeeded Matthew B. *Ridgway in April 1952 in command of *United Nations forces. In July 1953, he signed the armistice and initiated the difficult prisoner exchange.

Retiring from the army, Clark served as president of The Citadel Military College of South Carolina (1953-65). Thereafter, he championed continued *Conscription and expanded U.S. military effort during the "Vietnam War.

Mark Clark's military career was frequently embroiled in dispute, in part due to his readiness to take controversial positions in difficult circumstances. Additionally, although an individual of undeniable courage and commitment, Clark lacked the personal aura of the other top U.S. Army commanders of World War II.

CLAUSEWITZ, CARL VON (1780-1831), Prussian general and theorist of war. Clausewitz's *On War* (1832) is the most important general study of war. Incomplete and in need of revision at the time of Clausewitz's death, its sometimes disconnected arguments are typically remembered as relatively simple propositions, which do not always reflect the complexity of the reasoning that produced them. Among these are: that war is not an autonomous phenomenon, but a political instrument; that the violence of war knows no theoretical limit, and is prone to escalate; that war's theoretically boundless violence is tempered in practice by the political goals of the belligerents, and by the "friction" to which military operations are subject; that armed forces possess "centers of gravity," whose successful attack promises the most decisive military results; that all attacks lose impetus as they proceed; and that the defensive is the stronger form of war. These and similar insights, although by no means universally accepted, are well established as foundational elements of serious strategic theory in the United States and throughout the world.

Clausewitz's work first attracted widespread attention among English-speaking readers in the aftermath of Germany's victory over France in 1871, a success that Prussia's chief of staff, Helmuth von Moltke, attributed in part to the influence of Clausewitz's ideas. The first English translation of *On War* appeared two years later, and thereafter Clausewitz acquired a growing reputation among military professionals as a proponent of operations that were swift, violent, offensive, and decisive in character to overcome the strength of defense conducted with modern weapons—an interpretation that owed more to the perceived requirements of industrialized warfare than to a close reading of his work. After 1914, Clausewitz's writings were studied for clues to German military conduct, and increasingly misread as harbingers of Prussian militarism. By the outbreak of World War II, it was not unusual for American authors to find significant links between Clausewitz and Hitler.

This baleful trend was checked primarily by the work of German expatriates like Herbert Rosinski and Hans Rothfels, who presented Clausewitz's ideas with greater comprehensiveness, and greater attention to their original context, than most of their Anglo-American counterparts had done. Of special significance was Rothfels's contribution to the first edition of *Makers of Modern Strategy* (1943), which demonstrated the analytic power of Clausewitz's identification of war as a political instrument, and also the fundamental significance of what Clausewitz called the "dual nature" of war, by which he had sought to reconcile the historical preponderance of limited war with the theoretically unlimited violence of war as such. Rothfels also portrayed Clausewitz himself as a figure of great intellectual integrity, striving for a disinterested and universally valid understanding of war.

Rothfels's essay set a new intellectual standard and a new direction for Clausewitz scholarship in English, which reached a culminating point in 1976 with the simultaneous appearance of Peter Paret's magisterial *Clausewitz and the State*, and a new translation of *On War* by Paret and Michael Howard. Clausewitz's insistence on war's political nature acquired special resonance in the nuclear era, when the means of organized violence so often threatened to dwarf the aims of policy; while his emphasis on the preeminence of limited war throughout history spoke directly to those who had endured the frustrations of Korea and Vietnam. At the end of the twentieth century, Clausewitz's ideas permeated the professional education and outlook of American military officers. When Michael Howard, writing in the wake of the * Persian Gulf War (1991), nominated Clausewitz (in the *New York Times*) as "Man of the Year," the proposal was rightly seen less as a jest than as tacit acknowledgment that, 160 years after his death, Clausewitz's influence and reputation had never been greater.

CLAY, LUCIUS (1897-1978), army general and diplomat. Born in Marietta, Georgia, Clay graduated from West Point in 1918 as a military engineer. His career departed from the routine with assignments to the International Naval Conference in Brussels in 1934 and to the staff of Gen. Douglas *MacArthur in the Philippines in 1937.

During World War II, Clay became deputy director of the Office of War Mobilization and Reconversion (1944). In 1945, he served briefly as deputy to Gen. Dwight *Eisenhower, and then as deputy military governor of the U.S. zone in Germany. From 1947 to 1949 he served as commander of U.S. forces in Europe, and as U.S. military governor in Germany. Clay won acclaim for his direction of operations including the * Berlin Airlift in the American response to the Soviets' blockade of the western access routes to Berlin in 1948-49. His determination and his blunt criticism of the Soviets made him a symbol of the U.S. support for West Berlin. He retired from the army as a full general in May 1949, and served as chairman of the board of Continental Can Company from 1950 to 1962.

At the time of the Berlin Wall crisis of 1961, President John F. * Kennedy recalled Clay to active duty to symbolize

U.S. commitment to the city. Clay served from September 1961 to May 1962 as Kennedy's personal representative in Berlin, with the rank of ambassador. The crisis reached a flashpoint in October 1961, when, with Kennedy's permission to take a strong stance, Clay ordered ten M-48 tanks to the entrapment of the wall, "Checkpoint Charlie," where they were met with a similar Soviet armored force. Kennedy made a secret appeal to Soviet premier Nikita Khrushchev to defuse the crisis, and both sides withdrew their "tanks after the show of force.

CLIFFORD, CLARK (1906-1998), longtime presidential adviser and secretary of defense. In his role as adviser to many Democratic presidents, the Washington lawyer Clark Clifford was extraordinarily influential at decisive moments of the *Cold War. As special White House counsel during President Harry S. *Truman's first term, the Missourian worked with George Elsey in 1946 on a key top-secret report to Truman, assessing U.S. Soviet relations. Explaining Soviet policy as a quest for domination, Clifford and Elsey recommended expanded military programs and foreign aid efforts to support potential allies overseas. Clifford also helped draft the *National Security Act of 1947 that created the Department of *Defense and the *National Security Council. Early in 1948, he played a key role in the debate over Palestine by supporting partition and U.S. recognition of the state of Israel.

Resuming private law practice in 1949, Clifford developed an important corporate clientele that made him one of the wealthiest and most influential attorneys in Washington for decades, through the 1980s. Moreover, he developed close personal, advisory, and legal relationships with leading Democratic politicians, including John F. *Kennedy. During the Kennedy-Johnson administrations, he served as a member, and then chairman, of the President's Foreign Intelligence Advisory Board (PFIAB), where he strongly supported efforts to modernize intelligence collection capabilities by adopting the latest electronic and satellite technologies.

As an informal adviser to President Lyndon B. *Johnson, Clifford was highly critical of escalating the Vietnam War, which he believed could not be won. Johnson initially rejected his recommendations for a negotiated settlement, but Clifford kept his access to the White House by publicly supporting the war. When Robert S. *McNamara left his position as secretary of defense, Johnson appointed Clifford his successor on 18 January 1968; his official tenure lasted from March 1968 to January 1969.

As Clifford began his work at the * Pentagon, the Vietnamese Communists launched the *Tet Offensive, a development that confirmed Clifford's growing pessimism about the war. Worried that the "bottomless pit" of war could wreck America's social fabric, he began strongly to advocate disengagement. By the end of 1968, he had helped convince the president to stop the bombing of North Vietnam, begin negotiations with the Viet Cong, and support a greater South Vietnamese role in the

fighting—a move that presaged Richard M. *Nixon's later "Vietnamization" policy.

Clifford also played a central role in another Johnson initiative renewed by the Nixon administration: an attempt to begin strategic arms limitation negotiations with Moscow, which foundered when the Soviets invaded Czechoslovakia in August 1968. However, Clifford contributed to escalation of the *arms race by approving air force programs to test multiple independently targetable reentry vehicle (MIRVs), also in August 1968. Returning to private law practice after he left the Pentagon in January 1969, Clifford remained a Washington influential, although financial scandal tarnished his reputation at the end of his life.

CLINTON, BILL (1946–), forty-second president of the United States. William Jefferson (Bill) Clinton was born in Hope, Arkansas, graduated from Georgetown University in 1968, went to Oxford University as a Rhodes Scholar (1968–70), and then Yale Law School. With the exception of 1981–83, he served as Democratic governor of Arkansas from 1979 until 1993 when he became president, defeating the Republican incumbent George *Bush and a third-party candidate, Ross Perot.

From the beginning, President Clinton had a rocky relationship with the military. During the campaign, it was alleged that as a college student he had dodged the draft and publicly protested the *Vietnam War. As president, his first policy action was to pledge to end the ban on *gay men and lesbians in the military. The attempt to allow homosexuals to serve openly in the armed forces faced vigorous opposition in the *Pentagon and the Congress. Clinton ultimately accepted a compromise dubbed the "don't ask, don't tell" policy.

Clinton's first secretary of defense, former representative Les *Aspin, Jr., initiated a "bottom-up" review of the post-*Cold War military. His successor, William Perry, further reduced the armed forces by closing bases, capping expenditures, and emphasizing reservists. Active duty personnel declined in Clinton's first term from 1.7 million to under 1.5 million. William Cohen became secretary of defense after Clinton's reelection in 1996. The former Republican senator from Maine sought to maintain a 1.4 million active duty force while boosting weapons spending by 50 percent and simultaneously keeping the defense budget at about \$255 billion. Skeptics predicted more troop and procurement cuts instead.

In his foreign policy, Clinton often combined brinkmanship with indecision over the use of military force. He escalated the use of force in Somalia, then withdrew in 1994 after the killing of U.S. Army *Rangers. Later that year, however, his brinkmanship with North Korea contributed to Pyongyang's agreement to dismantle the reactors that could make *nuclear weapons. His vacillating policy on the military junta in Haiti ultimately led in September 1994 to the dispatch of an airborne invasion force, recalled only at the last minute when a negotiating team, led by former President Jimmy *Carter, convinced the junta to step down. A combined *United Nations/U.S. oc-

cupation force landed peacefully and ensured the return of Haiti's democratically elected president. In the *Bosnian Crisis, Clinton avoided ground intervention until the peace accord of 1995, then included 20,000 Americans in the UN peacekeeping force, which was still in Bosnia four years later.

After a terrorist bombing of U.S. embassies in Nairobi and Khartoum, he ordered sea-launched missile attacks on a plant in the Sudan and a terrorist camp in Afghanistan in August 1998. Faced with Saddam *Hussein's blocking of UN weapons inspectors and challenging of U.S. air surveillance, Clinton ordered sporadic American air attacks against Iraqi military targets beginning in December 1998. Domestically, in January 1999, Clinton was acquitted in a Senate trial on House impeachment charges involving a sex scandal. In March 1999, he brought the Czech Republic, Hungary, and Poland into *NATO. In the Balkans, Clinton announced on 23 March 1999, a decision to use force to halt Serbian aggression against ethnic Albanians in the *Kosovo Crisis; the next day, NATO began air strikes against the Serbs. The war lasted 78 days.

CLINTON, SIR HENRY (1730–1795), British general. Sir Henry Clinton succeeded Sir William *Howe as commander in chief of British forces in the American colonies in 1778. Clinton inherited an army demoralized by Burgoyne's defeat at the Battles of *Saratoga and a war radically altered by France's 1778 alliance with the Americans. An aggressive and annoying junior officer, Clinton had continually bombarded Howe with ambitious plans to crush the *Continental army. As commander in chief, however, Clinton acquired Howe's caution. He fought the Continental army only once in 1778, at the Battle of *Monmouth. In 1779, his army saw only limited action that included taking two minor American forts. The next year, Clinton captured Charleston. This brilliant victory, however, could not overcome his reputation for caution. London named a more aggressive general, Lord Charles

• Cornwallis, his second in command in 1779; now Clinton was ordered back to New York and Cornwallis took over in the South. Powerless to intervene in Cornwallis's campaigns, Clinton nevertheless became the scapegoat for Cornwallis's devastating defeat at the Battle of *Yorktown in 1781. Replaced by Gen. Guy Carleton in 1782, the embittered Clinton returned to England. He devoted the rest of his life to defending his tattered reputation.

COAST GUARD, U.S. The Coast Guard has existed in various forms since 1790, although its name dates from 1915.

On 4 August 1790, President George * Washington signed an act of Congress "to regulate the collection of the duties imposed by law on the tonnage of ships or vessels, and on goods, wares, and merchandise, imported into the United States." Ten boats, "for securing the collection of the revenue," were to be built, and forty officers and men would be hired to operate them. In 1799, during the Undeclared Naval War with *France, Congress authorized the president to place the Revenue-Cutter Service (or "Revenue Marine," as it was often called in its early days) under the U.S. Navy in time of war or other national emergency.

In that capacity revenue cutters gained their first combat experience. In 1799 and 1800, they captured fifteen French vessels. During the *War of 1812, the Revenue Marine took several British prizes, though four of its vessels surrendered to British warships. Revenue cutters searched the Caribbean for pirates and slavers throughout the early nineteenth century, and patrolled the coast of Florida during the Seminole War of 1836—the only "Indian War" in which naval forces took part.

In 1843, the Treasury Department set up a Revenue Marine Bureau, headed by Capt. Alexander Fraser. He initiated a series of administrative reforms that made the service function on a military basis. In the *Mexican War of 1846-48 the Revenue Marine participated in the blockade of Mexico.

The Coast Guard cutter *Harriet Lane* took part in the first Union victories of the *Civil War: the operations against Forts Clark and Hatteras. The service assisted the *Union navy with the blockade of the Southern ports and the protection of northern shipping.

In 1876, Congress authorized the establishment of the Revenue-Cutter Service School of Instruction on board a training ship. (The school would move in 1918 to New London, Connecticut, becoming the nucleus of the U.S. Coast Guard Academy.)

In 1880, the service inaugurated the Bering Sea Patrol. The Coast Guard cutter *Bear* became a familiar sight in Alaskan waters, rescuing icebound whalers, providing medical services for the Eskimos, and enforcing the international seal protection treaty. Several scientists made oceanographic expeditions to the arctic in revenue cutters.

Thirteen revenue cutters served with the Union navy during the *Spanish-American War. The *McCulloch* participated in the Battle of *Manila Bay, and the *Hudson* towed a disabled navy torpedo boat out from under enemy fire in the Battle of Cardenas Bay.

In 1914, two years after the *Titanic* sank after hitting an iceberg, a Convention for the Safety of Life at Sea held in London established the International Ice Patrol, to be carried out by revenue cutters with financial support from the other signing countries.

The following year, President Woodrow * Wilson signed a law amalgamating the Revenue Cutter Service and the coastline Life-Saving Service, a civilian agency of the Treasury Department. The new service was headed by Commandant Ellsworth Price Bertholf. The government accepted his suggestion that "'Coast Guard' is the logical name for the old Revenue Cutter Service as well as the new combination." It was to "constitute a part of the military forces of the United States ... under the Treasury Department in time of peace and [to] operate as a part of the Navy, subject to the orders of the Secretary of the Navy, in time of war or when the President shall so direct."

During World War I, the Coast Guard was responsible for policing the massive shipping traffic that passed through American seaports. Several cutters served as convoy escorts. One, the *Tampa*, was sunk by a German submarine; two others were destroyed in collisions.

In 1924, Congress appropriated funds for the first Coast Guard aviation stations at Cape May, New Jersey, and Gloucester, Massachusetts. The airplane proved useful for search and rescue operations. Coast Guard cutters and aircraft formed the federal government's front-line defense during the Prohibition era against liquor smugglers.

In 1939, the Coast Guard expanded again when it absorbed the U.S. Lighthouse Service. On 1 November 1941, with U.S. entry into World War II imminent, President Roosevelt transferred the Coast Guard to the Navy Department.

World War II presented the Coast Guard with the most rigorous set of challenges it had faced yet. Wartime recruiting swelled the service's ranks to 171,000—including 12,000 members of the Women's Reserve (*SPARS). More than 51,000 volunteers enrolled in the Coast Guard Reserve. The Beach Patrol waged a tedious war against German espionage and saboteurs, and the Port Security program absorbed 20 percent of the service's personnel.

Coast Guard cutters and patrol boats traded their peacetime white paint for wartime camouflage; armed with depth charges, sonar gear, and substantial optimism, they were renamed convoy escorts and submarine chasers. The Coast Guard manned 351 navy vessels, ranging from troop transports to landing craft, and 288 vessels of the Army Transportation Corps. Primarily as landing craft operators, Coast Guardsmen took part in most of the amphibious campaigns in the Pacific, the Mediterranean and in the *D-Day landing. During the invasion of *Normandy, 60 Coast Guard patrol boats pulled some 150 survivors from the English Channel.

One of the Coast Guard's most vexing, if least publicized, wartime assignments was to patrol the waters around Greenland. Lt. Cdr. Edward H. "Iceberg" Smith took command of the Greenland Patrol, a handful of cutters, tugs, and smaller vessels. The *Northland* made the first American naval capture of the war by seizing a radio-equipped German trawler in September 1941.

Several converted merchant ships in Coast Guard service added significant footnotes to naval history. The *Cobb* was the site in June 1944 of the first landing of a helicopter on board a ship, and the *Sea Cloud*, a yacht converted to a weather ship, became in 1943 the first racially integrated vessel in U.S. naval service.

On 1 March 1942, the Bureau of Marine Inspection and Navigation was transferred from the Department of Commerce to the Coast Guard. That arrangement completed the administrative structure of the Coast Guard as it exists today.

During World War II, twenty-eight Coast Guard and Coast Guard-manned vessels were sunk. The service's wartime deaths totaled 1,030, including 572 killed in action. Coast Guard cutters and Coast Guard-manned naval vessels sank eleven enemy * submarines; a twelfth was sunk by a Coast Guard aircraft. Coast Guardsmen rescued more than 4,000 survivors from sinking of sunken vessels.

In 1945, the Coast Guard resumed its peacetime law enforcement and search and rescue functions. In 1948, Congress gave the service responsibility for operating the chain

of LORAN (LONG-RANGE-NAVIGATION) electronic aids to navigation. High-endurance cutters cruised the Ocean Stations—designated spots in the Atlantic and Pacific from which they radioed weather reports, collected scientific data, and assisted foundering ships and aircraft.

During the Red Scare of the 1950s, the Treasury Department ordered the Coast Guard to withhold licenses from merchant sailors suspected of subversive activity. Several labor unions filed protests against the Coast Guard in federal courts and before the United Nations.

Fidel Castro's takeover of Cuba confronted the Coast Guard with a major refugee problem, an exasperating one that was to continue for decades. In each Caribbean crisis, Coast Guard cutters have had the duty of intercepting refugees, and in accordance with the current edicts of the State Department, either escorting them to the United States or turning them away.

Coast Guard icebreakers have cruised to both poles, and break paths for shipping in the Great Lakes and other inland bodies of water each winter. In 1957, the cutters *Storis*, *Bramble*, and *Spar* forced their way from Bellot Strait on the west coast of Canada to Baffin Bay on the east coast, demonstrating the feasibility of a mercantile route north of North America.

In 1965 during the * Vietnam War, seventeen Coast Guard patrol craft helped inaugurate Operation Market Time, the navy's ongoing effort to sever the supply lines from North Vietnam to Viet Cong guerrillas in the South. More than 50 Coast Guard vessels and 8,000 Coast Guardsmen took part in the "brown-water" war in Vietnam destroying nearly 2,000 vessels at a cost in American casualties of 7 deaths and 53 wounded.

On 1 April 1967, the Coast Guard was transferred from the Department of the Treasury to the newly created Department of Transportation.

In 1996, women comprised about 7 percent of the Coast Guard's 37,000 active duty personnel. New London was the first service academy to accept female applicants, and in 1988, Lt. (J. G.) Beverly Kelly became the first woman to command a U.S. naval vessel, the patrol boat *Cape Newagen*.

The Coast Guard has seven peacetime missions: the enforcement of recreational boating safety regulations; search and rescue operations; the maintenance of aids to navigation; the enforcement of Merchant Marine safety regulations; environmental protection; the enforcement of fisheries, customs, and immigration laws; and port safety.

The commandant of the Coast Guard presides over the Eastern and Western Coast Guard Areas, which are subdivided into ten Coast Guard districts. The service is supported by a Coast Guard Reserve and the Coast Guard Auxiliary, which conducts recreational boat inspections, teaches boating courses, and assists in search and rescue missions.

The service's motto is *Semperparatus*—"Always ready."

COAST GUARD RESERVE. The Coast Guard Reserve Act of 1939 was a response to the booming hobby of pleasure boating. The law created an organization of civilian boat owners who volunteered to assist the U.S. *Coast Guard in such activities as patrolling regattas and promoting marine safety.

On 19 February 1941, Congress passed a law restructuring the Coast Guard Reserve. The existing civilian organization was renamed the Coast Guard Auxiliary. A new Coast Guard Reserve would function as a source of military manpower, like the reserves of the other armed services.

Coast Guard reservists were divided into two categories. "Regular Reservists" were paid for their services and could be assigned to any duty. A "Temporary Reservist," or "Coast Guard TR," was an unpaid volunteer who served part time in some designated geographic area.

During World War II, the Coast Guard itself suspended regular enlistments; virtually all of the approximately 115,000 people who joined the service during the war served as reservists. That figure includes 51,000 temporary reservists and 12,000 members of the Women's Reserve, called *SPARS.

The Coast Guard Reserve and the Coast Guard Auxiliary became permanent institutions after the war. In 1994, the reserve had a strength of about 12,000 and auxiliary membership stood at about 34,000.

CODING AND DECODING. *Cryptography*, the art of creating or deciphering secret writing, is an ancient military process with a rich history in the American military experience. U.S. coding and decoding expertise trailed that of European nations, particularly Britain, until World War II, but America became the premier cryptographic power during the Cold War and has maintained a lead in this field ever since. While military cryptography has been a powerful tool for uniformed leaders in obtaining information about an enemy's capabilities, limitations, and intentions, it is just as important to the commander in masking his own powers, vulnerabilities, and plans. In the rare case, such as the naval Battle of "Midway in 1942, American deciphering abilities have proven decisive. Cryptography normally supplies only partial solutions for military intelligence and counterintelligence problems. Coding and decoding is and has always been a "cat and mouse" game, the coder occasionally gaining a temporary advantage on those who intercept and decode, only to experience the shock of a role reversal at other times.

From the outset of U.S. military operations, cryptography was practiced, but the security of American codes and the ability to read an enemy's secret writing lagged behind the U.S. *Army and U.S. "Navy's mentors, the British. Codes and ciphers were personally used in the "Revolutionary War by both Gen. George Washington and the Continental Congress's Secret Committee. However,

British agents were quite successful in penetrating Washington's headquarters as well as gaining knowledge of Benjamin Franklin's diplomatic operations in Paris. American cryptographic skills made little difference in the outcome of the Revolutionary War.

During the nineteenth century, American military cryptography suffered from the same ills that plagued U.S. military and political intelligence in general. There would be a flurry of coding and decoding activity in time of war, but with the coming of peace, cryptographic knowledge and skills would atrophy and have to be relearned again at the next outbreak of hostilities. The entire U.S. intelligence capability in this era can best be described as primitive. Those Americans who engaged in the craft were invariably amateurs.

This cycle was broken during the twentieth century through the efforts of Herbert O. Yardley, a State Department code clerk who demonstrated a capability to break foreign ciphers before World War I. During that war, Yardley was used as an instructor and organizer for U.S. military cryptography. Afterward, he resumed his State Department work in the 1920s, and much to the advantage of U.S. negotiators, broke the Japanese diplomatic code during the Washington Conference that led to the Washington Naval Arms Limitation Treaty of 1922. When the State Department discontinued this work, Yardley retired and wrote *The American Black Chamber* (1931), exposing his feats and causing foreign nations to manufacture ciphers that were far more difficult to decode.

The next master American codebreaker was the War Department's William F. Friedman, who managed to create a machine that could decipher much of the Japanese Foreign Office's "Purple" Code in 1940. Army and navy intelligence officers coordinated the placement of radio intercept stations, exchanged information, and produced signals intelligence known as MAGIC even before the Japanese attack on Pearl Harbor in December 1941. However, the Japanese main naval code was not broken until early 1942. During World War II, the army and navy became adept at both signals intelligence and the ability to create codes that were nearly impossible for the Axis powers to decipher. But American intercept and deciphering capabilities were no panacea; for example, in late 1944 there was a rapid decline in the quality of U.S. Army intelligence as American forces approached the German border. Telephonic communications of the German Army had been monitored and reported to the Allies by the French Resistance. Learning or suspecting this, Germans defending France were forced to use their radios more often than they would have liked and these coded radio messages were intercepted (as they had been since 1940) by the British and decided through the process called ULTRA. But as the German forces withdrew into Germany in late 1944, they traded radio communications for the comparatively secure German telephone system, and other land lines. The concentration of troops that led to the rapid and initially successful German thrust into Belgium in December 1944 in the Battle of the Bulge was not detected by a U.S. intelligence system that had grown too reliant on communications intelligence.

Following World War II, the Department of Defense (DoD) combined army and navy cryptography and in 1952 designated the resulting organization the National Security Agency (NSA). Headed by a military officer and making its headquarters in Fort Meade, Maryland, NSA

kept a low profile during the Cold War. By the 1990s, it had created over 2,000 air, land, sea, and space-based intercept sites. During this period, it gained the largest budget and the most personnel of any element of the U.S. intelligence community, including the Central Intelligence Agency. Much of the reason for this size and expense stems from the fact that NSA's work is not only dependent on the latest technology, it is also labor-intensive. Cryptanalysis, particularly work in breaking some of America's adversaries' high-level codes, requires large numbers of people who must endlessly toil to decipher critical foreign communications for the use of U.S. decision makers. The same applies to the creation of secure communications for the U.S. government. Secure communications also demands manpower and equipment. And NSA's work is not limited to creating or deciphering "secure" communications between people. As the missile age developed from the 1950s on, telemetry between instruments, guidance systems, and detection systems was increasingly deciphered or encoded.

Since most industrialized nations have created sophisticated codes for use in their most sensitive communications, NSA cannot quickly decipher an opponent's high-level messages. Lower-level codes, those associated with typical military units, are somewhat easier to break; but here some of the best information may be which units are communicating with a particular headquarters. This "traffic analysis," the art of associating one organization with another in time and space, is a specialty of military intelligence analysts and has contributed to several American military successes, particularly before and during the Persian Gulf War, 1990-91. But as U.S. cryptographic achievements have become known, opponents have avoided radio communications, relying on face-to-face meetings or the simple use of messengers. Electronic intercept is only one of several components the American military intelligence community uses to provide their commanders with the best information about an adversary.

COLD WAR (1945-91): CAUSES

The Grand Alliance of the United States, Great Britain, and the Soviet Union was the indirect creation of Adolf Hitler. Only such a challenge as Nazi Germany could

bring together the world's leading capitalist democracy, the world's greatest colonial empire, and the world's major Communist state. Relations between the Anglo-Americans and the Russians, moreover, had been marked by ideological clash and distrust since the Bolshevik Revolution. The Western powers had intervened in the Russian civil war against the Bolsheviks, and the United States had refused to recognize the Soviet Union from 1917 to 1933. Prewar diplomacy, particularly Western appeasement of Hitler and rejection of collective security with the Soviet Union, followed by the Nazi-Soviet Pact in August 1939, led each side to be wary of the other's intentions and motives.

During World War II, President Franklin D. *Roosevelt set forth two parallel strategies for postwar peace. The first was the continuation of the Grand Alliance. Best symbolized by the *United Nations, this path sought continued cooperation with the Soviet Union, great power control over different spheres of influence, and incorporation of socialist economies into a world trade system. The other strategy was based on American power, the "open door," policy, and unilateral planning. It was best represented by the development of the atomic bomb, which Roosevelt refused to share with the Russians. Though Roosevelt wished for continued cooperation with the Soviets, he was also willing to hedge his bets and keep his options open. Underlying both approaches was Roosevelt's tactic of delaying the major decisions on boundaries, governments, occupation policies, and reparations and reconstruction aid until the end of the war, when American power would be at its height. With his characteristic optimism, Roosevelt believed that time would allow the conflicts in these approaches to be worked out.

The *Yalta Conference in February 1945 appeared to expose the problems and contradictions of Roosevelt's two-track approach. The Allies clashed over the composition of Poland's government, and could not reach firm agreements on the crucial questions of the occupation of Germany and postwar reparations and loans. Roosevelt, believing any truly representative government in Warsaw would be anti-Soviet, accepted a vague compromise that allowed the Soviet-imposed government to maintain control without technically violating the agreement. Four zones of occupation were established for Germany, and \$10 billion was adopted as a working figure for German reparations to the Soviet Union, with the details to be settled later. Still, Roosevelt saw the common desire to prevent a resurgence of German power, along with Soviet needs for postwar reconstruction, to be firm roads to continued cooperation among the Big Three (the United States, the United Kingdom, and the USSR). He believed that concessions to Soviet security concerns in Eastern Europe were necessary in the short run until the West could demonstrate its good faith through American economic aid and guarantees against German remilitarization. Once Soviet dictator Josef *Stalin was persuaded that the West did not intend to allow Germany again to threaten Europe's peace, and that it would assist the Soviet Union in its recovery, Moscow would no longer need to dominate its neighbors. The Soviet Union would find its security protected within the collective arrangements of the United Nations Security Council.

Roosevelt's hopes of resolving the contradictions of his policy died with him on 12 April 1945. The new president, Harry S. *Truman, was by all accounts unaware of

Roosevelt's plans, generally uninformed about foreign policy and military matters, and therefore initially reliant upon a set of advisers that included Ambassador to the Soviet Union Averell Harriman, Secretary of War Henry L. *Stimson, and Truman's choice for secretary of state, James Brynes. This group tended to take a harder line toward the Soviet Union than had Roosevelt. Truman believed in cooperation* but he thought it should be on American terms. He stated that he did not expect to get his way every time, but he did believe "we should be able to get eighty-five percent." In his first meeting with the Soviet foreign minister, V. M. Molotov, in late April 1945, Truman used blunt language in accusing the Soviets of failing to carry out their promise of establishing a democratic government in Poland. In July, when Truman learned of the successful testing of the atomic bomb, he wrote privately that he now had an "ace in the hole," which he could use to end the war in the Pacific and in negotiations with the Soviets. The unilateral approach was winning out over cooperation and negotiation.

The bombings of *Hiroshima and Nagasaki did indeed add to Soviet distrust of the United States, but Soviet leaders in the Kremlin continued in 1945 to seek cooperation with the West. The reasons for this were compelling. The devastation of the Soviet Union by the Germans was unprecedented. Over 20 million Soviet citizens died during the war, and over 1,700 cities, 70,000 villages, and 31,000 factories were destroyed. To ensure more secure borders, rebuild, and prevent a future resurgence of German strength seemed to demand continued good relations with the United States. Only Washington could ensure Soviet security through its occupation policies and provide funds for reconstruction. Cooperation, for Stalin, was a means to ensure the Soviet sphere of influence, control Germany, and secure vital economic aid.

Yet, from Washington's perspective Soviet actions in Eastern Europe more and more came to be seen not as necessary steps for security but as aggressive actions that threatened American plans for postwar peace and prosperity. From the outset of World War II, officials in the Roosevelt administration were determined that the United States would seize its "second chance" (the first chance had been lost after World War I) to shape the postwar world in such a way as to promote American interests and peace. It was an article of faith for advocates of American *internationalism that the United States had an obligation to accept responsibility for postwar leadership and to see to it that the world adopted American ideas of self-determination, free trade, arms limitations, and collective security. These were not only good for the United States but beneficial to all nations. With *isolationism discredited, the objective was to maintain the principles of the Grand Alliance as set out in the Atlantic Charter. The United States had fought the war in part to protect self-determination and open trade.

It was therefore necessary to combat spheres of influence and closed trading systems. No one nation or group of powers could be allowed to establish a competing system to the one the U.S. government envisioned for the world. Truman and his advisers believed that political and economic freedoms were interrelated and necessary for American prosperity and international *peace. Any restrictions of trade or exclusive economic spheres would lead to a repetition of the 1930s. As Truman declared in 1947,

"peace, freedom, and world trade" were inseparable; "the grave lessons of the past have proved it." Limiting a Soviet sphere of influence was perceived as necessary to postwar peace. This understanding led to great fears among American officials that if they did not respond to Soviet actions, the United States would find itself once again in a world of trade blocs and international competition. To compel the Soviets to accept American interpretations of agreements, the Truman administration denounced Soviet behavior in Poland, Romania, and elsewhere, threatened action over Soviet involvement in Iran, and held up economic assistance until the Soviets demonstrated their willingness to cooperate on American terms. Truman, believing he had either the power to force Soviet compliance or the ability to achieve American goals without the Kremlin's cooperation, was convinced by the end of 1945 that it was time to "stop babying the Soviets." "Unless Russia is faced with an iron fist and strong language," he said, "another war is in the making."

The arrival of George E. Kennan's Long Telegram from Moscow in February 1946 served to provide coherence to the developing hard line against the Soviets. Kennan argued that the Soviet Union was motivated by a combination of traditional Russian desires to expand and by Marxist ideology that taught there could be no cooperation with capitalist states. There was therefore no room for compromise and negotiation. The Soviets would take advantage of all sincere efforts at peace and only honor agreements when it was expedient to their goals. He portrayed Stalin as acting on a coherent design, rather than as a man responding to events in the interests of his nation. The obvious conclusion for Kennan—and the one drawn by the Truman administration—was that the Soviets had no legitimate grievances. There was thus no need to try to understand and meet Soviet concerns. Rather, a policy of opposition and the containment of Soviet power was necessary.

A few weeks later in Fulton, Missouri, former British prime minister Winston S. Churchill delivered his "Iron Curtain" speech sounding the call for an Anglo-American alliance against the Soviets, whom he said had established a dictatorial regime behind an "iron curtain" from "Stettin in the Baltic to Trieste in the Adriatic." Problems seemed to be multiplying around the world, and from the White House it appeared that more often than not the source of the difficulties was the Soviet Union. In Asia, revolutionary nationalist movements, often headed by Communists, were fighting against the restoration of Europe's colonial empires, while civil war between the Nationalists and Communists resumed in China. In Europe, economic recovery was slow, food and other essential goods short, and Communist parties, particularly in France and Italy, were gaining ground. Truman's advisers warned him that time was running short. The Soviet strategy, they argued, was to weaken the position of the United States in Europe and Asia to create confusion and collapse. The threat was not necessarily a military one, but a political and economic challenge.

Other apparent challenges appeared in Turkey and Iran. In 1946, the Soviets pushed for access to the strategic Dardanelles Straits while simultaneously delaying the removal of troops from Iran's northern provinces.

The event that spurred Truman to action was the British government's announcement in February 1947 that it was pulling out of Greece. It could no longer afford to finance

the Greek royalist forces in their civil war against a Communist-led rebellion. Rather than viewing the war as a civil conflict revolving around Greek issues, American policymakers incorrectly interpreted it as a Soviet effort. Secretary of State Dean Acheson told congressional leaders that the "Soviet Union was playing one of the greatest gambles in history at minimal cost" in an effort to expand into the Middle East, Asia, and Africa. The United States alone could stop this. In March 1947, the president announced the *Truman Doctrine. It "must be the policy of the United States," Truman declared, "to support free peoples who are resisting attempted subjugation by armed minorities or outside pressures." This was followed in June by the * Marshall Plan (1948-52), a pledge of economic assistance to Europe to stimulate recovery and trade.

By 1947, U.S. policy was predicated on the containment of the Soviet Union. In its efforts to establish a postwar order based upon American institutions and ideals, the Truman administration came to see the Soviet Union as a threat to U.S. interests. In the late 1940s, containment and anticommunism were globalized to include Asia, Africa, and Latin America. Competing security and economic demand in Europe shattered the Grand Alliance and brought about the Cold War.

COLD WAR (1945-91): EXTERNAL COURSE

The most famous image to emerge from the *Yalta Conference in 1945 is a picture of Winston S. Churchill, Franklin D. Roosevelt, and Josef Stalin seated outdoors, wearing their overcoats, Churchill with his trademark cigar and Stalin with his marshal's cap. The three look pleased, almost jovial. The war in Europe had turned decisively against Nazi Germany and the Allied leaders knew that victory was near.

When the Allied leaders next met, in July 1945, Roosevelt had died, replaced by his vice president, Harry S. Truman. A man of scant foreign policy experience, Truman arrived at the * Potsdam Conference, near Berlin, with the knowledge that an atomic bomb had been successfully detonated in New Mexico. He was hopeful about a future U.S.-Soviet detente, but the relationship was marked by suspicion and distrust on both sides. At some point before 1947, it deteriorated to the point where the two superpowers became locked in a global struggle that stopped short of direct armed conflict.

The Role of Nuclear Weapons. By 1949, both countries possessed *nuclear weapons. There has been much debate over the exact role of these weapons in the Cold War. Many historians argue that the only reason the Cold War never became "hot" was that the fear of nuclear annihilation effectively deterred each side from directly attacking the

other. Others disagree, pointing to the fact that the Cold War had already reached a fever pitch before the Soviets had nuclear weapons, and that until the widespread development of hydrogen bombs in the 1950s, atomic weapons were only slightly more deadly than the most concentrated conventional attacks.

Without question, nuclear weapons were an integral aspect of the Cold War, and it is impossible to understand the history of the conflict without an appreciation for how large the threat of these weapons loomed, not just over Washington and Moscow but throughout the world. The rapid growth of nuclear arsenals altered the nature of international relations and made both nuclear superpowers far more wary of military confrontation with one another than they might otherwise have been.

After the *Cuban Missile Crisis in October 1962, both sides made strenuous efforts to establish a *modus vivendi*. A period of detente continued until 1979, when the Soviet invasion of Afghanistan contributed to renewed American military spending and to the election of President Ronald *Reagan, who pursued what is sometimes known as the "second Cold War." This lasted from 1979 to 1986, when Reagan and the reform-minded Soviet premier, Mikhail Gorbachev, came to an agreement in Iceland. The final years, between 1986 and 1991, saw the rapid dissolution of the Soviet Union. Its collapse in December 1991 marked the end of a Cold War that had all but sputtered out in the previous five years.

Phase One: 1945-46. After Potsdam, the United States and the Soviet Union approached each other warily. Throughout the fall of 1945, the two countries shifted attention from the European and Asian wars that had consumed them for the past five years. As they did so, they found that their visions for a post-Cold War world differed, most noticeably in Poland and occupied Germany. The United States envisioned a world dominated by democracy and free market economics, while the USSR saw that vision as a thinly veiled strategy to dominate the Soviet Union. By the end of 1946, the level of antagonism between the two nations had risen precipitously. Each viewed the other as the primary foreign policy threat, and both governments mobilized resources and planned strategy with one goal in mind: maximizing their own influence and minimizing that of the other.

Phase Two: 1947-62. The second phase was the most intensive of the Cold War, and the most dangerous. During this period, the United States and the Soviet Union constructed formidable nuclear arsenals and enormous conventional forces, and at several points the two countries nearly came to blows.

In 1947, the U.S. government reorganized. The *National Security Act created a unified Department of *Defense, a *Central Intelligence Agency (CIA), and a *National Security Council. These would be the primary bureaucracies for American policy in the Cold War. Responding to a Communist insurgency in Greece and to Stalin's pressure on Turkey to allow Soviet military access to the straits connecting the Black Sea to the Mediterranean, Truman requested Congress to authorize a \$400 million aid program. In order to mobilize isolationists in the Republican Congress, the Democratic president heightened the rhetorical stakes, painting the Cold War as a contest between "free institutions and representative

government" and those who were forcibly ruled by "the will of the minority." The struggle between the two sides in the Cold War was more than military, strategic, or economic; it was also profoundly ideological, with each side presenting the other as the embodiment of evil.

The *Truman Doctrine was followed by an announcement of European aid by Secretary of State George C. *Marshall, in June 1947. The twin policies of the Truman Doctrine and the *Marshall Plan led to billions in economic and military aid to Western Europe and the eastern Mediterranean. With American assistance, the Greek military defeated the insurgents, and the Christian Democrats in Italy defeated the powerful Communist-Socialist alliance in the elections of 1948.

At the same time, tension over Germany grew. Unable to agree on a partition of Germany, both Soviet and U.S. troops remained in Berlin, and in an attempt to force the Americans out, the Soviets blockaded Berlin in the summer of 1948. Rather than backing down, the United States orchestrated the *Berlin airlift of supplies to Berlin, which lasted nearly a year until Stalin realized that his blockade had failed in its aims.

The year 1949 saw three developments that deepened the conflict. In April, a Western military alliance, the North Atlantic Treaty Organization (*NATO), was created, and it bound the United States to the defense of Western Europe. In September, the Soviet Union successfully tested a nuclear weapon; and in October, the Communist forces of Mao Zedong defeated the last remnant of the Nationalist Army and took power in China. In response to these events, the National Security Council in Washington drew up a plan in early 1950 known as NSC 68, which called for a massive buildup of American conventional and nuclear forces and an aggressive military response to Communist *expansionism throughout the world.

When war erupted between North and South Korea in June 1950, Truman and his advisers barely hesitated before acting on NSC 68 and sending U.S. troops to bolster South Korea. By late fall, more than 1 million Chinese troops crossed the Yalu River in North Korea and entered the *Korean War against American, South Korean, and other *United Nations troops. The war turned into a stalemate that lasted until an armistice in 1953 that returned Korea essentially to its pre-1950 dividing line.

The inauguration of Dwight D. *Eisenhower as president in January 1953 and the death of Josef Stalin that March shifted the dynamic of the Cold War somewhat. Eisenhower and his secretary of state, John Foster *Dulles, initiated the "New Look" strategy, which called for a greater reliance on nuclear weapons to deter China and the Soviet Union. Dulles enunciated a doctrine of massive retaliation that called for a severe American response to any Soviet *aggression and violence, and the "New Look" also drew the United States more closely into Third World politics. The Soviets, now led by Nikita Khrushchev, moved away from the depredations of Stalinism, but in foreign policy they remained dedicated to global competition with the United States.

The Cold War in Europe settled into an uneasy armed truce, with NATO troops stationed in West Germany and *Warsaw Pact and Soviet forces stationed throughout Eastern Europe. In 1956, the Soviets invaded Hungary rather than allow the Hungarians to move out of the Soviet orbit.

Berlin remained divided and contested, and in 1961, the East Germans erected a wall to prevent their citizens from fleeing to West Berlin.

The other arena for the Cold War during the 1950s was the Third World, where nationalist movements in countries such as Guatemala, Iran, and the Philippines were often allied with or led by Communist groups. The United States and the Soviet Union began to compete by proxy in the Third World, and the U.S. government utilized the CIA as well as various forms of covert operations in order to remove certain Third World governments and support others. Third World countries reacted by rejecting the impetus to choose sides in the Cold War. At Bandung, Indonesia, in 1955, dozens of Third World governments gathered and resolved on staying out of the Cold War. This resolve culminated with the creation of the Non-Aligned movement in 1961.

During the 1950s, the Soviets and the Americans created a new generation of nuclear weapons—hydrogen bombs—which magnified exponentially the potential damage of nuclear war. In the late 1950s, the Soviets launched the first of the reconnaissance satellites, Sputnik, while the United States developed U-2 spy planes. Both innovations soon led to aerial reconnaissance, allowing Cold War adversaries to gain a clearer picture of the military strength of the other.

But in 1960, U.S. reconnaissance did not prevent the CIA and the American military from overestimating the strength of the Soviet military. During the presidential election of 1960, John F. Kennedy criticized the Eisenhower administration for allowing an alleged “missile gap” to develop with the Soviet Union, even though in reality the United States was ahead of the Soviets in missiles, in particular, intercontinental missile development. On his inauguration as president, Kennedy promised that the United States would not fall behind the Soviet Union in military strength.

Kennedy and Khrushchev held a summit in Vienna in June 1961, but it did not go well. Kennedy felt bullied, and Khrushchev felt that Kennedy was a weak man surrounded by hawkish advisers. At the same time, Khrushchev knew that the only missile gap was on the Soviet side, and he intended to redress that imbalance. In the summer of 1962, Khrushchev decided to station nuclear missiles in Cuba, where the anti-American Fidel Castro had recently come to power and thwarted a CIA-sponsored invasion by Cuban exiles. An American U-2 overflight of Cuba detected these missiles, and that discovery set off what has since become known as the Cuban Missile Crisis.

For thirteen days in October 1962, Kennedy and Khrushchev played a deadly game of “chicken,” each threatening to escalate the crisis to the brink of nuclear war. After a tense standoff, Khrushchev decided to withdraw the weapons from Cuba in return for a pledge from Kennedy that the United States would not invade the island. Though the crisis was a victory for Kennedy, it signaled to both the United States and the Soviet Union that the cost of direct confrontation in an era of nuclear weapons was greater than any potential gain. In 1963, the two countries agreed on a Limited Test Ban Treaty, which marked the first step toward normalization of relations.

Phase Three: 1963-79. After 1963, the United States and the Soviet Union entered the period that came to be

known as *detente*. Ideological passions gradually dissipated in favor of a more pragmatic approach to international politics. The United States turned its attention to the Vietnam War, and until 1973, it remained mired there. The civil war in Vietnam was part of the Cold War insofar as it was the logical outgrowth of American policies of containment and rollback, but with its military attention locked on Vietnam and beset by severe domestic unrest, the administration of Lyndon B. Johnson focused less on Moscow. President Richard M. Nixon, while disengaging from Vietnam, worked assiduously to establish a diplomatic rapport with the Soviets, aided in that task by his chief foreign policy official, Henry Kissinger.

The Soviets until the very end of this period focused on their bitter rivalry with Mao's China; after Khrushchev's ouster in 1964, the Soviet leadership turned inward to attend to the many domestic problems that plagued the Soviet Union. Soviet rulers such as Alexei Kosygin and Leonid Brezhnev warily embraced the notion of *detente*, although like the Americans they continued to expend considerable energies trying to win various Third World states to their side.

The year 1972 was the apogee of *detente*. Nixon and Kissinger orchestrated a stunning and secretive rapprochement with Communist China. For their part, the Chinese had sought improved relations with the Americans in order to gain advantage over the Soviets. In February, Nixon traveled to the Forbidden City in Beijing and met with Mao and Chou En-Lai. Then, in June, Nixon and Kissinger met with Brezhnev and Soviet military officials in Moscow. The result was the first of the SALT Treaties (an acronym for Strategic Arms Limitation Talks), which pledged the United States and the USSR to limit the deployment of antiballistic missiles and set restrictions on offensive nuclear missiles as well. SALT I was followed in 1974 by SALT II, which went even further in specifying numbers of warheads each side could possess.

President Jimmy Carter came into office in 1977 with SALT II unratified, and he announced that his administration would make human rights a central concern. Carter had great success brokering a Middle East peace agreement between Israel and Egypt, the Camp David Accords (1979). However, though relations with the Soviets and the Chinese were civil, the spirit of *detente* began to dissipate. In December 1979, Brezhnev ordered Soviet troops to invade Afghanistan to support a tottering pro-Moscow regime. The U.S. Embassy in Teheran, Iran, had been seized a month earlier by Islamic militant students allied with the Ayatollah Khomeini, and the American hostages were held until the day Ronald Reagan was inaugurated in January 1980. The dual effects of the Iranian hostage crisis and the Soviet invasion of Afghanistan led to a significant increase in U.S. military spending in Carter's last year, to the election of Reagan, and to the end of *detente*.

Phase Four: 1980-86. Reagan arrived in office determined to restore American pride and power. He and his advisers believed that both the realpolitik of Kissinger and the weakness of Carter had sacrificed America's ideological and strategic advantage in the Cold War. Calling the Soviet Union an “evil empire,” Reagan embarked on a huge military buildup that ranged from new aircraft carrier groups to research for a space missile defense system known as the Strategic Defense Initiative (or “Star Wars”). The most

visible manifestation of Reagan's renewed Cold War fervor was the support given to the Contra rebels in Nicaragua, who were fighting a guerrilla war against the Communist Sandinista government.

The Soviets attempted to match Reagan's military spending. But the war in Afghanistan deteriorated, and Moscow discovered that the ailing industry and economy of the Soviet Union simply could not keep pace with the Americans. In 1985, a young, dynamic Mikhail Gorbachev became premier, and he instituted a series of domestic reforms known as *glasnost* (openness) and *perestroika* (restructuring the economy).

At first, the Reagan administration saw these initiatives as a ruse. They were not. Meeting with Gorbachev in Reykjavik, Iceland, in October 1986, Reagan made what was for him a leap of faith, agreeing to both the *INF Treaty (Intermediate Nuclear Forces) and the *START Treaty (Strategic Arms Reduction, the stepchild of SALT II). At Reykjavik, the Cold War began to thaw.

Phase Five: 1987-91. Few could have predicted how quickly the ice would melt. Although *glasnost* was designed to save and strengthen the Soviet Union, it helped cause the Soviet system to collapse. The economy was in shambles, and the pressures of war in Afghanistan and deep structural reform were simply more than the system could bear. In 1989, taking their cue from Moscow, people throughout the Eastern bloc demanded change. In Poland, Hungary, East Germany, and Czechoslovakia, Communist regimes fell and were replaced by interim governments dedicated to democracy and the free market. At the same time, in the Soviet Union itself, the Baltic states declared their independence, and Gorbachev significantly refused to authorize the use of the military to force either Eastern Europe or the Baltics back into the Soviet fold.

The end came in 1991. In August, Gorbachev survived a coup attempt by hard-liners opposed to any further reforms, but he survived largely because the newly elected Russian president, Boris Yeltsin, rallied army units and crowds to oppose the coup in Moscow. Gorbachev returned, but only for a brief time, before the Ukraine, Belarus, and the Russian Federation declared their independence. In December 1991, Gorbachev resigned as president of the defunct Soviet Union.

Assessment. The end of the Cold War came as a surprise to Moscow, Washington, and to the world. Almost no one had thought that the conflict would end so suddenly with one side collapsing internally. Both the Americans and the Western Europeans were unprepared for the rapid demise of Soviet military and economic power, and in the years after 1991, the major players in the Cold War tried to find a new strategic template that would organize their foreign policy. With the possible exception of China, that template proved elusive in the 1990s.

Like the Westphalian system in 1648 after the Thirty Year's War, and that of the Congress of Vienna in 1815 after the Napoleonic Wars, the Cold War was as much an international system following a major war as it was a struggle between two nuclear superpowers. It was a system that dominated all aspects of world politics between 1945 and 1991, and one that both exacerbated conflict in the Third World and prevented armed nuclear confrontation between the United States and the Soviet Union.

COLD WAR (1945-91): DOMESTIC COURSE

It was no accident that nine days after Harry S. *Truman asked Congress to enact a massive aid program to fight communism in Turkey and Greece—the *Truman Doctrine—he issued Executive Order 9835 creating the Federal Employee Loyalty Program with a mandate to purge America's own government of any hint of political deviance. With these two actions in March 1947, the president put into place the twin pillars of foreign and domestic policy that would determine the structure of American political discourse for the ensuing four decades. Just as Truman made it virtually impossible for any American political leader to question fighting the "Red menace" wherever it threatened—this, after all, was a battle between freedom and slavery, atheistic communism and God-fearing democracy—he also made deeply suspect any American politician who appeared overcritical of the nation's social and economic fabric, or who advocated reforms, such as national health insurance, that could be characterized as "socialistic." No one, on either the foreign policy or the domestic front, could afford to be accused of being "soft on communism." It was the ultimate political anathema, hence the boundary line of permissible political debate.

The implications of this new hegemony of anticommunism became crystal clear during 1947 and 1948, well before the vaunted rise of "McCarthyism" in the early 1950s. The chilling effect on cultural freedom became manifest when in 1947 the House Committee on Un-American Activities (known popularly by the acronym HUAC) sought to blacklist any actors, playwrights, or producers who refused to "name names" and list Communists or "fellow travelers" they might have met in the course of their work or political activities. The HUAC's technique was insidious. Under the guise of inquiring about a Hollywood personality's own beliefs, the committee insisted that its witnesses list all other people who might have attended a meeting of a "subversive" group in the 1930s or 1940s. The only recourse for someone who wished to avoid betraying friends who could or could not have entertained a sympathy for socialism was to "take the Fifth" Amendment and refuse to answer—at which point, of course, "taking the Fifth" became synonymous with being a traitor, hence someone who could not be employed lest the contagion of disloyalty spread.

The exact same process occurred in electoral politics during the 1948 presidential election when President Truman denounced Henry Wallace—his main opponent on the left, and the former vice president—for his "Communist" sympathies. Wallace had urged a softer stance toward

Russia and a bolder commitment to social welfare measures at home. It did not take other politicians long to learn from that exchange the degree to which one could be excluded from the political dialogue simply by being accused of sympathy toward communism. When Senator Joseph McCarthy turned that mode of debate into a political art form in the 1950s with his insistence that the State Department (and other agencies) was infested with Communists, he was simply carrying to its extreme a pattern already imbedded in the political process.

One major result of the politics of anticommunism, therefore, was to shrink the political spectrum in the United States. In Britain, France, Germany, Italy, and Scandinavia, there were political parties on the left that advocated social democratic policies such as universal health insurance, generous maternity leaves, and high unemployment benefits. Yet precisely because these political groups identified themselves with some socialist ideas, they had no counterparts in America, where expressing even toleration for such ideas was *verboten*. American politics thus became a dialogue between the Center and the Right, rather than the Left and the Right. Everything began with the premise of anticommunism and a faith in the virtues of capitalism as an engine of positive change. Incremental reforms in the status quo could be considered—for example, a hike in the minimum wage or in Social Security benefits—but anything more radical never made it to the negotiating table.

This shrinking political spectrum limited substantially the tactics and mobilization strategies of civil rights and labor groups. FBI agents questioned African Americans who boldly criticized the U.S. government, and interrogated whites who fraternized with such radicals. In the thirties and early forties, an alliance had begun to develop between civil rights groups and more “progressive” or radical unions such as the electrical and auto workers. Now, civil rights groups retreated to a more legalistic strategy of challenging segregation in the courts and seeking incremental reforms through modest congressional legislation—at least until the 1960s. Labor, in turn, moved away from pushing for a model of shared management/labor control toward “business unionism,” in which unions traded a share in decision making for higher wages and benefits. At the same time, organized labor purged its ranks of any Communist or Left-leaning leadership in 1948 and 1949. Much of labor’s success in organizing industrial unions—autos, rubber, the electrical industry—came from the energies of left-of-center activists. Now, these voices were stilled.

A similar insistence on conformity affected American family life and sexual norms during the postwar era. World War II had generated significant social changes. Millions of women, most of them married, had entered the labor force and found they enjoyed their work outside the home. Now, with the return of peace, government and civic leaders, magazine publishers and advertisers joined in a crusade to urge women back to a life of “normality” as housewives and mothers. The three- and four-child suburban family became a new standard of “success” for women, with a life of segregated sexual spheres a domestic version, in the historian Elaine Tyler May’s words, of the “containment” policy practiced by America toward world communism. Traditional roles for women became America’s answer to the free love, antifamily, collectivist social policies of the Soviet Union. Not surprisingly, Vice President Richard M. Nixon

used such traditional roles as his trump card in the famous “kitchen debate” he held with Nikita Khrushchev in 1958 to celebrate America’s superiority in competition with the Soviet Union.

Similarly, gay and lesbian Americans experienced a substantial increase of official and unofficial pressure to conform to heterosexual norms. During the war, increased travel, military experience, and access to more anonymous environments had made it possible for some homosexuals openly to express their sexual preference. The politics of anticommunism, on the other hand, now placed a premium on conformity to traditional masculine and feminine roles. Denunciations of “pinko queers” went hand-in-hand with efforts to purge the federal bureaucracy of anyone suspected of deviance, whether political or personal. Any affirmation of civil liberties or civil rights had to take place within a framework of pledging loyalty to all the ingredients of 100 percent Americanism, including total support of heterosexuality.

In the context of this narrowed political and cultural spectrum, an enormous amount of ferment continued to develop. The musical rebellion of rock ‘n’ roll and rhythm and blues signaled a growing restlessness among the young; so too did the plays of Tennessee Williams, the poetry of Allen Ginsberg, the novels of Jack Kerouac, and the rising religious commitment of young people who felt called to something more than another tract house in a suburban community. But ironically, it was still the Cold War—and the fear of losing it—that prompted the most obvious social changes of the 1950s. The Interstate Highway system emerged primarily as a means of facilitating *mobilization and response to a military threat; the National Defense Education Act, with its cutting-edge role in providing government support for scholars in graduate school, responded to the terror Americans experienced after the Russians were the first to conquer space with Sputnik; and the civil rights gains of the *Brown v. Board of Education* decision, and the Civil Rights Acts of 1957 and 1960 were at least in part a response to America’s embarrassment in the face of Russia’s Cold War propaganda accusing the United States of being hypocritical in its defense of freedom.

Yet, appropriately, it was the civil rights movement that provided the wedge for finally undermining the dominance of Cold War cultural politics. Based on the simple and patriotic claim to equal treatment for blacks and whites under the law, the civil rights movement insisted on dramatic change. Armed with the powerful religious appeal of the Judeo-Christian tradition, Martin Luther *King, Jr., and his colleagues mobilized millions to criticize the status quo. The ethical call to join in the quest for a better America galvanized all the other groups in America seeking a way of expressing their frustration with the doctrines of conformity and false pride in the status quo—women, Chicanos, gays, students, Vietnam antiwar activists. It may have been only a small segment of each group of critics who seized public attention; but the attention they secured focused the entire nation on a different perspective toward the values, behaviors, and political norms that had reigned unchallenged for the preceding two decades.

The Cold War remained central to American society and politics all the way through the 1980s. Arguably, it remains central today, even though the actual conflict has

ended. But after the successful challenge of the civil rights movement in the early and mid-1960s, the ubiquitous hold of Cold War culture and politics was broken, providing at least the opportunity for a different kind of individual and group expression of dissent.

COLD WAR (1945-91): CHANGING INTERPRETATIONS

The Cold War generated two often indistinct battles: the first being the actual struggle between the West and Communism; the second being the continuing battles among historians, political scientists, and journalists—not to mention laymen—as to the origins and nature of, as well as the blame for, the Cold War. At the core of debates has been the contention that one side, either the Soviet Union or the United States (depending on one's interpretation), was primarily responsible for beginning the Cold War and the havoc it wreaked. The debates first focused on the origins of the Cold War, but the stakes were soon raised. Scholars would also blame the responsible party for the *arms race and the proliferation of *nuclear weapons, as well as apportioning an overriding share of the blame for a series of local wars around the world.

Since scholars immediately after World War II did not have access to top-secret documents from American and Soviet policymakers, almost all Western writers took as their cue Winston S. *Churchill's famous declaration in 1946 that the Soviet Union had dropped an "iron curtain" over Eastern Europe, and that the West needed to do everything in its power to prevent further loss of liberty. To almost all American commentators at the time—with the noticeable exception of the journalist Walter Lippmann—the United States had no choice but to challenge this new enemy; after fighting the Nazis, the United States then had to take on the Soviet Union, now compared to the Nazis by the common use of the terms *Red fascism* and increasingly *totalitarianism*.

Scholars who argued from this perspective came to be known as the "orthodox" (or "traditional") school and generally viewed U.S. actions as being virtuous and sincere. George E. *Kennan, in his Long Telegram to the State Department and later writing as "Mr. X" in his article "The Sources of Soviet Conduct" in *Foreign Affairs* (July 1947), remains the classic formulator of this argument. He noted that Soviet actions were inexorably expansionist, antidemocratic, and posed a very real threat to the United States

and its allies. The United States therefore needed to adopt a policy of "containment" toward the Soviet Union. Kennan expanded upon this argument in his *American Diplomacy* (1951). To Kennan and other traditionalists, the United States was facing a new type of enemy and had to adapt accordingly. Hans Morgenthau, Jr., continued this form of interpretation in his classic *In Defense of the National Interest: A Critical Examination of American Foreign Policy* (1951). Herbert Feis's *Roosevelt-Churchill-Stalin* (1957) remains the best summary of this position, with its unapologetic championing of the West and its hysterical condemnation of Soviet premier Josef *Stalin.

Arthur Schlesinger, Jr., is another renowned historian who worked within this framework. His influential essay "The Origins of the Cold War" (*Foreign Affairs*, October 1967) built on Kennan's and Morgenthau's apportioning of blame, and further, argued that the Cold War emanated not only from Soviet imperialism but from Stalin's paranoid psychological profile. To Schlesinger, Stalin's adherence to Communist doctrine and his alleged mental illness combined to make the Soviet state both imperialistic and unstable. Unlike other members of this school of thought, Schlesinger acknowledged that the United States had global economic interests and was not always sensitive to the needs of peoples in the Third World. Yet he was at pains to note that the United States had almost single-handedly ensured economic and political freedoms throughout the postwar world. In sum, the orthodox perspective viewed the United States as innocent of any political nefariousness and simply acting at the invitation of beleaguered nations. An updated version of this interpretation is Geir Lundestad's "Moralism, Presentism, Exceptionalism, Provincialism, and Other Extravagances in American Writings on the Early Cold War Years" in *Diplomatic History* (Fall 1989).

The orthodox interpretation remained the dominant mode of historical thought until the 1960s—and it continues in various forms to this day. Beginning in 1959, though, an alternative approach appeared when William Appleman Williams published *The Tragedy of American Diplomacy*. This work challenged a number of long-held assumptions made by the orthodox interpretation and American Cold War policies in general. Williams's work became an instant classic (or a notorious act of disloyalty, depending upon one's politics). Williams argued here and later in revised editions of the book that Americans had been far from innocent actors upon the world stage and in fact had always been an empire-building people, even as they fiercely denied it. So incendiary was this charge that Williams was accused of disloyalty and even treasonous behavior by those who saw U.S. actions in the Cold War as just. However, Williams's work deeply influenced others, and within ten years' time it generated an entire school of historical thought known as *revisionism*—one that sought to reexamine all aspects of American foreign relations, but was especially concerned with defining the nature of the Cold War.

One of the intriguing qualities of Williams's work was his use of lengthy quotes from American policymakers to support his interpretation. To Williams, these statements were the documented proof that these people were far more honest when they spoke among themselves about an "American Empire" than in the explanations of policy to the public. Leaders like Franklin D. *Roosevelt and Harry

S. *Truman and their advisers were therefore seen as far-sighted and lacking any naïveté in considering American foreign policy objectives. According to Williams and many of his followers, these policymakers shared an overriding desire to maintain capitalism at home; in order to ensure this goal, they advocated the "open door" policy abroad, which would therefore increase access to foreign markets for American business and agriculture. This in turn would create a healthy economic climate at home and the propagation of American power abroad.

Williams's overall argument gained currency throughout the 1960s as a new group of historians sought to explain the roots of American foreign policy, especially as it related to the origins of American involvement in the *Vietnam War. Though a school of thought invariably contains differences between individual scholars, one of the most intriguing claims of the revisionist school is that the classic definition is mistaken in claiming that the Cold War began after World War II. Historians in such works as N. Gordon Levin's *Woodrow Wilson and World Politics: America's Response to War and Revolution* (1968), Walter LaFeber's *America, Russia, and the Cold War* (1972), and David Foglesong's *America's Secret War Against Bolshevism: U.S. Intervention in the Russian Civil War, 1917-1920* (1995), point to the century-old conflicts between the two powers, and especially to the conflict after the Bolshevik triumph in the 1917 Russian Revolution. It was the domestic policy of the United States—visceral anticommunism dating from the early twentieth century—that helped shape American Cold War policy as much as any foreign event.

Other revisionists have pointed out provocative Soviet actions such as installing puppet regimes in Eastern Europe. Yet Gar Alperovitz in his influential *Atomic Diplomacy: Hiroshima and Potsdam* (1965) places much of the blame on the Cold War on President Truman's calculated use of the atomic bomb. Alperovitz's updated version, *The Decision to Use the Atomic Bomb and the Architecture of an American Myth* (1995) extends his argument, while Michael Hogan's edited collection, *Hiroshima in History and Memory* (1996), finds problems with his analysis. According to Alperovitz, the bomb was unnecessary in defeating Japan, and was intended instead as a provocative signal to the Soviets that the United States would use such a weapon to fashion a postwar world accessible to American interests. A more moderate revisionist view of this position was put forth by Lloyd Gardner. His *Architects of Illusion* (1970) offered a slight modification of Williams's and Alperovitz's insistent critique of U.S. foreign policy, but still found America's overarching belief in economic expansion the key to understanding America's hostile view of the Soviet Union. An even harsher indictment of U.S. foreign policy appeared in Joyce and Gabriel Kolko's *The Limits of Power: The World and U.S. Foreign Policy, 1945-1954* (1972), in which the United States's Cold War policy was seen as both reflexively anti-Communist and counterrevolutionary. Any form of challenge to the American form of politics or economics was controlled by either covert or military means.

Not surprisingly, each new historical interpretation of the Cold War begat another—one that built on the earlier findings even as it contradicted them. For an early but still cogent breakdown of these historical camps, see Warren Kimball, "The Cold War Warmed Over," *American Historical Review* (October 1974). An example of this process at

work is John Lewis Gaddis's *The United States and the Origins of the Cold War, 1941-1947* (1972). It was immediately hailed as ushering in a new interpretative approach, *postrevisionism*, which claimed to synthesize a variety of interpretations. Gaddis's work did not simply blame the Americans or the Soviets for their postwar actions; it also mentioned the economic motives of the West in regard to Eastern Europe. But the tenor of Gaddis's argument was clear: the Soviets were definitively more responsible for the origins of the Cold War, through their aggressive and anti-democratic policies in Eastern Europe. Interestingly, Gaddis's position seems to have become more antagonistic over time; his essay, "The Tragedy of Cold War History" (in *Diplomatic History* [Winter 1993]), is a not too subtle attack on Williams and the revisionist school in general for refusing wholly to indict Soviet policy. Gaddis's "post-revisionist synthesis" remains highly contentious, as indicated by the caustic critique of it in Bruce Cumings's "Revising Postrevisionism," *Diplomatic History* (Fall 1993).

The battles over the origins of the Cold War continue; but they are not as fierce, given the dissolution of the Soviet Union in 1991. Selective releases from Soviet archives have, however, continued to fuel debates. Many of these documents have been translated and can be found in the volumes of the *Cold War International History Project*. For a survey of differing interpretations, see Melvin Leffler and David Painter's edited collection, *Origins of the Cold War: An International History* (1994). Further, Melvin Leffler's *A Preponderance of Power: National Security, the Truman Administration and the Cold War* (1992) is an important work, for it built on Gaddis's ideas but changed the focus of the debate from issues of imperialism and morality to a more searching critique of U.S. notions of national security. Howard Jones and Randall Woods believe that some kind of national security synthesis is now possible, given the United States's ability to fuse the insights of both the orthodox and revisionist interpretations. However, other historians such as Emily Rosenberg, Anders Stephanson, and Barton Bernstein continue to disagree. For an exchange on these views, see "Origins of the Cold War in Europe and the Near East," and the successive commentaries in *Diplomatic History* (Spring 1993). Finally, Michael Hogan's edited collection, *The End of the Cold War: Its Meaning and Implications* (1996), summarizes a variety of viewpoints now that the Cold War is history.

—Jonathan Nashel

COLLECTIVE SECURITY. The term collective security was coined in the 1930s, but the concept that each nation's security depended upon that of all other nations, that peace was universal and indivisible, was not new. Earlier advocates, especially President Woodrow *Wilson, had affirmed this concept during World War I. The victorious Allies had institutionalized it in the postwar *League of Nations. Despite the Senate's rejection of the League, and the League's failures to stop aggression during the 1930s, Wilson's legacy—his vision of a "new world order"—continued to shape U.S. foreign policy throughout the twentieth century. As one of the world's great powers, the United States by midcentury abandoned its earlier policy of neutrality in favor of collective security.

Wilsonian collective security presupposed U.S. hegemony. Drafting the Covenant for the postwar League at the Paris Peace Conference of 1919, Wilson ensured that it

would conform to his vision of world order. He viewed the League as the worldwide extension of the *Monroe Doctrine. He expected the United States to control the League so that it would extend U.S. influence abroad without jeopardizing U.S. independence. A veto over potentially unacceptable decisions by the League Council would guarantee that its actions would coincide with U.S. preferences.

Rejecting Wilson's globalism, Republican senators doubted that the United States could control the League. Led by Henry Cabot Lodge, they feared that the League would endanger U.S. independence and entangle the United States indiscriminately in foreign wars. They did not want Wilson or any president to use the League to involve the United States in foreign wars without congressional approval. Although most had supported war against Germany in 1917, these senators repudiated the Wilsonian vision of collective security.

After World War I, Republican presidents largely shunned the League in Geneva, Switzerland. The closest they came to global collective security was the Kellogg-Briand Pact of 1928 and the Hoover-Stimson Doctrine of 1932. President Calvin Coolidge approved the multilateral treaty that Secretary of State Frank Kellogg had negotiated with French foreign minister Aristide Briand to renounce war except for self-defense. The Kellogg-Briand Pact did not, however, prevent Japanese aggression against China in Manchuria in 1931. In response, Secretary of State Henry Stimson announced his and President Herbert Hoover's doctrine of nonrecognition. The United States rejected forceful changes in the territorial and political independence of nations, but it also eschewed both unilateral and collective action to enforce the avowed right of national self-determination.

During World War II, President Franklin D. *Roosevelt revived the Wilsonian idea of collective security. In the 1930s, the United States had attempted neutrality while Fascist Italy, Nazi Germany, and Imperial Japan committed aggression against their neighbors in Europe, Africa, and Asia. After the 1938 Munich Agreement failed to preserve peace, Roosevelt and other U.S. policymakers concluded that the nation could not protect its security alone. In 1939-41, the United States formed an alliance with the United Kingdom and the Soviet Union, and also China. This alliance served as FDR's model for a postwar *United Nations to replace the discredited League. Like Wilson earlier, he expected the victorious powers—the world's policemen—to dominate world affairs. Five nations, eventually including France, would each have the right to veto the UN Security Council's decisions.

The United Nations failed to fulfill its Wilsonian promise. FDR's secretaries of state, first Cordell Hull at Dumbarton Oaks in 1944 and then Edward Stettinius at Yalta in 1945, helped to draft the new UN Charter. Their efforts culminated in 1945 at the San Francisco Conference, where President Harry S. *Truman, after FDR's death, reaffirmed Wilson's legacy. However, this revived concept of global collective security, involving cooperation among the great powers, soon succumbed to the *Cold War. The Soviet Union and the United States divided the world into competing spheres of influence, creating a new balance of power rather than universal collective security.

Only once during the Cold War did the United Nations provide collective security as FDR and Truman had hoped. In 1950, after North Korea attacked South Korea, the

United Nations responded with collective defense against aggression. Because the Soviets were temporarily absent, the United States obtained the Security Council's approval for the use of military force to defend South Korea from aggression. From the *Korean War to the end of the Cold War, the United Nations served as an international forum for U.S.-Soviet rivalry rather than as an organization for collective security. U.S. presidents, frustrated by their lack of control over the United Nations, routinely criticized it for failing to fulfill its original intent.

As an alternative throughout the Cold War, the United States pursued regional collective security, which the UN Charter permitted. Under the 1947 *Inter-American Treaty of Reciprocal Assistance, the United States committed itself to defend Latin American nations. The 1949 North Atlantic Treaty ended American isolationism by involving the United States in a long-term military alliance with western European states (*NATO). Other mutual security treaties extended the U.S. network of alliances to the Pacific and Asia, including Australia and New Zealand in 1951 (ANZUS), Southeast Asia in 1954 (*SEATO), and bilateral treaties with the Philippines, Japan, Taiwan, and Korea. Claiming authorization under these mutual security treaties, the United States intervened in various countries to sustain allies and prevent Communist victory, most notably in Vietnam from the 1950s to 1975. This unilateral form of regional collective security epitomized U.S. involvement in the Cold War.

The end of the Cold War opened another opportunity for the United States to use the United Nations for collective security. After Iraq's invasion of Kuwait in 1990, President George *Bush organized a broad coalition, including the Soviet Union, to stop this aggression and restore Kuwait's sovereignty. For the first time since the Korean War, now that the United States was the world's only superpower, it could provide leadership in the United Nations to use military force in the Persian Gulf. During the *Persian Gulf War of 1991, Bush proclaimed a "new world order" of global collective security. Thus the Wilsonian legacy still influenced U.S. foreign policy in the post-Cold War world.

President Bill *Clinton extended collective security into the Balkans, involving both the United Nations and NATO in conflicts arising from the breakup of Yugoslavia, the *Bosnian Crisis. In 1995, the United States and its NATO allies retaliated with air attacks against Serbia to enforce UN resolutions calling for the end of Serb aggression and ethnic cleansing in Bosnia-Herzegovina. NATO intervention enabled the United States and its UN partners to negotiate the 1995 Dayton Peace Accords, which established an international peacekeeping regime in Bosnia-Herzegovina and ended most fighting in the region. Three years later, after Serbia resorted to ethnic cleansing of Albanians in its province of Kosovo, the United States and its NATO allies threatened military reprisal against Serbia to force it to comply with UN demands. This collective action curtailed Serbia's attacks and facilitated the negotiation of the 1998 Kosovo Accords, which required Serbia to remove some armed forces and accept international supervision in Kosovo, even within its own province. This was enforced in the *Kosovo Crisis (1999). Thus the United States, along with its partners in the United Nations and NATO, continued to pursue collective security in the post-Cold War world.

COLONIAL REBELLIONS AND ARMED CIVIL UNREST (1607-1775). Rebellions and armed unrest did not so much punctuate as define the history of colonial British America. All three of colonial society's constituent groups—Native Americans, Africans, and Europeans—took part. The Stono Rebellion by South Carolina slaves in 1739 and the New York City slave conspiracies in 1712 and 1741 were important points in setting the terms of black-white relations. "Frontier" warfare was not so much a matter of continuous Indian dispossession as a means by which Indians and whites dealt with one another within a social order they shared.

Unrest stemmed in part, then, from the unprecedented encounter of three groups, each ignorant of the others, that created "early American" society. In part, too, it arose from the character of colonial social organization. "Mobs, a sort of them at least, are constitutional," commented Thomas Hutchinson in 1768, three years after he had seen his own house thoroughly sacked by his fellow Bostonians. But he knew that a volunteer fire company, a militia unit, or a posse was just a "mob" drawn into ranks and given official standing.

In this sense white Americans and Europeans shared a great deal. For both, popular uprisings could be a means of negotiation across class and community lines, within a framework that recognized "liberties" but made no pretense of equality. Such was the "Knowles Riot" in Boston in 1747, named for the British naval officer who ordered the impressment of Bostonians despite local procedures and customs. For merchant sailors and fishermen, resisting the press meant protecting their own lives. For community leaders, it meant protecting the town, because during a press neither merchant nor fishing vessels would sail. Similarly, a community might respond to food shortage by forcing merchants to release reserves of grain at "just" prices, or prevent pestilence by keeping smallpox victims away. Such uprisings rested on three assumptions. First, local customs bound rulers and ruled, rich and poor alike. Second, both official actions and uprisings offered means by which "society" rightly controlled its members. Third, the subject could usually be negotiated. A press gang might withdraw, releasing its victims. The price of salt, bread, or grain could be adjusted.

This dimension of colonial-era uprisings fit perfectly with the *ancien régime* in Europe. One historian has described the same thing in England as "the moral economy of the crowd"; another has written about "the reasons of misrule" and "the rites of violence" in early modern France. Marie Antoinette's suggestion that Parisians protesting the absence of bread might "eat cake" showed her profound ig-

norance of what obligations a time of shortage imposed upon her class. Thomas Hutchinson knew better.

Rural upheaval was another matter. Among the major events were mid-eighteenth-century land rioting in New Jersey and New York, the Green Mountain Boys' insurrection that led to the creation of Vermont, and separate 1760s "Regulator" movements in the two Carolinas.

Uncertainty about the basic conditions of rural life, especially landholding, underpinned all of these episodes. Who would hold and develop the land could not be compromised among whites, any more than between whites and Indians. Colonial-era land distribution was extremely haphazard. A grantee could "locate" land almost at choice, with virtually none of the regularity that the national-era grid system was intended to provide. The ultimate example was how Kentucky became "shingled" four times over with conflicting claims.

Individual claims had their counterpart in ill-drawn provincial boundaries. A map of 1774 shows Massachusetts towns extending into New York and New York manors reaching into New England. Charter grants overlapped, as Connecticut's claim to the Wyoming Valley of Pennsylvania and the claim of both New Hampshire and New York to the Green Mountains showed. In such circumstances would-be owners clashed repeatedly over possession, typically creating extended movements rather than short-lived risings.

Of the movements, only the Green Mountain Boys achieved all they wanted. They originated among Yankee settlers who had New Hampshire titles to lands between the Upper Connecticut River and Lake Champlain and who proposed to organize the region in New England style. New York also claimed the territory, perhaps with the better title, and imposed its own system of counties and of large estates where "amiable and innocent tenants" would toil. The New England migrants created a countergovernment and found the chance in 1777 to claim statehood.

Others traveled the same path, but not so far. Hudson Valley land rioters denied the validity of the region's great manorial land grants, broke jails open, and flourished rhetoric about mobs overcoming kings. In 1766, they staged a great rising between New York City and Albany. New Jersey rioters who claimed land under Indian titles established their own courts and "a gaol [jail] back in the woods." Authorities responded as strongly as they could, with laws that condemned known rioters, like Vermont's Ethan Allen, to death by name. New York officials sent British troops against the Hudson Valley rioters in 1766.

The southern situation offers a variation on this theme. North Carolina's huge land grants were the subject of contention. But the problem both there and in South Carolina was as much poor government as poorly defined land claims. The immediate subject that sparked the North Carolina Regulation was Tryon's Palace—an elaborate mansion constructed at public expense for the royal governor. Like northern land riots, this turned into a dispute about public power, as perhaps 8,000 Piedmont farmers resisted the taxes and closed courts to prevent collection. The authorities responded with strong force, crushing the armed rebels in 1771 at the Battle of the Alamance. The South Carolina Regulators did not come to blows with government. Aspiring farmers who wanted to develop a stable slave society, they claimed that colonial authorities did nothing to protect them against mixed-race bandits, and

set up their own institutions to remedy the problem. Those bandits themselves present a case of a colonial rising that still awaits its historian.

COLORED TROOPS, U.S. From the beginning of the *Civil War, concern over the use of black soldiers pervaded Union military policy. In order to avoid alienating slaveholding states that had not seceded, the federal government did not sanction the black volunteer regiments that were organized in South Carolina, Kansas, and Louisiana during the early years of the war. By 1863, the federal government needed manpower and passed a national *conscription act, subsequently authorizing the recruitment of black soldiers, particularly in the South. In May 1863, the War Department established the Bureau of Colored Troops to oversee the organization of black regiments. These regiments formed the United States Colored Troops (USCT).

By the end of the war, the USCT consisted of over 140 regiments (infantry, cavalry, heavy and light artillery) with troop strength numbering almost 180,000 enlisted men and 7,000 officers. The bulk of the enlisted soldiers were Southern free blacks and freedmen, although the North provided some 30,000 men. Nearly all of the USCT's commissioned officer corps was white; only 100 or so blacks ever received commissions. Literate black soldiers became noncommissioned officers, largely to serve as intermediaries between white officers and their mostly illiterate troops. Training, esprit de corps, and presence on the battlefield varied among regiments, often influenced by the preconceptions of a particular unit's officers. Saddled with racial stereotypes of blacks as incapable of self-discipline and possessing the character of children, many officers tailored their training methods to fit these prejudices. USCT regiments received a simpler training manual from the War Department, along with substandard weapons and equipment, and until March 1865, lower wages than white soldiers. Many regimental commanders, however, circumvented this unequal treatment and potentially low morale by training their troops under standard military protocol. The racial predispositions of military policies were also counterbalanced by the enthusiasm of black soldiers. The opportunity to strike a blow against slavery and racism, along with expected recognition of their citizenship, drove most USCT recruits to master the art of soldiering.

Initially, USCT regiments were mustered into service as labor and support units. The War Department and a substantial amount of the Northern public did not think that

black troops could withstand the rigors of combat. Once they fought, black regiments dispelled that notion. In the spring and summer of 1863, USCT units engaged in three major battles. The 1st and 3rd Louisiana Guards participated in an assault on the Confederate stronghold of Port Hudson on the Mississippi River in May. Although they did not break through the Confederate defenses and lost almost 20 percent of their men, the regiments proved their mettle on the battlefield. Black troops, facing a Confederate force nearly twice as large, held their position at Milliken's Bend, Louisiana, in June, despite horrendous *casualties. In July, men of the 54th Massachusetts Infantry, under the command of Col. Robert Gould Shaw, proved their courage in the siege of *Fort Wagner, South Carolina, although they lost over 40 percent of their regiment, including Shaw. Overall, USCT troops fought in more than 400 battles, including 39 major engagements. Other significant fighting took place at the Battle of *Fort Pillow, Tennessee, in April 1864; the Battle of Chaffin's Farm, Virginia, in September 1864, where fourteen blacks received Congressional Medals of Honor; the Battle of *Nashville in December 1864, where the Confederacy's Tennessee campaign was halted; and the Battle of Fort Blakely, Alabama, in April 1865, one of the last major battles of the war. By war's end, USCT fatalities totaled almost 38,000. Most regiments were disbanded after the war, but six all-black regiments (four infantry and two cavalry) were organized as regular army units. Eventually, two infantry regiments were decommissioned and the resulting four (the 24th and 25th Infantry and the 9th and 10th Cavalry) were stationed west of the Mississippi, where they participated in the Indian wars and the federal suppression of strikes.

Whether the Union would have won the war without the aid of the black troops was heatedly debated by Northerners and Southerners alike. The consensus among historians is that the USCT played an integral role in the Union's victory. More important, the USCT started a precedent in the American military's use of black soldiers, characterized by a reluctance to employ them, unequal treatment, and a grudging acknowledgment of their indispensable service. As blacks displayed their loyalty to the U.S. government and performed the highest duty of citizenship, limited gains in civil rights among the entire black community usually followed military crises.

COLT, SAMUEL (1814-1862), inventor and manufacturer. The flamboyant Samuel Colt was best known for his patented revolving pistols, called *six-shooters*. After an abortive attempt to manufacture an early version of his pistol, Colt turned to other pursuits—including the development of a submarine battery and a submarine telegraph—before going back to manufacture an improved version of his pistol at the outbreak of the *Mexican War (1846-48). Provided with U.S. Army contracts, as well as an expanding market for his product in Europe and the

American West, Colt's business thrived to such an extent that in 1854-55 he constructed a large state-of-the-art armory at Hartford, Connecticut. Equipped with the latest tools and machinery, "Coltsville" became a showplace of American industry and the training ground of numerous inventor-entrepreneurs. During the * Civil War, the Colt armory approached mass-production levels, producing over 400,000 pistols and 85,000 rifles, second only in quantity to the output of the U.S. government-owned Springfield Armory.

By the 1870s, Colt firearms (including the *Gatling gun) could be found in virtually every part of the world. Moreover, former Colt workers proved instrumental in transferring the machine-based technology initially developed in the small-arms industry to technically related industries making such consumer durables as sewing machines, typewriters, business machines, bicycles, and, eventually, motorcycles and automobiles. Though many gifted individuals contributed to what, by the 1850s, became known as the "American system of manufactures," Samuel Colt was the system's most vocal spokesman. Few other manufacturers achieved greater prominence or exerted greater influence on the developing American economy during the age of the first Industrial Revolution (c. 1815-76).

COMBAT, CHANGING EXPERIENCE OF. The English settlers of North America twice made principled attempts to detach themselves from the world of war altogether. Many of the Puritans who arrived in the early seventeenth century hoped to lead a peaceful life in the New World. The founding fathers of the eighteenth-century republic, George *Washington foremost among them, wanted to create a society in which war as Europe knew it would have no place. Indeed, the United States tried at the outset to dispense with an army as an instrument of government, even though it was through a successful war that its independence from European rule had been won.

Both efforts to create an America liberated from the imperatives of combat failed. The Puritans, who had first sought peace with the Native Americans, quickly fell into conflict with them. The young United States found it could not govern its territory without an instrument of force. Two military institutions were the outcome of these disappointments. The first was the militia of the original colonies. The second, which had its origins in the colonies' militias, was the U.S. *Army.

Americans, when called upon to perform military duty, proved adept at its discharge. The early colonists created an effective military frontier against the Indians, and despite some setbacks, successfully protected their settlements against raiding. Their successors in the later seventeenth and eighteenth centuries contributed importantly to the defense of the colonies against French power in North America. Using techniques learned from the Indians in forest fighting, they played a major part in King William's War, King George's War, and the *French and Indian War, the conflicts in which the British eventually triumphed over the French in the New World.

The colonial militias were transplants from England, modeled on the home defense forces successively raised

and reformed under the Tudors, the Stuarts, and the Hanoverians. They were not a regular force and the crown raised none in the colonies for their defense. The Royal Americans, formed during the French and Indian War, was a unit of the British army (it survives today as part of the Royal Greenjackets, having in the interim been known as the 60th Regiment and the King's Royal Rifle Corps), while Roger's Rangers, a truly local formation, was an irregular body, albeit the precursor of the U.S. Army * Rangers. Both the Royal Americans and the Rangers, nevertheless, were a valuable leaven in the crown's forces during the French-Indian War, bringing to its conduct a skill in "Indian" or "American" warfare the redcoats shipped across the Atlantic did not possess. The redcoats further benefited from the local knowledge and expertise of militia officers, George Washington prominent among them, in forest and backcountry operations.

"Indian" or "American" warfare was a bloody business, if only because the Europeans who fought it—French and British alike—did so hand-in-glove with their Indian allies. Its central techniques were those of the raid and the ambush, in which there were no formal tactics and little quarter was given. "American" tactics subsequently made their way back into European warfare, through the raising by both the British and French of irregular units modeled on those that had proved so successful in the American forests.

"American" warfare also contributed greatly to the eventual victory of the colonists over the crown in the *Revolutionary War. At the outset, the colonial militias, which provided the Revolution with its first military force, attempted to overcome the redcoats on their own terms, fighting in fixed lines on open battlefields. They were not up to the task and were beaten at the Battle of *Bunker Hill and the Battle of *New York. When Washington, appointed commander of the *Continental army, withdrew his force to more distant regions in New Jersey and Pennsylvania, his army achieved greater success by appearing when not expected on small battlefields, such as Trenton and Princeton, close to its sanctuaries, and often in bad weather. Nevertheless, Washington was eventually reduced to withdrawing his army into a secure sanctuary near the frontier in the hope of waiting out a better turn of events.

The better turn came when the British despaired of bringing Washington's army to battle on conventional terms and transferred their main force into the southern colonies, where they expected wider loyalist support. In that roadless, heavily forested, and sometimes swampy terrain, it was their enemies who in practice achieved superiority, by reverting to a form of American warfare. Their guerrilla tactics overcame the superior force the British deployed, obliging the redcoats to abandon their southern strongholds and retreat northward to the shores of Chesapeake Bay in the hope finding support from the British Fleet. They did not, and at the battle of *Yorktown they lost a final conventional battle in defense of formal *fortifications.

Having won a war of independence in part by unconventional tactics, which they had also exported to the Old World, the Americans found themselves in their own civil war obliged to relearn contemporary tactics from Europe. This was largely because the conditions that had made so-called "American" warfare so effective against *George III's army no longer prevailed in most of the theater of operations between 1861 and 1865. The forest east of the

Appalachians had largely gone, to be replaced by pasture and plowland, and had been severely reduced between the mountains and the Mississippi. In open country, both North and South had to fight European-style, in closed formations, supported by *artillery.

This not to say that there was not something distinctively American about the way the *Civil War was fought. Indeed, there was, and its Americanness would eventually be transmitted to Europe, though with little acknowledgment by European armies of who had pioneered the new developments. The most important innovation was the dismissal of cavalry from the line of battle. North and South learned early on that horsed formations could not charge ranks of infantry armed with the new rifled *musket, and they relegated cavalry to scouting and raiding roles. They also learned the importance of massing artillery forward in direct support of the infantry. They further learned the importance of leadership by example by senior officers—a practice that produced the exceptionally high level of *casualties suffered by generals on both sides. Finally, they demonstrated that infantry, if strongly motivated and well led, could carry positions or sustain attack even at the cost of unprecedentedly high casualties inflicted by long-range, accurate rifle fire. The Americans were the first soldiers to undergo the experience of the attrition battle and to overcome the ordeal.

Because the armies of the Civil War were largely amateur, their achievements were not noted in Europe, or, if noted, were dismissed as irrelevant to the demands of warfare between professional forces. This lack of appreciation of the significance of Civil War combat obliged the European armies, during World War I, to relearn its lessons at terrible cost. In that war, the American Expeditionary Force, when it began to deploy in strength on French battlefields, also suffered grievously. By attacking in Civil War style, however, it achieved a moral superiority over the German Army, spirited by four years of attrition, that contributed greatly to the Allied victory.

World War II compelled the U.S. Army once again to adapt its tactics to a new form of combat, as it had had to do in 1861. Mechanized warfare in Europe, * amphibious warfare in the Pacific required novel responses, all the more difficult to make because of the parsimony with which the armed forces had been funded in the interwar years. The earliest success was achieved in amphibious operations, thanks chiefly to the prescience of the leadership of the U.S.

* Marine Corps, which during the 1920s had worked out the fundamental principles of cross-beach attack and designed the essential equipment, in particular, the first practicable landing craft, the Higgins boat. The principles and the equipment were to underlie Allied success in the amphibious operations of the Mediterranean, European, and Pacific campaigns. Without the Marine Corps experiments the *D-Day landing would not have worked.

American forces lagged behind those of Europe, particularly the German, in mechanized operations and in the ancillary field of airborne operations. They proved, thankfully, quick learners. After an uncertain start in the * North African campaign, the American expeditionary armies developed in the invasion and conquest of *Italy a formidable expertise in airborne and conventional ground operations. But their greatest success came in Northwest Europe, the theater in which they first deployed a large mass of armor. Profiting in part from a stalemate in the invasion

of *Normandy that drew German armor into a battle of attrition with the British and Canadian forces, the Americans were able eventually to achieve an enormous superiority in numbers of *tanks over the Germans at their section of the bridgehead, and to stage a breakout at *St. Lô into open country that culminated first in the encirclement of the enemy and then in a headlong advance to the frontiers of Germany.

By the time of the coming of * victory in May 1945, the American soldier had unarguably established his distinctive combat style. Flexible and adaptive, particularly to varied conditions of combat, it was characterized above all by a ruthlessly decision-oriented ethos and, as long as victory promised, a hardheaded disregard for casualties. Americans fought to win—and to win as quickly as possible—even at heavy cost to their own side.

Little in U.S. military history since the victory of 1945 vitiates that judgment of American military style. The

* Korean War continued the tradition. Even at the gloomiest periods of the *Vietnam War, many front-line units continued to soldier with courage and dedication, however ill-supported by domestic opinion. In the *Persian Gulf War of 1991, American combat expertise was seen at its best. The outcome established the American armed forces as without peer in the contemporary world, and that reputation is likely to be preserved for the foreseeable future.

COMBAT EFFECTIVENESS. The mystery of why men fight has always tantalized students of warfare. Explanations usually reflect cultural and military-institutional prejudices. Men have fought—and died—against all instincts for survival because of many factors: tribal loyalties, charismatic leaders, ethnic and cultural characteristics, strict military discipline, demanding training, superior physical condition, hatred and revenge, advanced weapons, love of God or gods, belief in an afterlife that favors slain warriors, fate, sexual and biological imperatives, loot, and national *patriotism. Not until the nineteenth century did military commanders and planners begin to study the phenomenon, assisted in the last 100 years by social scientists and psychologists. Despite a brief confidence that unit cohesion and peer pressure determined combat performance, the question of combat motivation remains elusive, subject to the interaction of many characteristics of military units and the conditions of particular types of warfare.

Combat effectiveness should be seen, first, as only a part of a general framework of military effectiveness. National defense politics produces the resources for the armed forces: leadership, manpower (and now womanpower) in quality and quantity, advanced weapons, logistical support, public support, a sense of legitimacy and purpose, and a promise of rewards and compensation for the service member and his or her immediate family, especially as dependent survivors of dead or permanently incapacitated veterans. Political effectiveness is not within the province of the armed forces—except in a military dictatorship—but it certainly can be affected by how well or poorly resources are transformed into capable military forces by the nation's military leadership. Linked to political effectiveness is strategic effectiveness, or the general framework for the employment of military forces in the pursuit of war

aims or the deterrence of war. Sound strategy always considers the relationship of means to ends, and the issues of appropriateness and proportionality, when examining the use of real or threatened violence as a political instrument. The history of warfare is strewn with examples in which flawed strategy doomed combat-effective forces to eventual defeat, the most recent being the experience of Germany and Japan in World War II.

Combat effectiveness is a combination of operational and tactical effectiveness, which is the performance of military units in direct contact with the enemy. Questions of operational effectiveness usually focus on the integration of forces of different combat specializations (land, air, sea) and nationality (allies); logistical sustainability for a campaign extended in time and/or distance; provisions for effective higher command in both the personal and the technical sense; the identification of fundamental enemy weaknesses; and the maximum combination of overwhelming firepower and surprising maneuver. Tactical effectiveness concentrates on the actual performance of combatant forces (infantry, armor, artillery, warships, combat aviation units) in engagements with the enemy. Operational and tactical effectiveness have an organic relationship; neither in isolation is likely to bring battlefield victory. For example, a sound operational concept like the attack by U.S. Navy *submarines on Japanese commerce (1942-1945) can be ruined (it wasn't) by poor submarine employment, faulty *torpedoes, and timorous officers and crews—all tactical considerations.

The American experience in identifying fundamental truths about combat effectiveness and transforming theory into training practice has undergone substantial change since the creation of the U.S. armed forces. It has also varied by service, since the army and Marine Corps have always worried about the special trials of ground combat, while the air force (and its predecessors) and the navy have argued that their combat functions have unique characteristics that differentiate them from ground combat units. Until the twentieth century, the normative questions about combat effectiveness concentrated on training, discipline, and mental conditioning. For wartime ground forces, the issue became avoiding the fatal combination of untrained volunteer officers with untrained militia and volunteers. Lack of peacetime military training for citizens meant that few emergency units could fight Indian warriors, European troops (i.e., the British), or even each other (the Civil War) with any prospect of success with acceptable casualties. In fact, the *citizen-soldier showed that he could fight well—if properly led and deployed in the tactical defense. Citizen-officers, on the other hand, showed little understanding of the demands of command until they had been awakened by losing a battle or two. In the early twentieth century, the problem of officership in wartime armies was addressed by providing peacetime training for prospective officers in special summer camps and at land-grant universities, and after 1916 in the Reserve Officers' Training Corps (*ROTC).

The U.S. Navy viewed its combat efficiency problems differently since its peacetime maritime constabulary missions provided it with at least a cadre of trained mariners around which to build wartime naval forces. As long as the United States had a large merchant marine—a condition that lasted into the second half of the nineteenth century—the navy could draw merchant seamen and officers

into uniform for wartime service in adequate numbers and skills. The *Union navy of the Civil War represented the high point of this policy. Merchant seamen might need additional training in gunnery, but they already knew discipline and seamanship from their civilian occupations. Only when the navy had to depend upon landmen for recruits did it worry about recruit and advanced training; most officers came from the Naval Academy and needed little more than practical experience to function well. For the navy, the major challenge became training all its personnel in the technological advances that eliminated sails and muzzle-loaded broadside guns late in the nineteenth century. New demands came from steam engines, fire direction systems, advanced turret ordnance, torpedoes, and (eventually) radar-defined and then electronic naval combat effectiveness; the introduction of aircraft and submarines only accelerated the concern for technical competence as the foundation of combat performance.

The entry of aircraft as weapons over land and sea created another approach to combat effectiveness that combined technical training with elite personnel selection—a common approach in the armies and navies of all the belligerents in World War I, and continued by separate or integrated air forces thereafter. The U.S. Army Air Service determined that the requirements of technical training, hurried under wartime conditions, meant that it had to recruit young men of bold temperament, exceptional physical skill and conditioning, and the highest intellectual acuity, with an emphasis on academic performance in formal schooling. This argument that air combat demanded the best human potential was extended to all other aircrews and even to ground service personnel. Pilots, who would almost always be officers, were promised extra pay, symbols of skill (winged insignia) and daring, freedom from ordinary military discipline, exceptional living conditions, special medical attention, and organizational preference in matters of command and training. The public fascination with aviation, as well as potential employment in the civilian aviation industry, simply reinforced the cult of the pilot. The only real modification of his ethos has been the realization that flying skill does not perish with youth and that successful combat pilots are experienced in terms of hours flown, not chronological age or prime physical condition. The spiraling demands of aviation technology and the increase of multiperson aircrews—even for superior fighters like the F-4 and F-14—also reinforced the experience of World War II (high-quality recruits still needed much flying to be combat effective). The cost of such flight training remains a concern, but the U.S. Air Force has substituted virtual reality simulator training with some success.

In the classic tradition, observers of human performance in combat from Ardant du Picq to S. L. A. *Marshall have stressed the importance of group cohesion and collective values, but the issue is complicated and in a sense exaggerated in American experience by other factors. First, a ship's crew may or may not be happy, but its fate is certainly collective: stricken warships almost always produce superhuman, selfless behavior on the part of some crewmen. The issue there, however, is not killing the enemy but saving comrades. In combat, shipboard organization stresses teamwork and a social context of cooperation and trust, based on repetitive training. The U.S. Navy has used demanding psychological testing in selecting submariners

since World War II, but the screening process emphasizes adjustment to claustrophobic living rather than combat performance. Physical ability is less important than steadiness under stress and keen technical skills, a condition that also applies to aircrew service. The navy and the air force also understand the effects of fatigue, poor health, sustained tension, mental exhaustion, and eating habits on effectiveness, and expend special effort to address these problems, which make them the envy of ground forces.

Since the nineteenth century, American ground forces had plenty of group cohesion—they fought or ran in groups—and the army did not worry about the problem until World War I, when *conscription produced combat units that lacked such with civilian bonds as ethnic homogeneity, community identification, religious preference, common occupation, and self-selected leadership. In the *Civil War, volunteer infantry regiments like the 69th New York, the 1st Minnesota, the 15th New Jersey, the 20th Maine, the 4th Alabama, the 26th North Carolina, and the 27th Virginia needed no social scientist to tell them about the importance of group cohesion in combat. The introduction of conscription and the use of individual replacements by the army in every war since 1917 produced serious concern that the army would have to create group cohesiveness where none existed. The Marine Corps, never homogeneous, used one approach: complete institutional socialization from boot camp to battlefield. Smaller in number (the Marine Corps has never been larger than one-fifth the size of the army), Marines found their inspiration in limited occupational specialization ("every Marine is a rifleman") and dedication to the Corps, not some part of it. This organizational loyalty centers on the commitment to combat. The army, on the other hand, found that it had a special problem in keeping infantry units effective in wartime (America's enemies have consistently rated U.S. Army artillery and aviation as more fearsome than its foot soldiers). The issue emerged in the late stages of World War I when the divisions of the * American Expeditionary Forces endured a lack of trained replacements, of effective junior leaders, of healthy troops untouched by bad weather and the flu epidemic, and of superior firepower. That experience reshaped army definitions of combat effectiveness in World War II and thereafter.

The ground forces in World War II showed weakness in almost every aspect of combat effectiveness, especially in infantry units from divisions to squads. Arguing that they required high-quality personnel, the army air forces and navy took more than their fair share of the ablest men; the army ground forces made the wound self-inflicted when they placed similar talent into support units in excessive numbers. Combat divisions received personnel on the basis of physical condition, not maturity and intelligence, and casualties quickly thinned the ranks of junior leaders. Elite units (airborne divisions, ranger battalions) enjoyed substantial training periods, as well as quality personnel; but the average infantry and armor division had little relief from combat, especially in the European theater. Divisions that entered combat in 1942 stayed in action until the end of the war; divisions committed in June 1944 never really had an opportunity thereafter to rest and retrain.

The army's own decision to cap the wartime ground forces at eighty-nine divisions had much to do with the difficulty of maintaining combat effectiveness. This condition could not be remedied, even with the infusion of quality

(but untrained) troops from service units late in 1944. Ground combat analysts also reported that excessive fatigue caused by overloading, poor weapons training, and a lack of good junior officers and NCOs reduced combat effectiveness. The relative aggressiveness and skill of German infantry suggested a new stress upon the factor of peer pressure, based on studies by sociologists Edward Shils and Morris Janowitz as well as the work on American soldiers by a team of psychologists organized by Samuel Stouffer and the observations of former journalist S. L. A. Marshall, the latter a persuasive, self-promoting reserve officer who wrote convincingly if controversially of his after-action interviews with infantry units. The research on the Wehrmacht did indeed show that German personnel assignment and training produced good infantrymen and cohesive units, but Shils and Janowitz underestimated the influence of Nazi ideology and the German Army's practice of field executions for desertion or non-performance. Marshall stressed weapons employment and argued, without real statistical evidence, that the great majority of American soldiers did not shoot their rifles in combat—a conclusion partially supported by other analysis but also hotly contested. Marshall did identify real problems like overloading and fatigue, and he saw that the Germans stressed the use of crew-served machine guns and mortars, which demanded teamwork and produced large enemy casualties.

The postwar army sought ways to improve the performance of its ground forces—especially infantry—through a variety of reforms and succeeded within tactical definitions under its control. One policy (adopted by all the services) was to rotate personnel on and off active operations. Aviation units had begun this practice in World War II for sound operational reasons. Ships also required periodic relief from operations for service and repair, and their crews benefitted.

The idea that large numbers of ground troops, especially enlisted men, would rotate out of combat, and even leave the service before a war ended, emerged during the *Korean War (1950-51). In retrospect, combat effectiveness had little to do with the rotation policy. Equity in exposure to death and domestic politics had a great deal to do with the policy of limited liability, which was subsequently extended to the *Vietnam War. Only about one-third of the mobilized armed forces actually reached the Korean War theater; the rest remained in training in the United States or deployed to Europe. Individual reservists, especially World War II veterans, went off to fight, while National Guard and reserve units (with some exceptions) only served elsewhere. Sociologists like Janowitz and Charles Moskos reinforced the views of senior army officers that rotation weakened group cohesion and performance, but the policy was an effect, not a cause, of fighting an undeclared war with limited public support for limited goals and a negotiated (not imposed) armistice. Casualties reduce group cohesion, not rotation. The practice of conserving infantrymen by calling for deluges of artillery fire and close air support paradoxically produced excessive American casualties from so-called *friendly fire. Such a reliance also allowed many infantry units to avoid serious training and combat experience. One useful change by the army was the wider use of crew-served weapons and the internal reorganization of squads into fire teams.

Problems that went unsolved in Korea returned in the Vietnam conflict, but as long as soldiers saw some prospect

of victory, they fought well. The conduct of American soldiers and Marines well into 1969 showed superior training and commitment, even in a dubious cause. Limiting Vietnam tours of duty to twelve months gave some prospect of relief, though not much for infantrymen. It was hard for "grunts" to survive a year in the "bush" under the pressures of combat and disease. The most invidious policy was rotating officers out of infantry companies after six months when grunts had no such option. Committed warriors often actually extended their combat tours, but did so most often if they belonged to elite special forces or reconnaissance units, the ground equivalent of aviation fighter squadrons. Personnel policies that reduced group cohesion may have been counterproductive. The root cause, however, of undiscipline, malingering, drug use, and soldier crime against each other and civilians was the lack of belief in the war's value, and the widespread demoralization and even incompetence in the officer corps. Just how to deal with this potential problem remains unresolved, since post-1975 operations in Grenada, Panama, and Kuwait did not last long enough or produce enough casualties to test group cohesion under sustained combat. Instead, the prevailing view is that sophisticated technology, massive firepower, low casualties, and unambiguous causes now characterize the American Way of *War. Whether this combination constitutes combat effectiveness in every instance remains to be seen.

COMBAT ETHICS. See Just War Theory.

COMBAT SUPPORT. Land warfare is the mission of the U.S. Army, and army forces are divided into three categories according to their function on the battlefield: *combat*, *combat support*, and *combat service support*. *Combat* forces engage in direct confrontation with enemy forces to kill or capture them, to break their will to continue the fight, and to seize and hold terrain or to deny it to the enemy. *Combat support* forces provide direct support of the forces on the battlefield by providing intelligence, communications, engineering, and chemical warfare services of immediate impact on the course of the battle. *Combat service support* forces provide administrative and technical (logistical) services to ensure that the combat and combat support forces are adequately manned, armed, fed, fueled, maintained, and moved as required. This division of forces into three functional groups applies specifically to the army, but navy, Marine Corps, and air force units and personnel fall into the same general categories.

With the exception of general officers, every officer, soldier, and unit of the army is assigned to one of the army's twenty-five basic and special branches. The basic branches are: Armor, Artillery, Air Defense Artillery, Aviation, Infantry, Military Intelligence, and Special Forces; the Corps of Engineers; and the Adjutant General's, Chemical, Finance, Military Police, Ordnance, Quartermaster, Signal, and Transportation Corps. The special branches include the Chaplain's and Judge Advocate General's Corps and the six branches of the Army Medical Service (the Medical,

Dental, Veterinary, Army Nurse, Army Medical Service, and Medical Specialist Corps). The Adjutant General's, Chaplain's, Finance, Judge Advocate General's, and Military Police Corps are considered administrative services. Technical services include the Corps of Engineers, Army Medical Service, and the Chemical, Ordnance, Quartermaster, Signal, and Transportation Corps. One additional special branch, Civil Affairs, is found only in the reserve components. The General Staff Corps and the Inspector General's Corps are not in fact separate branches at all, even though they have distinctive insignia. Rather, officers and enlisted personnel are detailed to the General Staff Corps or Inspector General's Corps for limited periods and then return to their basic branch.

The basic and special branches of the army are aligned with the three functional categories. The combat arms (branches) are Infantry, Armor, Artillery, Air Defense Artillery, Aviation, and Special Forces. The combat support branches include the Corps of Engineers, the Military Intelligence Corps, the Chemical Corps, and the Signal Corps. The U.S. *Army Corps of Engineers is considered both a combat arm and a combat support branch in that engineers perform direct combat missions as well as support functions. In many respects, the Signal Corps and the Chemical Corps also perform both functions. Finally, the combat service support branches include the Adjutant General's Corps, the Chaplain's Corps, the Finance Corps, the Judge Advocate General's Corps, the Military Police Corps, the Ordnance Corps, the Quartermaster Corps, the Transportation Corps, and the six branches of the Army Medical Service.

The Combat Service Support Mission. According to the official armed forces definition, combat service support covers "the essential logistic functions, activities, and tasks necessary to sustain all elements of operating forces in an area of operations. At the tactical level of war, it includes but is not limited to that support rendered by service troops in ensuring the operational and tactical aspects of supply, maintenance, transportation, health services, and other services required by aviation and ground combat troops to permit those units to accomplish their missions in combat." Thus, combat service support incorporates those functions necessary to man, arm, feed, fuel, maintain, and move the fighting forces and their equipment in the field. Its forces provide immediate support as organic elements of the forward combat units (battalions, brigades, divisions, and corps), as well as administrative and technical services in rear areas and at the highest national level. Members of the combat service support branches, like their comrades in the other branches, prepare plans, estimates, and orders; participate in the development of doctrine and materiel; and conduct training in their respective specialties.

The combat service support forces form the "tail" in the often-cited "tooth-to-tail" ratio. In fact, the analogy is a poor one. A somewhat better characterization of a field army as a living organism would be to consider the staff the brain; the combat arms, the arms and legs; the combat support branches, the eyes, ears, and nervous system; and the combat service support forces as the heart and circulatory system, which provide nourishment to the other elements.

Although the bulk of combat service support is provided out of direct contact with the enemy, these troops on

the modern battlefield often become engaged in direct combat with the enemy. Soldiers receive basic combat training, and with the exception of army medical personnel and chaplains, are armed. No small percentage of the Medals of Honor and other decorations awarded for gallantry on the battlefield have been given to combat service support soldiers.

Evolution of Combat Service Support Forces. The process by which our armed forces create combat service support forces reacts to the same stimuli that influence the structuring of the combat forces themselves (namely, changing organization, doctrine, and technology). The process is especially sensitive to new developments in technology and to the ever-increasing scope and scale of modern war. Over the past two centuries, the evolution of the army's support structure has followed general trends in warfare. Four main factors have emerged: increasing complexity and scale; increasing specialization; an increasing proportion of manpower required for combat service support functions; and an increasing proportion of civilians.

Combat service support forces have been an integral and important part of the army since its creation in 1775. As the size and technological sophistication of the forces have grown, so too have the size and technological sophistication of the combat service support elements of the army. Most of the present-day support branches were established in 1818 in the aftermath of the *War of 1812, and evolved alongside the combat arms and combat support branches through the * Mexican War, the * Civil War, the *Spanish-American War, and the two world wars. Until 1912, the army had a separate Commissary of Subsistence Department, which handled the procurement and distribution of rations. However, in 1912 the Subsistence Department was merged with the Quartermaster Department. In 1950, the secretary of the army received authority to determine the number and strength of the various combat arms and services. The Infantry was retained as the premier combat arm; Armor replaced Cavalry; the Field Artillery, Coast Artillery, and Antiaircraft Artillery were consolidated in one artillery branch; the Transportation Corps and Military Police Corps were made permanent; and the six medical branches were consolidated in the Army Medical Service. A Military Intelligence branch was created in 1962, and in 1971 the Artillery was redivided into separate Artillery and Air Defense Artillery branches. The Women's Army Corps (*WAC), made a permanent part of the army establishment by the Women's Armed Services Integration Act of 12 June 1948, was discontinued in October 1978, and all women in the army were assigned to one of the twenty-five basic or special branches. The Army Air Corps, which had become the independent U.S. Air Force in 1947, was revived in 1983 as the Aviation branch. The Special Forces branch was created in 1987 by the transfer of officers and soldiers from several other basic and special branches.

Since the end of the *Vietnam War, two important developments in the organization and employment of combat service support forces have taken place. First, the proportion of female soldiers assigned to service support units of all types has increased dramatically. Second, in the Total Force concept since the 1980s, most of the army's combat service support force structure has been taken out of the active (regular) army and assigned to the reserve com-

ponents. Thus, in the *Persian Gulf War (1991), over 70 percent of the army's combat service support forces deployed to the region came from the Army Reserve and National Guard.

Traditionally, the combat service support forces have occupied a status seen as somewhat inferior to those of the other two categories. Even today, many army leaders give lip service to the importance of combat service support on the modern battlefield but still fail correctly to assess its contribution to the overall equation of victory. In modern warfare such a faulty appreciation can no longer be sustained in view of the ample evidence of the importance of administrative and logistical matters.

COMBAT TRAUMA. That war can wound minds as well as bodies was not recognized for many years. Military physicians often diagnosed combat trauma as malingering; high-ranking officers regarded it as a threat to discipline and combat effectiveness. Some of the soldiers executed as cowards during the * Civil War probably suffered from combat trauma. Not until the 1980s did the U.S. government unequivocally recognize psychic injury as a legitimate service-related disability.

Symptoms of combat trauma have almost always been similar to those of a heart attack: involuntary trembling, exaggerated startle response (usually with respect to noises), outbursts of uncontrollable anger, nightmares, flashbacks, emotional numbing, restlessness, depression, and alcoholism. Combat trauma might persist for days or months; it can also haunt a lifetime.

Chronologically, such labels as "soldier's heart," "shell shock," "battle fatigue," "Post-Traumatic Stress Disorder" hint at the different medical and cultural assumptions of the times in which they were devised. The mid-nineteenth-century conviction that mental disease had an organic origin gave way to the notion that wounds to the mind have psychological causes. Recently, the pendulum has swung in the direction of biopsychological explanations for mental disorder.

Civil War surgeons were almost wholly preoccupied with amputating arms and legs, a form of higher butchery that left little time and no patience for the treatment of combat trauma—had its existence been recognized. Countless Union veterans bore psychic injuries of greater or lesser severity long into the peace—among them the jurist Oliver Wendell Holmes, Jr., and the writer Ambrose Bierce—but neither government nor society recognized this in any direct way. And in all likelihood, many ex-soldiers themselves probably did not understand the cause of their troubles.

In the early months of World War I, combat trauma took British medical officers by surprise. At first ascribed to the concussive effect of exploding artillery rounds on the brain, "shell shock" was soon seen as an emotional re-

sponse to the overwhelming and sustained life-threatening character of modern warfare. Some medical officers prescribed "disciplinary therapy"—electric shock treatments—betraying their conviction that combat trauma was a form of malingering; others resorted to psychotherapy, the still-novel "talking cure."

Fully a year before the entry of the United States into the war in April 1917, the Rockefeller Foundation sponsored an inquiry by the psychiatrist Thomas Salmon into the Allies' methods of dealing with shell shock. By the time elements of the American Expeditionary Forces began landing in France, Salmon had established a psychiatric field hospital. The Americans emulated the French, treating psychiatric casualties at aid stations near the front rather than waiting, as the British did, until they had reached the rear. A medical officer's military duties tended to override his obligations to his patients. Treatment aimed at returning psychically wounded men to the front. As Sigmund Freud noted: "The physicians had to play a role somewhat like that of a machine gun behind the front line, that of driving back those who fled."

The leading postwar veterans group, the * American Legion, called for welcoming shell-shocked veterans back into society and lobbied successfully to see them compensated, at least in part, for a war-related disability. Within the armed forces, combat trauma was largely disregarded because medical and military authorities had come to believe that psychological testing provided an effective preventive measure against it. The prevailing degeneration theory held that mental disorders were inheritable; they were discernible at an early age. Men likely to break down in combat could be weeded out before they ever put on a uniform.

In World War II, the American armed forces swelled to enormous size; psychological testing itself was put to the test, and its premises with respect to combat trauma were found to be false. Military psychiatrists were soon convinced that *any* infantryman exposed to prolonged fighting would eventually break down. "There is no such thing as 'getting used to combat,'" an official study found. If the incidence of combat trauma was likely to be highest among foot soldiers, it was by no means unknown to sailors and airmen. The crews of ships targeted by kamikazes during the Okinawa campaign (April-June 1945) sustained numerous psychiatric casualties; Joseph Heller's absurdist war novel *Catch-22* (1961) rests on the premise about what it took, in terms of a diagnosis for combat trauma, to be relieved of flying bombing raids over enemy territory.

If all wars are fearful, each is fearful in different ways. In World War I, for instance, the prevalence of shell shock was ascribed to the lethality of the western front. In the *Vietnam War, however, the risk of getting killed was lower than it had been in 1917-18, but the incidence of combat trauma was higher. In Vietnam, perhaps the elusiveness of the enemy and the absence of a front inspired fears similar to those that the low odds on surviving had inspired in *trench warfare. Yet in provoking combat trauma, all modern wars display common elements. The terror peculiar to undergoing sustained artillery fire, for instance, unites combat soldiers in the field at Fredericksburg in 1862 with their counterparts in the trenches of 1917, on Okinawa in 1945, and in the rice paddies of Vietnam in 1968.

Post-Traumatic Stress Disorder (PTSD) was a post-

Vietnam creation. The outcome of the successful lobbying of Congress and the *Veterans Administration by veterans' interest groups, PTSD also expressed the shifting balance of influence within the psychiatric profession: away from psychodynamic psychotherapy toward biopsychiatric, pharmacological approaches to the treatment of mental illness. So far, however, the great increase in the explanatory power of biomedical stories about combat trauma has not been accompanied by a commensurate increase in the efficacy of therapies directed against it. By altering minds, the horrific experiences of combat have reshaped lives—drastically shortening some, blighting the promise of others, ruining still others. Psychiatric casualties are implicated in what the medical anthropologist Arthur Kleinman calls "social suffering," a web in which the woes of one person engender woes for many.

COMMAND AND CONTROL. In the military, the term *command and control* (C2) means a process (not the systems, as often thought) that commanders, including command organizations, use to plan, direct, coordinate, and control their own and friendly forces and assets to ensure mission accomplishment. Command and control of U.S. armed forces today is the result of a long historical evolution. From 1775 to 1947, there was no common superior to the War and Navy Departments and their respective military services, except for the president of the United States, who was commander in chief of the army and navy under the Constitution. Only in 1947 were all the military departments and services unified in principle.

The rudiments of U.S. national military command and control emerged in 1775, when the American colonists challenged the government in London and ultimately obtained independence from the mother country. Initially, the American colonists were loosely organized and lacked a recognized military commander. The Second Continental Congress convened in Philadelphia and on 15 June 1775 named Gen. George * Washington commander in chief "of all the continental forces raised, or to be raised, for the defense of American liberty."

After 1776, the Continental Congress acted as the principal coordinator of the war effort of the American colonies. It organized an army and navy and appointed commanders of these forces. However, there was no clear direction as to whether Congress or the commander in chief was to devise strategy. Unwilling to put a single person in charge of the war effort, Congress appointed a committee, the Board of War and Ordnance, in June 1776. But the board did not work satisfactorily, and Congress kept close watch on the military and its commanders. The war proved the need for strong, central direction and the subordination of state to national interests.

The new Constitution of 1789 created a separate executive branch, but declaring war, raising armies, and providing for a navy was assigned exclusively to Congress. In March 1789, Washington became the first president under this Constitution, and as such he was also designated commander in chief of the army and navy. The Department of War was established on 7 August 1789; the secretary of war headed the War Department and was a deputy to the president in military matters. The Navy Department was not created until 30 April 1798.

In the *War of 1812, the lack of a senior line officer in the chain of command to act as adviser to the secretary of war and the president proved a serious deficiency. Command and control of the U.S. Army and Navy remained essentially unchanged between 1821 and the beginning of the *Civil War in 1861. The president was commander in chief of the army and navy, while his two civilian deputies ran the War Department and the Navy Department. In command of army troops after 1821 was the senior army officer, the commanding general or general in chief. However, his duties were left undefined. There was no corresponding position for the navy.

In the aftermath of the Civil War, the Commanding general of the army was made responsible for the efficiency, discipline, and conduct of the troops, while the secretary of war was responsible for the administrative and technical services. The latter also controlled budget, and all the army bureau chiefs reported to him. The secretary of war was a civilian, often with very little military experience, and he depended for guidance on bureau chiefs. Hence, Gen. Ulysses S. *Grant proposed in 1866 to place the Adjutant General under the control of the commanding general of the army, who was to be responsible directly to the president through the secretary of the army in all army matters. No action was taken until 1869, when General Grant became the president and issued an order putting his proposal into effect.

The *Spanish-American War exemplified all the worst features of the archaic U.S. system of military command and control. The lack of military planning and very poor coordination between the services led to general confusion and inefficiency. Nonetheless, the war was successful, due to the initiative, courage, and endurance of the American soldier and his immediate superiors.

The underlying cause of friction and confusion in the War Department was between the commanding general of the army and the bureau chiefs. The new secretary of war, Elihu *Root, proposed to abolish the position of commanding general, and the new position of chief of staff of the army was created. That officer was to be in charge of all army forces and the staff departments, and directly responsible to the secretary of war. The chief of staff would act as adviser and executive agent of the president through the secretary of war. Congress adopted Root's proposal in February 1903. Another significant change proposed by Root and approved by Congress was the creation of a General Staff Corps (patterned after the Prussian system but greatly reduced) of forty-four officers to prepare plans for the national defense and for the mobilization of the military forces.

The disruptive experiences of attempted navy-army cooperation during the Spanish-American War led to an attempt in 1903 to improve matters by institutionalizing coordination between the two services through a Joint Army

and Navy Board, consisting of four army and four Navy officers. However, the Joint Board did not have a group of officers to do the planning. Its work was suspended by President Woodrow *Wilson in 1914, and it did not play any role during World War I.

National command and control underwent some changes in the 1920s. The National Defense Act of June 1920 remained the principal piece of legislation pertaining to the U.S. Army until 1950. The Joint Board was reestablished in 1919 and its membership increased to six. In contrast to its predecessor, the newly reestablished board acted continuously. It was also provided for the first time with a subordinate staff group: the Joint Planning Committee.

In 1922, the Joint Committee on the Reorganization of Government Departments proposed that the army and navy be unified into a Department of *Defense under a single cabinet secretary, who would be assisted by under-secretaries for the army, the navy, and for national resources. Nothing came of these efforts because the two military departments opposed unification. A further attempt by Congress at unification failed in April 1932.

In 1939, President Franklin D. *Roosevelt placed the Joint Board, the Joint Economy Board, the Aeronautical Board, and the Army-Navy Munitions Board under his own direction as commander in chief. The Joint Board of the Army and Navy was never organized as a body to provide strategic direction; its meetings were held only once a month, while its Joint Planning Committee met twice a month. A more serious problem was that any decision of the Joint Board required the approval of the secretaries of war and the navy before it could be effected. By May 1941, the Joint Board established a Joint Strategic Committee as a part of the existing planning committee. Its major responsibility was to draft joint war plans. In July, the Joint Board began to meet weekly.

The Joint Board evolved into the *Joint Chiefs of Staff (JCS) as a result of a visit by British prime minister Winston S. *Churchill and his military advisers who came to Washington in late December 1941 to confer with President Roosevelt about collaboration in the war against the Axis powers. By early 1942, a decision was made that the Combined Chiefs of Staffs (CCS)—a collective term for the U.S. and the British chiefs of staff—were to provide strategic direction for all operations under Anglo-American responsibility. The first formal meeting of the CCS took place on 23 January 1942.

The chiefs of staff of the various U.S. armed services held their first meeting on 9 February 1942. Afterward, the chiefs of staffs constituted themselves with tacit approval of the president as Joint Chiefs of Staff. The Joint Board for all practical purposes ceased to operate. Initially, the JCS served as the U.S. representative of the CCS and as the coordinating agency for the war efforts of the army and navy, directly responsible to the president. The JCS was also in the direct chain of command of each U.S. theater commander. No legislative or executive action was taken to formalize the JCS until the *National Security Act (NSA) of 1947 was adopted. This proved to be an advantage, because it allowed a great deal of flexibility and innovation in the work. The act created the National Military Establishment (NME) and the civilian secretary. It unified all the services and created co-equal cabinet-level secretaries for the new Departments of the Army, Navy, and Air Force. The roles and missions of the military services were specified in an

executive order (Congress did not do the same until 1958). The NSA also legalized both the JCS and its Joint Staff. For the first time it defined the term *combatant command*. The “unified” combatant command was defined as a command composed of forces from more than a single military department and with one broad, continuing mission.

The act became effective when Secretary of Defense James V. *Forrestal took the oath of office on 18 December 1948. The act also established the *National Security Council (NSC) as the principal forum to consider national security issues that require presidential decision. NSA was subsequently supplemented or amended by several other pieces of legislation and executive agreement. The *Key West Agreement of 1948 clarified the residual roles left to the military departments. It also allowed members of the JCS to serve as executive agents for unified commands—a responsibility that enabled them to originate a direct communication with the combatant command. (This authority was canceled by a 1953 amendment to NSA.)

The NSA was amended in 1949 and the name of the NME changed to Department of *Defense (DoD). The secretary of defense’s position was strengthened by his appointment as the head of an executive department. The authority of military department heads was reduced, and they assumed budgeting responsibilities. In 1953, the president and secretary of defense agreed to designate military departments to function as “executive agents” for the unified commands. Also, the chairman of the JCS was not to exercise any command over theater forces. The Reorganization Act of 1958 further clarified the direction, authority, and control of the secretary of defense; moreover, the act clarified the operational chain of command by stipulating that it ran from the president and the secretary of defense to the combatant forces, thereby removing military departments from the operational chain of command and redefining their support and administrative responsibilities.

The most important piece of legislation on national defense since 1947 was the *Goldwater-Nichols Act of 1986. It was specifically aimed to enhance cohesion between the services, clarify the chain of command, and further strengthen civilian control over the U.S. military. It also strengthened the position and authority of the CJCS. The chairman became principal military adviser to the president, secretary of defense, and NSC. However, in presenting his advice, the CJCS was required to present the range of advice and opinions he had received, along with any individual comments of the other JCS members.

The 1986 act also created a new position, vice chairman of the JCS, and two new directors of the Joint Staff. The size of the Joint Staff was expanded but limited to 1,627 personnel. The vice chairman is the second-ranking member of the armed forces and replaces the CJCS in his absence. The National Defense Authorization Act (1993) vested the vice chairman as a full voting member of the JCS.

In legal terms, the National Command Authorities (NCA)—that is, the president and the secretary of defense or their duly deputized alternates or successors—retain ultimate authority and responsibility for U.S. national security. The DoD Reorganization Act (1986) reiterated that the chain of command runs from the president to the secretary, and from the latter to the combatant commanders. A provision permits the president to authorize communications through the CJCS. Presidential directive 5100.1 of 25 September 1987 placed the CJCS in the communica-

tions chain of command. Communications between the National Command Authorities and the combatant command pass through the CJCS. Directly subordinate to the NCA in the operational chain of command are five geographical combatant commands (Atlantic, Central, European, Pacific, and Southern) and three functional combatant commands (Strategic, Space, and Transportation).

U.S. national military command control today is much more effective than it was only a decade ago. Civilian control of the military is preserved and strengthened. The operational chain of command is simple and clear. And the geographic combatant commanders possess the necessary resources and authority to accomplish their assigned missions.

COMMANDER IN CHIEF, PRESIDENT AS. The Constitution (Article II, section 2) specifies that “The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several states, when called into the actual Service of the United States.” This language provides the president with constitutional powers over the armed forces, powers shared with Congress; but the constitutional framework leaves several unsettling questions unanswered. May the president use force if he believed an attack were imminent; use force without a declaration of war; defend American lives and property abroad; execute treaty obligations involving the armed forces; or engage in “coercive diplomacy” to get leaders of other nations to accede to his wishes?

The president’s most important duty as commander in chief is to defend the United States, its territories and possessions and its armed forces, from attack. Domestically, this may mean using or threatening to use force to make sure that laws are faithfully executed, as George *Washington did when he rode out at the head of a column of troops to put down the Whiskey Rebellion, as Andrew *Jackson did in 1832 when he threatened to use force against South Carolina if it did not permit collection of the tariff, and as Abraham *Lincoln did to end the secession of Southern states. Presidents may also use the armed forces to maintain “the peace of the United States,” as several presidents in the late nineteenth and early twentieth centuries did in enforcing district court injunctions against striking miners and railway workers.

Presidents are not expected to march at the heads of their armed forces. Some, such as Franklin D. *Roosevelt, Lyndon B. *Johnson, and George *Bush, maintained close control over military operations, not only reviewing

strategy but controlling the details of specific missions. They communicated directly with key theater commanders. Others, such as Woodrow *Wilson and Harry S. Truman, set overall parameters, but tended to rely more on going through channels and trusting the judgment of their top commanders. As Lincoln discovered during the * Civil War, the most important war power the president possesses is the power to hire and fire those commanders.

The most controversial constitutional issue involves presidential warmaking without a declaration from Congress, when presidents depend solely on their constitutional prerogative as commander in chief. Outside the United States, presidents have used the armed forces without congressional declarations of war in more than 230 instances, relying on that constitutional prerogative. Fewer than half of these instances involved prior legislative authorization. Almost all use of force by presidents in the nineteenth century without a declaration of war involved minor incidents—mostly against pirates and bandits. Uses of force in hostilities without congressional sanction in the twentieth century, however, have involved much wider operations against organized governments. With large numbers of American soldiers killed or wounded in pursuit of foreign policy goals, such actions raised serious questions of constitutionality.

Uses of force based on the commander in chief's power include gaining additional territory for the United States, such as Florida (actions of James *Monroe and John Quincy Adams), the American Southwest (during the *Mexican War), and Hawaii. Presidents may order actions against politically unorganized pirates and bandits, drug smugglers, and terrorists that may involve limited incursion into another state or its airspace or territorial waters. Presidents may order the evacuation of U.S. citizens and interventions to protect American lives and property during disorders in foreign nations. In some situations, the United States may be involved unilaterally or multilaterally in efforts to restore law and order in other nations. During the last half of the nineteenth century, the U.S. Army fought frontier wars against Indian tribes. In the early twentieth century, presidents ordered U.S. forces to intervene in Caribbean nations to administer their assets on behalf of their creditors; these included Haiti, *Nicaragua, the Dominican Republic, and Cuba. Presidents have used force to topple regimes unfriendly to the United States, such as the Dominican Republic (1965), Grenada (1982), Panama (1989), and Haiti (1994).

Presidents have enforced *blockades and quarantines, for example, the quarantine of Cuba during the *Cuban Missile Crisis (1962-63); the blockade of Iraq in 1990 to attempt to pressure that nation to withdraw from Kuwait; the subsequent blockade designed to ensure acquiescence in * United Nations resolutions; and the blockade of Haiti in 1993 in an effort to force a change in government. Since the early 1950s, presidents have had the capacity to launch preemptive or retaliatory nuclear strikes in the event of all-out nuclear war, or to order a nuclear "first use" against an enemy in the process of defeating U.S. conventional forces. The exigencies of the use of nuclear weapons make it highly unlikely that Congress could be part of such a decision. More recently, presidents have used U.S. forces for United Nations' or other multilateral *peacekeeping, humanitarian, or monitoring operations, such as the protection of foreign aid workers in Somalia in 1992-93, the re-

lief of famine in Rwanda in 1994, and the *NATO peacekeeping mission in Bosnia beginning in 1995.

The most controversial use of presidential power has involved deployment of U.S. forces in major hostilities without a declaration of war. Three major instances come to mind: North Korea (1950-53), North Vietnam (1964-73), and Iraq (1991). In the Korean and Iraq hostilities, Presidents Truman and Bush cited UN authorization. However, Truman used force prior to obtaining UN authorization, and neither president followed the procedures set down by Congress in the UN Participation Act (1945), which required congressional approval for commitments of force in UN operations. In the *Vietnam War, President Johnson claimed he was executing provisions of *SEATO, yet the relevant provisions required consultation with other signatory nations and did not specify the use of military force to deal with a civil war between two "military regroupment zones" (i.e., North and South Vietnam). In all three cases, presidents acted according to their prerogative power, and in Korea and Vietnam, no hostilities were authorized by Congress (though the Gulf of Tonkin Resolution did authorize Johnson to use necessary measures to protect U.S. forces). Indeed, the *War Powers Resolution of 1973 sought to impose Congressional approval for committing U.S. troops to combat. In 1991, Bush lobbied Congress for authorization to use force to implement UN resolutions; but in his signing statement once a resolution had been passed, the president refused to concede that he had needed such authorization, claiming instead that he had "constitutional authority to use the Armed Forces to defend vital U.S. interests." Congress passed a second resolution reiterating its understanding that the president had been required to obtain prior authorization from Congress before using force against Iraq, leaving the two institutions at loggerheads about the authority of the president to engage in military actions to implement UN resolutions.

Use of the armed forces exposes the incumbent to significant political risk. Presidents Truman and Johnson became so unpopular because of mounting casualties during the Korean and Vietnam Wars, both decided not to run for second elected terms. Studies have shown that there is a direct correlation between increased * casualties in congressional districts and a drop in approval for the war—and for the commander in chief who authorized it. To minimize this political risk, presidents in the post-Vietnam era have authorized operations that involve overwhelming force against weak opponents—the operations in Grenada, Panama, and Haiti—and have tightly controlled the media so that reportage emphasizes military successes rather than any operational failures. Such quick operations have been highly successful politically, resulting in a "rally 'round the flag" effect and an upward surge in popularity for the commander in chief. Presidents have also been reluctant to remain involved in operations with significant American casualties. President Reagan withdrew American forces from Lebanon after 240 Marines were killed in a bombing of the American barracks; President Clinton withdrew forces from Somalia after eighteen army Rangers were killed in military operations.

With the end of the *Cold War, the commander in chief's power focuses on the use of armed forces for humanitarian, policing, and peacekeeping operations. Does the president have the power to assign U.S. forces to foreign command? Can Congress prohibit or regulate such

assignments? Republicans in their 1994 "Contract with America" proposed a National Security Restoration Act to prohibit such assignments, in a replay of the partisan controversy over a Democratic president's power to do so during the Korean War (when U.S. troops were nominally under UN command). Although such a prohibition did not pass, the constitutional questions involving presidential use of force remain open in the post-Cold War era.

COMMEMORATION AND PUBLIC RITUAL. The memory of past wars has played a central role in creating and defining American national identity. After the signing of the Declaration of Independence in 1776, Independence Day became the new republic's preeminent national holiday, even before the United States won the armed struggle against Great Britain. Neither the Continental Congress nor succeeding federal Congresses ever mandated rituals for the day, but certain patterns emerged culturally that lasted into the twentieth century. In many communities, Fourth of July observances centered on public orations, readings of the Declaration of Independence, religious services, parades, public dinners, and fireworks. Local governments often sponsored Independence Day ceremonies, but this was by no means universal.

The Fourth of July has often been contested as dominant and dissenting groups have created rituals to bolster their ideologies and social positions. During the 1790s, for example, Federalists and Jeffersonian Republicans held separate, competing celebrations. Whereas Federalists went so far as to drop the reading of the Declaration of Independence in order to diminish Thomas *Jefferson's crucial role, Republicans made the reading of this text a central part of their ceremonies.

During the nineteenth century, especially in larger urban centers, the Independence Day parade developed into a broad-based celebration that included virtually every major group in the locality. Strong traditions of popular participation still fostered dissenting groups' tendencies to use Fourth of July ceremonies to advance their aims. Ethnic, religious, labor, and other groups commonly sponsored their own observances. Susan B. Anthony, Frederick Douglass, Charles Sumner, and other speakers used Independence Day orations to protest injustices; such speeches were frequently published, thus reaching substantial regional and national audiences.

The militia also played an important ritualistic role in the commemoration of the Revolution, especially on Independence Day. Militia units, particularly elite volunteer regiments, used the occasion to march in parades and display their military prowess and social standing. In the 1820s and 1830s, volunteer militia staged some of the first reenactments of Revolutionary battles.

To honor and later memorialize George *Washington and successive generations of war leaders, Americans created a range of holidays, many of them transitory. As early as the 1780s, Americans commemorated the birth of Washington. During his presidency, Federalists lit bonfires and held balls in his honor, carrying over earlier British practices of honoring the birthday of the sovereign. Jeffersonian Republicans disapproved; only after the demise of the Federalist Party in the 1820s did Washington's Birthday observances lose their partisanship and evolve into the permanent holiday that eventually gained federal recognition. Later in the nineteenth century, Andrew *Jackson, Abraham *Lincoln, Jefferson *Davis, Robert E. *Lee, and George *Dewey all had their birthdays or other days associated with them commemorated. Jackson Day, celebrating his victory at the Battle of *New Orleans on 8 January 1815, was always a partisan affair. Lee's and Davis's birthdays remained southern holidays, while Lincoln's birthday too had regional overtones; most southern states never made it an official holiday.

The passing of the Revolutionary generation in the 1820s and 1830s gave impetus to the creation of new forms of commemoration. By the antebellum period, monuments—controversial in the 1790s because of their association with monarchical Europe—became widely accepted. Usually funded by private organizations, the inauguration and completion of such monuments could be marked by lavish celebrations. In 1824, the Marquis de Lafayette laid the cornerstone of many Revolutionary memorials, including the Bunker Hill Obelisk.

The *Civil War led to a democratization and an emphasis on rituals that remembered the sacrifice of average *citizen-soldiers. In both North and South during the late 1860s, cemeteries became the focal point of a new holiday—Memorial Day, often known as Decoration Day. This holiday, which developed concurrently in both regions, centered on decorating the graves of the war dead with flowers and holding religious services, parades, and other ceremonies. Veterans' organizations, especially the *Grand Army of the Republic, played a crucial role in organizing and promoting these observances.

Reconciliation, but also continued sectional bitterness, emerged as competing themes in the rituals commemorating the Civil War. Memorial Day orators often stressed the need to honor the fallen from both sides and early accounts of the holiday emphasized decorating the graves of soldiers, regardless of the army in which they fought. Nonetheless, in the North, the Memorial Day observance took place on 30 May whereas most Southerners (except for African Americans) commemorated Confederate Memorial Day on varying dates in the spring. Ladies' Memorial Associations and later the Daughters of the Confederacy played a crucial role in organizing Confederate holiday activities.

Most Civil War "veterans never joined any veterans' organization, but a significant number became members of either the Grand Army of the Republic or the United Confederate Veterans, the two dominant societies to emerge after the war. Encampments on old battlefields or in or near major cities remained a central activity for these organizations. "Blue-Gray" reunions, joint gatherings of participants from opposing armies, began as early as the 1870s, but took place with greater frequency during the Gilded Age and Progressive Era. Participants in the Battle

of *Gettysburg gathered under federal sponsorship on its fiftieth and seventy-fifth anniversaries. Both Woodrow *Wilson (1913) and Franklin D. *Roosevelt (1938) addressed these reunions, stressing national unity and sectional reconciliation.

In the late nineteenth century, federal and state governments joined private organizations in sustained, if uncoordinated, efforts to preserve battlefields, homes, and other sites associated with past American wars. Under pressure from veterans' organizations, the federal government began acquiring Civil War battlefields. During the twentieth century, while continuing to purchase Civil War sites, congress added locations associated with the * Revolutionary War, The *War of 1812, and Indian wars to a growing list of national military parks. These sites had already been important places for memorial services, reunions, and tourism, and the National Park Service, from the 1930s onward, promoted their use for a range of ceremonies, including battlefield reenactments.

After * World War I, members of both major political parties sought to diminish ethnic, racial, class, and gender divisions by instituting national rituals of remembrance. In response to a conflict marked by antiwar resistance and an ambiguous peace, these commemorative activities were intended to reassure Americans that the United States' participation in the war had been necessary. As in the post-Civil War era, the war dead remained a central symbol. The federal government maintained cemeteries and monuments in Europe, but also responded to pressures from families and localist groups by allowing next-of-kin to decide whether the fallen should be repatriated or remain in these newly created overseas burial grounds.

To represent the sacrifice of the average soldier, Congress followed British and other European precedents in authorizing the burial of an Unknown Soldier in a place of honor in Arlington National Cemetery. The remains of unknown soldiers from *World War II, the *Korean War, and the *Vietnam War have since been interred there. The Tomb of the Unknown Soldier, visited by presidents and other high officials to lay wreaths and to participate in ceremonies at the Arlington National Amphitheater, has become an important site of commemorative ritual.

In the 1920s, Armistice Day emerged as holiday to mark the anniversary of the end of World War I, and an occasion to honor not only the fallen but all of the veterans who had served. The * American Legion promoted community observances, including parades, orations, and memorial services; many citizens joined veterans in observing two minutes of silence on the eleventh of hour of the eleventh day of the eleventh month to mark the exact time the war ended and to mourn its dead. In 1938, the American Legion convinced Congress to make Armistice Day an official federal holiday.

Despite its epic nature, World War II led to few significant changes in the American pattern of remembrance. Only Arkansas and Rhode Island made V-J Day—the anniversary of the end of the conflict—into a holiday. Renamed Veterans' Day, Armistice Day evolved in the 1940s and 1950s into a holiday that honored veterans of all wars.

The post-World War II era witnessed a decline in public rituals centered on remembrance of the past. The concurrent growth of suburbia, the mass media (especially television), and a consumer culture all diminished attendance at public commemorative events. In 1968, Congress recog-

nized the fact that holidays had become days of leisure and consumption by decreeing that the official celebrations of civic holidays, except for Independence Day and Thanksgiving, would take place on the Monday nearest their customary dates. In the 1970s, veterans' groups successfully lobbied Congress and state legislatures to return the commemoration of Veterans' Day to 11 November.

Meanwhile, the federal government under took a more active role in planning and organizing commemorative rituals. Created in 1957, the Civil War Centennial Commission sponsored national commemorations and encouraged states and local communities to organize their own observances. Controversy embroiled this commission, especially over its policy of segregation in the South and the widespread use of battlefield reenactments to mark major events of the war. Critics assailed the commission, as well as a number of state and local organizations, for commercializing centennial activities. Even under nationally organized commissions, however, localist traditions still predominated: the American Revolution Bicentennial Commission, for instance, maintained that its central role was to encourage state and local community observances.

In the late 1970s and 1980s, Americans memorialized the Vietnam War in monuments that rejected classicism and embraced modernism, as well as a more pluralistic depiction of American society. Critics, especially on the right, often derided these memorials as "anti-monuments." Maya Lin's highly influential design—two stark black granite walls inscribed with the names of all those killed in Vietnam—for the national Vietnam Veterans' Memorial on the Mall in Washington, D.C., aroused considerable opposition. Critics forced the addition in 1984 of a more traditional statue and a flagpole. Even after its dedication in 1982, controversy still dogged the Vietnam Memorial over its failure to recognize the contribution of women. Responding to appeals from women veterans, Congress mandated in 1989 that a statue honoring their service be added to the memorial. Despite such criticism, the Vietnam Memorial emerged in the 1980s as one of most visited sites in the nation's capital. The scores of poems, letters, and artifacts left each day by visitors testify to the monument's power to evoke collective and personal grief.

As America entered the closing decade of the twentieth century, a renewed interest in both rituals and monuments emerged. In the late 1980s, a number of communities staged long-delayed welcome home parades for Vietnam veterans. After the * Persian Gulf War in 1991, several major cities held victory parades to honor both the combatants of this conflict and those who served in Vietnam. Responding to the success of the Vietnam Memorial, the American Battle Monuments Commission received congressional authorization for a national Korean War Veterans' Memorial in 1995, also in the Mall in Washington. A monument commemorating World War II is proposed for completion by the close of the twentieth century.

COMMUNICATIONS. From the * Revolutionary War to the present, the American military has used communications in order to command and control its forces and other assets, but the technology has changed dramatically. Methods employed during the nation's war for independence (messengers, signal lights, and voice commands) differed little from those used by ancient armies.

During the *Civil War, visual signaling remained the primary communications method. The utility of the electric telegraph (invented 1837) had been amply demonstrated by European armies since the 1850s; but Albert J. Myer gave it little attention when designing the nation's first military communications organization, the U.S. Army Signal Corps. Established by an act of Congress on 21 June 1860, the Signal Corps employed Myer's "wigwag" system. Using an adaptation of the Bain telegraph code, movements of flags (and at night, torches) transmitted tactical communications within visual range. Although army signalers operated "telegraph trains" (communications wagons with telegraphs and field wire), fixed wire communications were beyond Myer's purview. With regular trips to the War Department, President Lincoln read the latest telegraphic reports on the progress of the war. The conduit for that information, more than likely, was the rival U.S. Military Telegraph, a contract firm that used commercial lines and civilian employees to meet the administrative and strategic needs of the army.

After the war, the Signal Corps assumed responsibility for the electric telegraph and used it to create a national weather service as well as a military communications network. Although visual signaling—wigwag, sun-powered heliograph, and observation balloons—remained important to the U.S. military, the *Spanish-American War found commercial and military telegraph enjoying extensive use. Commanders in widely dispersed theaters of war—Cuba, Puerto Rico, and the Philippines—made use of both military and commercial telegraph. Telegraph and ocean cable connected the front lines of Cuba with defense planners in Washington. Wire communications facilities across the Philippine Islands linked the archipelago by submarine cable. At the same time, Adolphus W. Greely (chief signal officer 1887-1906) adapted and equipped the army with emerging late nineteenth-century technology, such as the telephone (invented 1876), to command and control its forces. Its use was demonstrated by the telephone system in Cuba that enabled Gen. William Shafter's Fifth Army to communicate within yards of the front line, as well as with the admiral of the U.S. Fleet.

While providing a communications network and trying to quell the *Philippine War (1899-1902), the Signal Corps simultaneously supported the army on another frontier. Signal Corps celebrities such as then Lt. Billy *Mitchell helped to construct the Washington-Alaska Military Cable and Telegraph System (WAMCATS). The network, which connected the region's isolated military posts, helped the army coordinate its peacekeeping efforts in the

territory during the Alaska gold rush. Renamed the Alaska Communication System in 1936, it remained under military control for over sixty years. Radio replaced Alaska's telegraph system in 1928, owing much to the efforts of George Owen Squier (chief signal officer 1917-24), who tested Marconi's invention, the wireless (1895), for military use.

The U.S. Army and the U.S. Navy both employed the wireless. In 1904, a radio station in the Boston Navy Yard transmitted the first official Naval Observatory time. Although experimentation continued and the navy employed wireless to transmit time and weather reports, the navy's admirals had little faith in its tactical uses.

The Army Signal Corps introduced the first portable wireless sets into the field in 1906, and began experimenting with radio telephony (voice radio) the following year. In 1914, it tested a radio set mounted in an automobile. Parallel efforts by the navy during this period included in-house experimentation and support of the commercial development of radio. Regarded as a novelty, however, radio remained largely unused. Army land forces in *World War I relied on the telephone, telegraph, and even homing pigeons for communications in the era of trench warfare.

Supporting the American Expeditionary Forces, the army was also responsible for combat photography and aviation. Nevertheless, the Signal Corps' grandest achievement was the establishment of a massive wire communications system that ran from the seacoast to the American battle zone in France. The system consisted of literally thousands of miles of administrative and combat lines: 134 permanent telegraph offices and 273 telephone exchanges, facilitated by 200 bilingual American telephone operators. Multiplex printing telegraph equipment linked Tours, Chaumont, Paris, and London.

The army's communications arm also oversaw the adaptation of the airplane to military use. With its genesis in Civil War and Spanish-American War observation balloons, the Signal Corps purchased a Wright brothers' flying machine in 1908. James Allen (chief signal officer 1906-13) and his immediate successors perceived the airplane as an observation platform and vehicle for courier service. When aviation's role as a fighting and bombing force expanded during World War I, the army created the Army Air Service (1918), separating aviation from the Signal Corps.

Experimentation before and during World War I contributed to the Signal Corps' development of radio for military purposes. Stepping stones included the achievements of Signal Corps captain (later major) Edwin H. Armstrong. Armstrong invented a major component of amplitude modulated (AM) radio—the superheterodyne circuit—during World War I. His next invention, frequency modulated (FM) radio, came during the interwar years. Chief Signal Officer Squier facilitated the standardization and mass production of vacuum tubes. He established the first Signal Corps Laboratory at Camp Alfred Vail, New Jersey. Introduction of the SCR-68, an airborne radio telephone, and its companion ground set, the SCR-67, were significant steps in the development of radio communications.

During the interwar years, developments in both wire and radio technology set the stage for communications support for "World War II. Naval research included experimentation with the radio compass, airborne radio, and radio remote control. The teletype, remarkable for its accuracy, speed, and simplicity of operation, came into the

arsenal in the 1930s. The battery-powered field telephone was developed as the Germans improved both the switchboard and communications cable. The War Department Radio Net (established 1922) became the genesis for an elaborate command and control communications system that enveloped both army forces and navy ships during World War II. About the same time, the International Radio Convention (1927) adopted the navy's plan for worldwide frequency allocation.

A 25-pound army walkie-talkie, developed in 1934, made its debut in the army maneuvers of 1939. A truck-mounted long-range radio, with a 100-mile voice range and several times greater range for Morse Code, was introduced in the 1940 Louisiana maneuvers. Captain Armstrong helped Col. Roger Colton develop his invention into the army's first FM pushbutton, crystal-controlled, tactical radio in the Signal Corps Laboratory at Fort Monmouth, New Jersey. Although the army's armor and artillery branches communicated via FM radio (proven feasible by 1936), the infantry (as well as the navy) failed to integrate the new technology until after World War II.

Numerous countries claimed ownership of *radar, developed during the 1930s. Its significance in World War II communications cannot be overstated. By 1943, the Germans were effectively using radar as an early warning and weapons-directional device. In the United States, navy research and development paralleled that of the Army Signal Corps. Prewar, the navy installed it on ships (1940), while the army used it as a short-range radio locator for directing searchlights. A new, long-range aircraft detector radar, on Oahu, Hawaii, issued a warning (unfortunately ignored) when Japanese aircraft approached the island on 7 December 1941. By early 1942, the Signal Corps SCR-517 microwave radar was used in aircraft to search for ships in the Atlantic. In 1944, a microwave SCR-584 helped aim U.S. weapons in combat at Anzio, Italy. By the end of the war, such communications advances as the bi-service advancement of radar, navy perfection of sonar, army development of FM radio, and overall miniaturization of electronic components laid the groundwork for the electronics and space ages to follow.

The Signal Corps used a modified SCR-271 long-range radar set (1946) to bounce radar signals off the Moon to test the properties of radio communications in space. Post-war navy technological achievements included over-horizon VHF radio communications, the use of radar waves to reflect signals off the Moon (1951), and Moon-relayed messages between Honolulu, Hawaii, and Washington (1956). Both services contributed to the development of artificial space satellites and communications. By the 1960s, rockets of the U.S. Air Force were sending manned and unmanned vehicles into space.

Improved radar supported land and air forces and naval batteries in the conduct of the *Korean War. The Signal Corps played a major supporting role in that conflict. Although doctrine dictated wire as the primary means of communication, the exigencies of Korea—distance, terrain, primitive roads—led to a dependence on very high frequency (VHF) radio. VHF, effective far beyond its 25-mile range, carried teletype as well as voice traffic. It proved adaptable to the frequent infantry moves characteristic of the fighting in the first two years of the conflict. But line-of-sight properties restricted its usage; VHF station components, weighing hundreds of pounds, often re-

quired transportation to—and operation and maintenance from—high, remote communication sites. In spite of the difficulties, army communicators proclaimed VHF the backbone of communications during the Korean War.

Between Korea and Vietnam, military efforts again focused on the peaceful uses of communications. The army, in 1958, used its technology to explore outer space. The Signal Corps' Space Sentry bounced signals from the Moon, developing the ability to ensure the close tracking of satellites. The same year, Vanguard II's infrared scanning devices mapped the cloud cover over the Earth.

Technological advances in communications during the "Vietnam War were the end product of twenty years of research and experimentation by the army, navy, and air force. Miniaturized electronic components increased the payloads of U.S. communications satellites propelled into space by air force boosters. One notable benefit was initiation of the first operational satellite communications system in history when the Army Satellite Communications Command established two clear channels from Tan Son Nhut, South Vietnam, to Hawaii (1964).

Radio transmission had improved as well. Line-of-sight wave transmission was surpassed by tropospheric scatter or troposcatter propagation radio with a maximum 400-mile range. The new technology enabled radio waves to travel long distances by using special antennas to bounce them off clouds of ionized particles in the higher ionosphere before they returned to Earth hundreds of miles away.

Military communications support in Southeast Asia proved that advanced electronics could master the geography. Although Vietnam's Integrated Wideband Communications System (established and funded by the air force and operated jointly with the army) never fulfilled the promise of a regional civil-military network, it demonstrated the need and effectiveness of a high-capacity area telecommunications system in an undeveloped region. More important, the wideband system reflected a permanent move to an area-oriented communications doctrine. Improved technology was directly responsible for the shift in focus.

As a joint-services endeavor, Vietnam communications included numerous examples of inter-service cooperation. For example, army field commanders enjoyed rapid aircraft response because of connectivity with air force support centers. Joint army-navy mobile riverine forces, using command and communications boats, had well established internal as well as external communications with the South Vietnamese army. A continuing problem in Vietnam, security was addressed first by the navy's "Talk Quick" system which preceded the army's automatic secure voice system (1967).

Major communications systems in Vietnam included the 1st Signal Brigade's Southeast Asia Defense Communications System and the Southeast Asia Automatic Telephone Service (1968). The latter comprised 9 switches connected to 54 automatic army, navy, and air force dial exchanges. Overall, communications support for the Vietnam war could be characterized as the beginning of an ongoing trend toward the use of commercial-type facilities for both strategic and tactical communications. While mobile multichannel radios, switchboards, and teletype centers linked headquarters throughout the chain of command, strategic and administrative networks comprised a variety of commercial sets.

Changes in military strategy and tactics such as the

long-range and heavy logistical requirements of modern weapons, and reliance on coordinated air-ground operations, both prevalent in Vietnam, dictated more flexible and extensive communications support than that offered by traditional chains of command. Technical advances in communications made it possible—indeed, imperative—to create interconnecting area networks. The merger of tactical and strategic communications became official in 1966 with the formation of the 1st Signal Brigade. As part of the Strategic Communications Command, area networks linked fighters with intelligence, personnel, and logistical centers in the United States. At the same time, combat commanders kept organic tactical communications to respond to military requirements.

Higher-echelon advances did little to change Vietnam's combat communications from those of previous conflicts. Field telephones connected by single-strand wire linked artillery battery, guns, fire direction centers, and commanders. Infantry platoon command posts used small field switchboards and wire lines to connect squads, sentries, and listening posts. The 173rd Airborne Brigade, in 1965, deemed the PRC-25 (transistorized FM voice radio) its greatest communications device. Hand-held, vehicle-, and aircraft-mounted PRC-25s were the primary means of combat communication for army units from squads through division level.

The Vietnam conflict demonstrated the interdependence of the army, navy, and air forces in the conduct of mid-twentieth-century warfare. The secretary of defense acknowledged this fact in such cooperative efforts as the Joint Tactical Satellite Research and Development Program (1965). At the same time, the communications arms of the various military branches continued to invest in their own unique information systems.

Post-Vietnam technology further changed the face of military communications. The 1970s development of the semiconductor dramatically decreased size and power requirements of communications systems. The microprocessor revolution, in turn, led to the development of modules rather than discrete systems. Miniaturization, greater standardization, and modules all made commercial equipment cheaper, more adaptable, mobile, and secure.

The U.S. military's post-World War operations revealed major weaknesses in the Department of Defense's (DoD) efforts to weld its various communications assets into a cohesive whole. Communicators in Operation Urgent Fury (Grenada, 1983) encountered major obstacles in the coordination and provision of support for the Joint Task Force. Both the DoD and Congress took positive steps to strengthen cooperation among the various service components—DoD through the establishment of the Joint Tactical Command Control and Communications Agency (1984) and Congress with the Goldwater-Nichols Act (1986). The positive results of these and other actions became clear in Operation Just Cause (Panama, 1989-90).

Operation Desert Storm (1990-91), a major joint operation directed by the U.S. Central Command, provided a true test of service cooperation. The Persian Gulf War demonstrated that military communications had expanded and transformed into information technology. In the few years between Panama and the gulf, joint training had become the rule.

As information systems achieved equal footing with military hardware in the conduct of the Gulf War, all of the

services incorporated numerous commercially produced systems. The Army Signal Corps' network, connected with those of the other services and Allied Coalition forces, spanned the geographic area with commercially developed cellular telephone and a single-channel ground and airborne radio system.

Operation Desert Storm left little doubt that late twentieth-century military communications embraced all aspects of information management. Using multimedia sources, communicators need to get the right information to the right people almost instantaneously. At the end of the twentieth century, information activities in war have equaled and in some cases supplanted industrial activities.

Military communication—or more accurately, information management—presents a seamless network on the late twentieth-century battlefield. As a result of technological advancements, the centerpiece of the battlefield is no longer simply the weapons platforms but also an information grid into which weapons are plugged.

Information technology will continue to transform military communications. Because the value of information increases exponentially through dissemination, its potential is virtually limitless.

COMPREHENSIVE TEST BAN TREATY. See Limited Test Ban Treaty.

CONANT, JAMES B. (1893-1978), scientist, educator, and diplomat who played a key role in the development of the atomic bomb. Conant received his Ph.D. in chemistry at Harvard in 1916. During World War I, he joined the Chemical Warfare Service, where he directed the Organic Research Unit in the production of mustard gas. He subsequently taught at Harvard, became chair of the chemistry department, and in 1933, the university's president. In the depth of the depression, his dealings with conservative and radical groups on campus led him to take positions in national politics. He generally opposed New Deal programs, but also the isolationist views that dominated in his own Republican Party.

When World War II broke out, Conant advocated aid to the democracies and worked through the National Defense Research Committee to enlist U.S. scientists in war preparations. Later, with the Office of Scientific Research and Development, he played a key role in coordinating atomic research with Great Britain and setting up the Manhattan Project. His June 1945 suggestion to drop the newly completed atomic bomb on a Japanese war plant and its populated environs in order to shorten the war was taken up by President Harry S. Truman, who targeted Hiroshima, a sizable city, an army headquarters, a rail center, and a major producer of material. From 1946 to 1962, Conant served as adviser to the Atomic Energy Commission.

The outbreak of the Korean War in 1950 convinced

him of the magnitude of the Soviet threat, and he soon headed the Committee on the Present Danger, which urged the United States to station up to 1 million troops in Europe under *NATO command. An appreciative President Dwight D. *Eisenhower named Conant U.S. high commissioner for occupied western Germany in 1953, and, after the occupation ended in 1955, first U.S. ambassador to the Federal Republic of Germany. During his four years in Bonn, Conant aided in the transformation of Germany into a democratic state and a dependable military ally against communism.

After his return to the United States, Conant devoted his reforming energies primarily to the field of education, heading a Carnegie Foundation study of American secondary schools (1957-62) and publishing a number of important works on education.

CONFEDERACY, THE MILITARY IN THE. From the moment the representatives of the seceded Southern states met in Montgomery, Alabama, on 4 February 1861, they sought to defend the South. As a former military officer and secretary of war, the provisional president, Jefferson * Davis, seemed to possess impeccable credentials for that task.

The Confederate War Department had the specific responsibility of assembling an army using state militia units and volunteers. The governors of the states would then transfer those units to Confederate service, and thus create a national army. Hastily organized units soon bombarded the War Department for requisitions and instructions; with limited resources, the government could not provide the necessary arms and accoutrements for its troops. Even so, by April 1861, the Confederate states could boast some 70,000 men in the field.

After the Confederate capture of *Fort Sumter on 12 April 1861, U.S. president Abraham *Lincoln issued a call for 75,000 volunteers to suppress the rebellion. Davis countered with a call for 100,000 men.

But if the Confederates had established the basis for a military, significant problems remained. That military had to be supported and maintained adequately. It had to be deployed properly and employed effectively. All of this demanded a coherent war * strategy.

The closest the Confederate hierarchy came to such a plan was an implicit belief in the defensive nature of their war. Rather than subjugate the North, the Confederacy relied on the fact that it could win simply by continuing to exist and that its people would be waging war in defense of their homes. Even so, the South could not afford to conduct a completely passive defense, thereby exposing its citizens to the ravages of war.

Instead, Davis planned to implement an "offensive-defensive" strategy. This overall defensive scheme would allow the Confederate forces to exploit their interior lines of communication and supply and concentrate Southern forces against invading Union columns. The South could shift troops to repel a threat at a time and place of its own choosing.

Unfortunately, Davis faced political demands that greatly hampered his plan. In addition to his personal difficulties with some generals, the Confederacy's creation of a rigid departmental command structure militated against this strategy. Thus, Davis and the War Department confronted localized pressures from governors, such as Joseph E. Brown of Georgia and Zebulon Vance of North Carolina, and from various generals more concerned with protecting their own interests than with cooperating with others.

Despite the South's defensive strategy, Confederate armies did mount several major offensive operations into Union territory, including the Maryland campaign of Gen. Robert E. *Lee in 1862, the Kentucky campaign of Gen. Braxton *Bragg, also in 1862, and Lee's invasion of Pennsylvania in 1863. All of them failed, depleting the South's offensive power.

Manpower shortages in particular prevented the Confederacy from engaging in further grand offensives. Such concerns had led to the implementation of * conscription, or the draft, in April 1862. Initially designed to include able-bodied men between the ages of eighteen and thirty-five, conscription was expanded to men between seventeen and fifty, and exemptions were sharply reduced. Finally, in 1865, the Confederate government authorized the arming of slaves, but the war ended with the program only in its initial phases.

The Confederate government ultimately attempted to establish a unified command structure under General Lee. Unfortunately, by then—February 1865—the Confederacy was in its death throes. Lee's army and the rest of the main Confederate field armies would surrender in a matter of months.

Debates continue to rage over the relative importance of the eastern and western theaters of operations and the Civil War's role as a "total" or "modern" war.

[See also Civil War: Military and Diplomatic Course; Civil War: Changing Interpretations.] g_ian \$ wills

CONFEDERATE ARMY. On 19 February 1861, President Jefferson *Davis appointed Leroy P. Walker of Alabama secretary of war of the newly formed Confederate States of America—the first of the five men to serve in that troubled office—and on 6 March, the Confederate Congress authorized an army of 100,000 volunteers to serve for twelve months. In May 1861, following the outbreak of war, Congress authorized the further enlistment of as many as 400,000 volunteers for three-year terms.

The white male population of the eleven Confederate states, aged fifteen to thirty-nine, was approximately 1 million. The best estimates of total Confederate enlistments range from 850,000 to 900,000. Less than 2,000 men served in the regular army; nearly all were in the Provisional army, a force intended to be disbanded at the end of the war.

At the outset, the South had more volunteers than it could arm and equip, forcing the army to turn away some 200,000 volunteers that it would soon sorely miss. In June 1863, the army peaked at almost 475,000 men; it declined steadily thereafter. By comparison, some 2.3 million men served in the Union army, with more than 1 million in uniform in 1865. As martial enthusiasm waned in late 1861, the Confederate government was forced to resort to conscription for the first national draft in American history. On 16 April 1862, the Confederate Congress enacted the

First Conscription Act, which declared all able-bodied, unmarried white men between the ages of eighteen and thirty-five liable for the draft. One-year volunteers already in the army were enjoined to serve for two additional years but were allowed to return home on a sixty-day furlough and to elect new field- and company-grade officers. The Second Conscription Act of September 1862 and the Third Conscription Act, adopted seventeen months later, extended the ages of liability from seventeen to fifty, although exemptions greatly weakened the draft law. The stigma of conscription induced potential draftees to volunteer before they were called, so that only 82,000 were actually conscripted.

In the spring of 1861, seceding states consolidated their militia companies into regiments, mustered them into Confederate service, and sent them where the need seemed greatest, without reference to higher organization. Soon, however, President Davis began to pattern the Confederate States Army after the armed forces of the old Union during the *Mexican War. A full-strength regiment consisted of 10 companies of 100 men each, although many regiments began with far fewer than 1,000 men and their numbers dwindled throughout the war due to "casualties, disease, and desertions. Each regiment, upon muster into Confederate service, received a numerical designation in chronological order of organization, such as the 3rd Louisiana Volunteer Infantry or the Eighth Texas Cavalry. From three to five regiments, ideally from the same state, formed a brigade. The brigade's commander, a brigadier general, was appointed by the president, subject to Senate confirmation, from the unit's home state. Three brigades, in turn, combined to form a division commanded by a major general; and two or more divisions, commanded by a lieutenant general, would become an army corps. Ideally, two or more corps constituted an army.

Confederate territory was organized into military departments, usually named for the state or states in which it operated. A general officer commanded each department, with responsibility for all military administration, resources, and operations within it. By this definition, the Confederacy fielded at least forty "armies," yet most departmental forces were such in name only.

Although the states recruited and organized regiments for the army, the Confederate government was responsible for their rations, uniforms, training, arms, equipment, and pay—at the rate of \$11 per month for privates. The South's underdeveloped industrial and transportation systems were, however, never able to overcome the army's logistical and supply problems. Quartermaster General Abraham Myers struggled to provide the necessary material to wage a modern war, and Commissary General Lucius B. Northrop proved grossly incompetent at supplying rations. Josiah Gorgas, chief of the Bureau of Ordnance, was the one high-ranking Confederate supply officer who excelled in his job, improvising the manufacture of gunpowder, cannons, and rifles in sufficient numbers and quality.

The South selected cadet gray as its official uniform color—in tribute to "the long gray line" at West Point—but the War Department could not begin to supply so many shell jackets and trousers. Consequently, Rebel armies, from beginning to end, were clad in everything from state militia uniforms to "butternut"-dyed homespun to captured Union apparel. Before the Confederacy could provide Southern soldiers with modern rifles, many volun-

teers relied on sporting rifles, shotguns, revolvers, and even Bowie knives brought from home. Moreover, Confederate soldiers provided their own horses, which contributed materially to the decline in the superiority of Rebel cavalry and the further disadvantage of Rebel artillery after 1862.

Volunteers were mustered in so-called camps of instruction, but their training was minimal, consisting mainly of the manual of arms and basic squad, company, and regimental drill. Regiments sometimes went into combat within three weeks of their organization, aggravating the chaos of the typical Civil War battlefield and the consequent appalling casualty figures. By 1862 or 1863, those who survived had become veteran soldiers, with fighting skills as formidable as any army on record. Confederate troops, however, from first to last were notorious for their resistance to formal discipline.

Southerners viewed the soldier's profession as an especially honored one, and a disproportionate number of Southern-born officers held high rank in the U.S. Army in 1860. Three hundred and thirteen officers—nearly one-third of the West Point-trained officers on active duty at the outbreak of war—resigned to join the Confederacy, contributing crucial leadership to the Southern armies.

This infusion, however vital, did not begin to fill the need for officers. As American volunteers had always done, Confederate troops elected their own company-grade officers, while governors generally appointed regimental officers. This practice often undermined discipline and morale, replacing efficient officers with those who promised to enforce a less rigorous military regimen. On the other hand, soldiers were generally a canny lot and chose intelligently. Since units were recruited from communities, the men had often known candidates all of their lives and judged their potential as leaders shrewdly. Too, the men usually selected officers with some military training or experience, either from a military academy—notably Virginia Military Institute in Lexington and The Citadel in Charleston—or in the war with Mexico, or at least in an antebellum militia company. To weed out the incompetents, in October 1862 the War Department established examining boards for officers.

Jefferson Davis, a graduate of the U.S. Military Academy, favored West Point-educated professionals for high command, leading to bitter complaints of a "West Point clique" monopolizing promotions. Occasionally, a general appointed from civilian life, such as Richard Taylor and Nathan Bedford * Forrest, rose to high rank and performed admirably. To a remarkable degree, untrained officers at company or field grade overcame their deficiencies by studying *Hardee's Tactics* and by setting an example in camp and field. Leading from the front, the Confederate officer corps absorbed appalling casualties—15 percent higher than those suffered by their enlisted men—and generals enjoyed a 50 percent greater chance of dying in battle than those they led.

Confederate "casualties, sustained during four years of heavy fighting, were enormous. Within a year of its organization, a typical regiment was reduced to half or less of its original number by sickness, battle casualties, and desertions, and by 1865 many regiments mustered fewer than two hundred men. More than 250,000 Confederate soldiers died of wounds or disease; 200,000 or more men were wounded in the course of the war. At least 100,000 Southern soldiers deserted during the course of the war, most in

1865. At the end of the war, 359,000 names appeared on Confederate muster rolls, but only 160,000 were on active duty, and of those, only 126,000 were present for duty.

Despite poor to nonexistent pay, uniforms, food, training, and equipment; the bane of amateur officers; and horrific casualties, the Rebel soldier maintained a remarkably high level of morale—at least until the closing months of the war, when Union invasion and the destruction of civilian property sapped the fighting spirit of the army and desertion increased.

Moreover, the Confederate army performed remarkably well in the field, especially in the eastern theater, where the Army of Northern Virginia under Gen. Robert E. *Lee won a string of stunning victories. The Army of Tennessee, assigned the task of defense of the Confederate heartland, was less fortunate. Plagued by poor leadership, accorded only cursory attention from Richmond, and expected to hold a vast area, it was doomed to four years of frustration. It nevertheless maintained a high level of morale and remained a potent fighting force until squandered by John Bell *Hood at Atlanta, Franklin, and Nashville. In the trans-Mississippi region—the darkest corner of the Confederacy—makeshift Rebel armies often overcame even greater neglect, especially during the 1864 Red River campaign that saved Texas and Northwest Louisiana from Union occupation.

CONFEDERATE NAVY. Confederate navy secretary Stephen R. Mallory of Florida, who had chaired the U.S. Senate Naval Affairs Committee, assessed his navy's ten ships and fifteen guns in 1861: "The Union have a navy; we have a navy to construct." That construction would take place in a region where strategic resources were largely untapped, and agriculture dominated an undiversified economy. Foreign carriers shipped Southern raw materials in exchange for manufactured goods—and Southerners foresaw no interruption of that commerce. Those assumptions held for about two months between the inauguration of the Confederate states in February 1861 and Lincoln's declaration of the Union *blockade after the capture of *Fort Sumter in April.

The Confederacy needed merchant ships and transports along with warships to defend its harbors and rivers. It also needed ships capable of breaking the blockade. And as a daring strategy, the Confederacy commissioned raiders to disrupt and destroy Union merchant shipping, hoping this would draw Union naval strength away from the Confederate coast.

The Confederacy's major asset for meeting those needs for a navy resided in some 300 officers who had left the Union to join the Confederacy. Although some were aged admirals, others were brilliant officers whose careers had been mired in an antiquated seniority system. Matthew

Fontaine Maury, already an internationally respected naval scientist, had chafed against the bureaucracy; he would pioneer the use of *torpedoes, or mines. John Mercer Brooke was to design a naval cannon, the Brooke rifle, which was superior to the Union standard designed by his commander, John *Dahlgren. Another "scientific sailor" who was to command the *Virginia* in the first battle of ironclads was Catesby ap R. Jones. These and dozens of other officers added to their experience a wealth of innovative spirit.

To build a serviceable merchant and transport fleet, the Confederacy purchased and, in some cases, commandeered ships in Southern ports. By the fall of 1861, the Navy Department let numerous contracts to private builders to construct small wooden gunboats. In keeping with the need to develop industry, the navy also considered these wartime contracts an investment in postwar industries.

In actual practice, the gunboat policy was plagued by inexperience at every level. It was said that ships were built along any stretch of river with banks level enough to work on. There was slave labor available, but shipwrights, machinists, sailmakers, and all the skilled trades required in shipbuilding were in critically short supply. An increasingly effective Union blockade reduced the availability of ships' machinery and even such items as nails and spikes. Only a fraction of ships laid down were ever fully operational.

The blockade prodded the Confederate navy to devise new means of overcoming the Union's overwhelming advantage. Blockade runners, which could retract a funnel and change profile or burn nearly smokeless coal, were sleek and fast, more like seagoing yachts than transports of guns, ammunition, and medicines.

Seeking to overcome numbers with technology, the Confederates constructed an ironclad on the burned hulk of the *Merrimack* and rechristened it *Virginia*. The battle with *Monitor* in March 1862 changed the course of naval history. During the war, the Confederacy completed twenty-two ironclads; as with the wooden gunboat projects, however, steam engines were makeshift affairs. There were insufficient supplies of iron for armor, and designs at one site or another were so individually eccentric that mass production was impossible.

One pervasive power of the ironclads was their psychological effect upon Union blockading crews: "ram fever" caused endless anxiety, and even a floating log could send all hands scrambling to battle stations. The semisubmerged torpedo boat, or "David," also had a powerful effect upon Union blockaders. This small craft was designed to steer in under the guns of a man-of-war and detonate a torpedo against the hull below the waterline. Mines, too, were a hazard when deployed in rivers and harbors, and more effective against Union ships than any other weapon.

Confederate innovative technology culminated in the submarine *Hunley*, first employed at Mobile and then at Charleston. Called a "Peripetetic coffin" because of the crews killed in its operations, *Hunley* was lost in a mission against the U.S.S. *Housatonic*, but became the first submarine to sink a ship in battle.

Operating in a rather loosely structured administration that cast about in search of some means to overcome the Union advantage, Confederate naval forces went further in devising strategies. On the Mississippi, cotton was used as armor on the river defense fleet. Raiders in small boats would launch surprise attacks against Union blockaders; capturing the Union *Underwriter* was one success. A

scheme elaborately planned but unsuccessful was a large-scale covert operation in Canada. The plan was to disrupt rail shipments along the Great Lakes, capture vessels and disrupt shipping on the lakes, and rescue Confederate prisoners in Ohio.

The Confederate navy was spectacularly successful with its commerce raiders, which harassed and destroyed Union ships in global warfare. *Alabama* was built in England, secretly commissioned in the South Atlantic, and set free under the command of Raphael Semmes to detain and destroy Union merchantmen in the Atlantic, around Africa into the Indian Ocean, and as far east as Singapore. Before being sunk by the Union *Kearsarge* in a famous battle off Cherbourg in the English Channel, *Alabama* took sixty-five ships.

Sumter, *Tallahassee*, and *Florida* had briefer careers. The more famous *Shenandoah* wreaked havoc in the Pacific where American whalers harvested critical supplies of oil. Considered pirates by the Union, these ships captured the world's imagination, and the willingness of neutral ports to welcome the ships and lionize their crews resulted in U.S. claims against England in the 1870s.

Deficiencies in industrial strength, scarcities in raw materials and skilled labor, and the overwhelming numbers of Union vessels express in naval terms the same disadvantages that helped to defeat Confederate armies. In ships, they were outnumbered more than three to one; in enlisted ranks, more than ten to one; yet the Confederate navy employed technologies that, in time, became essential to naval warfare.

The CONFERENCE ON SECURITY AND COOPERATION IN EUROPE (CSCE) involved thirty-three European states plus the United States and Canada in a series of negotiations bridging the East-West divide through the 1970s and 1980s. Washington linked initial U.S. participation to settlement of the status of Berlin and Soviet agreement to parallel talks on conventional force reductions (the MBFR). The CSCE Final Act, signed in Helsinki on 1 August 1975, codified the diplomatic "rules of the road" for the remainder of the *Cold War, including the inviolability of frontiers, nonintervention, and respect for human rights.

Publication of the Final Act catalyzed an upsurge of activity for human rights and in opposition to totalitarianism across the Soviet Union and Eastern Europe in the mid-late 1970s. CSCE review meetings in Belgrade (1977-78), Madrid (1980-83), and Vienna (1986-89) focused on implementation and extension of the Final Act, especially in the areas of human rights and military confidence-building measures. By 1989, the political principles established by the Final Act were widely credited with contributing to the collapse of Communist rule in Eastern Europe.

After the *Cold War, the CSCE established a permanent

Secretariat in Prague, a Conflict Prevention Center in Vienna, an Office for Democratic Institutions and Human Rights in Warsaw, and an Office on National Minorities in the Hague. With the breakup of the Soviet Union, Czechoslovakia, and Yugoslavia, and the accession of Albania, membership in the CSCE increased from thirty-five to fifty-three states. In 1994, it was renamed the Organization for Security and Cooperation in Europe (OSCE). Since then, the OSCE has supervised democratic elections, promoted respect for human rights in new laws and constitutions, and negotiated and monitored cease-fires throughout Eastern Europe and the former Soviet Union.

CONGRESS, WAR, AND THE MILITARY. Article I, section 8, of the U.S. Constitution states that Congress has the power to "provide for the common Defence," "To declare War," "To raise and support Armies," and "To provide and maintain a Navy." In theory, these enumerated grants of power give Congress extensive (but not unlimited) power over the preparation and use of U.S. military forces. In practice, Congress has found its ability to control the military, and especially its ability to dictate when and where military force will be used, challenged by the executive branch.

Declaration of War. Congress's role in decisions to go to war has changed dramatically since the early days of the republic. Traditionally, congressional authorization was seen as necessary for any offensive use of military force, but following World War II presidents began to claim that their role as commander in chief gave them independent authority to order U.S. troops into combat. In 1973, Congress tried to reclaim its war powers by passing the War Powers Resolution, but the question of when (or even if) congressional authorization is needed to use force remains a continuing controversy.

The delegates to the constitutional convention clearly intended to lodge the war power with Congress rather than the president. They explicitly rejected a proposal to give the president the power to declare war, and while they designated the president as commander in chief, they saw the position simply as an office and not as an independent source of warmaking authority. The delegates expected that it would be the exclusive province of Congress to decide whether to move the nation from a state of peace to a state of war. Presidents were empowered to send U.S. troops into combat without congressional authorization only to repel sudden attacks on the United States.

The founders' views on the war power largely guided political practice over the next one 150 years. Congress passed formal declarations of war four times: the *War of 1812 (1812); the *Spanish-American War (1898); *World War I (1917); and *World War II (1941). In the case of the *Mexican War (1846-1848), Congress did not formally declare war but rather passed a resolution recognizing that a state of war existed. (The *Civil War was undeclared because a declaration of war would have recognized the legitimacy of the Confederate government.) On other occasions, Congress authorized, or refused to authorize, the

president to use force in situations short of full-scale war. Moreover, in the 150 years before World War II, presidents repeatedly acknowledged the need for Congress to authorize offensive military actions.

Of course, the original intent of the founders was not always followed in practice. The U.S. military on occasion—the exact number is a matter of some dispute—used force without congressional sanction. Yet most of these incidents involved relatively inconsequential attacks on nonstate actors such as brigands and pirates, and they frequently occurred without the benefit of either congressional or presidential authorization. When presidents did violate congressional prerogatives, they typically drew sharp criticism. In 1848, the House of Representatives censured President James K. Polk for “unnecessarily and unconstitutionally” provoking war with Mexico.

The willingness of presidents to order the use of force against sovereign states on their own authority grew after World War II. When North Korea invaded South Korea in June 1950, President Harry S. Truman decided against asking Congress to declare war because he thought his critics might filibuster the resolution and thereby dilute its symbolic effect. Over the next four decades, presidents used Truman’s precedent to argue that the commander-in-chief clause empowers them to send U.S. troops into combat without congressional authorization. In August 1964, Congress passed with only two dissenting votes the Tonkin Gulf Resolution, which approved President Lyndon B. Johnson’s decision to use force to prevent further Communist aggression in South Vietnam. Although legal scholars differ over whether the resolution constituted an adequate legal basis for American military involvement in the Vietnam War, Johnson and Richard M. Nixon both argued that they had full authority to prosecute the war without congressional authorization. Congress repealed the resolution in January 1971, but American involvement in Vietnam continued.

The experience in Vietnam soured many in Congress on the wisdom of giving presidents wide berth to send U.S. troops into combat. In 1973 Congress passed, over President Nixon’s veto, the War Powers Resolution. The resolution stipulates (among other things) that the president can send troops into situations of imminent or actual hostilities for no more than sixty days (ninety days in some circumstances) unless Congress authorizes the deployment.

During its first two decades in operation, the War Powers Resolution failed to check the president’s use of force. Every president but Jimmy Carter and Bill Clinton denied its constitutionality, and successive administrations exploited ambiguities in the law to prevent the sixty-day clock from starting. President Ronald Reagan did sign a 1983 bill that gave him authority to keep U.S. troops in Lebanon for eighteen months, but in doing so he repeated the claim that the War Powers Resolution is unconstitutional. (No court has ruled on the constitutionality issue.) The resolution did not figure in the invasions of Grenada in 1983 and Panama in 1989, the intervention in Haiti in 1994, or the peacekeeping missions in Somalia in 1992 or Bosnia in 1995.

In the case of the Persian Gulf War of 1991, President George Bush refused to invoke the War Powers Resolution, and he argued that he did not need congressional authorization to order U.S. troops to liberate Kuwait. Public opinion, however, eventually forced Bush to seek the ap-

proval of Congress. The authorizing resolution, which did not mention the War Powers Resolution, passed in the Senate with five votes to spare.

The circumstances in which presidents can initiate the use of military force without congressional authorization remain an open constitutional question. The federal courts have generally declined to hear lawsuits challenging the president’s right to use military force, either on the grounds that such suits raise political and not legal questions or that it is up to Congress and not the courts to preserve congressional prerogatives. The net effect of the courts’ reluctance to settle the issue has been to diminish the war powers of Congress and to enhance those of the president.

Conduct and Termination of War. Congress has no direct constitutional authority over the conduct of war. The founders expected that once the United States was at war, the command and direction of the military would fall to the president, pursuant to his role as commander in chief. Indeed, to make clear that the president and not Congress would direct military operations, the delegates to the Constitutional Convention voted to substitute the phrase “to declare War” for the phrase “to make War” in the initial draft of the Constitution.

The Constitution fails to say which branch of government has the power to make peace, and there is no evidence that the delegates to the convention discussed the matter. As a matter of custom, presidents are not required to gain congressional approval for a peace settlement. President Nixon, for example, handled U.S. withdrawal from the Vietnam War through an executive agreement that was not submitted to Congress. In theory, Congress can use its appropriations power to terminate American participation in a war, though no such cases exist. Any formal peace treaty is not binding, of course, until the Senate gives its “advice and consent” by a two-thirds majority.

Deployment of Troops. The executive power and commander-in-chief clauses of the Constitution give the president broad authority to deploy troops overseas where combat is not anticipated. Congress itself recognized this authority when it passed the War Powers Resolution. Unlike the case of imminent or actual hostilities, the resolution places no time limits on presidential decisions to send U.S. troops overseas during peacetime, even if those troops are equipped for combat. Thus, President Clinton did not need congressional authorization for his decision in 1995 to send U.S. troops to Bosnia as peacekeepers. The one undecided constitutional question is whether Congress can, through its appropriations power, bar the president from deploying troops to a specific country or theater of operations. The federal courts have never decided the issue, and legal scholars are divided on the matter.

Military Alliances. U.S. participation in formal military alliances is handled through treaties, which under the U.S. Constitution must be approved by two-thirds of the Senate. Despite frequent claims that U.S. alliance commitments render Congress’s war power obsolete, no alliance in which the United States is involved requires the automatic commitment of troops once war begins. Instead, most treaties of alliance follow the precedent set by the North Atlantic Treaty of 1949, which states that the signatories will take the actions they deem necessary under the treaty “in accordance with their respective constitutional processes.”

On occasion, and especially in the 1950s and 1960s,

presidents have used executive agreements to commit the United States to defend other countries against aggression. Such agreements are not submitted for congressional approval, and in most cases the commitment was initially kept secret. These commitments are of dubious constitutional validity.

Appropriations Power. Article 1, section 9, of the U.S. Constitution stipulates that "No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law." This appropriations power, in conjunction with the more specific constitutional charges to "raise and support Armies" and "provide and maintain a Navy," gives Congress tremendous say over the budgets, structures, and duties of the armed forces. The Constitution forbids Congress from making defense appropriations more than two years in advance, and by custom appropriations laws are passed annually. In addition to using the appropriations power to determine how much the armed services may spend, Congress can use the appropriations power to bar the armed services from undertaking specified programs or operations. The Supreme Court has never struck down any use of the appropriations power as an unconstitutional infringement on executive authority, which is why it stands as Congress's foremost instrument for shaping military policy.

The funding of defense programs follows a twin-track process on Capitol Hill. First, defense programs must be authorized, a process spearheaded in the Senate by the Armed Services Committee and in the House by the National Security Committee. Second, the funds for defense programs must be appropriated, a process spearheaded in each house by the Appropriations Committee. In theory, the authorizers focus on policy issues and the appropriators on budgetary issues, but in practice the line between the two is heavily blurred. The authorization requirement is rooted in congressional rules rather than the Constitution, and thus Congress may, if it so chooses, dispense with the requirement that defense programs be authorized before any money for them is appropriated.

The tremendous size of the U.S. military establishment means that as a practical matter Congress writes its defense authorization and appropriations bills in close consultation with the executive branch. By both tradition and law, the executive branch has some flexibility to reprogram the monies appropriated by Congress across defense accounts, as well as to spend funds to meet unanticipated military contingencies. At times, presidents have used their reprogramming authority and contingency funds to frustrate congressional efforts to dictate military policy.

Oversight. Oversight of the U.S. military is a longstanding congressional power that dates back to the House of Representatives' inquiry into Gen. Arthur St. Clair's disastrous defeat at the hands of the Wabash Indians in 1791. Most oversight activities are conducted by standing committees such as the Senate Armed Services Committee and the House National Security Committee. Special congressional panels, such as one convened to investigate the *Iran-Contra Affair, may also be convened to hold hearings on matters of special interest.

The Constitution gives Congress wide powers over the American military. In many respects, though, Congress finds its ability to exercise these powers frustrated by what Alexander Hamilton in *Federalist* No. 70 called the president's inherent advantages of "decision, activity, secrecy,

and dispatch." The ability of Congress to override these inherent advantages depends ultimately on the wisdom and the political popularity of what the president seeks to accomplish.

CONSCIENTIOUS OBJECTION. Whenever government in America has employed compulsory military training or service, it has been confronted by those who, on principle, refuse to bear arms. The early colonists included many members of pacifist Protestant sects—*Quakers, Mennonites, Brethren—who believed the Bible and the teachings of Jesus of Nazareth prohibited them from participating in war or engaging in any violence against other human beings. Colonial officials fined them for refusing to serve in the militia, but since they were economically productive and otherwise law-abiding, most colonial governments eventually exempted them from personally bearing arms.

In the * Revolutionary War some objectors were forced into militia service, but several states recognized religious conscientious objection as a right and excused objectors if they paid a special tax. In 1790, James *Madison sought to include protection for religious objectors in the Bill of Rights, a measure that passed the House, but failed in the Senate.

Both the North and South dealt with religious objectors in the * Civil War. Some suffered severely, but ultimately both sides recognized their sincerity and stubbornness. Drafted members of the historic peace sects were allowed to purchase an exemption or hire a substitute. When some refused, the Lincoln administration gave them the option of aiding in the care of wounded soldiers or former slaves.

In World War I, the Selective Draft Act of 1917 recognized only members of the historical peace churches as "conscientious objectors" (COs), but required them to serve in the military in non-arms-bearing roles. Some 64,700 men, most of them not members of the pacifist sects, claimed CO status on religious or political grounds. Local draft boards classified 57,000 as COs, and 20,900 COs were inducted into the army. In the training camps, 80 percent abandoned their objections. Some 4,000 remained COs; ultimately most were furloughed into agricultural work, and 1,300 others served in the medical corps. But 450 "absolutists," who refused to cooperate in any way, were court-martialed and sent to military prisons.

The harsh and fumbling experience with COs during World War I contributed to a more liberal policy in World War II. The Selective Service Act of 1940 provided CO status for all religious objectors. It also allowed them to choose non-arms-bearing military service or alternative civilian service. In 1940-45, 50,000 draftees were classified as COs, most serving in the military, primarily the medical corps. Some 12,000 chose civilian alternative service, working without pay on soil erosion control, reforestation,

and agricultural experimentation in one of seventy Civilian Public Service (CPS) camps operated for the Selective Service System by the historic peace churches. Another 2,000 COs worked in mental hospitals and 500 volunteered as subjects for medical experiments on disease. Some 5,000 absolutists refused to cooperate and went to federal prison—a majority of them Jehovah's Witnesses, but also some pacifist social activists such as A. J. *Muste, Bayard *Rustin, and David Dellinger.

The 1948 draft law in effect reiterated the 1940 CO provisions throughout the *Cold War; but with no CPS camps, most of the 35,000 COs performing alternative service between 1951 and 1965 worked in local hospitals or mental institutions. During the *Korean War, the percentage of inductees exempted as COs grew to nearly 1.5 percent, compared with 0.15 percent in each world war.

In the "Vietnam War, the traditionally small group of religious objectors was succeeded by massive numbers of secular and religious young men applying for CO status or simply refusing to cooperate in the draft. The new COs tended to come from better-educated and higher socioeconomic groups. They received support from mainline religions—Protestant, Jewish, and Catholic—plus antiwar and antidraft groups. Established antidraft organizations included the War Resisters League (founded 1919); the National Interreligious Service Board for Conscientious Objectors (1940); and the Central Committee for Conscientious Objectors (1948). Numbers of African Americans applied as COs, most prominently Muhammad Ali, a Black Muslim and heavyweight boxing champion, who was sent to prison when he refused military service after his CO claim was rejected.

The Supreme Court, in the *Seeger* (1965) and *Welsh* (1970) decisions, expanded the criteria for CO status from religious to secular moral or ethical beliefs. More than 170,000 registrants were classified as COs between 1965 and 1970. CO exemptions granted to registrants as compared to actual inductions soared from 8 percent of inductions in 1967 to 43 percent in 1971, to three times that ratio in 1972, when more people were being exempted as COs than were being drafted into the army. Additionally, between 1965 and 1973, approximately 17,500 members of the armed forces applied for noncombatant status or discharge as COs.

Compulsory draft registration was reactivated in 1980. When 500,000 failed to register between 1982 and 1984, the Reagan administration prosecuted a few of those who publicly proclaimed their refusal to register. The Justice Department soon abandoned such an approach. Instead, Congress, adopting an amendment by Representative Gerald Solomon (Rep.-N.Y.) penalized nonregistrants by denying them student financial assistance from federal funds.

Within the armed services, even without conscription, conscientious objection became a public issue again during the preparation for the *Persian Gulf War, when between 1,500 and 2,000 persons in reserve and regular military units applied for discharge as COs. The army eventually reassigned or released these soldiers, but the Marine Corps court-martialed and imprisoned nearly fifty Marine COs.

In the 1990s, the right of conscientious objection in many other Western nations was being expanded to include recognition of secular and religious COs in and out

of uniform and in some countries, selective objection. Derived from the Vietnam War and new directions in Western political and ethical thought, this trend demonstrated that the tension between concepts of freedom of conscience and the "citizen-soldier continued to redefine conscientious objection in America.

CONSCRIPTION. Compulsory military service has played a periodic and often controversial role in raising America's wartime forces. It has only rarely been used in peacetime in America.

English colonists revitalized the county militia system of compulsory, short-term training and service for local defense. However, in the eighteenth century for longer-term forces most colonies turned to ad hoc units composed primarily of volunteers with occasional draftees and legally hired substitutes.

During the *Revolutionary War, state governments assumed the colonies' authority to raise their short-term militias through drafts if necessary. They sometimes extended this to state units in the *Continental Army, but they denied Gen. George *Washington's request that the central government be empowered to conscript. As the initial volunteering slackened, states boosted enlistment bounties and held occasional drafts, producing more hired substitutes than actual draftees.

The Constitution neither mentioned nor prohibited national conscription, simply providing Congress with the power "to raise and support armies." Most of the framers apparently believed that the United States, like England, would enlist rather than conscript its soldiers, paying for them through federal taxes.

For much of the nineteenth century, the United States relied upon a small, all-volunteer regular army, augmented in wartime by the militia (renamed the National Guard) and by large numbers of temporary, locally organized, federally funded units—the U.S. "Volunteers. During the *War of 1812, however, the Madison administration tried unsuccessfully to adopt a national draft (which Daniel Webster, a New England Federalist, denounced as "Napoleonic despotism").

National conscription came to America in the *Civil War. With fewer people, the South adopted conscription in 1862, eventually applying it to white males seventeen to

fifty years of age. Conscription raised 21 percent of the 1 million Confederate soldiers. But because it violated individual liberty and states' rights and included unpopular class-based occupational exemptions, such as for overseers on large plantations, it eroded some popular support for the Confederacy.

The North adopted the draft in 1863, making it applicable to males twenty to forty-five. Avoiding unpopular occupational exemptions, Congress permitted draftees to hire a substitute or pay a commutation fee of \$300, then comparable to a worker's annual wages. Peace Democrats denounced it as a "rich man's war but a poor man's fight," and thousands evaded or resisted when military provost marshals began conscripting. Bloody draft riots erupted in New York and other cities.

Four federal drafts produced only 46,000 conscripts and 118,000 substitutes (2 and 6%, respectively, of the 2.1 million Union troops). Most soldiers were U.S. Volunteers. However, the draft was credited, along with \$600 million in enlistment bounties, with prodding volunteers, encouraging reenlistments, and demonstrating political will.

Not until "World War I did the United States rely primarily upon conscription. A civilian-led "Preparedness" movement helped persuade many Americans that national compulsion was more equitable and efficient than local voluntarism for an industrial society to raise a mass army. President Woodrow Wilson overcame considerable opposition—particularly from agrarian isolationists and ethnic and ideological opponents of U.S. involvement—to obtain a temporary wartime, national, selective draft.

The Selective Service Act of 1917 prohibited enlistment bounties and hiring substitutes but authorized deferments on the grounds of dependency or essential work in industry or agriculture. The draft was implemented by a Selective Service System composed of a national headquarters commanded by Gen. Enoch Crowder and some 4,000 local draft boards staffed by civilian volunteers. The boards decided, within overall national guidelines, on the induction or deferment of particular individuals.

In 1917-18, Selective Service registered and classified 23.9 million men, eighteen to forty-five, and drafted 2.8 million of them. In all, 72 percent of the 3.5 million-man wartime army were draftees. Despite the initial divisions over the war, there were no draft riots. Authorities arrested those who counseled draft resistance, including the anarchist Emma Goldman and Socialist Party leader Eugene V. "Debs. Except for a few rural incidents, opposition took the form of draft evasion or registration as conscientious objectors (COs). Apparently between 2 and 3 million men never registered, and 338,000 (12% of those drafted) failed to report when called or deserted after arrival at training camp. In addition, 64,700 registrants sought CO status. The U.S. Supreme Court upheld the draft law in 1918.

In "World War II, following the German defeat of France, Congress in 1940 adopted the nation's first prewar conscription act, the result of a campaign headed by old "Preparedness" leaders. The draft system was set to operate through 1945, but because of intense opposition from isolationists, Congress obligated the 1940 draftees to serve only one year, for training purposes. A year later, the lawmakers voted (203-202 in the House) to retain the 600,000 draftees. After Pearl Harbor, the Congress extended the draft to men aged eighteen to thirty-eight (and briefly to forty-five), and prolonged military duty for the duration.

Headed by Gen. Lewis Hershey, Selective Service drafted a total of 10.1 million men in World War II, the majority for the army. Nearly 6 million other men and women joined voluntarily, primarily in the Army Air Corps, the navy, and the Marines. Deferments were limited primarily to war industries, hardship cases, and agriculture.

Still there was dissent, reflected in the 72,000 registrants who applied for CO status and in antidraft incidents in Chicago and other cities. The latter included protests by African Americans against discrimination and segregation in the armed forces. In addition, the Justice Department investigated 373,000 cases of draft evasion; 16,000 evaders were convicted.

After the war, until Congress let the induction authority expire in 1947, conscription was extended to help maintain the much-reduced military. Escalation of "Cold War tensions led Congress to adopt a new draft law in 1948. It required twenty-one months of military training and service by individuals selected by their local draft boards. The Cold War military was composed of volunteers, draftees, and draft-induced volunteers.

During the "Korean War, 1.5 million men, eighteen to twenty-five, were drafted; another 1.3 volunteered, primarily for the navy and air force. Discontent led to an increase in the number of COs, and there were 80,000 reported cases of draft evasion.

Cold War conscription became a casualty of the "Vietnam War. The draft enabled President Lyndon B. Johnson to build up U.S. forces in Vietnam between 1964 and 1968 from 23,000 military advisers to 543,000 troops. In 1964-66, annual draft calls soared from 100,000 to 400,000.

Although draftees were a small minority (16%) in the U.S. armed forces, they comprised the bulk of infantry riflemen in Vietnam (88% in 1969). They accounted for more than half the army's battle deaths. Because of student and other deferments, the draft and the casualties fell disproportionately upon working-class youths, black and white.

Dissent increased, along with soaring draft calls and casualty rates. Supported by an antiwar coalition of students, pacifists, and clergy, and many liberal and radical groups, draft evasion and resistance increased dramatically. There were antidraft demonstrations, draft card burnings, sit-ins at induction centers, break-ins and destruction of records at a dozen local draft boards.

In 1965-75, confronted with well over 100,000 instances of draft evasion or resistance, the federal government indicted 22,500 persons. Some 8,800 were convicted and 4,000 imprisoned. As the Supreme Court expanded the criteria for conscientious objection, CO exemptions rose to more than 170,000 between 1965 and 1970.

An estimated 571,000 young men illegally evaded the draft. Of these, 360,000 were never caught, and another 198,000 had their cases dismissed, but some 9,000 were convicted and 4,000 sent to prison. Between 30,000 and 50,000 others fled into exile, mainly to Canada, Britain, and Sweden.

Congress came under pressure to reform or eliminate the draft. With conservative support, however, General Hershey, Selective Service director since 1941, blocked any significant changes, including recommendations for national uniformity by a 1967 presidential commission headed by former Assistant Attorney General Burke Marshall.

Having criticized the draft in his 1968 campaign, President Richard M. *Nixon removed Hershey, ended new occupational and dependency deferments, and initiated an annual draft lottery in 1969 among eighteen-year-olds (to reduce prolonged uncertainty). He also appointed a commission, headed by former Secretary of Defense Thomas *Gates, which in 1970 recommended an *All-Volunteer Force (AVF), with a standby draft for emergency use.

President Nixon reduced draft calls while gradually withdrawing troops from Vietnam. However, his dispatch of American units into Cambodia in 1970 triggered massive new public protests. Only reluctantly did Congress in 1971 extend the draft for two more years. The lawmakers also eliminated student deferments, deemed a class-based privilege, and voted a major pay increase (\$2.4 million) for the lower ranks of the military to achieve an AVF by mid-1973. During the 1972 election campaign, Nixon cut draft calls to 50,000 and stopped requiring draftees to go to Vietnam. On 27 January 1973, the day a cease-fire was announced, the administration stopped drafting, six months before induction authority expired on 1 July 1973.

Even without induction, Selective Service maintained compulsory draft registration until 1975, when President Ford suspended the process. President Jimmy *Carter resumed it in 1980 in response to the Soviet invasion of Afghanistan. With local draft boards dismantled, Selective Service headquarters directed the program. In response to a suit that women, as equal citizens, should also have to register, the Supreme Court upheld the constitutionality of male-only draft registration. In 1980-84, half a million young men did not register, and under President Ronald *Reagan the Justice Department prosecuted a few of those who publicly refused to register.

In the post-Vietnam era, the military relied entirely on volunteers. However, in the 1990 buildup for the *Persian Gulf War, Selective Service headquarters prepared contingency plans to call up 100,000 men in 30 days if reactivation of the draft was required to obtain replacements if there were massive American casualties. In November 1990, Secretary of Defense Richard *Cheney issued orders preventing any military personnel from leaving even if their enlistment contracts had expired, in effect, making the AVF temporarily less voluntary. The quick victory against Iraq in 1991 did not produce massive American casualties; the draft was not reactivated; and after the war, military personnel were allowed to leave the service.

By 1991, with the collapse of the Soviet Union and the end of the Cold War, debate resumed over whether to maintain even a semblance of Selective Service. The House of Representatives voted in 1993 to eliminate Selective Service headquarters and end compulsory draft registration, but the Defense Department successfully argued the need to retain Selective Service and draft registration, and the measure to end them died in the Senate. Appropriations were reduced in the 1990s and evaders were not prosecuted.

CONSTITUTIONAL AND POLITICAL BASIS OF WAR AND THE MILITARY. When the framers met in Philadelphia to draft the U.S. Constitution, they were aware that existing models of government placed the war power squarely in the hands of the king. John Locke, William Blackstone, and other writers on government regarded the power to go to war as a monarchical prerogative. But when America declared its independence from England, all executive powers were placed in the Continental Congress. The first national constitution, the Articles of Confederation, also concentrated all powers of government in a legislative branch.

By the time the Constitution was completed in Philadelphia, many of the executive prerogatives envisioned by Locke and Blackstone had been vested in Congress, such as the power to declare war, to raise and regulate fleets and armies, and the power over foreign commerce. Unlike Blackstone's model, the president had no power to issue letters of marque and reprisal (authorizing private citizens to undertake military actions). That power was reserved to Congress. Other powers, including treaties and the power to appoint ambassadors, were shared with the Senate.

The reason for breaking decisively with Locke and Blackstone is clearly explained in the debates at Philadelphia, the ratification debates in the states, and *The Federalist Papers* written by Alexander *Hamilton, John Jay, and James *Madison. James Wilson told his colleagues in Philadelphia that it was incorrect to consider "the Prerogatives of the British Monarch as a proper guide in defining the Executive powers. Some of these prerogatives were of a Legislative nature. Among others that of war & peace &c." In *Federalist* No. 69, Hamilton pointed out that the British king "is the sole possessor of the power of making treaties," whereas the U.S. Constitution shared that power with the Senate. The power of the king, he said, "extends to the declaring of war and to the raising and regulating of fleets and armies," powers now entrusted to Congress. Madison later remarked: "The constitution supposes, what the History of all Govts demonstrates, that the Executive] is the branch of power most interested in war, & most prone to it. It has accordingly with studied care, vested the question of war in the Legislative[.]"

The framers empowered the president to be commander in chief, but that title relates to responsibilities authorized by Congress. The language in the Constitution reads: "The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States." Congress, not the president, does the call-

ing. Article 1 gives to Congress the power to provide "for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel invasions."

The debates at the Philadelphia convention include a revealing discussion of Congress's power to declare war. The early draft empowered Congress to "make war." Charles Pinckney, who expected Congress to meet only once a year, objected that legislative proceedings "were too slow" for the safety of the country in an emergency. Madison and Elbridge Gerry recommended that "declare" be substituted for "make," leaving to the president "the power to repel sudden attacks." Their motion carried.

The president's authority was carefully constrained. The power to repel sudden attacks represented an emergency measure that allowed the president, when Congress was not in session, to take actions necessary to repel sudden attacks either against the mainland of the United States or against American troops abroad. It did not authorize the president to take the country into full-scale war or mount an offensive attack against another nation.

Remarks on the Madison-Gerry amendment clarify the framers' intent. In support of the amendment, Roger Sherman said that the president should be able "to repel and not to commence war." George Mason spoke "ag[ain]st giving the power of the war to the Executive, because not [safely] to be trusted with it He was for clogging rather than facilitating war." At the Pennsylvania ratification convention, James Wilson expressed the prevailing sentiment that the system of checks and balances "will not hurry us into war; it is calculated to guard against it. It will not be in the power of a single man, or a single body of men, to involve us in such distress; for the important power of declaring war is vested in the legislature at large."

Madison insisted that the power of commander in chief be kept separate from the power to take the nation to war: "Those who are to *conduct a war* cannot in the nature of things, be proper or safe judges, whether *a war ought* to be *commenced, continued, or concluded*. They are barred from the latter functions by a great principle in free government, analogous to that which separates the sword from the purse, or the power of executing from the power of enacting laws."

Early Precedents. Presidential use of force during the first few decades conformed closely to the expectations of the framers that the decision to take the country to war was lodged solely in Congress. Whether involving military actions against Indian tribes, the *Whiskey Rebellion, or the Undeclared Naval War with *France from 1798 to 1800, presidential actions were based on authority granted by statute. Two decisions by the Supreme Court in 1800 (*Basv. Tingy*) and 1801 (*Talbotv. Seeman*) recognized that Congress could authorize hostilities either by a formal declaration of war or by a statute that authorized an undeclared war. In the second case, Chief Justice John Marshall wrote for the Court: "The whole powers of war being, by the constitution of the United States, vested in congress, the acts of that body can alone be resorted to as our guides in this inquiry." The Barbary Wars during the administrations of Thomas *Jefferson and James Madison were repeatedly authorized by Congress. The *War of 1812 against England was declared by Congress.

The power of the president as commander in chief is at its low point when there is no standing army and Congress must act to raise troops. But when a standing army exists,

ready to move at the president's command, the balance of power can shift decisively. The capacity of the president to put the nation at war is illustrated by the actions of President James K. *Polk in 1846, when he ordered Gen. Zachary *Taylor to occupy disputed territory on the Texas-Mexico border. The order provoked a clash between American and Mexican soldiers, prompting Polk to tell Congress a few weeks later that "war exists." After a few days of debate, Congress declared war against Mexico, recognizing that "a state of war exists." In 1848 the House of Representatives censured Polk's actions as a war "unnecessarily and unconstitutionally begun by the President of the United States."

One of the members of the House who voted for this censure was Abraham *Lincoln, who some years later would exercise military force during the *Civil War without first obtaining authority from Congress. In April 1861, with Congress in recess, he issued proclamations calling forth the state militia, suspending the writ of habeas corpus, and placing a blockade on the rebellious states. However, Lincoln never claimed that he had full authority to act as he did. He conceded to Congress that he had probably overstepped the constitutional boundaries established for the president and thus needed congressional sanction. Legislators debated this issue at length, eventually passing legislation "approving, legalizing, and making valid all the acts, proclamations, and orders of the President, etc., as if they had been issued and done under the previous express authority and direction of the Congress of the United States." Presidents have used force unilaterally a number of times, but the actions were relatively small in scope and duration.

Aside from Polk's initiatives in Mexico and Lincoln's emergency actions during the Civil War, the power of war remained in the hands of Congress during the nineteenth century, and the first half of the twentieth. The *Spanish-American War of 1898, *World War I, and *World War II were all formally declared by Congress.

The UN Charter and Korea. In June 1950, President Harry S. *Truman ordered U.S. troops to Korea without first requesting congressional authority. For legal footing he cited resolutions passed by the United Nations Security Council, but the history of the UN Charter and its implementing legislation demonstrates that UN machinery is not a legal substitute for congressional action. If it were, the president and the Senate, through treaty action, could strip from the House of Representatives its constitutional role in deciding questions of war.

In adopting the Charter, all parties in the executive and legislative branches understood that the decision to use military force through the United Nations required prior approval from both Houses of Congress. In response to any threat to the peace, breach of the peace, or act of aggression, the Security Council may decide under Article 41 of the Charter to recommend "measures not involving the use of armed force." If those measures prove inadequate, Article 43 provides that all members of the United Nations shall undertake to make available to the Security Council, "on its call and in accordance with a special agreement or agreements," armed forces and other assistance. These agreements spell out the numbers and types of forces, their degree of readiness and general location, and the nature of the facilities and assistance to be provided. Article 43 further states that the special agreements shall be ratified by

each nation "in accordance with their respective constitutional processes."

The meaning of constitutional processes within the U.S. system was defined by Congress when it passed the UN Participation Act of 1945. The statute clearly provides that special agreements "shall be subject to the approval of the Congress by appropriate Act or joint resolution." The legislative history of the Participation Act underscores the need to protect congressional interests by obtaining legislative approval in advance.

Notwithstanding the UN Charter and the Participation Act, President Truman acted militarily in Korea without ever coming to Congress for approval. He circumvented Congress by never entering into special agreements with the Security Council. The very procedural safeguard carefully enacted into law to protect the constitutional prerogatives of Congress thus amounted to nothing. No special agreement has ever been entered into under the UN Charter, although there have been many UN military actions.

From the War Powers Resolution to Bosnia. In an effort to restore its powers over war and peace, Congress enacted the *War Powers Resolution of 1973. The purpose was to provide for the "collective judgment" of both Congress and the president before U.S. troops are sent into combat. Because of ambiguities in the statute and Congress's failure to protect its institutional interests, presidents from Gerald *Ford to Bill *Clinton have taken a range of military actions with little involvement by Congress.

Military actions in the years immediately after the War Powers Resolution were modest, ranging from President Ford's evacuation of Americans and foreign nationals in Southeast Asia to efforts by President Jimmy *Carter to rescue American hostages in Iran. Congressional efforts to restrict the Reagan administration's assistance to the Contras in Nicaragua caused a major clash between executive and legislative branches, beginning in 1982. Although the administration testified repeatedly that it was complying with these statutory directives, executive branch officials actively solicited funds from private parties and from foreign governments to assist the Contras. When these activities surfaced in November 1986, as the *Iran-Contra Affair, Congress passed several statutes to tighten controls over covert operations.

Another confrontation occurred in 1990 when President Bush claimed that he could take offensive action against Iraq, after its invasion of Kuwait, without authorization from Congress. The Bush administration regarded a UN Security Council resolution of 29 November 1990 as sufficient legal basis. On 8 January 1991, President Bush decided to ask Congress to pass legislation supporting his policy in the Persian Gulf. A day later, however, when reporters asked him whether he needed a resolution from Congress, he replied: "I don't think I need it I feel that I have the authority to fully implement the United Nations resolution." A potential constitutional crisis was averted when Congress debated, and passed, legislation authorizing the military action against Iraq.

President Clinton repeatedly insisted that he could use military force against other nations without seeking authority from Congress. While threatening to invade Haiti in 1994, he encouraged the UN Security Council to adopt a resolution "inviting" all states, particularly those in the region of Haiti, to use "all necessary means" to remove the

military leadership in that island. By a vote of 100 to zero, the Senate passed a "sense of the Senate" amendment stating that the Security Council resolution "does not constitute authorization for the deployment of United States Armed Forces in Haiti under the Constitution of the United States or pursuant to the War Powers Resolution."

A few weeks later, Clinton "welcomed" the support of Congress for an invasion of Haiti, adding: "Like my predecessors of both parties, I have not agreed that I was constitutionally mandated to get it." In a televised address in September, he told the American public that he was prepared to use military force to invade Haiti, referring to the Security Council resolution as authority, and stating his willingness to lead a multilateral force "to carry out the will of the United Nations." Several votes by the House and the Senate to deny funds for the contemplated military action failed. An invasion became unnecessary when former president Jimmy Carter negotiated an agreement in which the military leaders agreed to step down to permit the return of ousted President Jean-Bertrand Aristide. Both Houses of Congress resolved that "the President should have sought and welcomed Congressional approval before deploying United States Forces to Haiti."

President Clinton also used air strikes against the Bosnian Serbs and sent 20,000 ground troops to Bosnia-Herzegovina without obtaining authority from Congress. In 1993, he acted in concert with the United Nations and *NATO to authorize humanitarian airdrops of food, helped to enforce the no-fly zone (a ban on unauthorized flights) over Bosnia-Herzegovina, and supported an arms embargo on that region. The next year, while contemplating air strikes in Bosnia, he looked not to Congress for authority but solely to the Security Council and to NATO. In response to a reporter's question whether he had decided to use air strikes to retaliate against shellings in Sarajevo, Clinton referred to UN and NATO authority. At no time did he acknowledge a need to obtain congressional authorization.

In late February 1994, U.S. jets shot down four Serbian bombers over Bosnia. The United Nation and NATO, not Congress, became the authorizing bodies. Other air strikes occurred throughout 1994 and 1995. At the end of August 1995, after NATO aircraft had carried out the war's biggest air raid, Clinton announced that the bombing attacks "were authorized by the United Nations." In proposing the introduction of U.S. ground troops into Bosnia, he welcomed the "support" of Congress without conceding that he needed its authority. Congress passed several nonbinding resolutions to withhold funds for ground troops to Bosnia unless the president first obtained legislative approval, but never employed binding statutory language. In the end, President Clinton dispatched the troops to Bosnia.

Presidential war power has expanded dramatically since 1950 because of a combination of factors: presidents pressing their powers to the limit and the passivity and acquiescence of Congress. The courts have tended to remain above the fray when members of Congress have objected that presidents have violated the War Powers Resolution or the Constitution. Federal judges have regularly told legislators that if they want to check the president, they must exercise the considerable powers within their arsenal. They should not expect courts to do Congress's job for it. That message is well stated and soundly based, but legislators have consistently failed to protect their institutional prerogatives.

Members of Congress continue to use the power of the purse to direct the president in foreign affairs and war, but increasingly seem to lack the institutional self-confidence to function as a coequal branch. In 1973, Congress succeeded in invoking its power of the purse to end the Vietnam War, but only after escalating financial costs and military casualties tore the country apart. At various points legislators could have used the purse to constrain or terminate the war, but generally allowed the president to define the scope of hostilities. Only sustained public opinion forced Congress to vote for a cutoff in funds. Efforts to use the power of the purse to prevent military operations in Haiti and Bosnia came to naught.

Arguments about presidential war power that would have been astonishing fifty years ago are now routinely accepted as plausible, credible, and well within the bounds of reason. The political and constitutional costs are heavy. Instead of the two branches working in concert to create a program that has broad public support and understanding, presidents unilaterally offer various forms of economic and military assistance to other countries, consigning legislators to the backseat. In this era of executive hegemony it may take a major crisis to restore respect for the constitutional allocation of war-making authority, and the principle of checks and balances.

CONSULTANTS. An important but often controversial part of the post-World War II defense establishment was the contracting-consulting industry, which grew apace amid deteriorating relations with the Soviet Union and rising levels of *Cold War military spending. Traditionally, contracting denoted mainly construction and procurement functions, while consulting involved the occasional services of individuals (usually skilled professionals) outside the military. However, from 1945 on, as national security came to rest on expensive high-tech weaponry, the military's need for outside expert advice and technical evaluation services increased dramatically. Demand was heaviest in the areas of science and technology, though cost-effectiveness, logistical, and operations analyses figured prominently as well.

During the 1950s, as the military competition between East and West intensified, the use of consultants hired by the Department of *Defense (DoD) on a contractual basis became increasingly institutionalized through the establishment of nonprofit "think tanks," later known as feder-

ally funded research and development centers (FFRDC). These organizations owed their principal source of funding to annual contract subsidies from the DoD. Most engaged in research and development of one sort or another; rarely did they actually produce a manufactured item. FFRDCs had two distinct advantages: they bypassed low government pay scales in the hiring of expert technical and scientific personnel; and they provided relatively easy and direct access to the industrial, academic, and scientific communities which had the knowledge and expertise the military services needed. Two early examples of such collaboration were the development in *World War II of the proximity fuse, a joint endeavor of the navy and the Applied Physics Laboratory of the Johns Hopkins University; and the systematic application of operations research to air warfare through Project RAND, started in 1945 by Douglas Aircraft and reconstituted as a nonprofit corporation funded by the air force in 1948.

The next decade witnessed a veritable explosion in the number of FFRDCs, reaching a total of thirty-nine by the early 1960s. Among the larger and more prominent were the Institute for Defense Analyses (IDA), founded in 1956, to help support the Weapons Systems Evaluation Group under the *Joint Chiefs of Staff; Analytic Services (ANSER), created in 1958, to provide specialized operations analysis for the air force; MITRE (1958), another air force-sponsored technical organization, which grew out of the Lincoln Laboratory of the Massachusetts Institute of Technology; Aerospace Corporation (1960), which initially specialized in ballistic missile systems; Research Analysis Corporation (RAC), the 1961 successor to the Operations Research Office (ORO), which had performed technical evaluations for the army since 1948 under contract with Johns Hopkins; and the Center for Naval Analyses (CNA), established in 1962 to consolidate scattered navy-sponsored technical research activities.

Accompanying the growth in FFRDCs was an increase in the number of for-profit contracting and consulting firms in the private sector. The greatest opportunities generally awaited contractors involved in hardware development and production, but a growing number of profit companies also emerged in direct competition with the FFRDCs. Many of these new companies moved into the burgeoning field of "systems analysis" that Secretary of Defense Robert S. *McNamara introduced in the 1960s in an effort to streamline and improve Pentagon planning and fiscal management through the application of computerized models.

Criticism by Congress and public interest groups that the Defense Department was becoming overly dependent on outside consultants and contractors led to periodic investigations and calls for reform. Initially targeted were the FFRDCs, whose activities their rivals in the private sector often strenuously lobbied to have curbed. At one point Congress imposed a funding ceiling on FFRDCs, until DoD agreed in 1972 to exercise closer controls and to shed all but ten FFRDCs from the military budget. In 1976, a task force of the Defense Science Board concluded that consulting arrangements with profit and nonprofit companies alike were an essential part of the Defense Department's operations. However, a year later, amid continuing controversy, President Jimmy *Carter ordered a governmentwide crackdown on what he termed "the excessively large volume of consulting and expert services."

Over the years Congress frequently debated legislation to curtail the use of consultants and contractors and the jobs they could perform. Congress tried to halt one alleged abuse—the so-called “revolving door”—when in 1985 it barred presidential appointees for two years from taking related jobs in the private sector. But as a rule efforts to legislate reform produced few dramatic changes in the system, due largely to the difficulty of finding workable definitions for terms like *consulting* and *consulting services*. Though it was clear that the number of consultants and contractors had increased enormously since World War II, no one was ever able to say with certainty how many there were, who they were, or how much DoD was spending on their services. According to a General Accounting Office audit in 1988, the Department of Defense devoted anywhere between \$2.8 and \$15.9 billion for consulting services in fiscal year 1987, excluding individual consultants earning under \$25,000 per year.

Despite criticism, consultants and contractors performed functions that the military departments found difficult and expensive to do on their own. One appealing feature of “contracting out” was that it was less costly and more efficient in certain cases—small jobs especially—than doing the work in house; and in 1994, responding to recommendations from a task force headed by Vice President Albert Gore, Jr., Congress enacted legislation relaxing the rules and paperwork so that DoD and other government agencies could make freer use of contractors.

CONTAINMENT. See Truman Doctrine.

CONTINENTAL ARMY. Americans used various forms of military organization in the Revolutionary War, the most prominent of which was the set of traditional forms and innovative solutions called the “Continental army.” The name meant more as the military expression of a collective political resistance than as a description of the variety of forces fighting in scattered theaters.

In simplest terms, the Continental army was the military force that delegates to the Continental Congress agreed to support financially by requisitions on the states. Each state raised a segment of the army, called its “Continental Line” because the troops were to be trained to fight according to European linear tactics. States reinforced, reorganized, and re-created their lines many times in response to the enormous demand for armed forces during the war; they retained the responsibility for raising, clothing, feeding, and paying their own troops. Congress annually assigned each state a quota of men, leaving each legislature to decide how to fill it. Without effective central management, levels of recruitment and support varied widely. No state raised all the Continentals that Congress thought were required.

At the start of the conflict, Americans raised the same kinds of units they had previously used to fight French, Spanish, and Indian enemies. These units were separate

from the militia, which remained responsible for home defense, local political control, and funneling manpower into active service units. The first “Continental” army was born on 15 June 1775, when Congress adopted the thirty-six regiments the four New England governments had created in late April to maintain the siege of Boston after the militia, which had besieged the town after Lexington and Concord, went home. These regiments (plus one from Pennsylvania) so closely resembled their *French and Indian War predecessors that the first campaign of the new conflict was, in terms of the composition of American forces, the last colonial war.

New England soldiers were volunteers who expected to be paid wages comparable to what they would receive in civilian employments, and expected to serve for only a single campaign. (Virginia in late 1775 raised troops for three years as had been its practice during the French and Indian War.) Most soldiers expected to go home in November or early December, and viewed their enlistment as a contract, the terms of which they expected their governments strictly to observe. Recruits enlisted to serve under men they knew, and disciplinary problems arose whenever the men in a unit lost confidence in an officer; discipline was based more on collective agreement among the soldiers than on anything imposed from above. Legislatures selected officers who could persuade their neighbors to enlist incorporated combat veterans of the French and Indian War in the mix of officers. By force of character and example, these men created an army out of an armed mob, and were the principal reason why New England soldiers performed so well at Bunker Hill on 17 June, two weeks before their “Continental” commander arrived from Philadelphia.

The most important military decision Congress made was to appoint George *Washington as commander in chief. Regiments from every state except South Carolina and Georgia served at one time or another under Washington’s command, and although many units served in other theaters, the name “Continental” army is most closely associated with the force Washington superintended from early July 1775 through late fall 1783. Washington, a veteran of French and Indian War service, insisted that officers act as gentlemen, soldiers obey those whom Congress had set over them, and the army be subordinate to civil authority. He wanted a force modeled after the British army, and capable of defeating the British with linear tactics. He disliked the militia: incapable of remaining in service long enough to be trained in linear tactics, profligate of arms and accoutrements, and unsuited to fulfilling his aspirations to military respectability (sniping at the enemy from behind stone walls was no way to earn a place among the civilized nations of Europe), militiamen remained throughout the war the bane of Washington’s existence.

Washington begged Congress to enlist men for more than one year at a time. A minimum of three years of service, he argued, was required to build a proficient army. Congress, more attuned to the ideological problems that standing armies posed, and the practical difficulty of inducing their constituents to serve over the winter, never gave Washington all he wanted. In 1776, it opted again for annual enlistments, although it did expand the term of service from 1 January through 31 December and emphasized the army’s “Continental” pretensions by numbering New England regiments sequentially. In late 1776, Congress authorized the states to raise eighty-eight regiments “for

three years or the war," from 1 January 1777; thereafter, these were the officially preferred terms of enlistment. Massachusetts and Virginia were assigned the most regiments, eighteen apiece, Delaware only one.

Some states raised more Continentals than did others. Massachusetts, with roughly the same total white population as Pennsylvania and Virginia (about 310,000 in 1775), raised perhaps 34,000 men—over twice as many as its two peers in population. Connecticut, with roughly 195,000 white people in 1775, raised more proportionally, and ranked second with about 16,000 Continentals. Virginia probably raised less than 15,000 and North Carolina fewer than 6,000. Of course, states raised men differently—southern states relied more on militiamen than did their northern counterparts—but as these figures indicate, New Englanders and Pennsylvanians predominated in the main army.

As the war dragged on, it became more difficult to find soldiers. States increased bounties, shortened terms, and reluctantly forced men to serve. But conscription was such a distasteful and dangerous exercise of state power that legislatures would use it only in extreme circumstances. More frequently, legislatures tried to reinforce the army with men drawn by incentive or compulsion from the militia for only a few months of summer service. The army's composition thus reflected a bewildering variety of enlistment terms. After 1779, for example, a Connecticut company might have eight or ten privates serving for three years or the war, and twice or three times that number enlisted only for the summer. Washington's complaints to Congress have obscured his genius in building an effective army out of the limited service most Americans were willing to undertake.

Because Congress reckoned military service by individual enlistments—one man serving one time for terms that ranged from one day in the militia to "during the war" in the Continentals—it is impossible to know precisely how many men served in the Continental army. Multiple and consecutive enlistments were commonplace; men crossed from Continental to militia units and back again; record-keeping left much to be desired during intense campaigning; many muster rolls were lost around New York in 1776, Canada in 1775-76, and in the South in 1780-81. Francis Heitman, an early twentieth-century authority, estimated that 250,000 individuals performed military service supporting American independence during the war, or about one in four white men (African American men also served in significant numbers in New England units, especially regiments from Rhode Island). Perhaps as many as 120,000 men served in some part of the Continental army. The largest number of Continentals in Washington's army at one time was probably 32,000 men in November 1778; of these, only 21,500 men were fit for duty. The core of the army—men who repeatedly reenlisted and officers who served for several consecutive years—probably numbered less than 15,000 men. Washington's Continentals always had to be reinforced by summertime recruits or militiamen before they could take the field.

A Continental soldier's service record could be extremely complex. In Massachusetts, for instance, a minuteman might enlist for the rest of 1775 in what became the Continental army, reenlist in 1776, again in 1777 for three years, again in 1780 for a year, and again in 1781 for the war. Or, tired of continuous Continental service, another 1775 veteran might serve in the militia in 1776 and 1777,

and, because he knew his experience was a valuable commodity, enlist in the Continental army for nine months in 1778, nine months in 1779, and six months in 1780, each time collecting the bounty money offered by a government increasingly desperate to fill its quota. A third veteran of 1775 might eschew Continental service altogether and serve in the militia sent to Rhode Island or the Northern army, lending his experience to units that might otherwise appear to have little military value. Similar patterns elsewhere, many even more complex in southern states, illustrate the amalgam of tradition and innovation that was the Continental army.

Who served? Because enthusiasm was highest in 1775, the earlier units offered a better social, economic, and ethnic cross section of society than later units. American society was never perfectly reflected in its army: the colonies had traditionally left the fighting to men willing to accept money to serve, whether voluntarily or under threat of compulsion. As in late colonial armies, some soldiers came from economically disadvantaged groups (including free blacks and Indians), and enlisted because the army offered the best prospects of survival. But the Continental army was not drawn from the dregs of society; nor was it intended to be. Many young men viewed military service, and especially enlistment bounties, as a means to accumulate money. When inflation eroded the value of currency, towns used creative methods to recruit, among others, young men just entering the manpower pool. In Massachusetts in early 1781, for instance, an eighteen-year-old who agreed to serve for three years in the Continental army received an enlistment bounty of a few dollars in specie and several hundred dollars in paper money, plus six three-year-old cattle to be delivered when he completed his service. The town thus paid him with cattle not yet born, which he might not live to collect!

The quest for economic advancement does not imply lack of patriotism; if the discontinuous character of Continental army service was a nightmare for recruiting officers and Washington, it allowed soldiers the flexibility to combine self-interest with commitment to the cause. Moreover, many men enlisted and reenlisted in the Continental army for reasons that had less to do with economic or ideological motives than with adventure, camaraderie, and the opportunity for more responsibilities than they might exercise as a civilian—all the factors that have motivated soldiers at other times and in other wars.

Despite its continual turnover in personnel, the Continental army became an effective fighting force. It became a sophisticated, mobile human community, with a population that during the summer campaigning season in most years was exceeded only by Philadelphia, New York, and Boston. The army absorbed tremendous amounts of money and resources to feed, cloth, equip, house, train, transport, and pay its members, and to build and maintain its own infrastructure, including services like baking bread, butchering cattle, constructing shelter, and repairing clothing. Later in the war, especially in 1778-81, a corps of light infantry, formed each year from the best soldiers from each regiment, furnished much of its fighting power. Under Anthony Wayne, light infantrymen captured Stony Point with great élan in 1779; at Yorktown in 1781, ten companies under Alexander Hamilton demonstrated that the American army could field forces equal to the best of Europe. American soldiers did not always look

the part. In the South, especially in 1780-81, Continental soldiers counted themselves lucky to have even threadbare uniforms. But their clean muskets, neat cartridge boxes, and quick response to battlefield commands showed them to be the equal of their opponent. Out of sometimes unpromising elements, Americans had crafted a unique military force, one that in the end performed the tasks demanded of it.

CONTINENTAL NAVY. The first vessel to sail under authority of the Continental Congress was the schooner *Hannah*. Shortly after taking command of the *Continental army at Cambridge, George *Washington realized the usefulness of interdicting British supply vessels entering Boston as a means of tormenting the enemy and supplying his own troops. *Hannah* went to sea on 5 September 1775.

Hannah's success encouraged the Congress to take further action. At the urging of Rhode Island and other colonies, Congress on 13 October 1775 authorized the fitting out of a "swift vessel to carry ten carriage guns" and formed a committee to oversee this task, as well as to find additional vessels and bring in an estimate of the expense. This legislation marked the official launching of the Continental navy.

As often happened with the Continental Congress, ambition exceeded resources. Spurred by dreams of naval glory and an exaggerated opinion of American capabilities, Congress eventually authorized the construction of twenty frigates (thirteen in December 1775), three ships of the line, and at least two smaller vessels. Some of these vessels were never built and many never got to sea. Almost all of those that did set sail were captured or destroyed by the British.

Nevertheless, the Continental navy made important contributions to American victory. Continental vessels harassed British trade, carried American diplomats to foreign posts, and forced the Royal Navy to stretch its resources further than they would otherwise have been required to do.

Among the earliest accomplishments of the Continental navy was Commodore Esek Hopkins's capture of the Bahamas Islands. Sailing from Philadelphia in mid-February 1776, Hopkins's squadron captured Nassau, remaining only long enough to load cannon from the fort before returning to Connecticut. En route Hopkins's squadron encountered the British frigate *Glasgow*, which managed to inflict considerable damage on its pursuers and then escape. This unhappy engagement cast a pall over what had until that moment been an important accomplishment. Hopkins came under heavy criticism and Congress later dismissed him from the service.

Among the chief achievements of the Continental navy was to bring the war to Europe. Both Capt. Lambert Wickes and Gustavus Conyngham sailed in British home waters, capturing several enemy vessels and generally embarrassing the Royal Navy. The most famous Continental captain to sail these waters, however, was John Paul *Jones.

Having sailed the Continental sloop of war *Ranger* to France, Jones lobbied the French for the loan of a large warship. Thanks to help from Benjamin Franklin, the French provided him with an old East Indiaman, *Duc de Duras*, which he renamed *Bon Homme Richard* in honor of his friend Franklin. Jones took his ship, sailed around the British Isles, and on 23 September 1779, in a bravely fought battle, defeated the British frigate HMS *Serapis* off Flamborough Head. It was the most celebrated American naval victory of the Revolution.

While Jones, Conyngham, and other captains brought fame to the American navy, in home waters the story was less encouraging. A few weeks before Flamborough Head, a combined expedition of Continental navy and state naval vessels, with reinforcements of privateers, suffered a disastrous defeat at Penobscot Bay on the Maine coast. Sent to dislodge the British from that area, the expedition was surprised by the Royal Navy and completely destroyed. Less than a year later at Charleston, South Carolina, the Continental navy lost four additional vessels when that city fell to the enemy.

When Gen. Charles *Cornwallis surrendered in mid-October 1781 at the Battle of *Yorktown, the Continental navy had been reduced to two frigates, *Alliance* and *Deane*. In November 1782, after innumerable delays, the Continental navy launched its first and only ship of the line, *America*, at Portsmouth, New Hampshire. Eager to economize, Congress quickly presented her to the French to replace a ship of the line that had run aground in Boston.

By early in 1783, only *Deane* and *Alliance* remained in service; at the end of the year *Alliance* was the sole American warship left. She remained in commission but inactive until 1785, when she too was sold out of the service.

The federal Constitution of 1787 stipulated (Art. I, sec. 8) that Congress might "provide and maintain a Navy," and made the president its commander in chief (Art. II, sec. 2). It was not until 1794, however, that the new government authorized a navy; and not until 1797 were the first ships launched. Several captains from the Revolution, including John Barry and Silas Talbot, received commissions in the new navy.

In addition to the vessels that sailed under the authority of the Continental Congress all of the states also authorized public warships. Most of these vessels remained close to their own states and were used primarily to defend local commerce. Far more numerous than public warships were privateers. Commissioned by either the Continental Congress or the state governments, several hundred of these vessels sailed during the Revolution. Although they captured hundreds of enemy merchant vessels they did not have a dramatic effect on the war. As the Royal Navy dispatched more warships to American waters many privateers were either trapped in port or captured at sea.

Although not a direct part of the naval effort American sailors did make a contribution to Washington's army. During the escape from Manhattan sailors from Marblehead, Massachusetts manned the small boats that evacuated American troops. They were also important later in that same year when Washington depended upon them to help his army cross the Delaware River.

COOPER-CHURCH AMENDMENT (1970). During the "Vietnam War, President Richard M. *Nixon on 30 April 1970 ordered American and South Vietnamese troops to invade Cambodia in order to attack North Vietnamese and National Liberation Front sanctuaries. Nixon defended his action as necessary to carry out his Vietnamization program. In protest, Senators John Sherman Cooper (R-Ky.) and Frank Church (D-Idaho) introduced a bipartisan amendment to the Foreign Military Sales Act to prohibit the use of American forces in Cambodia after 30 June 1970.

By 1970, the nation was deeply divided concerning the wisdom of the war in Southeast Asia. Senate opposition had been building since 1965, but most members of Congress still yielded to the president. The invasion of Cambodia proved to be the pivotal point for change. In addition to the time limit for withdrawal of U.S. forces from Cambodia, the Cooper-Church Amendment barred the reintroduction of forces into that nation without express congressional approval. The Nixon administration strove to limit the impact of the proposal, chiefly through a series of modifications sponsored by Robert Dole (R-Kans.) and Robert Byrd (D-W. Va.) that would have allowed broad presidential discretion over the deployment of military forces. However, on 30 June the Senate adopted the original amendment in a historic vote of 58 to 37. Under heavy pressure from the White House to weaken the amendment, the House of Representatives did approve a weakened measure in December. The passage of the Cooper-Church Amendment was a milestone in congressional-presidential relations, the first time that the Congress had restricted the deployment of U.S. troops during a war. After 1970, congressional debate was now not on whether to withdraw troops from the Vietnam War, but when.

CORAL SEA, BATTLE OF THE (1942). The first confrontation during *World War II between American and Japanese aircraft carriers occurred on 7-8 May 1942 in the Southwest Pacific. Imperial Japanese naval forces under Vice Adm. Shigeyoshi Inoue, Fourth Fleet commander, sought to capture Port Moresby in southeastern New Guinea and Tulagi in the Solomon Islands in order to threaten Australia to the south across the Coral Sea. The fleet carriers *Shokaku* and *Zuikaku* under Vice Adm. Takeo Takagi and the light carrier *Shoho* with 140 planes covered the invasion forces.

Warned in April by naval code breaking of *ULTRA intelligence, Adm. Chester W. *Nimitz, Commander of the U.S. Pacific Fleet, hurriedly deployed Rear Adm. Frank Jack Fletcher's Task Force 17 with the carriers *Lexington* and *Yorktown* (a total of 138 planes) to the Coral Sea. In support were Australian and American naval and air forces from Gen. Douglas *MacArthur's Southwest Pacific Area.

Tulagi fell on 3 May. The Port Moresby landing was scheduled for 10 May. However, Fletcher attacked the inva-

sion force on 7 May and sank *Shoho*. That morning Takagi failed to find the American carriers, but sank the fleet oiler *Neosho* and destroyer *Sims*. On 8 May in the main carrier duel, Fletcher lost *Lexington* and 66 planes and suffered damage to *Yorktown*, in return for damaging *Shokaku*. Although Fletcher withdrew, Inoue canceled the Port Moresby invasion due to high Japanese carrier plane losses (73 aircraft). *Shokaku* and *Zuikaku* missed the Battle of *Midway in June, but *Yorktown* contributed decisively to the victory.

The Battle of the Coral Sea was the first naval battle in which opposing forces fought solely with carrier aircraft. Although it achieved a tactical Victory, Japan also suffered its first strategic defeat of the Pacific War.

CORNWALLIS, CHARLES (1738-1805), British soldier. Favored with distinguished ancestry and a good education, Cornwallis rose rapidly in the British army. By age twenty-nine, he was colonel of the 33rd Regiment, having performed with *éclat* in Europe during the Seven Years' War. In the * Revolutionary War, with Henry *Clinton at Charleston in June 1776, he joined Sir William *Howe in New York for the Battle of Long Island, 7 August, and a series of campaigns in New Jersey in the winter of 1776-77. In 1777, he campaigned in Pennsylvania, and performed well at Monmouth, 28 June 1778. He served under Clinton at the capture of Charleston on 12 May 1780. Although he and Clinton despised each other, Clinton nonetheless placed him in command in the South before returning to New York. Routing Horatio *Gates at Camden on 16 August 1780, Cornwallis pursued Nathanael *Greene into North Carolina the following year, winning, but failing to destroy Greene's army. Ordered by Clinton to Virginia, and then entrapped at the battle of *Yorktown because of his own lackluster performance, he surrendered on 19 October 1781. Back in England, Cornwallis blamed Clinton for the disaster. Later, he redeemed his reputation by serving with distinction in India.

COUNTERINSURGENCY. *Counterinsurgency* was the name given in the 1960s to a U.S. political-military doctrine designed to defeat Communist-influenced insurgencies, what Soviet premier Nikita Khrushchev called "wars of national liberation" in the process of decolonization. The word *counterinsurgency* was used instead of *counter-revolution* since *revolution* had a more favorable, even heroic connotation to Americans.

Actually, insurgency and counterinsurgency are as old as empires and rebellions, as familiar as the Romans' harsh repression of uprisings within their empire. The Spanish insurgency against Napoleon's conquest gave birth to the term *guerrilla warfare*. In the nineteenth century European

empires fought what they called "small wars" against indigenous forces and frequently employed "antiguerrilla" and "antirevolutionary" warfare techniques. These were primarily attempts to keep armed insurgents from obtaining support from civilians in villages, often by isolating the villagers, and then tracking down and destroying the insurgents.

Separation of villagers and the use of brutal interrogation methods characterized many of the efforts to suppress armed rebellions. In Cuba in the late nineteenth century, the Spanish used a *reconcentrado* policy of herding rural dwellers into makeshift camps to prevent support for the Cuban rebels; the result, as almost always in makeshift arrangements, was widespread disease and death. The British used active antiguerrilla methods in the Boer War (1899-1902), including the establishment of internment camps in which thousands of Afrikaner men, women, and children died. In the * Philippine War, the U.S. Army, in response to guerrilla warfare by Filipino nationalists, isolated villages and sought to obtain information about rebel locations through various means, including the "water cure" (forcibly swelling suspects with water until they yielded information). Totalitarian governments in World War II used widespread executions and mass terror as part of their suppression of insurgent resistance movements.

In the post-World War II era, as colonial empires faced independence movements and insurgencies around the world, Britain, France, and Belgium in particular used counterrevolutionary warfare against Communist or simply nationalist insurgents. Britain isolated villages and set up internment camps successfully in Malaya in the 1950s. The American helped the Filipino government defeat the Communist-led Hukbalahap (Huk) rebellion in central Luzon in 1954. In Indochina, France fought a losing battle against multiparty independence forces led by the Communist *Ho Chi Minh; subsequently the French lost to insurgent urban guerrillas in Algeria.

American "counterinsurgency doctrine" was developed in the 1960s in an effort to counter guerrilla movements seen by the government as antithetical to U.S. interests. Although it originated as a response to Khrushchev's call for Communist-led wars of national liberation in the decolonizing Third World, it could be used against insurgency by any political group. In practice, however, it was employed mainly against Communist and left to left-center insurgencies.

American counterinsurgency doctrine sought to defeat the insurgents through both military and psychological means. Recognizing that such uprisings were based in part on the discontent of poor rural and urban Third World peoples with unresponsive political and economic institutions, American planners thought the discontent could be contained through "nation-building" or "modernization" programs, while military efforts sought out and eliminated insurgent units and leadership.

The U.S. Army established a Psychological Warfare Center at Fort Bragg, North Carolina, in 1952 to study psychological and unconventional warfare, and a Special Forces Group was created there that same year as the operational force. In 1961, President John F. * Kennedy, emphasizing the need to counter Communist guerrillas, particularly in Southeast Asia, ordered the buildup of Special Forces (and authorized their distinctive headgear, a green beret) and

the development of counter insurgency doctrine and training in special warfare.

U.S. doctrine included emphasis on isolating the insurgents from the population and resources, and the use of patrols and other means to maintain pressure on insurgent groups. The Special Forces underwent vigorous military training, including ranger and airborne training, guerrilla operations, intelligence gathering, demolition, communications, and hand-to-hand combat. But engagement with the civilian population was also emphasized, and therefore included training in indigenous languages, preventive medicine, and village sanitation.

Counterinsurgency was employed with U.S. assistance during the 1960s and 1970s in a number of Latin American countries—Bolivia, Columbia, Guatemala, Peru, and Venezuela—as well as in the 1980s in Guatemala and El Salvador.

The primary U.S. counterinsurgency effort, however, was in the * Vietnam War during the 1960s and early 1970s. The Special Forces grew to about 12,000 soldiers during that period, although they declined to about 4,000 by 1985. In Vietnam, both civilian and military U.S. agencies were involved in counterinsurgency, which was emphasized by the CIA and the Marine Corps (the latter through its Combined Action Program) and initially by the U.S. Army. But under Gen. William C. *Westmoreland, the army subsequently focused on a conventional strategy of searching for and then destroying enemy units with massive firepower. The counterinsurgency effort in Vietnam sought to isolate the villagers from the Communist Viet Cong through the "strategic hamlet" program, and to link the South Vietnamese government with positive programs involving medical care, local political and land reform, and agricultural development. Eventually these nation-building efforts were coordinated through the Office of Civil Operations and Rural Development Support (CORDS) under the supervision of the U.S. Military Assistance Command Vietnam (MACV). But these had inadequate support, and genuine rural politicization and land redistribution were opposed by both the Saigon government and the South Vietnamese Army. Partly in response to Communist terrorism in 1967, CORDS created Operation Phoenix, in which joint "provincial reconnaissance units" used ambushes and raids to kill, capture, or co-opt persons believed to be members of Communist cadres. In the end, the U.S. counterinsurgency and Opacification programs in Vietnam failed in their major aims of undermining the Communists' political-military organization and strengthening the link between the rural population and the government of South Vietnam.

During the 1980s, when Soviet client states in Angola, Mozambique, and Ethiopia faced ethnic uprisings, their Communist Soviet Cuban military protectors proved no better at counterinsurgency than had the French or the Americans in Vietnam. Nor were the Communist Vietnamese successful in suppressing Cambodian resistance after their invasion of Cambodia in 1978. The Russians also failed in their attempt to conquer Afghan guerrillas in the 1970s or Chechin insurgents in the 1990s.

The importance of U.S. counter insurgency doctrine should not be overemphasized in terms of the *Cold War. Conceptually, there was little new in the idea, other than the emphasis on political reform and nation-building. It

failed in Vietnam, its greatest test. And successes in Bolivia, Colombia, Guatemala, and Peru stemmed less from the success of the American doctrine than from the weakness of communism in those countries.

COUNTERINTELLIGENCE. Throughout U.S. military history, the term counterintelligence has referred to both an activity and a type of secret information. As the former, counterintelligence is designed to neutralize information gathering by foreign powers. In its guise as a kind of intelligence, counterintelligence consists of data on the personalities and modus operandi of other espionage services and systems. There is an important distinction between security and counterintelligence. Security involves monitoring and closing channels by which state secrets might reach unauthorized individuals or groups; whereas counterintelligence implies the use of such channels to identify, mislead, and frustrate foreign intelligence services seeking to gather those secrets. Counterespionage, the study and combatting of foreign spies, is a subset of counterintelligence.

Counterintelligence was not unknown to the founding fathers. The case of Benedict *Arnold, for example, helped to shape republican ideas about loyalty and treason. Yet the Secret Service was the only counterintelligence institution to emerge from U.S. military experiences from the * Revolutionary War through the *Civil War. Allan Pinkerton, the chief of the Secret Service, served as President Abraham *Lincoln's security officer before joining the staff of Gen. George B. *McClellan. Following the war, Congress provided a legal foundation for Pinkerton's Secret Service. But loath to retain a presidential or even a military police force, Congress placed the Secret Service in the treasury department and restricted its operations to security against counterfeiting. Only in 1908 would the Secret Service again assume responsibility for protecting the president.

For most of the nineteenth century, the *army and *navy shared the view held by Congress that counterintelligence was a form of detective work which was incompatible with the American military tradition. So deeply held was this belief that the military reforms of the 1880s that created the first peacetime military intelligence bureaus—the Office of Naval Intelligence (ONI) and the Military Intelligence Division (MID)—did not produce any counterintelligence units within the services. Even with the host of new threats that accompanied the rise of the United States as a world power at the end of the nineteenth century, the army and the navy preferred to contract out counterintelligence work instead of risking institutional contamination.

During the * Spanish-American War and the 1907 war scare with Japan, the services engaged Secret Service officers to investigate possible foreign espionage activity. The sole exception was the counterespionage mission undertaken by the U.S. army as part of its pacification of the *Philippines.

The traditional obstacles to counterintelligence eroded in *World War I. Suspicious explosions like Black Tom at munitions facilities and the advent of energetic advocates of counterespionage were the cause. For the first time, the U.S. army and the navy created separate "negative" bureaus for counterintelligence and a Counterintelligence Police (CIP) was recruited to protect Gen. John Pershing's American Expeditionary Force. Interest in institutionalizing counterintelligence work emerged throughout the federal government. The Justice Department set up a General Intelligence Division (GID) under an ambitious young lawyer, J. Edgar Hoover, to investigate radicalism and subversion in the U.S., and Woodrow Wilson asked the State Department to coordinate these new federal counterespionage programs.

Although World War I had institutionalized counterespionage in the military, no federal agency, civilian or military, considered foreign spying enough of a threat to warrant having a peacetime counterespionage service. Following the excesses of the Red Scare of 1919, the Justice Department closed its GID. Meanwhile the Office of Naval Intelligence (ONI) and the Military Intelligence Division (MID) were reduced in size, and the Counterintelligence Police (CIP) nearly disappeared entirely. Consequently when the U.S. government confronted the problem of German spying in the late 1930s, none of the established members of the national security state had a counterespionage program.

Counterintelligence was the first field of secret activity addressed by the Roosevelt administration when it took stock of an increasingly hostile world in 1938. Consistent with his general philosophy of leadership, President Franklin D. *Roosevelt chose to divide responsibility for counterintelligence between the FBI, which coordinated it at home and throughout most of the Western hemisphere, and the army and navy. The army received exclusive responsibility for counterintelligence on army bases, the Panama Canal Zone, and the Philippines. Aside from fleet security, the navy received the nod for Hawaii and Guam. Otherwise the services had an overlapping interest in all of the Eastern hemisphere. The entry of the Office of Strategic Services (OSS) into the U.S. intelligence system in 1942 did nothing to improve coordination among the existing services. Ultimately creating its own counterintelligence service in 1943, the OSS went into competition with the army's Counterintelligence Corps and the Office of Naval Intelligence.

The debate following *World War II involved not whether there should be counterespionage in peacetime but who should control it and what its targets should be. In 1947 the National Security Council subordinated all U.S. foreign intelligence and counterintelligence to the newly created Director of Central Intelligence, whose responsibilities included running the *Central Intelligence Agency and directing Washington's nascent intelligence community. National Security Council Intelligence Directive-5, which established DCI leadership in foreign clandestine

activities, removed the responsibility for counterintelligence in the Western hemisphere from the FBI and limited the military to conducting counterintelligence only as required to protect military installations and operations.

The new position of DCI threatened what the military considered to be its traditional prerogatives in wartime. With the intensification of the Cold War following the successful detonation of the Soviet Union's first nuclear device in 1949, the *Joint Chiefs of Staff sought to establish the principle that all foreign clandestine activity, including counterintelligence, would be transferred to its authority in wartime. In 1951, at the height of the *Korean War, the Joint Chiefs made their most serious effort to revise NSCID-5 to permit them to supervise U.S. clandestine activities as they had OSS operations between 1942 and 1945. The DCI, Gen. Walter Bedell Smith, successfully turned away these efforts.

As the *Cold War continued, the military services grew increasingly reluctant to accept a secondary position in overseas counterintelligence. Secretary of Defense Robert S. *McNamara's 1961 initiative to reform military intelligence coincided with another attempt by the services to weaken the CIA's authority in counterintelligence. The U.S. military recommended the formation of a security subcommittee of the United States Intelligence Board, the executive oversight organization for intelligence, in the hope of acquiring more of a voice in setting counterintelligence policy.

The military had more than institutional interests at heart. The CIA's counterintelligence efforts in its first decade had not been well regarded. The CIA's earliest operations in Eastern Europe were riddled with penetrations, and its tiny counterintelligence force had few successful exploitations of double agents to its credit. Even the agency's counterespionage experts considered their specialty but the stepchild of the organization. Notwithstanding this less-than-brilliant reputation in counterintelligence, the CIA was able to fend off military challenges to its supervisory control.

As president, Richard M. *Nixon responded to the weaknesses in U.S. counterintelligence with the so-called Huston plan, which envisioned White House coordination of these activities. Nixon believed that a more efficient federal program would produce evidence of Soviet assistance to the *peace and antiwar movements. The military counterintelligence units had maintained domestic operations on and off since World War I. In the 1960s, domestic counterintelligence operations by the U.S. army grew and coordination with other services became a problem. Opposition from J. Edgar Hoover at the FBI, however, thwarted the Nixon reforms and responsibility for counterespionage remained divided. The spate of spy cases in the 1980s, culminating in the "Year of the Spy" of 1985, brought the creation of a counterintelligence subcommittee in the "National Security Council.

COVERT OPERATIONS. In June 1948, National Security Council Directive 10/2 defined covert operations as actions conducted by the United States against foreign states "which are so planned and executed that any U.S. Government responsibility for them is not evident to unauthorized persons and that if uncovered the U.S. Government can plausibly disclaim any responsibility for them." It then authorized the *Central Intelligence Agency (CIA) to undertake such clandestine activities, including "propaganda, economic warfare; preventive direct action, including sabotage, anti-sabotage, demolition and evacuation measures; subversion against hostile states, including assistance to underground resistance movements, guerrillas and refugee liberation groups, and support of indigenous anti-communist elements in threatened countries of the free world."

Long before the CIA became involved in covert operations, however, the United States had used similar clandestine methods to achieve national objectives. President George *Washington, for example, who had a keen appreciation for the role of intelligence in both war and peace, persuaded Congress in July 1790 to establish the Contingent Fund of Foreign Intercourse. Known as the Secret Service fund, this money was spent by Washington (without a requirement for detailed accounting) in a covert operation to ransom Americans held hostage by the Barbary states.

During the nineteenth century, American presidents authorized covert operations on an infrequent, ad hoc basis. Although the United States remained isolated for the most part from international power politics, various administrations found cause to initiate covert operations in Canada, Cuba, Hawaii, and Central America. For the most part, the State Department maintained control over these clandestine activities. At no time did the government consider establishing a professional foreign intelligence service.

The increasing involvement of the United States in world affairs during the twentieth century led inexorably to the creation of a permanent intelligence service with the capability to undertake covert operations. Presidents Woodrow *Wilson and Franklin D. *Roosevelt both became deeply immersed in clandestine intelligence activities while fighting global wars. Indeed, the most immediate precedent for the CIA's covert operations can be found in World War I's Office of Strategic Services (OSS), an organization that combined intelligence gathering with paramilitary covert action. The OSS provided assistance to resistance and guerrilla groups from France to Burma. Although "plausible deniability" was not required for these wartime activities, the methods and techniques—and many of the personnel—that were used by Gen. William Donovan's clandestine fighters were passed on to the CIA.

After World War II, policymakers in Washington recognized the need for an option beyond diplomacy but short of war as they grew apprehensive about the emergence of an aggressive Soviet Union that seemed to threaten American interests around the world. The *National Security Act (1947), which created the CIA, gave the new organization not only the mission to collect and evaluate intelligence but also a vaguely worded duty "to perform such other functions and duties related to intelligence affecting the national security as the National Security Council may from time to time direct." At the end of 1947, the *National Security Council (NSC) first defined these "other functions and duties" when it made the CIA responsible for covert psychological operations. Directive 10/2 went much

further, creating the Office of Special Projects (later, Office of Policy Coordination), headed by Frank Wisner to conduct a wide variety of covert operations.

The first clandestine project undertaken by the CIA was an attempt through psychological warfare and political covert action to influence the elections of 1948 in Western Europe. Paramilitary covert operations began with the *Korean War. By 1952, the budget of the Office of Policy Coordination had grown from \$4.7 million (1949) to \$82 million. At the same time, personnel assigned to this covert action agency increased from 302 to 2,812 (plus 3,142 overseas contract personnel).

The presidency of Dwight D. *Eisenhower (1953-61) marked the "golden age" of covert operations. More than any other chief executive in the postwar era, Eisenhower made covert action a major part of his foreign policy. The CIA, led by Allen Welsh *Dulles, undertook a variety of clandestine activities at presidential direction, including the successful overthrow of unfriendly governments in Iran and Guatemala, and a failed attempt to topple the government of Indonesia. During the Eisenhower-Dulles era, clandestine collection and covert action accounted for 54 percent of the CIA's total annual budget.

Although the disastrous attempt to invade Cuba at the Bay of Pigs in 1961 painfully revealed the limits of the CIA's capability for cover paramilitary action and led to the dismissal of Dulles, presidents during the 1960s continued to utilize covert operations with undiminished enthusiasm, most notably in the Caribbean, Africa, and Southeast Asia. The CIA was especially active in Laos, where between 1961 and 1973 it directed local troops against major Communist forces in the largest covert paramilitary operation in the agency's history. As a result of these activities, the budget of the clandestine service remained at over 50 percent of the CIA's total budget in the sixties.

By this time, the original concept of "plausible deniability" had been broadened to include the presidency. Assassination plots against such foreign leaders as Cuba's Fidel Castro and the Congo's Patrice Lumumba by the Eisenhower and Kennedy administrations, for example, were structured in such a way that the president could deny responsibility for the activities.

Covert operations declined precipitously during the 1970s as a series of congressional investigations, especially the 1975-76 inquiry Senate's Select Committee on Intelligence (or Church Committee), led to greater skepticism about, and oversight of, intelligence activities. By 1977, the proportion of the CIA's budget allocated to covert action fell to less than 5 percent of the total budget, the lowest figure since 1948.

Congress, which had played little role in what was considered a prerogative of the executive branch, began to exercise tighter control of CIA clandestine activities with the Hughes-Ryan Act (1974). This amendment to the Foreign Assistance Act prohibited the CIA from spending money for operations in foreign countries (other than for the collection of intelligence) "unless and until the President finds that each such operation is important to the national security of the United States and reports, in a timely fashion, a description and scope of each operation to the appropriate committees of Congress." The Intelligence Oversight Act (1980) further expanded the role of Congress in monitoring covert operations. Indeed, by the 1980s, congressional committees not only exercised oversight over

intelligence operations but also became part of the decision-making process for covert action.

President Reagan and his CIA director, William Casey, placed renewed emphasis on covert operations as an instrument of national policy, especially in Nicaragua and Afghanistan. Their efforts, including the use of the staff of the NSC to conduct covert action, led to the Iran-Contra investigation, and increased congressional watchfulness over the executive branch's use of clandestine action. By the 1990s, covert operations, which could be conducted only under carefully controlled and fully reviewed conditions, had declined to a low ebb.

COWPENS, BATTLE OF (1781). Daniel *Morgan and his 1,100-man American army defeated Banastre Tarleton and 1,100 British and loyalist troops at the Cowpens in northwestern South Carolina on 17 January 1781 in the tactical masterpiece of the *Revolutionary War—a classic demonstration of a commander's ability to exploit the resources at hand. The Battle of *King's Mountain on 7 October 1780 demonstrated that British and loyalist forces in the backcountry could be overwhelmed by temporary concentrations of Rebel militia. But the aggressive Tarleton had little interest in caution; when he crossed the trail of the last regular American force in the South, he worried only that it might escape, and pressed forward without knowing his enemy's number or location. On the morning of 17 January, he fell headlong into Daniel Morgan's trap.

Morgan had picked unpromising ground, a rolling tree-dotted meadow used to winter cattle, which seemed to give Tarleton's cavalry the opportunity to outflank his force; the Broad River, five miles to the north, would impede any American withdrawal. But Morgan had planned to take advantage both of the impetuosity of Tarleton and the variable abilities of his own soldiers. Positioning his relatively untrained militia in the first two of three lines, he ordered them to shoot at British officers three times before withdrawing to the rear. This ensured that by the time the British reached his third line, made up of Maryland, Virginia, and Delaware Continentals, the enemy would be disorganized and leaderless. Lastly, behind a small ridge to his rear, Morgan stationed 100 horsemen under William Washington.

As Tarleton attacked, everything seemed to unfold as he expected. But when his troops encountered the third line, Washington's horsemen plowed into their right while the re-formed militia struck their left. Tarleton's force disintegrated in the midst of a double envelopment; Tarleton fled to avoid capture. Together, King's Mountain and Cowpens stripped the British army in the South of its most mobile troops, and thus severely diminished its ability to defeat the Americans.

CRAZY HORSE (1840?–1877), war leader of the Oglala Lakota Sioux. Crazy Horse achieved renown in intertribal warfare on the northern Great Plains and in conflict with the U.S. Army. Introverted, mystical, and eccentric in dress and deportment, he excelled at hit-and-run tactics. Between 1866 and 1876, he gained distinction in combat with U.S. soldiers. On 21 December 1866, he led the decoy party that enticed Capt. William J. Fetterman and eighty soldiers to their destruction near Fort Phil Kearny, Wyoming. He also participated in the Wagon Box Fight nearby on 2 August 1867. His greatest fame, however, arose from his role in the Battle of the *Little Bighorn, 25 June 1876, when he and other warriors wiped out an entire unit of Lt. Col. George Armstrong *Custer's 7th Cavalry Regiment. The Indian victory prompted decisive military reaction, and on 6 May 1877, Crazy Horse surrendered at Camp Robinson, Nebraska. On 7 September, resisting confinement in the post guardhouse, he received a fatal wound from a soldier's bayonet. His people buried him at an unknown spot on the plains. He is remembered as the greatest of all Sioux war leaders.

CROWE, WILLIAM (1925–), career naval officer and eleventh chairman of the Joint Chiefs of Staff. Crowe is a Naval Academy graduate (1947), a Stanford M.A. (1956), and a Princeton Ph.D. (1965). He pursued an unusual naval career path by combining political-military assignments with command. Crowe rose through the ranks to become Commander in Chief of Pacific Command (1983). He became the first chairman to serve under the *Goldwater-Nichols Act (1986), which made the chairman the nation's principal military adviser and mandated increased cooperation among the armed services. Crowe's career spanned major events of the *Cold War, and as chairman his principal contribution was to aid in decreasing American-Soviet rivalry at the end of the Cold War.

Following the Intermediate Nuclear Forces Treaty (1987), he developed on his own initiative military-to-military agreements and exchanges with his Soviet counterpart. In the Middle East, Crowe oversaw America's military responses to the hijacking of the cruise liner *Achille Lauro* by Palestinian terrorists (1985), hostilities with Libya (1986), the reflagging and escorting of Kuwaiti tankers in the Persian Gulf (1987), and the shootdown of an Iranian civilian airliner by the USS *Vincennes* (1988). After retirement, Crowe encouraged a cautious approach in dealing with Iraq's invasion of Kuwait (1990) and endorsed Bill *Clinton for president (1992). He was named ambassador to the United Kingdom in 1994 and retired from that position in 1997.

CRUISERS. Successor to the sailing frigate, the cruiser inherited the earlier ship's missions: scouting and screening

for the battle fleet, commerce raiding, or protecting trade. U.S. cruisers often provided flagship facilities for officers commanding destroyer flotillas or even entire fleets. In peacetime, cruisers frequently maintained a naval presence in troubled areas. To operate alone, cruisers carried substantial armament, were protected by armor of medium thickness, and possessed high speed, great range, and good seakeeping qualities. Thus, U.S. cruisers were sizable ships (from 3,000 to 35,000 tons), with crews of 300 to 1,700 men.

Because the traditional American strategy had been one of commerce raiding, when the United States began rebuilding its navy in the early 1880s, the first warships ordered were the steel cruisers *Atlanta*, *Boston*, and *Chicago*, beginning the tradition of naming them after cities. Over the next decade, the navy settled on a sustained program of cruiser construction, adding fifteen ships.

The successes of American cruisers (most famously George *Dewey's flagship *Olympia*) in the *Spanish-American War brought additional orders, culminating in ten very large cruisers (14,500 tons each). As the navy reoriented its strategy increasingly to the battleship during Theodore *Roosevelt's presidency, however, cruiser construction fell into abeyance.

World War I demonstrated anew the merits of the type, and in 1916, Congress authorized ten fast scout cruisers of the *Omaha* class, plus six huge battle cruisers of 35,000 tons armed with ten 14-inch guns. After U.S. entry into the war, cruisers performed important services by patrolling and escorting convoys (the *San Diego* was lost to a mine off Fire Island).

After the war, the U.S. *Navy confronted a reorientation to the Pacific and the limitations imposed by the *Washington Naval Arms Limitation Treaty, which limited cruiser size and armament. The six battle cruisers were scrapped on the ways or their hulls converted to aircraft carriers; the new scout cruisers were too short-legged (short-ranged) for Pacific work.

During the interwar years, the navy built long-range cruisers armed with nine or ten 8-inch guns, designated "heavy cruisers" for their gun caliber under the treaty provisions. Eighteen were commissioned prior to Pearl Harbor; they were reinforced by nine new "light cruisers" of the *Brooklyn* class, armed with fifteen 6-inch pieces. As aircraft increased in capability, the navy began construction of four ships designed for antiaircraft defense: the *Atlanta* class (of 6,718 tons), armed with a dual-purpose battery of sixteen 5-inch guns.

When *World War II broke out in Europe, Congress funded the most ambitious cruiser-building program in history. Authorized by 1943 were seven additional *Atlantas*. Two new designs were ordered in quantity: the Baltimore-class heavy cruisers (14,472 tons, nine 8-inch guns) of which fourteen entered service, and the Cleveland-class light cruisers (11,744 tons, twelve 6-inch guns) of which twenty-seven were built, making them the largest class of cruisers ever. The navy also ordered six ships classified as "large cruisers"—the *Alaska* class, of 29,779 tons and nine 12-inch guns. Intended as "cruiser killers," only the first two ships were completed.

Cruisers proved valuable in a number of wartime missions: antiaircraft escort, shore bombardment, and especially night surface action against enemy vessels. Off Guadalcanal, American cruisers fought numerous engage-

ments and even mortally damaged the Japanese battleship *Hiei*. During the war, the navy lost ten cruisers: two (*Juneau* and *Indianapolis*) to submarine torpedoes, one to air attack, and seven (*Houston*, *Astoria*, *Quincy*, *Vincennes*, *Atlanta*, *Northampton*, and *Helena*) to surface ship gunfire and torpedoes. Other cruisers (e.g., *Minneapolis*, *Salt Lake City*, *San Francisco*, and *Savannah*) proved their ruggedness by surviving damage from almost every type of weapon, including a German glide bomb. *Indianapolis* served as Fifth Fleet flagship for Vice Admiral Raymond A. Spruance in 1943. On several occasions in peacetime, that ship carried President Franklin D. Roosevelt.

To compensate for losses, the navy ordered slightly modified versions of the *Cleveland* and *Baltimore* types, although only two of the *Fargo* class and three of *Oregon City* class were finished postwar. More advanced cruisers were also begun: the *Worcester* class (two finished), with a 6-inch antiaircraft battery, and the *Des Moines*-class heavy cruisers (three commissioned) with rapid-firing 8-inch guns.

In the changed defense environment of the atomic age, the navy put most of its cruisers into mothballs, keeping only a few operational for flag duty or amphibious support. To counter aerial threat to the carriers, the navy began conversion during the 1950s of nine of the extant light and heavy cruisers to carry the new Talos or Terrier missile systems.

Two unique cruisers were also completed in this period. The *Northampton*, begun as a heavy cruiser, was converted into a command ship to provide accommodations and communications for the president and other national leaders in the event of nuclear war. Then, in 1961, the navy commissioned the futuristic *Long Beach*, armed only with guided missiles and propelled by nuclear power.

The "Vietnam War once again proved the usefulness of cruisers, for both shore bombardment and antiaircraft duties. In 1968, *Long Beach* was the first vessel in history to destroy an enemy aircraft with guided missiles. Nonetheless, nuclear warships were extremely expensive, and construction of more advanced ships, called "strike cruisers," was halted, mid-1970s, for budgetary reasons.

The dividing line between cruisers and lesser vessels now had so blurred that the navy reclassified as "cruisers" (1975) twenty-six larger surface warships earlier categorized as guided missile frigates or destroyers. Similarly, the twenty-seven ships of the new *Ticonderoga* class, ordered originally as guided missile destroyers, were labeled "cruisers" in 1980 to reflect their costs and capabilities. The breakdown in identity was further reflected in the naming of cruisers for states, battles, or individuals. The navy has contended that the old distinctions between cruisers and lesser ships are today irrelevant, given enhanced capabilities and similarities of mission between the types.

CUBA, U.S. MILITARY INVOLVEMENT IN. "So far from God, so close to the United States," one Cuban historian despaired. Proximity alone, however, did not determine the varied nature of U.S. military deployments to Cuba,

and the Cubans themselves bear part of the responsibility for *yanqui* military appearance. Fighting the Spaniards or themselves, they often asked for U.S. troops, then complained when they arrived.

Reflecting upon their defeat in the Ten Year War (1868-78), the Cuban political elite swore that the next rebellion against Spain would draw the United States into the war. Their failure to incite American military intervention had doomed their struggle for independence. Through media manipulation and careful political cultivation, Cuban rebels created popular support in the United States when they again "took to the field" in 1895. In the presidential campaign of 1896, all three major parties (Republican, Democratic, and Populist) called for Cuban independence, by force of arms if necessary. Stung by Spanish intransigence, atrocities, and the sinking of the USS

* *Maine* by an unexplained explosion in Havana Harbor, the Congress pressured President McKinley to lead the nation into the *Spanish-American War in April 1898. The goal was to free Cuba from Spain.

Rejecting one scheme to invest Havana, the U.S. Army and U.S. Navy agreed to blockade Cuba to turn back reinforcements, defeat any Spanish naval forces in the Caribbean, and join the Cuban rebel army in eastern Cuba and defeat the Spanish garrisons in detail. Two American expeditionary forces went to Oriente Province. A Marine battalion of 650 seized a fleet operating base at Guantanamo Bay. The army's Fifth Corps then landed to the west at Daiquiri and, 17,000 strong in regulars of the U.S. Army and wartime volunteers, marched toward Santiago to besiege the city and capture the Spanish naval squadron in refuge there. The advance guard fought Spanish outposts at Las Guasimas, and the whole force made a spirited if awkward twin assault on the Spanish fortifications at Kettle and San Juan Hills and El Caney. Despite 1,400 casualties, the Americans in the Battle of *Santiago forced the Spanish to surrender on 17 July, two weeks after an American squadron destroyed the Spanish squadron in its desperate flight. A general capitulation and peace negotiations soon followed.

Although the United States rejected annexation and agreed to limit its own economic penetration, it occupied Cuba until May 1902, and the ultimate agreement to withdraw contained a provision (the *Platt Amendment) that the United States reserved the right of future intervention in order to preserve republican government in Cuba and prevent European interference. Cuba also agreed to continue the social, economic, and educational reforms begun by the American military.

To keep internal peace, the United States formed the *Guardia Rural* (a national police), but no army. The first Cuban president, Tomás Estrada Palma, tried to rig his own reelection in 1906, and his opponents started a mild guerrilla war. President Theodore * Roosevelt refused to send troops to reinforce the ineffective Cuban constabulary, but agreed to assume temporary control of the government until a second election produced a new government. An expeditionary force of 5,000 soldiers and 1,000 Marines occupied Cuba without incident, remaining until 1909.

The Second Intervention of 1906-09, however, produced enough frustration for the United States that subsequent administrations chose to back the incumbent Cuban regime rather than adjudicate revolts. U.S. troops generally replaced Cubans around economic targets, not just to

protect foreign property but to prevent the rebels from using destruction to spark wider war and deeper intervention. A Marine brigade of 800 helped the Cuban Army suppress electoral revolts in 1912 and 1917. Marine detachments aboard navy warships provided small landing parties for short-term security duties. In most instances, the rebels avoided Marine outposts while the Marine companies did not seek out the enemy. The last security force departed in 1922.

The next threatened use of U.S. military occupation in 1933-34 had a major influence on Cuban politics, for President Franklin D. *Roosevelt wanted the oppressive regime of Gerardo Machado overthrown (which happened) and a legitimate, moderate, democratic regime to replace him (which it did not). Dismayed by the radical reformism of President Ramón Grau San Martín, the State Department negotiated an end to the Platt Amendment and signaled its willingness to accept a substitute regime. The result was a wave of military coups that produced a military-dominated authoritarian government headed by a former sergeant, Fulgencio Batista. Fearing Axis and Communist influence in the Caribbean and Mexico, the United States did not challenge either Batista's indirect rule (1934-59) or actual term as president (1940-44), nor his coup of 1952.

The Communist-led revolution of 1957-59 made Cuba a serious political and strategic problem for the United States for the first time in history. Alarmed by a U.S.-sponsored invasion by 1,300 Cuban exiles on 17-19 April 1961, President Fidel Castro turned to the Soviet Union for massive military assistance. Even though he overwhelmed Brigade 2506 at the Bahía de los Cochinos (Bay of Pigs) with 20,000 militiamen in one day's battle, Castro saw the continuing danger of invasion and insurrection. He allowed the Russians to use Cuba as a naval base, intelligence platform, and nuclear missile base. Castro welcomed a Russian Army combined arms task force of 40,000 to Cuba in 1962. Acutely aware that a navy-Marine task force had been minutes away from supporting the Cuban exile brigade, Castro even allowed the Russians to build launch sites for eighty-some offensive nuclear missiles, surrounded by antiaircraft missiles. In the *Cuban Missile Crisis of October 1962, President John F. *Kennedy and Soviet Premier Nikita Khrushchev both retreated, but not before the Navy blockaded the island and 400,000 American servicemen deployed for an invasion of Cuba. This expeditionary force would have faced a Cuban army of over 100,000 and the 40,000 Russians armed with tactical nuclear weapons.

Since 1962, the United States has not put significant military pressure on Cuba, even after the collapse of Russian support after 1989; but it deployed special operations forces and paramilitary covert action teams to counter Cuban revolutionary campaigns in Angola, Haiti, Bolivia, Nicaragua, and El Salvador. Paramilitary Cuban exile groups still conduct occasional raids and sabotage against the island itself. No Cuba-watcher would predict that U.S. military intervention has become only a historical phenomenon.

CUBAN MISSILE CRISIS (1962-63). On 15 October, 1962, U.S. intelligence discovered Soviet strategic nuclear missile bases under construction in Cuba, leading to the most dramatic and dangerous crisis of the nuclear age. After a week of secret deliberation with a group of advisers (the Executive Committee of the *National Security Council, or ExComm), President John F. *Kennedy demanded that the missiles be withdrawn and imposed a naval "quarantine" on shipments of "offensive" weapons to Cuba. Kennedy ordered a massive redeployment of U.S. forces to the Caribbean and placed the Strategic Air Command (SAC) on heightened alert.

Soviet premier Nikita Khrushchev was furious at what he considered Kennedy's flagrant interference in Soviet-Cuban affairs and his violation of freedom of navigation. But by the time the quarantine took effect on the morning of 24 October—after a unanimous endorsement by the Organization of American States—Khrushchev ordered Soviet ships not to challenge the blockade. For several days a settlement proved elusive and pressure built for more decisive action.

Neither Kennedy nor Khrushchev wanted to risk nuclear war over the issue, and both became increasingly concerned that an accident or inadvertent military action might trigger escalation. An apparent break in the tension came on 26 October, when, in a rambling, emotional letter, Khrushchev offered to withdraw the missiles in return for a U.S. pledge not to invade Cuba. But in a second, tougher letter received the following morning, Khrushchev demanded that Kennedy withdraw analogous Jupiter missiles from Turkey (deployed under the aegis of *NATO). Most of Kennedy's advisers argued strongly against this, on the ground that it would be interpreted by the Soviets as evidence of American weakness, and by NATO as betrayal of an ally. Kennedy decided to ignore Khrushchev's latest demand and accept his earlier offer.

As the ExComm deliberated on 27 October, word reached the White House that an American U-2 reconnaissance plane had been shot down over Cuba, and that another had inadvertently strayed over Siberian air space, narrowly avoiding a similar fate. Kennedy resolved to bring the crisis to an end. Ignoring the ExComm's advice, he secretly agreed that the United States would withdraw its missiles from Turkey "within a few months" as a private quid pro quo to a UN-verified withdrawal of Soviet missiles from Cuba. Kennedy would also pledge publicly not to invade Cuba. Khrushchev accepted, and on 28 October the acute phase of the crisis came to an end.

Castro, feeling betrayed by his Soviet patron, refused to allow *United Nations inspectors on Cuban soil to verify the withdrawal. But satisfied by aerial photography that the Soviets had withdrawn the weapons the United States considered offensive, Kennedy issued a proclamation terminating the quarantine on 21 November.

The causes of the crisis have long been debated. Khrushchev conceived the deployment in the late spring of 1962, after a hasty and uncritical decision-making process involving only a small group of advisers. His goals appear to have been to deter a feared American invasion of Cuba; to redress the United States's massive superiority in strate-

gic "nuclear weapons, publicly revealed by the United States in October 1961, exploding the myth of a "missile gap" favoring the Soviet Union; and less importantly, to reciprocate the Jupiter deployment in Turkey.

The crisis provides textbook illustrations of important misperceptions and miscalculations. The U.S. government had calculated that the Soviet Union would not deploy nuclear weapons to Cuba because such a move would be inconsistent with past Soviet behavior, and because it seemed obvious that it would trigger a major confrontation. The Kennedy administration also failed to appreciate the extent to which the public demolition of the missile gap myth heightened the Soviets' sense of vulnerability; the strength of Soviet and Cuban fears of a U.S. invasion of Cuba (heightened by the abortive Bay of Pigs invasion of the previous year); and the strength and sincerity of the Soviet view that if the United States had the right to deploy missiles in Turkey, the Soviet Union had the right to deploy missiles in Cuba. Consequently, Kennedy failed to deter the move in a timely fashion, issuing stern warnings against it only in September 1962, when the secret deployment was well underway.

Similarly, Khrushchev grossly overestimated the willingness of Kennedy and the American people to tolerate a major disruption in the hemispheric status quo; underestimated the likelihood that American intelligence would discover the missiles prematurely; and failed to appreciate that the secrecy and deception surrounding the deployment would inflame American passions. Consequently, Khrushchev underestimated the risks of the deployment.

Although scholars differ in their assessment, some consider the Cuban Missile Crisis a classic case of prudent crisis management. Kennedy and Khrushchev prevented the conflict from escalating while they sought and found a mutually satisfactory solution. They did so by avoiding irreversible steps, curtailing unwarranted bluster, and avoiding backing each other into a corner. Other scholars have criticized the handling of the crisis as being too timid or too reckless. Kennedy's critics on the right lament his unwillingness to seize the opportunity to destroy Castro; his critics on the other side of the spectrum condemn his willingness to risk nuclear war merely to delay the inevitable—the vulnerability of the American homeland to Soviet nuclear weapons. Hard-liners in the Soviet military severely criticized Khrushchev for yielding to U.S. pressure. New information on intelligence failures, * command and control breakdowns, and near accidents suggest that both leaders' fears of uncertainty, misperception, misjudgment, accident, and unauthorized military action provided a critical degree of caution and circumspection that prevented the crisis from escalating even further.

Paradoxically, the Cuban Missile Crisis led to an immediate improvement in U.S.-Soviet relations. A series of agreements intended to restrain the *arms race and improve crisis stability followed, most notably the Hot-Line Agreement and *Limited Test Ban Treaty of 1963. Over the following decades, the superpowers crafted a *modus vivendi* designed to prevent a similar occurrence whereby the Soviet Union refrained from deploying military equipment with offensive capabilities to Cuba, and the United States acquiesced in a Communist-controlled Cuba with close ties to the USSR.

CULTURE, WAR, AND THE MILITARY. Critiquing Clausewitz's aphorism that war is the continuation of politics by other means, John Keegan argues to the contrary in *A History of Warfare* (1993) that "war embraces much more than politics ... it is always an expression of culture, often a determinant of cultural forms, in some societies the culture itself." This applies to the American experience no less than it does to Keegan's examples in the Cossack steppes or the Himalayan foothills.

Exactly how has American culture shaped and defined American military institutions and the ways that Americans have waged war? Was there significant "feedback"—moments when the nature of those institutions or that warfare affected or altered the culture in significant ways? Defining the "culture" of a place as vast and differentiated as the United States at any period, let alone for over three centuries, is a daunting task; but some generalizations are clearly more warranted than others.

By the mid-nineteenth century, both Americans themselves and a number of insightful European visitors appeared to agree that American culture could be described by the use of such terms as *individualism*, *egalitarianism*, "*get-aheadism*," a respect for "rights" and "liberties," a diverse *religiosity* much *local boosterism*, and a tendency to join private associations of one sort or another. With the exception of the last two, these characteristics were not consistent with military service. Hence it is not surprising that President Andrew *Jackson's secretary of war, John Eaton, complained in his annual report for 1830 of his department's inability to recruit even the modest number of soldiers the Congress had authorized. "A country possessing 12 millions of people ought surely to be able at all times" to find and enlist 6,000 acceptable recruits "obtained upon principles of fair contract," he wrote. "If this can not be effected then will it be better to rely on some other mode of defense, rather than resort to the expedient of obtaining a discontented and besotted soldiery."

Secretary Eaton did not have compulsory military service in mind. American culture has been averse to the drafting of young men (let alone young women) for most of our past. "Draughts stretch the strings of government too violently to be adopted," Edmund Randolph told his colleagues at the Constitutional Convention in Philadelphia, May 1787, a view echoed by Horace Greeley, editor of the *New York Tribune*, in 1863 when he wrote to War Secretary Edwin Stanton: "Drafting is an anomaly in a free State; it oppresses the masses." Like imprisonment for debt, it had no place in "our system of political economy." A

limited draft was imposed by Congress in that year, to be sure, but it was designed to force individuals and communities to protect themselves against compulsory service with self-insurance schemes to purchase substitutes or pay commutation fees, like those that had come into being in the British Isles in 1757 and the 1790s when draft laws were passed by Parliament.

Opposition to the draft was pronounced in areas where "the party of personal liberty" (the Democratic Party) was strong. "If citizens do not choose to preserve the government, what right has the government to compel them to do so against their will?" asked D. A. Mahony, an Indiana Democrat and journalist. In Pennsylvania, the three Democrats who constituted the majority of the Supreme Court of that state simply declared the federal draft law unconstitutional, though after the by-election in November 1863, one Democratic member was replaced by a Republican, and the new Republican majority reconsidered the case and declared the act to be within constitutional bounds.

John Chambers's *To Raise an Army: The Draft Comes to Modern America* (1987) provides an account of the draft and resistance of Americans to drafts throughout the years before 1917 and the difficulties that advocates of Selective Service faced in 1917, 1940, and in the * Vietnam War. By 1973, this relatively brief venture in compulsion had ended.

Secretary Eaton's problem was somewhat different: He was not in charge of a draft; he was simply in charge of a *regular* army, and that was bad enough. American culture in the nineteenth and most of the twentieth centuries celebrated wartime volunteers, not regulars. Most self-respecting young men would not stoop to the low pay, regimented life, isolation, and boredom of the regulars unless they found themselves in the direst of straits. Moreover, the regulars were the "standing army" that the majority culture had feared and reviled since at least the mid-eighteenth century—a force that flourished at society's expense in a land where yeomen, tradesmen, and artisan volunteers were expected to defend their own freedoms with their own lives and honor.

But to say that compulsory service was anathema and that the regular army was not a popular occupational choice or a revered institution for much of our history is not to say that American culture rejected military service. There has always been a small pacifist subculture in America, and many other, nonpacifist youth have been indifferent to the call of fife and drum. But a substantial fraction of young American men have responded to the allure of what the editor of *Youth's Companion* called "the war-spirit." A. A. Livermore referred in 1850 to "the wooden sword, and the tin drum of boyhood," to "the training and the annual muster" of the militia and the volunteer companies, to "the red uniform and the white plume, and the prancing steed," to "the ballads of Robin Hood, and the stories of Napoleon, and the 'Tales of the Crusaders,'" to "the example of the father and the consent of the mother," to "the blood of youth, and the pride of manhood, and stories of revolutionary sires," the "love of excitement" and "the bubble of glory." "By one and all," he wrote, "the heart of the community is educated for war, from the cradle to the coffin."

What made these youth inaccessible to Secretary Eaton or many other secretaries of war was that they preferred to do their soldiering in local, volunteer companies. Whether

we look to the "covenanted" militia units of seventeenth-century New England, the volunteers of the *French and Indian War or the War, for Independence, the antebellum drill companies in both North and South, the volunteers of the * Civil War and *Spanish-American War, or the National Guard and reserve units that dotted the twentieth-century urban and suburban landscape, the process was essentially the same: Surprisingly large percentages of young men have been prepared to don uniforms and shoulder arms, often for little or no pay, under commanders and in settings of their choosing throughout the course of American history. Before the advent of public high schools and colleges, before football cheers and fraternities, there were volunteer military companies with fancy drill teams and cadence chants that served a similar social purpose for those in their late teens and early twenties, as Marcus Cunliffe's *Soldiers and Civilians* (1969) has shown.

When units like these joined the colors upon the outbreak of war, their contractarian and egalitarian nature puzzled and annoyed many regular army officers, whether the town militias during *King Philip's War in 1675-76, the volunteer companies of the *French and Indian War and War for Independence, or the volunteer units from midwestern towns during the *Spanish-American War. The story of the captain of one such group during the American Revolution who appeared before a quartermaster seeking pay and provisions may be apocryphal, but it rings true: "How many men do you command?" the quartermaster asked. "I command no one," the captain replied. "I am commanded by eighty."

When the regular army secured its own local volunteers (the Army Reserves) in the twentieth century and gained greater supervisory and regulatory control from the Congress over the nonregular local volunteers (the National Guard units), sparks sometimes flew. Later, in 1961, Secretary of Defense Robert S. *McNamara mobilized some 148,000 reservists during a Cold War crisis concerning Berlin. After several weeks of garrison service, many of these reservists became restless, organized mass rallies calling for their own demobilization, and generally behaved in ways the regulars regarded as mutinous. Reservists had formed important parts of American mobilizations for the *Korean War in 1950, but after these incidents in 1961, there would be fewer reservists in the next major mobilization, for Vietnam.

The modern, regular-led military responded relatively effectively to several mandates designed to address problems of racism, sexism, and drug use imported by recruits, draftees, and officers alike. The racial integration of the services beginning in the early 1950s successfully confounded critics of that measure who incorrectly predicted that white soldiers would never accept black soldiers as equals; later, in the 1960s, the McNamara Pentagon effectively saw to the integration of housing in southern communities where military bases were located as the price of obtaining military customers for rental units and realty. Simultaneously, the services, responding to changes taking place in the greater business culture, shifted their leadership style from coercion to "persuasion"—a process that accelerated after the Selective Service System was made moribund in 1973 and the * All-Volunteer Force became the order of the day. It was one thing to require young men to shave their heads and "do as I say" in the days of the

draft; it was quite another to expect that of badly needed electronics technicians in an all-volunteer army, navy, or air force.

In *The American Way of War* (1973), Russell Weigley argues that since the Civil War, American strategic planners have consistently promoted an “*American way of war,” one that relied on firepower and massive use of force. This emphasis on the “annihilation” of enemy strength is to be distinguished from the hit-and-run “attrition” strategy practiced by American forces during the American Revolution, when the nation’s new leaders lacked the financial and bureaucratic resources to fight in any other fashion, and when its military leaders were comfortable with a Cincinnatus-like “maneuver” strategy. The leaders who rose to the fore while America industrialized in the nineteenth and twentieth centuries were committed to the use of men and machines in massive direct attack to achieve “victory,” and they grew increasingly impatient with wars of maneuver and negotiation designed to achieve acceptable political outcomes short of the complete destruction of the enemy’s will. The strategic bombing raids during World War II on cities in Germany and Japan produced what W. Darrell Gerlach calls a “mutation in American values” as attacks upon population centers became less and less remarkable.

But no sooner had the day of “total” war arrived than it began to lose its appeal for American policymakers. Once intercontinental bombers became operational in the late 1940s, to be followed in short order by intercontinental ballistic missiles, and once the Soviet Union acquired nuclear weapons and the capacity to deliver them on American targets, a century and a half of “free security” (provided by the combined British and American fleets and some 3,000 miles of Atlantic Ocean) came to an end, and America entered a forty-year era of Cold War apprehension. Some would insist on the “rollback” of Soviet power in proper “annihilation” fashion; others on its “containment” in more limited fashion.

Thus when Gen. Douglas *MacArthur was dismissed in 1951 by President Harry S. *Truman, and MacArthur’s strategy of “no substitute for victory” gave way to the “attrition” and limited warfare policies of his successor, Gen. Matthew B. *Ridgway, it took some time for Congress and the general public to accept the verdict. The problem would resurface in Vietnam, the *Persian Gulf War, and the humanitarian and peacekeeping missions in Somalia and Bosnia. Has the greater American culture adopted itself to the new peace-keeping strategy as thoroughly as the leadership of the U.S. military has?

In the centuries before the advent of “total” war, it was possible for those who served as well as those who remained on what came to be known as “the home front” to find uplifting social and moral lessons in tales from the battlefield of self-sacrifice and valor. The dying were sometimes reported to have composed themselves in dignity, drawing their hands across their chests; official reports of action were expected to note at least one example of selfless or courageous behavior. Those too old to serve celebrated these feats and victories in poems (such as Herman Melville’s “On the Photograph of a Corps Commander,” 1866) paintings and prints (such as those produced by Currier & Ives during the Civil War), and sculpture (still found today in squares or beside courthouses throughout

the land). During the Civil War, as George Fredrickson tells us in *The Inner Civil War* (1965), a number of New England Brahmins who had been of a Transcendentalist persuasion abandoned that antistatist perspective for the more nationalist patriotism of the Union League clubs once the war began. War and culture were interrelated and sometimes war helped to shape culture.

As the battlefields grew larger and the battles longer in duration and more lethal, in the 1860s, 1918, the 1940s, and thereafter, those Americans who faced death found the experience more daunting than their predecessors, and discovered that their perception of combat as a “testing of mettle,” a rite of passage to full manhood, was hard to maintain, given the impersonal, random nature of the carnage they witnessed all about them. In *Embattled Courage: The Experience of Combat in the American Civil War* (1987), Gerald Linderman had described this loss of innocence, as have Stanley Cooperman in *World War I and the American Novel* (1967), Paul Fussell in *Wartime: Understanding and Behavior in the Second World War* (1989), and Lloyd Lewis in *The Tainted War: Culture and Identity in Vietnam War Narratives* (1985). Men who entered Vietnam, for example, often did so with a Hollywood-induced notion of what the war was about, how American forces would fare, and what they could accomplish (what Lewis, quoting veterans, calls a “John Wayne Wet Dream Syndrome”). But they soon acquired what many observers were to style “the thousand yard stare”—a symptom of combat stress that army psychiatrists encountered in each of the wars Americans engaged in throughout the twentieth century. And many of these young men would later experience Post-Traumatic Stress Disorder.

The horror of war and incompetent leadership would be the theme of many novels produced by veterans of World Wars I and II and Vietnam. The cynicism and anger bubbling up in John Dos Passos’s *Three Soldiers* (1919), e. e. cummings’s *The Enormous Room* (1922), Thomas Boyd’s *Through the Wheat* (1923), William Faulkner’s *Soldier’s Pay* (1926), Ernest Hemingway’s *A Farewell to Arms* (1929), Humphrey Cobb’s *Paths of Glory* (1935), Dalton Trumbo’s *Johnny Got His Gun* (1939), Norman Mailer’s *The Naked and the Dead* (1948), James Jones’s *From Here to Eternity* (1951), Joseph Heller’s *Catch-22* (1962), Tim O’Brien’s *Going After Cacciato* (1975), and James Webb’s *Fields of Fire* (1978) stand in stark contrast to the more “heroic” war novels written by older nonveterans like Arthur Train (*Earthquake*, 1918), Edith Wharton (*The Marne*, 1918), and Willa Cather (*One of Ours*, 1922). Early Hollywood filmmakers and song writers like George M. Cohan or Irving Berlin celebrated American military efforts and the men who “won’t come back till it’s over over there.” They now shared the stage with trench-bred tunes like “Home, Boys, Home,” “I Don’t Want to Join the Army,” antiwar numbers like Country Joe & the Fish’s “Fixin to Die Rag,” and films like Michael Cimino’s *The Deer Hunter* (1978), Francis Coppola’s *Apocalypse Now* (1979), and Oliver Stone’s *Platoon* (1986). This new, more critical perspective on warfare and the American military did not sweep the field or emerge as the dominant paradigm, as it did in some European countries; there was still a place in the hearts and minds of many Americans, for example, for John Wayne’s role *The Green Berets* and Barry Sadler’s song “The Ballad of the Green Berets” as the Vietnam War

ground to its bitter end. But the cultural terrain was now a contested one, just as the concept of what constituted "the American way of war" had become contested.

In this new cultural battlefield, a further skirmish was underway by the 1950s: a skirmish over the new masterpieces of the "annihilation" strategy, nuclear weapons. These quickly acquired their champion on the Hollywood scene in Jimmy Stewart's portrayal of an SAC pilot in *Strategic Air Command*. The alternative view was limned by Peter Sellers's three characters in Stanley Kubrick's *Dr. Strangelove*, and the contest was joined—a contest fortunately confined to celluloid.

CURTISS-WRIGHT v. UNITED STATES (1936). Using authority granted by a congressional joint resolution in May 1934, President Roosevelt embargoed all U.S. arms shipments to Paraguay and Bolivia in an effort to end their military conflict. In January 1935, the Justice Department indicted the Curtiss-Wright Corporation for selling machine guns in violation of the embargo. The company countered that the resolution was an unconstitutional delegation of power giving the executive uncontrolled discretion to make policy.

In 1936, the Supreme Court upheld the resolution and the president's action. Justice George Sutherland's opinion held that in foreign affairs, unlike domestic affairs, Congress had authority to delegate broad power to the executive. Moreover, Sutherland claimed, the president exercised inherent, extraconstitutional powers derived from international law and practice—to promote national interest and survival. This sweeping assertion of presidential supremacy in international affairs came, paradoxically, at a time when the Court sought to limit executive power in the domestic arena. Sutherland's opinion is often cited to support the president's authority, as commander in chief,

to commit U.S. armed forces to combat without Congressional authorization. However, in *Reid v. Covert* (1956), Justice Hugo Black's majority opinion suggested that all power, domestic and foreign, must flow from the Constitution. Black's opinion vitiated the argument for inherent executive authority in foreign affairs.

CUSTER, GEORGE ARMSTRONG (1839-1876), U.S. military leader in the Civil War and Indian wars. An 1861 West Point graduate, Custer rose to fame and high rank during the Civil War as a flamboyant and successful cavalry chief. He ended the war a major general at the age of twenty-five. In the postwar regular army he was a lieutenant colonel in command of the 7th Cavalry. His introduction to the Plains Indians Wars came in Kansas in 1867. The campaign ended in failure and court-martial on charges of misconduct. Sentenced to a year's suspension, Custer was recalled in the fall of 1868 by Maj. Gen. Philip H. *Sheridan to lead his regiment in a winter campaign against the southern Plains tribes. At the Battle of the Washita, 27 November 1868, Custer surprised and destroyed Black Kettle's Cheyenne village and laid the groundwork for his reputation as an Indian fighter.

Assigned to Fort Abraham Lincoln in Dakota Territory, Custer led the 7th in the Yellowstone Expedition of 1873, protecting surveyors of the Northern Pacific Railroad; he fought two actions with Sitting Bull's Sioux. In 1874, Custer's Black Hills Expedition discovered gold. The rush to the hills, part of the Great Sioux Reservation, inflamed the Sioux and led to the Sioux War of 1876. The 7th Cavalry formed part of Brig. Gen. Alfred H. Terry's column, one of three converging on the Indians. On 25 June, Custer attacked a large camp of Sioux and Cheyennes at the Battle of the *Little Bighorn. He and the five companies under his immediate command, about 225 men, were wiped out. The other seven companies, under Maj. Marcus A. Reno, held out on a hilltop four miles away until relieved two days later. Custer's actions at the Little Bighorn were and remain bitterly controversial, but he and his "last stand" gained lasting renown.

CUSTER'S LAST STAND. See Little Bighorn, Battle of the (1876).

D

DAHLGREN, JOHN (1809-1870), naval ordnance innovator and commander of the South Atlantic Blockading Squadron during the Civil War. Dahlgren joined the navy in 1826. Service on the U.S. Coast Survey (1834-37) distinguished his early career. In 1847, Lieutenant Dahlgren was assigned to ordnance duty at the Washington Navy Yard. Over the next fifteen years, he invented and developed bronze boat guns, heavy smoothbore shell guns, and rifled ordnance. He also created the first sustained weapons R8(D) program and organization in U.S. naval history. For these achievements, Dahlgren became known as the "father of American naval ordnance." His heavy smoothbores, characterized by their unusual bottle shape, derived from scientific research in ballistics and metallurgy, manufactured and tested under the most comprehensive program of quality control in the navy to that time, and were the navy's standard shipboard armament during the *Civil War. Promoted to commander in 1855, captain in 1862, and rear admiral in 1863, he became commandant of the Washington Navy Yard in 1861 and chief of the Bureau of Ordnance in 1862. With help from his friend President Abraham *Lincoln, Dahlgren took command of the South Atlantic Blockading Squadron in July 1863, and for the next two years led naval forces besieging Charleston, in the Union navy's most frustrating campaign. After the war, he commanded the South Pacific Squadron, then returned to the command of the Bureau of Ordnance and the Washington Navy Yard.

DAVIS, BENJAMIN O., JR. (1912-), first black lieutenant general. Born in Washington, D.C., the son of a black army officer, Benjamin O. *Davis, Sr., young Benjamin Davis attended school in Tuskegee, Alabama, and Cleveland, Ohio, and the University of Chicago, before entering the all-white U.S. Military Academy at West Point, where the last African American had graduated in the 1880s. Davis graduated in 1936 (35th in a class of 276). His request for assignment to the Army Air Corps was refused because there were no black aviation units; instead, he was assigned to an all-black infantry regiment and then to Tuskegee Institute as an instructor. In 1941, the War Department finally allowed blacks into the Air Corps, although in segregated units. Davis established a flight program at Tuskegee, and as a lieutenant colonel took command of the 99th Pursuit

Squadron (the "Black Eagles"), the first black air unit.

In 1943, during World War II, he led the unit to North Africa. Subsequently, he commanded the 332nd Fighter Group, a larger all-black flying unit, and as a colonel, flew sixty combat missions in the Italian theater. In 1948, following President Harry S. *Truman's desegregation order, Davis designed the implementation program for the U.S. *Air Force. In 1954, he was promoted to brigadier general, in 1959 to major general, and in 1965, he became America's first black lieutenant general, serving with the air force in Germany and the Philippines during the "Vietnam War before his retirement in 1970. Afterward, he served in the early 1970s in the U.S. Department of Transportation on issues involving air hijacking and aviation safety.

DAVIS, BENJAMIN O., SR. (1880-1970), first black general. Born the son of a U.S. government worker in Washington, D.C., Davis attended Howard University, then in the *Spanish-American War helped recruit a company for the 8th U.S. Volunteer Infantry as a lieutenant. In 1899, after *demobilization, he enlisted as a private in one of the army's traditional black cavalry units. Two years later, he passed a competitive examination and was commissioned a lieutenant in a black regiment. For the next three decades, Davis served in a number of positions—most of them designed to keep him from commanding white officers or white troops in the segregated army. These assignments included military attaché to Liberia, military science instructor at Wilberforce University and at Tuskegee Institute, and instructor with the Ohio and New York National Guard.

In 1930, Davis became the first black colonel. One week before the 1940 presidential election, President Franklin D.

*Roosevelt appointed Davis a brigadier general, the army's first black general. In World War II, Davis headed a special section of the Inspector General's Department dealing with racial issues involving U.S. troops. During the Battle of the * Bulge in December 1944, he convinced Gen. Dwight D. "Eisenhower to accept the integration of black platoons into white units, a temporary breakthrough in the army's traditional segregation by regiment.

Davis retired in 1948 after fifty years of service. His son, Benjamin O. *Davis, Jr., became America's first black lieutenant general. In 1998, the 85-year-old retired general was awarded a fourth star by President Bill *Clinton.

DAVIS, JEFFERSON (1808-1889), soldier, senator, U.S. secretary of war, and the only president of the Confederate States of America. Jefferson Davis was born in Kentucky on 3 June 1808, and the family moved to Mississippi when he was an infant. In 1828, he graduated from West Point with a modest record and an infantry commission. He served in a variety of posts in Missouri, Oklahoma, and the Old Northwest, resigning in 1835 as a first lieutenant of dragoons.

Receiving a Mississippi cotton plantation from an older brother, Davis married the daughter of Gen. Zachary *Taylor, but she died three months later. In 1845, he married Varina Howell and began a political career with election to the House of Representatives.

During the *Mexican War, Davis commanded a Mississippi regiment with distinction at the Battle of Monterrey (1846) and the Battle of *Buena Vista (1847), where he was wounded. Returning a hero, he was appointed U.S. senator in 1847, resigning to run unsuccessfully for governor in 1851. Under fellow Democrat Franklin Pierce, he served effectively as secretary of war, 1853-57, adopting improved rifled muskets; increasing pay; and obtaining four new regiments from Congress, which doubled the size of the regular army to protect western expansion.

A staunch states' rights Democrat as well as the owner of many slaves, Davis justified black slavery and championed Southern economic and territorial expansion to counter growing Northern influence. Returning to the Senate in 1857, Davis became a leader of the Southern bloc as well as head of the Military Affairs Committee. In the crisis following Lincoln's election, Davis was not a secession leader, but he resigned the Senate when Mississippi seceded in January 1861, and was immediately given command of his state's militia as a major general.

Chosen as president by the Confederate provisional government established at Montgomery, Alabama, Davis was inaugurated in February 1861. Subsequently, he was elected to a six-year term as president of the Confederate States of America and inaugurated at Richmond, Virginia, in February 1862.

As president of the Confederacy and commander in chief of its armed forces, Davis led the South's military effort in the *Civil War and also tried to deal with wartime economic and political matters. Despite his dedication to the task, Davis did not prove as politically able or publicly inspiring a war leader as U.S. President Abraham *Lincoln. Both presidents realized increased centralization was necessary for the war effort, but the South was much more resistant to such reduction of states' rights. As the war dragged on with diminishing hope and increasing deprivation, domestic political opposition mounted against Davis, who seemed politically and temperamentally hard put to deal with the rising dissent in the Confederate Congress and the Southern statehouses.

As a commander in chief who was also a West Pointer, war hero, and former secretary of war, Davis had considerable confidence in his own military judgment. He was closely involved with the army, particularly its organization and strategy, and became engaged in arguments with many of his generals. In his assignments, Davis made some

excellent choices, such as Robert E. *Lee, and some poor ones, such as Braxton *Bragg. For a long time, Davis failed to have a general in chief at Richmond to administer the army, and the burdens of personally performing that task contributed to his debilitation.

Strategically, Davis believed that the Southern forces must protect all of the Confederacy, east and west, and preserve territory rather than overthrow enemy armies. He sought to -divide the South's outnumbered military resources to block logical avenues of approach, and to concentrate two or more large commands—particularly via railroads—to confront any major Union advance. It was a strategy that was ultimately overwhelmed by simultaneous advances from numerous numerically superior Union armies. Despite the claims of his contemporary critics, most experts consider Davis to have been a sound strategist and a competent commander in chief under extremely adverse circumstances.

With the Confederacy collapsing, Generals Lee and Joseph E. *Johnston surrendered their armies in April 1865 against the wishes of Davis, who wanted to continue the war. Fleeing south, the Confederate president was captured at Irwinville, Georgia, in May, and imprisoned in Fortress Monroe on charges of treason. He was released on bail in May 1867 after his physical and emotional health had deteriorated. Davis refused to take the oath of allegiance, and in 1881 published a history of the Confederacy. He died in 1889.

D-DAY LANDING (1944). Operation Overlord was the greatest amphibious attack in history. Nearly 175,000 American, Canadian, and British troops landed in Normandy on D-Day, 6 June 1944, supported by 6,000 aircraft and 6,000 naval vessels ranging in size from battleships to 32-foot landing craft. The object of the attack was to win a beachhead in France in order to open a second front against Hitler's armies and to use the beachhead as a springboard for the liberation of France and Belgium, and the eventual conquest of Nazi Germany.

Planning began in earnest early in 1943. The critical need for the Allies was to gain surprise, because they would be taking the offensive with nine divisions, none armored, against an enemy with fifty-five divisions in France, nine of them armored. Gen. Gerd von Rundstedt, commanding the German forces in the west, and Gen. Erwin *Rommel, commanding the forces in France, assumed that the Allies would have to gain a major port in the initial assault, so they strengthened the "Atlantic Wall" around the French ports, especially Calais, which was on the direct line London-Dover-Calais-Belgium-Cologne-Berlin. The Allied supreme commander, Gen. Dwight D. *Eisenhower, achieved surprise by attacking straight south rather than east, and by going ashore in Normandy, where there were no significant ports. An elaborate and highly successful deception plan (Operation Fortitude) kept the German attention centered on Calais.

D-Day was set for 5 June, but a storm that day pre-

cluded amphibious operations. At the height of the storm, at 0430 on 5 June, Eisenhower's weather expert predicted that it would soon ease off and that conditions would be acceptable. Eisenhower decided to go for it.

The attack consisted of division-strength assaults on five beaches, two British (code-named "Gold" and "Sword"), two American ("Omaha" and "Utah"), one Canadian ("Juno"), preceded by a night assault of three airborne divisions to protect the flanks (one British on the left and two American on the right).

The night operation on 5/6 June caused great confusion among both attackers and defenders. The American paratroopers were scattered over the countryside and very few managed to hook up with their units before daylight. But the Germans were confused by reports of paratroopers and gliders landing here, there, everywhere. Meanwhile, small groups of airborne troops destroyed bridges and gun emplacements, and captured crossroads and routes inland from Utah Beach.

At dawn, before the 0630 first-wave attack, there was a tremendous air and sea bombardment, which was highly effective at all the beaches except Omaha, where most of the shells and bombs landed far inland. At Omaha, the first wave was decimated, the follow-up waves badly pounded. Those troops still alive huddled against the seawall, pinned down by fierce German fire. They had expected support from amphibious tanks (Shermans supported by rubber skirts and equipped with a propeller), but at Omaha the tanks were launched too far out in too-rough seas and thirty-two of thirty-four sank. At midmorning, Gen. Omar Bradley, commanding the U.S. First Army, contemplated withdrawing from the beach. But thanks to heroic action by individual soldiers, who led the way up the bluff, the crisis was overcome.

By nightfall, the Allies were ashore on a beachhead that stretched fifty-five miles. The cost was some 4,900 casualties, half of them at Omaha. German losses were not calculated, but they must have been considerably higher. Hitler's Atlantic Wall, built at enormous expense, had not held up the Allied landings for even one day.

DEBS, EUGENE V. (1855-1926), Socialist, presidential candidate, war opponent. Born of French immigrant parents in Terre Haute, Indiana, Debs became active in the labor movement in the 1870s and created the American Railway Union (ARU), an industrial union, in 1893. Following the federal government's smashing of the ARU-led Pullman Strike (1894), Debs slowly became convinced that corporate or monopoly capitalism could not be reformed, gravitated toward the socialist movement, and became its best-known leader and five-time presidential candidate of the Socialist Party of America.

In 1917, Debs led the socialist opposition to U.S. entry into *World War I, which he condemned as an imperialist war fought for the interests of the trusts. Arrested for an antiwar, antidraft speech at Canton, Ohio, on 15 June 1918, Debs began serving a ten-year sentence at the Atlanta Federal Penitentiary in April 1919. Still in prison, he re-

ceived nearly 1 million votes as the Socialist Party's presidential candidate in 1920, and was pardoned by President Harding on Christmas Day, 1921. He remained a committed socialist.

Debs's attitude toward war was best expressed in this widely quoted statement: "I am not a capitalist soldier; I am a proletarian revolutionist. I am opposed to every war but one; I am for that war with heart and soul, and that is the world-wide war of the social revolution."

DECATUR, STEPHEN (1779-1820), U.S. naval officer. Raised in a seafaring and naval family, Stephen Decatur served as midshipman and acting lieutenant during the Undeclared Naval War with * France (1798-1800) and as a first lieutenant and captain during the Tripolitan War (1801-05). In 1804, he commanded the party that burned the USS *Philadelphia*, which had fallen into enemy hands; then he led attacks on several Tripolitan vessels. Decatur's exploits, which entailed fierce hand-to-hand combat, won him great acclaim. After the Tripolitan War, he helped enforce the embargo. During the *War of 1812 he took part in two notable engagements: the celebrated victory of USS *United States* over HMS *Macedonian* in 1812, and the 1815 surrender of USS *President* to a British squadron. He commanded the flagship *Guerrière* in the Algerine War (1815), capturing or destroying several enemy vessels before extracting treaties from Algiers, Tripoli, and Tunis. Upon returning to the United States, he served on the Board of Navy Commissioners.

Decatur had served on the court-martial of James Barron after the *Chesapeake* affair of 1807, and enmity between the two led to a duel in 1820 in which Decatur was killed. A symbol of the reckless bravery and bold nationalism of the young Republic, Decatur was particularly remembered for his toast: "Our country! In her intercourse with foreign nations may she always be in the right; but our country, right or wrong!"

DECORATIONS, MILITARY. See Awards, Decorations, and Honors.

DEFEAT. Until the 1970s, Americans did not think much about defeat. U.S. military leaders usually defined war aims in terms of total victory, and the civilian culture they defended assumed that God guided the nation's fate and ensured its success. With a profound innocence, Americans denied those defeats that did occur and assumed their invincibility.

This sense of innocence and invincibility had deep roots in American history. During the * Revolutionary War, the American revolutionaries met with defeat and in many ways failed to live up to their own ideals. Led by the "Continental army, Americans still won their independence. Once they did, they gave little credit to the army or to

French aid, rarely dwelt on their defeats, but instead portrayed their victory as testimony to their own and the nation's virtue. The *War of 1812 offered a greater challenge to Americans' mythmaking powers. The military met frequent defeat in battle and the outcome of the war could at best be labeled a draw. Nevertheless, Americans came to remember this war too as a victory.

In the century and a half that followed, the United States sometimes endured defeat on the battlefield, but won its wars. In the Mexican, Civil, Indian, and Spanish-American Wars, the United States achieved the near-total victories its strategists sought. This persistent success deepened Americans' faith in their innocence, invincibility, and special favor in God's sight. After World War I, some Americans, disillusioned by the peace as well as by the war, questioned whether U.S. intervention had been wise; but World War II, with its total, if hard-earned, victory over foes Americans found evil, reaffirmed their conviction of invincibility and virtue. In the two decades that followed, the United States's sense of its power and rectitude never seemed surer.

Writing in the midst of this collective sense of American innocence, the historian C. Vann Woodward challenged it by pointing to the history of the American South. Unlike other Americans, Woodward argued, white Southerners had experienced military defeat. The loss of the *Civil War, along with poverty, guilt, and other frustrations, could have created a unique southern identity, one that would have offered an important corrective to the sense of innocence and invincibility that dominated American culture as a whole. Many southern intellectuals embraced Woodward's view and maintained that southern culture had been chastened, yet ennobled, by defeat. Other historians questioned such assumptions. They found that white Southerners interpreted the loss of the war as a sign of God's favor, blamed defeat on factors outside of their control, and celebrated the heroism, nobility, and fighting ability of Confederates. Defeat did not force them to reexamine old myths and assumptions; rather, like other Americans, Southerners celebrated a glorious, military achievement. And in the *Spanish-American War, they demonstrated their continued faith in American invincibility and inevitable victory. They did as well, as Woodward himself noted, in their involvement in and support for the Vietnam War.

American defeat in Vietnam, though, forced Americans, North and South, to confront their assumptions of invincibility. A few Americans, including some political leaders, at times claimed that the United States had never really been defeated on the field of battle. But this time the mythmaking seemed to fail; most Americans accepted the reality of what they saw as America's first defeat in war. Others, especially those in the military, searched for the cause of this defeat. Some blamed it on antiwar protesters or the press; others questioned American strategy or pointed to mistakes made by the military. Almost all agreed that the absence of a national consensus in favor of the war and the policy of phased escalation contributed to America's failure.

The latter lesson of defeat, the importance of delivering massive amounts of force at the beginning of the war, clearly shaped military strategy in the United States's next "major" military confrontation, the *Persian Gulf War. The military employed overwhelming airpower and as

many soldiers as had served in Vietnam at its height to win the war in days. In the wake of the victory, some talked of having buried the ghosts of Vietnam, by which they apparently meant not just America's post-Vietnam hesitancy to use military force abroad but also doubts about American innocence and invincibility as well. Whether the Gulf War has revived those myths remains to be seen, as does just how profoundly defeat in Vietnam has affected American attitudes toward war and its sense of providential blessing.

DEFENSE, DEPARTMENT OF. Created in 1949, the Department of Defense was an outgrowth of the *National Security Act of 1947, which had "unified" the armed services. The debate in Congress leading up to the 1947 legislation had its origins in the experiences of World War II, which, despite the overall success, had revealed numerous problems in command and control and the allocation of resources. Aiming to avoid similar situations in the future, President Harry S. *Truman recommended a War Department plan calling for a highly centralized and closely unified structure, including a separate air force, under a single secretary of defense. The navy worried that such a setup would threaten the future of naval aviation and the independence of the Marine Corps, and urged that instead of unification, attention be given to improving high-level policy coordination, with Britain's Committee of Imperial Defence serving as the model.

The resulting compromise, enshrined in the National Security Act of 1947, borrowed from both sides. Congress wanted the savings promised by unification, but it was afraid that an overly centralized system would produce a "Prussian-style general staff," reducing congressional and civilian control over the military. In enacting legislation, it leaned more toward the navy concept, with emphasis on a loosely unified defense establishment, a secretary of defense with limited authority, and new coordinating machinery, including a *National Security Council to advise the president on policy questions, a *Central Intelligence Agency for the coordination of intelligence gathering and analysis, and a National Security Resources Board to plan the management of resources.

The unique feature of the act was its handling of service unification. In the preamble to the law, Congress stated that its purpose was to unify the services but "not to merge them." Its vehicle was a hybrid organization it called the National Military Establishment (NME). Although the secretary of defense was designated the NME's senior presiding official, he exercised only "general direction, authority, and control" over the military services, which retained the status of "individual executive departments," but without cabinet status. The Navy Department remained the same, while the War Department became the Department

of the Army. To placate airpower advocates, the act established a new Department of the Air Force, organized from what had been the Army Air Forces. As part of the NME, the act gave statutory standing to the * Joint Chiefs of Staff (JCS), which had operated without a formal charter since their creation in 1942; and it established a Munitions Board for interservice coordination of logistical planning, a Research and Development Board to do the same in the areas of science and technology, and a senior-level War Council (renamed the Armed Forces Policy Council in 1949) to help coordinate overall NME policy.

Early Development. The first secretary of defense, James * Forrestal (1947-49), took office on 17 September 1947. For staff support he had but three special assistants whose statutory authority was unclear. As secretary of the navy during the unification debate, Forrestal had been a reluctant convert to service unification and had assured Congress that there would be no need for a large bureaucracy in the Office of the Secretary of Defense (OSD). Once installed in his new job, he adopted a go-slow approach—"evolution, not revolution"—toward integrating service activities, but did not receive what he considered sufficient support or cooperation from within the *Pentagon. An added handicap was President Truman's practice of setting rigid budget ceilings, an untoward consequence of which was to encourage interservice competition and feuding over the allocation of funds. At critical conferences in 1948—Key West in March and Newport in August—Forrestal tried to convince the services, especially the navy and the air force, to set aside their differences and work together. But he found it impossible to overcome their resistance with reason and persuasion.

Forrestal eventually concluded that the secretary's powers and staff support needed legislative strengthening. His successor, Louis *Johnson (1949-50), believed he already had the power and authority he needed, but acquired even more when in August 1949 Congress amended the National Security Act. The 1949 amendments converted the NME into a full-scale executive department, the Department of Defense (DoD), and designated the secretary of defense as "the principal assistant to the President in all matters relating to the Department of Defense." The services were downgraded to the status of "military departments," but with the proviso that they remain "separately administered," and the qualification of "general" to describe the secretary's powers and authority was dropped. The secretary also acquired a deputy (previously an undersecretary deriving from special legislation enacted in April 1949) and the special assistants became assistant secretaries of defense, one of whom was designated comptroller, while a nonvoting chairman was added to the Joint Chiefs. The secretary of defense thus emerged as a true executive, not the *primus inter pares* (first among equals) he had been under the original law. With unencumbered powers and a strengthened staff, he became the focal point of an increasingly centralized administrative system.

From this point on, challenges to the secretary's authority became rarer, but did not cease immediately. The most serious assault occurred in the summer and autumn of 1949 during the "Revolt of the Admirals," in which senior navy officers, reeling from Johnson's economy measures and imposition of authority, openly attacked the wisdom and impact of service unification and the growing reliance in U.S. defense policy on air-atomic power as the country's

first line of defense. But following the across-the-board military buildup precipitated by the outbreak of the *Korean War in June 1950, the stresses and strains on interservice relations eased as money for defense became more plentiful.

The 1953 and 1958 Reorganizations. The Korean War revealed that true unification still had far to go. As defense spending surged, jumping from approximately \$14 billion in fiscal year (FY) 1950 to \$49 billion in FY 1953, it put growing pressure on the secretary to effect sound departmental policies. A common complaint in Congress was that the services continued to mismanage and squander resources while unnecessarily duplicating functions. In November 1952, the outgoing secretary of defense, Robert A. Lovett (1951-53), sent President Truman a detailed letter pointing out flaws in the existing setup. Lovett thought the secretary should have more explicit authority over the services; a military staff of his own to augment the Joint Chiefs; and greater flexibility to deal with the problems of supply and logistics.

Lovett was only one of many who felt that defense organization could be improved, and with the change of administrations in January 1953, reforms came quickly. As a first step, President Dwight D. *Eisenhower named a committee headed by Nelson A. Rockefeller to review DoD's organizational needs. Eisenhower had long favored a more closely unified defense establishment, and it was with this goal in mind that the Rockefeller Committee framed its findings. Guided by the committee's report, Lovett's letter, and his own instincts, Eisenhower issued an executive order, Reorganization Plan No. 6, to provide a "quick fix" that avoided the need for legislation. Implemented in April 1953, the reorganization eliminated the Munitions Board and the Research and Development Board, transferring their functions to the secretary of defense. It also created six additional assistant secretaries of defense and a general counsel, and empowered the chairman of the Joint Chiefs to manage the Joint Staff (the JCS bureaucracy). Eisenhower had wanted to go further, especially in strengthening the powers of the JCS chairman, but his soundings among members of Congress convinced him that the time was not yet ripe.

In 1958, after the Soviet success in launching the first space satellite, Sputnik, and amid chronic interservice bickering and competition over the U.S. guided missile program, Eisenhower sent Congress additional proposals for defense reform, which this time would require legislative authority. Arguing that "separate ground, sea, and air warfare is gone forever," Eisenhower asked for further changes that he hoped would dampen interservice rivalry, blend their efforts more efficiently and effectively, and streamline command and control mechanisms to meet the new demands of the atomic era. Criticism of the proposed changes came mostly from the navy, fearing more loss of autonomy, and from its supporters in Congress, led by Representative Carl *Vinson, chairman of the House Armed Services Committee. But the predominant sentiment among legislators favored the more centralized and unified defense establishment the president wanted.

The Defense Reorganization Act of 1958 amended the 1947 law by taking the unification process about as far as it could go without abandoning the concept of individual military services. The main changes were a significant clarification of the secretary's authority, including the power

to transfer, reassign, abolish, and consolidate service functions; the addition of a new senior official, the director of defense research and engineering (DDR&E), to oversee research and development matters; a new chain of command, running from the president through the secretary of defense to the unified field commanders, thus bypassing the service secretaries; and increased authority for the chairman of the Joint Chiefs, who could now participate as an equal in their deliberations. Instead of being separately administered as in the past, the military departments were to be "separately organized"—a gesture toward preserving service autonomy but a distinct departure from the days when the departments had functioned as sovereign entities. Though the 1949 amendments had already largely settled the matter of the secretary's authority, the 1958 reorganization removed any lingering doubt and made it possible to consolidate and centralize activities with an unimpeded mandate.

McNamara's Impact. The first secretary of defense to make full use of the increased powers bestowed by the 1958 reorganization was Robert S. *McNamara (1961-68). A former president of the Ford Motor Company, McNamara entered office with a formidable background in business techniques that emphasized statistical analysis and close program management. His advent would, as it turned out, usher in some of the most far-reaching changes the DoD had yet experienced, earning him both high praise and summary condemnation. His initial task was to fulfill President Kennedy's campaign promise of overcoming purported inadequacies in the country's defenses—weakened conventional forces owing to an overreliance on nuclear weapons in the 1950s, and a dangerous "missile gap" in which preliminary evidence suggested that the Soviet Union was outproducing the United States in intercontinental ballistic missiles (ICBMs). Further intelligence confirmed that missile gap worries were unfounded, but as a precaution against expected Soviet increases, McNamara set in motion a strategic buildup, which by the end of his tenure encompassed a triad of strategic forces consisting of 1,054 ICBM launchers, a fluctuating number of long-range bombers, and 41 fleet ballistic missile submarines—the basic structure of the strategic deterrent until the 1980s.

Though Kennedy usually gave McNamara a free hand running the department, it was with the understanding that improved efficiency and toughened cost controls would offset much of the increase in expenditures for new missiles and other weapons systems. Defense spending at the outset of the 1960s consumed nearly 10 percent of the gross national product, and it was not Kennedy's intention that it should get any larger. Accordingly, McNamara introduced a variety of reforms, including mission-oriented budgeting with five-year expenditure projections, the use of "systems analysis" techniques that relied on computer-driven models to evaluate the cost-effectiveness of weapons, and a highly publicized cost reduction program. In addition, he expanded the practice, begun in the 1950s, of consolidating key functions by creating new DoD-wide agencies for supply, intelligence, and contract auditing. Not all of McNamara's unification measures turned out as he planned, however. A case in point was his abortive effort to cut aircraft procurement costs by developing a single fighter-bomber, the TFX (F-111), for both the air force and the navy. But compared with previous secretaries of de-

fense, he achieved an unprecedented degree of centralized civilian control.

Under McNamara, Defense also acquired a more prominent role in foreign affairs through its "little State Department," the Office of International Security Affairs (ISA), headed in the 1960s by a succession of able assistant secretaries, including Paul H. *Nitze, John McNaughton, and Paul Warnke. During a decade dominated by volatile national security issues—the Berlin Wall Crisis, the *Cuban Missile Crisis, the Dominican Republic, nuclear strategy, arms control, and Vietnam—McNamara and ISA were a conspicuous and influential part of the response. One of McNamara's most impressive accomplishments in foreign affairs was to convince *NATO to reduce its reliance on nuclear weapons and to develop a more balanced defense posture known as "flexible response." But his successes with NATO contrasted sharply with the debacle in Southeast Asia. Secretaries of defense had customarily stayed out of the operational side of military affairs, leaving them to the professionals, but McNamara inserted himself directly into many of the details of running the *Vietnam War. Initially a strong proponent of American involvement in Vietnam, he gradually came to have doubts and left office counseling stepped-up efforts at negotiations and disengagement.

Post-McNamara Changes. After McNamara came a reaction to centralized authority. Most of the managerial and budgeting techniques he had pioneered more or less survived, but his use of civilians in roles traditionally reserved for military professionals had aroused too much resentment among the services and too much skepticism in Congress for his successors to do likewise. Heeding the critics, President Nixon appointed a Blue Ribbon Defense Panel to review the department's procedures. The panel's report of July 1970 condemned the McNamara style of highly centralized decision making as "inherently inadequate to manage the spectrum of activities required of the Department of Defense," and urged that the military departments be restored to greater authority and responsibility. Few formal changes actually resulted, but in deference to the services' sensitivities, Secretary of Defense Melvin *Laird (1969-73) took steps to reinvolve the military in key decisions, notably budget planning, and to reduce the high profile that ISA and systems analysis experts had enjoyed in McNamara's time.

Meanwhile, the unpopularity of the Vietnam War had seriously eroded the military's prestige and credibility, and as the war wound down, cutbacks in military spending followed, leaving what some considered a "hollow" and demoralized force more in need of unified direction than at any time since the late 1940s. At Laird's suggestion, Congress in 1972 authorized a second deputy secretary of defense, though the post remained vacant until 1975. The role of the deputy had traditionally been that of the secretary's "alter ego" (Forrestal's concept), and having two in that job proved awkward and redundant. In 1977, in an effort to streamline functions, Congress abolished the second deputy slot and created two new under secretaries with broad responsibilities—one for policy, to supervise such tasks as strategic planning, military assistance, and international security affairs; and a second for research and engineering. President Carter wanted to go further and initiated a major defense organization study, completed in 1980, which recommended strengthening the

role of the Joint Chiefs and upgrading the management responsibilities of the service secretaries. But after Carter lost the 1980 election, the study was largely forgotten.

The Goldwater-Nichols Reforms of 1986. By the mid-1980s, organizational reform of the Defense Department was again a topic of intense discussion, with the initiative this time coming from Congress rather than the executive. President Ronald *Reagan was determined to reverse what he considered a decade of neglect of the armed forces, but the sustained buildup he launched in 1981 also gave rise to congressional criticism of waste, abuse, and cost overruns. Endeavoring to ease congressional anxieties, the administration in 1982 reluctantly accepted legislation creating an inspector general for the Defense Department. Reagan and Secretary of Defense Caspar *Weinberger (1981-87) opposed more extensive organizational change and tried to dissuade Congress from acting precipitously by forming an advisory commission on defense management headed by David Packard, a former deputy secretary of defense. One of the commissions main findings was that procurement procedures needed a drastic overhaul, starting with appointment of a high-level procurement "czar." Congress needed little nudging, and in the summer of 1986 it created the post of under secretary for acquisition, later giving it the same pay grade as the deputy secretary and potentially sweeping authority over nearly all facets of the procurement process.

More extensive reforms followed with the passage of the Defense Reorganization Act of 1986, a bipartisan measure spearheaded by Senator Barry Goldwater and Representative William Nichols. The goal of the *Goldwater-Nichols Act was to revitalize the Organization of the Joint Chiefs of Staff, whose stature and effectiveness had diminished steadily over the past several decades. In an attempt to reverse this trend, the law gave the JCS chairman added advisory powers and administrative authority over the Joint Staff; established a vice chairman to help oversee JCS business; and assigned more responsibility to the combatant (i.e., unified) commands. The idea was to encourage more "jointness" among the services, not just in Washington but in the field and at the various service schools, and in so doing, presumably, to improve planning and combat readiness. Although the performance of U.S. forces in the *Persian Gulf War (1991) seemed to bear out the soundness of the new emphasis on joint doctrine, subsequent misadventures in Somalia and command and control problems in the Middle East suggested a need for further refinements.

For the Department of Defense, the major challenge by the 1990s was to readjust to an international environment in which the dangers of Soviet military power no longer overshadowed all other security problems. The ending of the Cold War and the collapse of the Soviet Union in 1991 brought respite from the continuous tensions of the previous four decades, but also increased pressure from Congress and the public to curb military spending. This meant thinking differently about defense needs, and, as a congressional commission on military roles and missions pointed out in May 1995, more sharing of service responsibilities. In these circumstances, the demands on the secretary of defense to provide unified strategic and programmatic guidance were, if anything, apt to increase. Centralization of authority around the secretary of defense, though often unpopular with the services, had grown to be a practical necessity.

DEFENSE INTELLIGENCE AGENCY. Creation of a unified Department of *Defense (DoD) in 1947-49 was not accompanied by the unification of defense intelligence activities. Each of the military services maintained its own intelligence organization; indeed, maintaining these distinct capabilities had been a major demand of the military during deliberations over the creation of the CIA. But there were also a number of intelligence requirements that were either interservice or departmentwide. Thus, additional intelligence organizations designed existed to meet these broader needs.

In 1961, Secretary of Defense Robert S. *McNamara decided to rationalize much of the DoD's structure, and to improve resource management for broader defense intelligence efforts. The result was the Defense Intelligence Agency (DIA). Each service continued to argue, however, that it had unique intelligence needs that could not be met by a "joint" agency, and so the separate service units survived as well.

DIA is headed by a three-star military officer, a position filled by rotation among the services. DIA has been through several major reorganizations in the past few years, although its major functions remain the same: the collection and analysis of intelligence specifically related to military requirements. Collection is carried out overtly by defense attachés and covertly by the relatively new Defense HUMINT (Human Intelligence) Service (DHS). The functions of attachés remain known to host governments; DHS collectors operate under cover. DIA produces independent analyses and contributes to communitywide intelligence estimates. It is one of three "all-source" intelligence analysis centers (along with CIA and the State Department's Bureau of Intelligence and Research).

The DIA has sometimes found itself torn between its military customers (the *Joint Chiefs of Staff and their organization) and civilian customers in the DoD. The Joint Chiefs may seek analysis to support specific or preferred positions; the civilians may prove skeptical of military-produced analysis, which often tends toward more pessimistic assumptions about conflict and combat.

Competition with the military service intelligence units is less of a problem. But DIA has been among the intelligence agencies most severely hit by the end of the *Cold War, which led to a 25 percent reduction in its personnel.

DEFENSE REORGANIZATION ACTS (1950,1953,1958). Following quasi-unification of the armed forces in the Department of *Defense, created by the *National Security Act of 1947, Congress passed the Army Reorganization Act of 1950 to achieve simplicity and flexibility in the army's statutory organization. The law revised provisions, some of which dated back to the *War of 1812, and confirmed many of the changes made by executive action during World War II. It made the secretary of the army, now aided by an expanded staff, directly responsible for conducting all the affairs of the army. Congress abandoned appropriating funds directly to each technical service, and instead authorized the secretary of the army to make the allocations and to determine the number and relative strengths of the arms and services. In 1950, those included three combat arms: Infantry, Armor, and Artillery (including the old Field Artillery, Coast Defense, and Air Defense), and fourteen services, from the Chemical Corps to the Women's Army Corps.

Following the coordinating and centralizing efforts in the National Security Act of 1947, and its 1949 amendments, Congress, on the recommendations of the Rockefeller Committee and President Eisenhower, adopted the Defense Reorganization Acts in 1953 and 1958 designed to reduce service obstacles to coordinated defense planning and management. These acts strengthened the Office of the Secretary of Defense (OSD) by more than tripling its size and by giving it additional authority; they also somewhat enhanced the Office of the Chairman of the *Joint Chiefs of Staff (JCS). However, Congress continued to allow individual service chiefs to take their opinions directly to Capitol Hill.

The 1953 and 1958 reforms did not prevent open disagreement among the services nor the JCS from making split recommendations. Nor did they curtail budget requests or weapons procurement. They did, however, provide some additional centralized direction.

Individual secretaries of defense, chairmen of the JCS, and service chiefs continued to struggle over interservice *rivalry and coordination within this framework up to and even after the *Goldwater-Nichols Defense Reorganization Act of 1986, the most thorough revision of statutes governing DoD organization since the National Security Act of 1947. — white clay Chambers II

DEMOBILIZATION is the release or "draw down" of wartime military forces as the nation resumes peacetime status following a war or major buildup. It is, then, the opposing process of *mobilization*, which is the assembling and organizing of troops, materiel, and equipment for active military service in time of war or other national emergency. The extent of the process of demobilization depends upon the mobilization that preceded it. Factors include the size, duration, and location of conflict, as well as the level of technology and state of the industrial base and degree of public support. These factors, in turn, determine the number of men mobilized, the duration of service, the distance they move, and the equipment they use. Demobilization is as tumultuous and as fraught with change as mobilization, for after mobilization, and after the conflict, while there can be a normalizing, there cannot be a return to normality. Over the course of American history, demobilization has been a largely haphazard and rela-

tively unplanned process, reflecting a nation whose emphasis has been on peacetime pursuits while maintaining a small standing army.

For the United States, the history of demobilization begins, in modern terms, with the *Civil War. Previous conflicts had involved forces small enough to make demobilization relatively invisible. Over the course of the *Revolutionary War, for example, demobilization was a continual, and relatively informal, process. The Continental Congress had limited authority over the troops; soldiers were allowed to return home at the end of their enlistment, desertions were frequent, and men were often unceremoniously sent home after a campaign. With the cessation of hostilities, the Continental army was virtually disbanded. Men wandered home without medical examinations, outprocessing, written discharges, or pay.

The reasons for this are apparent after 200 years. The United States barely existed; the Continental Congress had little power; the army, composed of Continental troops and militia, was small and considered temporary; no bureaucracy existed to process or track either mobilization or demobilization. Significantly, there was strong distrust of standing armies during times of peace. That distrust was not only for the armed force itself, but the government that would control it. A standing force, it was felt, would contribute to a more centralized and more powerful government than many thought wise.

The *War of 1812 and even the *Mexican War changed this situation and sentiment very little. As during the Revolutionary War, men were continually inducted into service even as large numbers who had served out their enlistments were discharged. Terms of enlistment were short, from one to twenty months, and the total number of troops at any given time was relatively small for both conflicts. The Mexican War witnessed a movement to permanent enlistments, a precedent that would not be adopted again until the *Spanish-American War. At the end of each war, the army returned to a peacetime basis by disbanding all excess regiments and consolidating remaining ones with regiments in the active force. Demobilization could remain unorganized and informal because the forces were not large.

The Civil War changed the policy of demobilization, just as it changed warfare, public understanding of war, and almost everything else. True to tradition, prior to the end of the Civil War, little thought was given to how the war would end, much less to the processes of disbandment. As before, troops were continuously discharged after completing their terms of enlistment. With Lee's surrender in 1865, and a general public feeling that demobilization should be immediate, the Union faced the task of outprocessing over 1 million Federal troops. Demobilization directives were hastily drawn up and issued in May 1865.

The Union plan called for the movement of large units to rendezvous areas within the former Confederacy and the border states. This served both to facilitate the demobilization process and to position Union forces for reconstruction duties. Troops were marched to the rendezvous areas where they camped while muster rolls and payrolls were prepared. Units were mustered out of federal service and men were sent to their home state to be individually mustered out. Mustering out took time, and boredom and homesickness caused a mass of desertions. Payment for service was not uniform from state to state.

Meanwhile, Lee's Confederate army stacked its weapons, signed a pledge not to take up arms against the government, and marched home without pay. As word spread, many troops simply left without signing anything. Demilitarization of the South proceeded slowly and unevenly.

Because of the large numbers of troops who were recruited, fought, and were subsequently mustered out, America took some lessons on demobilization and applied them. The Spanish-American War was a foreign war, which set it apart from the country's preceding experience; as in previous conflicts, the armed forces consisted of regulars and volunteers. No volunteer units were mustered out of the service during the conduct of operations. At war's end, most nonregular units were returned to their home state and demobilized. The federal government required that soldiers be transported to their respective state camps. There they were furloughed while their records were prepared. They returned for separation and pay. The exception was those units that were held over for occupation duty in the Philippines.

With the turn of the century, defense organization and legislation changed the face of the military establishment. The new Army General Staff lent the services a guiding structure; the Militia Act (1903) set the National Guard's relationship to the federal government. This represented a serious attempt to professionalize the military establishment. Each was intended to contribute to the ability of the services—and hence the nation—to mobilize for war and demobilize afterward.

The army that fought World War I was composed of regulars, National Guardsmen, and individual volunteers. Volunteer units were no longer called; most of the ranks were filled through conscription, which was passed in the summer of 1917. During this war, all troops under enlistment served for the duration of the conflict. Unfortunately, despite the existence of the General Staff, the end of the Great War found the United States as unprepared to demobilize as it had been to wage war. When Congress declared war in April 1917, the armed forces numbered almost 300,000. Nineteen months later, over 2 million men were serving in France, yet planning for demobilization began only a month before hostilities ceased. The army, relying on the draft, had greater problems with demobilization than the navy or Marines, of which most were volunteers.

The traditional unit demobilization began with the war's conclusion. Some units were still required to man the ports of debarkation, demobilization centers, supply depots, hospitals, and various garrisons. Due to strong public outcry, however, the War Department accelerated demobilization by discharging individuals, generally before deactivating their units. The discharge was carried out at demobilization centers throughout the country, where physical exams were conducted, financial claims made, and administrative details gathered. The centers were primarily designed to accommodate troops returning from overseas. Soldiers were discharged at camps closest to their homes; physical needs were attended to; coal miners, railroad employees, and railway mail clerks were discharged immediately. Units were demobilized according to plan, with replacement battalions first and combat divisions following. Because of the number of men under arms, the demobilization process affected society in general: communities with war industries experienced an immediate labor surplus when those industries closed down, and the large

numbers of returning soldiers added to the unemployment problem.

In World War II, formal planning for demobilization began two years before the end of the war with Germany. For the first time in American history, demobilization was done primarily by individual rather than by unit. Demobilization by unit had previously been the standard for the army, and had worked well with small forces, for it allowed units to retain their integrity and combat effectiveness. The individual method, however, allowed for faster mustering out with acknowledgment paid to individual service—both of which were popular in American society. A service score plan was devised whereby individual soldiers were assigned points as credit for length of service, time spent overseas, time spent in combat, number of wounds sustained, and number of children at home. America began partial demobilization of its ground and air forces in May 1945 with over 8 million men under arms. The navy began demobilization on V-J Day with a strength of approximately 4 million. Demobilization took from 1945 to 1947, and was characterized by upheaval, waste, and confusion. By June 1947, the total strength of the army was just over 900,000.

This immense demobilization affected all phases of American life. The army, after having been perhaps the most powerful military machine in Western history, dwindled to a state of near impotence, impairing national security and limiting the flexibility of foreign policy. Demobilization also adversely affected supply, maintenance, and storage of munitions; experts in those fields were normally in rear areas during fighting and among the first to leave the service. The army thus was left with not only an absence of manpower to tackle the job of organizing and mastering demobilization and reorganization but also a low level of expertise in many significant fields. Waste was incredibly high; thousands of items of equipment worth millions of dollars were left to rust in place. The mass exodus of men from units overseas caused a complete turnover in leadership. In some cases, whole units disappeared, to be replaced by untrained and untried fillers. Throughout the process, congressional criticism was intense, made particularly acute by upcoming congressional elections in which candidates demanded swift, if not immediate, dismantling of the military.

With the war's end, debate again resurfaced over the issue of universal military training. Late in 1945, President Harry S. *Truman asked Congress for legislation requiring male citizens to undergo a year of military training. Proponents believed this would permit a quick expansion of the force when mobilization was necessary. Although this idea became the subject of extensive debate, American citizenry did not accept it, and reinforcement of the regular forces would continue to depend on the reserve forces. Interestingly, the draft, enacted in 1940, was maintained, although not without debate of its own, until 1973.

From the end of World War II until 1989, America was preoccupied by the *Cold War, as a result of which it maintained a relatively large standing army for the first time in its history. Conscription was enforced until 1973 to ensure that strength was held at that high level. The draft ended in 1973; since then, all services have been filled by enlistments alone. Over the Cold War period, no large conflict erupted between the superpowers. The United States did participate in limited hostilities, however, including the *Korean

War and the *Vietnam War. Both of these required the armed forces to be built up to fight on foreign soil; neither, however, resulted in mass mobilization or demobilization. During the Vietnam conflict, the United States returned to the earlier policy of "rolling" demobilization—recruits served in Vietnam for thirteen months (including one month of R&R) rather than for the duration, America's earlier pattern of demobilization.

DEMOGRAPHY AND WAR. Rapidly growing populations are often aggressive. They both enjoy and suffer from an abundance of young men seeking new places for themselves in the world because a plurality of sons cannot all inherit a father's property without suffering an unacceptable decline of living standards. As long as the majority of Americans lived on farms and had lots of children, this circumstance fueled rapid frontier expansion at the expense of Indian peoples. Easy victories in sporadic warfare were essential to the expansion of American settlement, beginning in the 1630s and lasting until 1890, when the final armed clash between the U.S. Army and an Indian people took place at the Battle of *Wounded Knee, South Dakota (1895). American military successes in turn reflected an abundance of armed men—militiamen in colonial times supplemented after independence by professional soldiers—who were willing and ready to invade Indian territory and seize new lands from the occupants.

Nonetheless, the demographic disasters that crippled the Indian population of North America were not primarily due to warfare. Indian communities were disrupted instead by repeated exposures to lethal diseases imported from the Old World, to which they initially had no inherited resistance. The result was a vicious circle: epidemic disease deaths weakened, when they did not paralyze, armed resistance; and sporadic defeats in war deprived survivors of any chance of recovery.

The upshot was a drastic re peopling of the broad swathe of the North American continent that frontier expansion brought within the boundaries of the United States. Starting from two tiny shoreline footholds in 1607 and 1620, English colonists quickly achieved rapid rates of population growth that carried the frontier across the Appalachians in the late eighteenth century, and across the Rockies some sixty years later. Africans, who crossed the ocean as slaves, and immigrants from Europe, who came initially as indentured servants, added additional strands to the re peopling of the country.

Throughout the colonial period, local militias conducted sporadic local offensives against Indians with only occasional regard for British imperial policy. But when imperial wars broke out in the Americas, colonial militiamen played a significant support role, and on several occasions (1710, capture of Port Royal; 1745, capture of Louisburg) carried through successful offensive operations. French and Spanish colonists in America were too few to support their home governments with comparably numerous or

well-organized military units. This was a factor—though scarcely the primary factor—in British successes in the decisive *French and Indian War of 1754-63 that added Canada and Florida to Great Britain's American empire.

But, almost at once, their remarkable demographic expansion allowed the colonists to leave their European rivals behind and (with help from France) to break their political bond with Great Britain in the *Revolutionary War. Former imperial restraints on frontier expansion and military aggression against the Indians were removed after the United States became sovereign. As a result, rapid population growth together with improvements in transport raised the westward movement to flood proportions during the first half of the nineteenth century. Local militiamen continued to play the principal role in Indian fighting and frontier expansion until the *Mexican War (1846-48), when regulars of the U.S. Army fought their way to Mexico City and compelled the Mexicans to cede California and the rest of their northern territories to the victors.

The *Civil War was by far the most costly conflict ever fought by Americans. The North enjoyed a definite demographic advantage from the start, with a total population of about 21 million opposing about 9 million Southerners, of whom 3.5 million were black slaves. More than 1.5 million soldiers served in the Union army, and suffered an official total of 359,528 deaths from lethal infections and battlefield casualties. The Confederates enrolled some 800,000 soldiers, and suffered about 258,000 deaths, so that the combined loss of life from the war exceeded 600,000. Such a trauma slowed but did not stop population growth for the nation as a whole, but aftereffects kept the South depressed and backward for the following two generations. The North suffered proportionately less, and an increasing flow of European immigrants more than made up for wartime losses.

A fundamental change in American demography and warfare set in between 1870 and 1890 when land suitable for pioneer cultivation disappeared after the frontier of settlement encountered the dry landscapes of the high plains. As a result, by about 1890, when the U.S. Census report announced that the open frontier had disappeared, the demographic regime that had sustained white territorial expansion at Indian expense for the preceding 270 years broke down. Instead of seeking new land to cultivate, surplus children from rural families headed into town, where industrial manufacturing and service jobs presented them with a radically different style of life—whether they arrived from American farms or from European villages across the ocean. Consequently, in 1920 the U.S. Census recorded an urban majority for the first time, and in ensuing decades the American countryside emptied out so that fewer than 5 percent of the population are today employed as farmers.

Wars fought by the United States since 1898 both reflected and affected these demographic and social changes. Superficially, the *Spanish-American War (1898) looked like the translation of old-fashioned frontier war to Cuban soil; but the aggressive dynamic of American rural society was already slackening. As a result, after the familiar sort of easy victory, the United States refrained from annexing Cuba, and despite an uneasy conscience, settled for annexing Puerto Rico and the Philippines. Overseas islands, already occupied by farming populations, were not

available for frontier settlement in the old way, and the drive for territorial expansion was therefore far weaker than before.

World Wars I and II were far more serious engagements, and provoked more thorough mobilization of the entire nation than had been possible during the Civil War, when a majority of the population had to remain working in the fields in traditional ways to assure sufficient food. About 4 million men were recruited undrafted into the army during * World War I and a total of 1.2 million crossed the ocean to France. But these figures were dwarfed during "World War II, when about 15 million men and women served in many different theaters of war and remained in uniform for a longer time than had been necessary in 1917-18. Yet military deaths in both wars totaled less than 410,000, almost a third fewer than in the Civil War—a tribute, more than anything else, to advances in military medicine that had taken place since 1890.

Wartime experience for so many millions in 1917-19 and again in 1941-45 had dramatic demographic impacts. Postwar baby booms were in both cases succeeded by an accelerated decline in birth rates, so that by 1990, births in the United States was just about at the replacement level—2.1 children per woman of childbearing age. Total population continued to grow rapidly, thanks to the relaxation of legal barriers to immigration after World War II; but without the inflow of newcomers, the population of the United States would no longer replace itself.

Many factors contributed to this radical departure from the earlier pattern of American demographic expansion—urbanization chief among them. But informal exposure to a long-standing professional military tradition of sexual habits designed to prevent unwanted births, supplemented by official medical efforts at inhibiting the spread of venereal disease, affected the behavior of millions of conscripted soldiers. This wartime experience surely (but secretly) carried over into civilian life, altering sexual habits and expectations much more rapidly than could otherwise have occurred. Birth rates plummeted to less than half of what they had been in the colonial era.

A second aspect of wartime mobilization, 1917-19 and 1941-45, confirmed and extended this basic demographic shift. Wartime labor shortages allowed and invited millions of women to start working outside the home; and not all of them resumed a merely domestic style of life when peace returned. By the 1960s, earning their own money by working for wages became a badge of women's liberation, and the costs of childbearing and infant nurture became correspondingly harder to bear. This kept birth rates low, opening the United States to newcomers from crowded rural communities in Latin America and elsewhere.

The re peopling of America, begun so radically in 1607, thus assumed a new guise in the 1960s. Except for an influx of Vietnamese refugees after the U.S. forces left the Vietnam war in 1973, warfare has had little significance, at least so far, for this second chapter in the exceptional demographic instability that distinguished the British North American colonies and the United States of America throughout their history.

DESEGREGATION, RACIAL, IN THE MILITARY. See African Americans in the Military.

DESERTION. Under American military law, *desertion* is the act of leaving one's service or duty without the intention of returning or being absent without authorization for more than a month.

In peacetime, desertion has been a continuing phenomenon in American military history, at least through the early twentieth century, although its extent has varied widely depending upon the circumstances facing the service people. Unlike European nations, the U.S. government had little control over its citizens, and deserters could escape relatively easily, particularly into the rural and frontier regions of the country. Low pay and poor conditions have contributed significantly to peacetime desertions.

The armed forces require enlisted men and women to serve tours of duty of specific duration. Unlike commissioned officers, enlisted personnel are not legally permitted to resign unilaterally. Thus, desertion constitutes an enlisted person's repudiation of his or her legal obligation.

A correlation has existed in peacetime between desertion rates and the business cycle. When the country experienced economic depression and high unemployment, fewer people abandoned the service. Yet in an expanding economy, with workers in demand and wage scales increasing, many more service men and women have forsaken the high job security but lesser monetary rewards of the military.

The highest peacetime desertion rates in American history were reached during periods of economic growth in the 1820s, early 1850s, early 1870s, the 1880s, early 1900s, and the 1920s, when the annual flow of deserters averaged between 7 and 15 percent of the U.S. Army. A peak of 32.6 percent was recorded in 1871, when 8,800 of the 27,010 enlisted men deserted in protest against a pay cut. (By contrast, the desertion rate in the British army was only about 2 percent.) Lured by higher civilian wages and prodded by miserable living conditions—low pay, poor food, inadequate amenities, and boredom—on many frontier western outposts, a total of 88,475 soldiers (one-third of the men recruited by the army) deserted between 1867 and 1891.

The peacetime navy had its own desertion problems. In the nineteenth century, many of the enlisted men had grim personal backgrounds or criminal records or were foreigners with little loyalty to the United States. A rigid class system and iron discipline contributed to high rates of alcoholism and desertion. In 1880, there were 1,000 desertions from an enlisted force of 8,500 seamen.

During wartime, desertion rates in all the military services have varied widely but have generally been lower than in peacetime—perhaps reflecting the increased numbers of service people, national spirit, and more severe penalties prescribed for combat desertion. The end of hostilities, however, generally was accompanied by a dramatic flight from the military. After almost every war, the desertion rate doubled temporarily as many regular enlisted

personnel joined other Americans in returning to peacetime pursuits. The variation in wartime desertion rates seems to result from differences in public sentiment and prospects for military success. Although many factors are involved, generally the more swift and victorious the campaign and the more popular the conflict, the lower the desertion rate. Defeat and disagreement or disillusionment about a war have been accompanied by a higher incidence of desertion.

In the * Revolutionary War, desertion depleted both the state militias and the Continental army after such reverses as the British seizures of New York City and Philadelphia; at spring planting or fall harvesting times, when farmer-soldiers returned to their fields; and as veterans deserted in order to reenlist, seeking the increased bounties of cash or land that the states offered new enlistees. Widespread desertion, even in the midst of battle, plagued the military during the setbacks of the *War of 1812. In the *Mexican War, 6,825 men, or nearly 7 percent of the army, deserted; and one unit of the Mexican Army, the San Patricio Artillery Battalion, was composed of American deserters.

The *Civil War produced the highest American wartime desertion rates because of its bloody battles, new enlistment bounties, and the relative ease with which deserters could escape capture, particularly in the mountain regions. The Union armies recorded 278,644 cases of desertion, representing 11 percent of the troops. As the Confederate military situation deteriorated, desertion reached epidemic proportions. The Appalachian Mountains, Florida swamps, and Texas chaparral became the domain of armed bands of Southern deserters. In the final year of the war, whole companies and regiments, sometimes with most of their officers, left together to return to their homes. In all, Confederate deserters numbered 104,428, or 10 percent of the South's armies.

The brief and successful *Spanish-American War resulted in 5,285 desertions, or less than 2 percent of the armed forces in 1898. However, the rate climbed to 4 percent during the long and arduous *Philippine War between 1900 and 1902. In World War I, because *conscription regulations classified any draftee failing to report for induction at the prescribed time as a deserter, the records of 1917-18 showed 363,022 deserters, who would have been more appropriately designated draft evaders. Traditionally defined deserters amounted to 21,282, or less than 1 percent of the army in World War I.

In World War II, desertion rates reached 6.3 percent of the armed forces in 1944, and during the American reverses at the Battle of the * Bulge, the army executed one American soldier, Private Ernie Slovik, for desertion in the face of the enemy as an example to other troops. Desertion rates dropped to 4.5 percent in 1945. During the *Korean War, the use of short-term service and the rotation system helped keep desertion rates down to 1.4 percent of the armed forces in fiscal year (FY) 1951 and to 2.2 percent or 31,041 in FY 1953.

The divisive *Vietnam War generated the highest percentage of wartime desertion since the Civil War. From 13,177 cases—or 1.6 percent of the armed forces—in FY 1965, the annual desertion statistics mounted to 2.9 percent in FY 1968, 4.2 percent in FY 1969, 5.2 percent in FY 1970, and 7.4 percent (79,027 incidents of desertion) in FY 1971. Like the draft resisters from this same war, many deserters sought sanctuary in Canada, Mexico, or

Sweden. In 1974, the Defense Department reported that between 1 July 1966 and 31 December 1973, there had been 503,926 incidents of desertion in all services during the Vietnam War.

The end of the draft and the Vietnam War, together with the enhancement of pay and living conditions in the

* All-Volunteer Force, dramatically reduced desertions, although there was somewhat of another upsurge during the * Persian Gulf War (1991).

DESERT SHIELD. See Persian Gulf War (1991).

DESERT STORM. See Persian Gulf War (1991).

DESERT WARFARE. The nature of deserts—arid, barren regions lacking sources of fresh water—makes combat operations there particularly demanding on troops and equipment. Additionally, deserts frequently lack readily identifiable landmarks, making map reading and navigation very difficult. Though visibility tends to be excellent at extreme ranges, cover and concealment are minimal. Thus, modern desert warfare tends to mean armored and mechanized warfare.

For many years U.S. doctrine failed to address desert warfare. During World War II, U.S. forces suffered heavy losses in the opening phase of the *North Africa Campaign (1942-43) at the hands of German and Italian troops at Sidi-bou-Zid and the Kasserine Pass in Tunisia. Stung by these defeats, American forces learned quickly and fared somewhat better later.

After the war, American military doctrine focused on the defense of Europe, and desert warfare was again ignored—until the Arab-Israeli War of 1973. Stunned by Israel's initially heavy losses to wire-guided *antitank weapons, and impressed by the Israelis' rapid recovery and counterattack, the U.S. military began to reevaluate its approach to armored warfare in the desert. A national training center was established in the Mojave Desert at Fort Irwin, California (1981)—the army's premier combat training center. All combat units were required to rotate through a warfare training cycle at Fort Irwin in the 1980s and 1990s, which pitted them against an opposing force (OPFOR) that until the 1990s employed *Warsaw Pact-style equipment and tactics.

The U.S. guiding principles in conducting desert operations may be summarized as find, fix (immobilize), and destroy the enemy at extreme long range. Typically, satellite imagery is used to gather intelligence on enemy force dispositions. Long-range air strikes are then launched to destroy these forces—as well as their communications infrastructure—to disrupt the enemy's system of command and control and deny him the ability to maneuver. Ground maneuver units of heavy armor and mechanized infantry punch through or bypass enemy positions, using sophisti-

cated fire control systems to destroy enemy assets at extremely long ranges (up to two and one-half miles in direct fire mode). This method was essentially employed successfully by the U.S. and Coalition forces during Operation Desert Storm in February 1991. Field Manual 90-3, *Desert Operations* (1993), incorporated the "lessons learned" during the * Persian Gulf War (1991).

DESTROYERS-FOR-BASES AGREEMENT (1940). On 3 September 1940, after intricate negotiations, President Franklin D. 'Roosevelt announced that he was transferring fifty destroyers of World War I vintage to England—already at war with Germany—in exchange for ninety-nine-year leases to seven British air and naval bases in the western hemisphere (Newfoundland, Bermuda, several Caribbean islands, and British Guiana). Prime Minister Winston S. *Churchill had first asked for the warships to replenish British losses in the Norwegian campaign. Despite his promise that spring to support England with "the material resources of this nation," Roosevelt waited as Britain continued the war against Nazi Germany after France's surrender. Private groups like the Committee to Defend America by Aiding the Allies worked to arouse public opinion in support of Britain, while FDR sought assurances that Churchill would never surrender the Royal Navy, even if Hitler occupied the British Isles.

Not until intelligence in August 1940 during the air Battle of Britain indicated that Britain had better than a fifty-fifty chance of defeating a German invasion did Roosevelt finally act. By obtaining valuable bases in exchange, he persuaded a reluctant chief of naval operations, Adm. Harold R. Stark, to certify, as required by law, that the destroyers were no longer essential to national defense. The President bypassed Congress by concluding the arrangement through an executive agreement, an action challenged by isolationists but justified legally by Attorney General Robert Jackson. Because most of the old vessels needed extensive repairs and refitting, the actual military value of the Destroyers-for-Bases-Agreement proved less important than the diplomatic implications. What Roosevelt called the most important "reinforcement of our defense ... since the Louisiana Purchase," Churchill considered "a decidedly unneutral act" that inaugurated the Anglo-American alliance of World War II.

DESTROYERS AND DESTROYER ESCORTS. The modern destroyer (DD) is a general purpose warship capable of surface, subsurface, and anti-air warfare. Destroyers evolved from ships designed to destroy torpedo boats that threatened battleships at the end of the nineteenth century. Much like the horizontal expansion of fortifications around castles to protect them from cannons, torpedo boat destroyers formed a defensive ring around capital

ships and engaged torpedo boats beyond torpedo range. By the turn of the century, destroyers mounted torpedoes and replaced the torpedo boat.

The introduction of the submarine during World War I resulted in the need for destroyers to escort convoys and hunt 'submarines. A destroyer shortage led to a conflict over U.S. shipbuilding resources. Adm. William S. 'Sims, commander of U.S. naval forces in Europe, disagreed with the chief of naval operations (CNO), Adm. William S. Benson, over the continued allocation of shipbuilding resources to capital ships. These battleships would provide the United States with naval superiority over Britain—considered by Benson to be a postwar rival. The anglophilic Sims successfully argued that the first priority was victory in the Atlantic, and resources were shifted to construct destroyers and other antisubmarine ships.

After the war, the battleship remained the standard of naval power. Since no modern battleship had been sunk by a submarine, submarines were largely discounted. The destroyer returned to its prewar mission of torpedo attack and defense. When President Franklin D. * Roosevelt restarted warship construction under the National Industrial Recovery Act (1933), Adm. William V. Pratt, the CNO, identified destroyers as the first construction priority since those built during World War I were approaching obsolescence and construction of capital ships was prohibited by the 'Washington Naval Arms Limitation (1922) and the London Naval Treaty (1930). The U.S. Navy commissioned 114 interwar destroyers in three major classes prior to the attack on 'Pearl Harbor in December 1941; another 67 of these 1930s designs were completed during the first two years of the war.

In fall 1939, the navy began design work on "Destroyer 1941"—the 175-ship *Fletcher* class that would bear the brunt of World War II destroyer action. The *Fletchers* were large ships, designed as torpedo attack vessels, with a secondary mission of antisubmarine defense of the battle fleet. Many senior officers were concerned over the increasing size of such destroyers, but increased capability required larger ships. In addition to their torpedoes, *Fletchers* were equipped with dual-purpose (anti-air and anti-surface) 5-inch guns, as well as 40mm and 20mm anti-aircraft guns to enhance their survival in a war in which the airplane was demonstrating its ascendancy.

Referred to as "tin cans" due to an absence of armor, destroyers relied on their high speed (up to 40 knots) for survival. But speed had failed to protect British battle cruisers at the 1916 Battle of Jutland, and unarmored destroyers proved equally vulnerable to gunfire, 'torpedoes, bombs, and kamikaze attacks during World War II. Seventy-one U.S. destroyers were sunk. By 1944, the *Fletchers* were joined by larger *Gearing/Summer-class* ships with even more emphasis on air defense.

In the post-1945 U.S. Navy, the destroyer continued to protect the capital ship—now the aircraft carrier—which came with more emphasis on anti-air warfare and secondary emphasis on antisubmarine warfare. The development of surface-to-air 'missiles and sensors drove up the size of postwar destroyer designs. The *Forrest Sherman-class* destroyers (1953) displaced almost 5,000 tons, approximately a fivefold increase over the mass-produced destroyers of World War I. The *Charles F. Adams* class of guided missile destroyers (1958) were nearly as large.

Adm. Hyman 'Rickover pushed for a nuclear-propelled

navy, which led to the construction of nuclear-powered destroyers (DLGNs) and cruisers to escort the new nuclear-powered aircraft carriers. Adm. Elmo *Zumwalt, CNO in 1970-74, viewed the increasing complexity, size, and cost of U.S. destroyers (now approaching the size of World War II cruisers) with alarm. Zumwalt advocated a "high-low" mix of ships but ran afoul of Rickover's political clout. Zumwalt was able to shepherd the "low-end" FFG-7 class of guided missile frigates (ships smaller than destroyers and designed for convoy escort) into production. But "purebred" destroyers continued to increase in size and cost. The *Spruance* class (1975) weighed in at 7,800 tons, and its hull design was large enough to be used for the CG-47 class of Aegis air defense cruisers.

The navy's most recent destroyers, the *Arleigh Burke* (DDG-51) class (1991), are large, capable ships, and like the *Fletchers* that Adm. Arleigh *Burke commanded during World War II, are designed for three-dimensional warfare, using sophisticated sensors and weapons, including cruise missiles, to strike targets above, on, and under the sea.

DETECTION, OBSERVATION, AND FIRE CONTROL SYSTEMS. Hitting a distant moving target requires observing its range and bearing, estimating its speed and direction, extrapolating into the future to compute the lead, and then calculating ballistics (that is, how to set a gun with the proper angle and elevation to hit a target at a particular range and bearing). Before the twentieth century, gunners performed these tasks manually or aided by small instruments, observing with optical telescopes and rangefinders, looking up ballistics in firing tables, and setting guns by hand. Beginning around World War I, however, these operations became progressively automated and combined into specialized fire control systems. The apparatus integrated target detection and tracking, ballistics calculation, and gun command into a connected set of machines. For much of the twentieth century, fire control ranked among the most secret and delicate technologies in the American arsenal.

Automated fire control began in the navy with the adoption of "director firing," which controlled all guns on a ship from a centralized location. Before World War I, Arthur Hungerford Pollen designed an early automated plotting system for British ships. In America, the Sperry Gyroscope Company connected instruments that collected observed data about a target into a central plotting room. An automatic plotter drew the paths of both the firing ship and the target ship on paper, from which a gunnery officer could read the range and bearing for the guns to fire. He then electrically transmitted these data to gunners in the turrets. In 1915, Sperry's chief designer, Hannibal Ford, left to start the Ford Instrument Company and introduced the Ford Rangekeeper, which both incorporated British technology and added new mechanisms of Ford design. The Rangekeeper, a mechanical analog computer, estimated the

course and speed of a target ship based on repeated observations of range and bearing, continually updating the estimate in accord with new observations. The U.S. Navy enthusiastically adopted the Ford Rangekeeper, at first for *battleships and then for *destroyers and *cruisers. Before World War II, the secret and novel military-industrial alliance of the Bureau of Ordnance and the Ford Instrument Company, the Arma Engineering Company, and General Electric built nearly all fire control systems for the navy. Ford Rangekeepers, in numerous updates and modifications, directed guns on American warships into the 1990s. Arma also designed the famous Torpedo Data Computer (TDC) for *submarines and surface ships. Sperry and another spinoff, Carl Norden Inc., began building bombsights, a technology similar to Rangekeepers that played a critical role in World War II.

Naval fire control systems achieved a certain technical maturity between the world wars, but the critical problem in fire control shifted from hitting surface targets to a new challenge: aircraft. This problem, including all the difficulty of surface fire but at higher speed and in three dimensions, pushed fire control technology to its limits. Both the army and the navy developed antiaircraft directors, which tracked airplanes (at first with telescopes and then with radar), calculated the "lead," and directed guns to proper aiming positions. During World War II, lightweight, low-cost "lead computing sights," mounted directly on manually controlled guns, approximated the solution for close-in attacks. An extensive research program under the National Defense Research Committee extended the scope and sophistication of fire control technology, covering theory, electronics, bombsights, fuses, radar, fire control for aerial guns, and automation. This led not only to new fire control technologies but also to fundamental advances in computers, including work by Norbert Wiener (founder of cybernetics), Claude Shannon (founder of information theory), and George Stibitz (builder of the first digital computers). Automated, radar-directed fire control systems achieved critical successes during the war, especially against the German V-1 "buzz bombs" in Britain, and against Japanese air attacks in the western Pacific. Still, researchers never adequately solved the general problem of hitting rapidly maneuvering targets with ballistic shells (although the current Phalanx system does so at short ranges). Engineers, then, moved the control system into the projectile itself so it could continue to observe the target and control the shell during flight. The proximity fuse, developed during World War II for antiaircraft munitions accomplished this control in a single dimension, detecting a target with a miniature radio transmitter and detonating the shell at the optimum time. Extending control to further dimensions and adding rocket motors for propulsion produced guided missiles.

Today, numerous military systems, including tanks, aircraft, and submarines, have their own specialized fire control systems. Guided missiles rely on fire control to find, track, and select targets. Large, computerized command and control systems, such as Sage and BMEWs for air defense, and NTDS and *Aegis for naval warfare, also inherited the legacy of fire control and made significant contributions to computer science. The problem of directing fire against rapidly moving targets still drives military technology, even in public perception. The *Stark* and *Vincennes* incidents in the Persian Gulf in the 1980s, the questionable

performance of the Patriot missile system in the *Persian Gulf War (1991), and the continuing controversy over ballistic missile defenses such as the *Strategic Defense Initiative all illustrate that fire control remains a critical and difficult component of American technological warfare.

DETERRENCE is an exercise in coercion: it involves the use of threats and/or promises to dissuade an adversary from undertaking some action it might otherwise have taken. In political science terms, one entity, A, is said to have deterred another entity, B, if B, influenced by A's explicit or implicit threats or promises, chooses to refrain from certain activities. From A's perspective, deterrence represents an effort to achieve A's goal of preserving some aspect of the status quo by obtaining B's compliance, rather than by physically preventing an alteration in that status quo. From B's perspective, deterrence represents A's deliberate manipulation of B's calculation of costs and benefits to make acceptance of the status quo more attractive than challenging it.

For deterrence to operate, two conditions must exist. First, A must possess an effective coercive strategy—some combination of negative and positive sanctions large enough to shift B's evaluation of the desirability of a particular action. Negative sanctions for noncompliance may be of three sorts: denial of benefits; retaliation; or punishment. Second, A must be able credibly to commit itself to carrying out its effective coercive strategy. Because imposing negative or positive sanctions is unlikely to be cost-free for A, A's capacity credibly to commit itself may be problematic. Credible commitment to threats and promises can be established in three ways: by taking steps, *ex ante*, to ensure that the costs of failing to carry out threats and promises exceed the costs of carrying them out; by arranging for the threats and promises to be carried out automatically (as in "Dr. Strangelove's" fictional doomsday machine); or by ensuring, *ex ante*, that decisions to execute sanctions will be made irrationally, without due attention to costs and benefits.

Though both are exercises in coercion, deterrence differs from *compellence* in what A demands of B. In deterrence, A seeks to convince B not to undertake particular actions. In compellence, A seeks to force B to undertake particular actions. The distinction is between coercion aimed at preserving the status quo and coercion aimed at changing it. Deterrence is likely to be easier to accomplish than compellence because deterrence does not involve a deadline for action and is less likely to involve a visible and humiliating act of compliance, and because, whereas deterrence simply maintains the status quo, in compellence it is unclear where A's demands will end once B begins to make concessions.

Deterrence and compellence both involve coercive uses of power by A to achieve its goals indirectly, by obtaining B's compliance. They differ from direct uses of power aimed at achieving A's desired outcome regardless of B's behavior. This difference yields the distinction between deterrence and *defense*. Deterrence aims to reduce or eliminate B's interest in undertaking certain actions, and its success rests on A's capacity credibly to commit itself to harm B. Defense aims to reduce or eliminate B's capacity to hurt A or A's interests: its success rests on A's capacity to disarm, defeat, or protect against B. A's ability to limit or eliminate B's physical capacity to impose pain on A is irrelevant to deterrence, but is the essential element of defense. Measures aimed at defense may be *preemptive* (that is, may involve destroying or neutralizing B's capabilities before B has an opportunity to use them); *active* (defeating, repulsing, or blunting B's actions); or *passive* (protecting items of value against the consequences of B's successful actions).

The distinction between deterrence and defense is evident in alternative *Cold War strategies developed for dealing with the possibility of a Soviet nuclear attack. The Assured Destruction and Mutual Assured Destruction (MAD) doctrines enunciated by Secretary of Defense Robert S. *McNamara, and the various strategies of controlled nuclear retaliation developed after the early 1960s, reflect the logic of deterrence: they acknowledged the vulnerability of American society to a Soviet attack, but aimed to protect the territory of the United States by credibly committing it to exact appropriate retribution. By contrast, *active* defenses like the proposed Sentinel thin area defense antiballistic missile (ABM) program of the late 1960s, or broad missile defenses like those envisioned in President Ronald *Reagan's 1984 *Strategic Defense Initiative (SDI), reflect the idea of defending against, rather than deterring, an attack.

Though deterrence has always coexisted with defense as an element in American military policy, the development by the end of World War II of effective long-range airpower, missile technology, and atomic weapons simultaneously rendered defense more difficult and increased national capacity to threaten an adversary with massive suffering. Insightful observers like Bernard Brodie noted almost immediately the basic implications of these technological developments for American security policy. The Eisenhower administration's explicit incorporation of nuclear deterrence—"massive retaliation"—into U.S. defense planning in 1954 as part of its "New Look" in national security policy sharply accelerated the development of deterrence theory, principally by civilian analysts and scholars.

The early theorizing of the immediate postwar period was supplemented in the late 1950s and early 1960s by careful analyses by Brodie, Herman Kahn, William Kaufman, Klaus Knorr, Thomas Schelling, Glenn Snyder, and Albert Wohlstetter, among others, who explored the problems of achieving credible commitment, assuring "second-strike" capability, enhancing stability in situations of mutual vulnerability, using threats of limited and controlled retaliation to make nuclear deterrence credible even while American cities remained hostage, and employing arms control to enhance crisis management and arms race stability. This theorizing provided the blueprint for American nuclear strategy and arms control policy from the mid-1960s until the administration of Ronald *Reagan. With SDI and particularly with the end of the

Cold War, the focus of U.S. nuclear policy shifted increasingly from the problem of deterrence to the problems of defense against limited nuclear attacks, as well as nuclear proliferation.

DEWEY, GEORGE (1837-1917), American admiral and popular naval hero. Dewey was born in Montpelier, Vermont, in 1837 and graduated from the U.S. Naval Academy in 1858. He served with distinction at the battles of New Orleans and Port Hudson during the *Civil War and ended the war as a lieutenant commander. He served in varying peacetime assignments, including command of the sloops *Pensacola* and *Narragansett*. Dewey spent the 1890s in Washington as chief of the Bureau of Equipment, president of the Lighthouse Board, and president of the Board of Inspection and Survey. In 1897, with the support of his Vermont senator, Redfield Procter, and Assistant Secretary of the Navy Theodore *Roosevelt, Dewey was appointed to command the Asiatic Squadron, based in the Far East.

Dewey's squadron was at Hong Kong when the *Spanish-American War began in April 1898. The U.S. Navy had long-standing plans to attack the Philippines in the event of war with Spain, and on 1 May 1895, Dewey led his squadron boldly into Manila Bay, disregarding reports of sea *mines at its narrow entrance. In a few hours Dewey had destroyed the antiquated Spanish squadron in the Philippines and blockaded Manila. News of the dramatic victory in the Battle of *Manila Bay, achieved without the loss of a single American life, made Dewey a popular hero and set in motion a chain of events leading to the U.S. annexation of the Philippines.

Following his return to the United States, Dewey, now promoted to the rank of admiral of the navy, flirted briefly with a run for the presidency, then settled down to preside over the General Board, the navy's first military planning organization. Under Dewey's stewardship, the board prepared plans for possible war with Germany and Japan and dealt with such questions as the location of naval bases in the Pacific, ship characteristics, and Navy Department organization. He died in January 1917 having served as a trusted naval adviser to three presidents.

DISCIPLINARY VIEWS OF WAR: ANTHROPOLOGY

Anthropology seeks the type of comparative explanations that are lacking in histories of specific wars or in the synchronic analyses of social and political science. Because of anthropology's access to the archeological and ethnographic data, it is well placed to analyze not only the causes of specific wars but also the origins of warfare itself.

The definitions of warfare anthropology uses to achieve this special focus are a source of continuing debate; in part because of these problems in defining *war, some anthropologists turn to the study of *peace, seeing war only as socially dysfunctional. However, most definitions of war draw attention to its collective and socially sanctioned nature, allowing its distinction from the great variety of human behaviors that demonstrate *aggression and violence.

How, and with what causal significance, individual motivations, biological predispositions, and sociocultural purposes are manifest in warfare is therefore the substance of anthropological debate. In addition, anthropology's perspective allows special investigation of the persistence, positive consequences, and sociocultural variation in the practice of war. Traditionally, anthropology concentrated on the first two issues, and a number of derived causal models dominated the literature.

Biological models stressed the links between human and other primate violence, as well as the putative links between success in war and success in reproduction. The inference was that violent conflict was a critical factor in shaping human evolution and that this *natural* selection produced a *cultural* predilection for "war" (Napoleon Chagnon, in Haas, 1990). More recently, biological anthropology is beginning to decouple small-scale human warfare from simplistic evolutionary models (Knauff, 1991), but the problem remains that even if genetic selection were occurring in war, this still wouldn't explain why or how a change from war to peace occurs.

Ecological models suggested that war has a positive feedback for smaller-scale societies by playing a hidden role in mediating relationships with the environment. Warfare was ethnographically noted to maintain space between settlements and so prevent resource degradation, or to provide a means to ensure the fluidity of settlement patterns critical to the practice of low-intensity agriculture or nomadic pastoralism.

Social-structural models developed the idea that certain types of social organization (or the lack thereof) impelled people to war. The antagonistic constitution of clan and lineage groupings, or the lack of any overarching authority

in nonstate societies, were observed to create perennial tensions that might erupt into war.

However, the shortcomings of such models become very apparent when trying to explain the particular motivations and meanings that warriors give to their acts. The reductive nature of these models thus made many aspects of warfare—especially such phenomena as torture, cannibalism, or head-hunting—even more obscure, something to be assigned to the “primitive savagery” of tribal societies. Yet, cultural values clearly affect the pragmatics of war. *Hermeneutic* approaches have revealed the symbolic and ritual influences that modulate modes and intensities of armed conflict. Case studies show the importance of ritual performance in forms of reciprocal warring, as well as illuminating the links between symbolic schema and the practices of cannibalism and trophy taking.

This kind of approach leads to wider debate on “cultures of resistance,” where the study of violent conflict in tribal societies is integrated with the study of terrorism, state repression, or “guerrilla warfare. It is important to note that such approaches suggest that *external* linkages often underlie internal cultural patterns of conflict and violence; this is particularly evident during the regional intrusion of colonial powers or the local collapse of state authority.

Such recognition represents the starting point for the other main strand of current anthropological theory, which stresses *diachronic* processes. Like the hermeneutic approaches, historical anthropology suggests that there is no one cause for war, and that the specific circumstance of conflict must condition our explanations. Commitment to historical explanation means that questions are also asked about the origins of observed levels of conflict, and about the factors underlying their persistence. Previously, anthropology generally accepted the premise that tribal war was a given, part of what must be a long-standing pattern of behavior. Recent work reacts against this presumption and through the concept of the “tribal zone” brings together a nuanced analysis of the hermeneutic approach with a historical appreciation of how external relations are critical in patterning a given war complex.

A *tribal zone* is defined as a spatial and conceptual arena affected by the proximity of state systems, but not under direct state control. European global colonialism is an obvious context in which this has occurred, but the implosion of a nation-state is also an important context.

The consequence of being located within a tribal zone is rapid sociocultural transformation, occurring through the linked processes of militarization and tribalization. *Militarization* refers to the growth in armed collective violence, whose purpose, conduct, and technology rapidly adapts to the threat of state expansion or collapse. This often leads to the emergence of *ethnic soldiering*, whereby collective identities become indissolubly linked to military capabilities—either as specialists in state armies, or as guerrillas in opposition to them. *Tribalization* is the social corollary of this process, through which collective sentiments are transformed into overt political principles, as seen in the emergence of authoritarian or charismatic leaders during times of war. There is also an increasing rigidity in sociocultural boundaries and a burgeoning economic dependency on an intrusive state system or transnational institutions.

The main implications of these recent theoretical innovations for the future anthropological study of war are,

first, that the militarizing effects of state expansion or collapse typically precede ethnographic or journalistic accounts of local warfare, and so cannot be taken as direct evidence of other people's predilection for war. Second, that state systems tend to intensify existing local levels of conflict and rarely suppress them, except through an even deadlier application of force. Third, that tribe/state interactions, not just existing indigenous cultural patterns, produce observed levels of warfare. In turn, local warfare may be transformed through these external links into new forms of violence emerging as banditry, terrorism, or guerrilla conflict. Ethnic sentiment is not the direct cause of war but can itself be a consequence of those extraneous factors that structure many “tribal” conflicts, or those wherein nation-states confront ethnic minorities.

DISCIPLINARY VIEWS OF WAR: CULTURAL HISTORY

The study of the cultural history of war is the analysis of the ways groups and individuals ascribe meaning to military conflict: in anticipation, during such conflict, or in its aftermath.

Research has concentrated on four specific areas. The first focuses on the role in military history of *popular culture*, understood as the codes, gestures, and forms of voluntary associations and collectives, elaborated not through the “state but in civil society and through the marketplace. These associations engage in leisure activities at home while war goes on elsewhere. Through such activities they express commonly held notions about the rights and wrongs of military conflict, the nature of military service, and views of the “enemy. In every war, entrepreneurs sell items or services that derive from these forms of expression. Profit and “patriotism frequently go hand in hand. Here the emphasis is on the evolution of propaganda, not necessarily manipulated from above, but consonant with prewar cultural forms and modes of expression, like music hall, organized sports, or the cinema. The destination is a deeper understanding of what may be termed *wartime culture*, or the negotiation of consent through entertainment or other cultural activities.

Examples of this kind of research include the analysis of the intersection of the history of motion pictures with the two world wars. Newsreels are usually manipulated forms of disseminated information. Cultural historians recognize this area, but turn more frequently to the commercial film industry and its indirect messages, which by that very fact makes them subtler and more powerful carriers of ideas about war than officially produced films or newsreels.

The second area of research concerns the impact of war on *cultural forms*. Here the emphasis is on writers, artists, and other workers in the field of cultural reproduction. Many are deeply affected by their own military service, and spend years elaborating the echoes and nightmares that inhabit their imagination. Others turn to political activism

and use their art to convey messages about war to the yet unknown world.

Edmund Wilson's study of American writing after the *Civil War, *Patriotic Gore*, is a case in point. Here the echoes of the *Civil War were heard in areas of American cultural life not usually associated with the conflict. Oliver Wendell Holmes's "cosmic skepticism" is one kind of cultural outcome of war with consequences far beyond the field of military affairs.

The third area well developed in this field is the analysis of the *indirect effects* of war on other cultural forms, such as notions of gender, insanity, or race. Here the focus is less on war and its representations than on the way war highlights or deflects notions of difference between classes, races, ethnic groups, or men and women.

Much attention has been focused on the "overfeminization" of women in wartime, their relegation to a maternal role less threatening to patriarchy than their continued participation after the war in industrial employment. Notions of racial injustice have also been explored in the aftermath of maltreatment of African Americans or other racial and ethnic groups while in uniform, or simply as suspect groups in wartime. The mass incarceration of Japanese Americans during World War II is a subject that highlights the effect of war on preexisting racial and ethnic prejudices.

The history of Post Traumatic Stress Disorder (PTSD), in existence long before it was recognized as a medical syndrome in 1980, is a subject that has drawn many scholars in the field of cultural studies and medical history. It throws considerable light on the way we understand mental illness and on the evolution of its treatment.

The fourth area of research is the study of *sites associated with war*. The Tomb of the Unknown Soldier in Arlington National Cemetery and Maya Lin's Vietnam Veterans' Memorial are just two such sites; thousands exist in towns and parks surrounding battlefields. The iconography, preparation, and reception of these sites are central parts of American cultural history.

DISCIPLINARY VIEWS OF WAR: CAUSES-OF-WAR STUDIES

The causes of war have puzzled Western thinkers since Thucydides attributed the Peloponnesian War to fear of the growing power of Athens. Machiavelli thought that war was the natural order of things and fighting the first business of the prince. Immanuel Kant noted that states with republican regimes were more peaceful than other states, an insight that anticipated a flurry of scholarship at the end of the *Cold War.

The systematic study of the causes of war, however, emerged only in the twentieth century. The greatest achievement in the field was stimulated by World War I. Following that unexpectedly costly and protracted war,

scholars sought its causes in biology, psychiatry, politics, statistics, anthropology, history, and other disciplines. A group of scholars at the University of Chicago sought to synthesize these disciplinary analyses. Working from 1926 to 1942, they produced the monumental *A Study of War* under the authorship of political scientist Quincy Wright.

Wright developed a four-tier model of the causes and nature of war. Animal warfare, he believed, was driven by biological instincts. Primitive war was driven by the nature of society. What he called civilized war, that is, war among states after the appearance of civilizations, was driven by the nature of the international system. And modern war, war after 1500, was driven by technology. The primary drive in each era, he believed, dominated the shaping of war but did not entirely eliminate the drives still extant from previous eras.

Historians and political scientists have taken the lead since Wright in exploring the causes of war. Kenneth Waltz influenced many successors with *Man, the State, and War* (1954), a three-tier model similar to Wright's but without animal warfare. Subsequent literature in the field may be divided among those that look for the causes of war in individual behavior or decision making, the political imperatives of individual states, or the anarchy of the international system. As yet, no general theory has captured a consensus. Historians such as Michael Howard—*The Causes of War* (1983)—and John Stoessinger—*Why Nations Go to War* (1974)—have attempted to generalize from specific cases without reducing their conclusions to theory. Neither political science nor historical discipline has succeeded in integrating theories and explanations of nuclear war with those of conventional war.

Scholars in other disciplines have also continued to study the causes of war. Anthropologists, sociologists, biologists, psychologists, and economists have all advanced theories. Whole new disciplines, such as conflict resolution and peace studies, have grown up around the topic. One tendency within this scholarship has been to define war more broadly than heretofore and to seek to understand the nature of all large-scale, organized intergroup violence. Yet little interdisciplinary work has followed in the tradition of Quincy Wright. With the end of the Cold War, two scholarly communities, one at Rutgers University and another at Duke University and the University of North Carolina at Chapel Hill, have turned their attention to interdisciplinary study of this topic.

DISCIPLINARY VIEWS OF WAR: DIPLOMATIC HISTORY

In a simpler time, diplomatic historians wrote about what diplomats did. And in that simpler time, *war was war, *peace was peace, and the twain met only when countries exchanged declarations of belligerence or negotiated armistices and surrenders. Consequently, although the diplomatic historians had much to relate regarding how wars began and how they ended, they had little to offer about war per se. They covered events up to the moment the antagonists broke diplomatic relations, and resumed the story when the belligerents began suing for peace. Alliance diplomacy, in those cases when the United States had allies, gave them partial employment for the duration.

But just as the diplomats left the fighting itself to the generals, so the diplomatic historians left war to the military historians. For every chapter the diplomatic historians devoted to American participation in World War I, they wrote a dozen on the period of American *neutrality or on Wilsonian peacemaking. The road to Pearl Harbor quickly grew crowded with diplomatic historians explaining how the United States got itself to 7 December 1941; the same generation of diplomatic historians found far less to say about the global conflict that followed.

But the traditional treatment broke down under the unusual circumstances of the *Cold War. The superpower struggle belied the conventional dichotomy between war and peace; Americans now found themselves in a chronic condition that was neither one nor quite the other. Moreover, the principal U.S. armed conflicts of the Cold War—in Korea and Vietnam—were undeclared, partially proxy contests, and never provoked the United States and the Soviet Union to break diplomatic relations. (Relation breaking—the traditional precursor to belligerence—had been another reason the diplomats left war to the generals: wars put them out of business.) But the diplomats found themselves busier than ever during the Korean and Vietnam Wars, struggling to keep those limited conflicts limited. Diplomatic historians, who habitually shadowed diplomats at a distance of five to thirty years, found themselves necessarily drawn into this no-man's-land.

In addition, even as the context of diplomacy was changing during the Cold War, so was the context of diplomatic history. Starting in the 1960s, the American historical profession experienced a revolt against elitism. The study of governing groups and ruling classes gave way to investigations into the lives of common people. Women and racial and ethnic minorities were judged more interesting than white males. Political history was supplanted by social and cultural history. On nearly all points, traditional diplomatic history came under attack: its subjects were overwhelmingly white and male; they operated, even if they didn't always originate, as an exclusive elite; and their actions were frequently quite removed from the concerns of ordinary folks.

It was a toss-up whether the assault from within the academy or the changing reality of the Cold War was the more responsible, but between the two influences the diplomatic historians altered their approach to war. It certainly was not coincidental that the alteration accelerated with the souring of the American intervention in Vietnam—the single event of the Cold War that went farthest toward discrediting diplomatic elites and rebutting received notions regarding the nature of war. Quite obviously, the diplomats had got things horribly wrong. The diplomatic historians, in order to understand the error and prevent its repetition, needed to lift themselves to a higher plane of understanding. The diplomats had misconceived the social and cultural roots of Vietnamese resistance; the diplomatic historians must make such social and cultural roots central elements of a new, more inclusive, and presumably more enlightening diplomatic history.

The earliest reexamination involved the origins of the Cold War. Historians being the reflexive regressionists they are, this in turn provoked a fresh look at previous wars. Radical revisionists like Gabriel Kolko saw the Cold War as the inevitable outgrowth of decisions made during World War II; John Lewis Gaddis and other moderate “post-

revisionists” interpreted the outgrowth as not exactly inevitable but still strongly influenced by developments of the war years. Atomic revisionist Gar Alperowitz was even more explicit in describing the last shots of World War II as the first shots of the Cold War. Others among the new generation of diplomatic historians (now often restyled “historians of American foreign relations,” a label designed to encompass unofficial relations as well as the official ones dear to the diplomats) applied the revisionist analysis to World War I. N. Gordon Levin, Jr., found the battle between the belligerents in the Great War to be less instructive than the jockeying for position between Woodrow *Wilson and Lenin; Lloyd C. Gardner perceived the war as part of a larger American drive for ideological hegemony.

The first wave of revisionists typically stayed within the bounds of traditional diplomatic history, if not within the traditional lines of war and peace; gradually, however, the culturally inclined exponents of the “new diplomatic history” gained a voice. Foremost among these was Akira Iriye, who interpreted the Pacific War less as a clash of American and Japanese arms than as a long-building collision between American and Japanese cultures. Iriye was comparatively highbrow, as the culturalists went, concentrating on the more literate representatives of the Pacific Rim cultures. John W. Dower took a lower road, -examining popular wartime stereotypes in all their scurrilousness. An entire school of interpretation adopted the same tack for the *Vietnam War: the failure of American culture, it was discovered, predestined the United States to defeat in Indochina.

The cultural-egalitarian approach didn't convince all diplomatic historians, many of whom pointed out that whether one liked it or not, elites wielded power, especially over foreign policy. Yet, unwilling, in an age of academic multiculturalism, to be seen as apologists for tradition, some diplomatic historians adopted what amounted to an elitist alternative to multiculturalism, namely, multi-archivalism. These researchers deliberately decentered the debate and deprived the United States, traveling to foreign archives and taking pains to write from the perspective of foreign governments. Pains were indeed often required, since few foreign governments granted anything like the access to internal records that Washington did (although the end of the Cold War resulted in opened archives in certain formerly Communist countries). That most international conflict of the Cold War—the *Korean War—was a natural candidate for the internationalist approach. Strikingly, the insights the internationalists provided forced only modest revisions of traditional views on the subject.

DISCIPLINARY VIEWS OF WAR: ECONOMICS

Wars are often assumed to be special cases in which the normal principles of economics do not apply. In fact, however, economics has much to say about wars, and much to learn from them.

Consider first the financing of wars. There are numerous ways of raising the necessary resources. The government can, for example, simply commandeer resources from its own citizens or from its enemies. *Conscription has been the most important example of commandeering in the United States. But in terms of financial resources, three have been predominant: borrowing, taxing, and printing money.

But which source, or combination of sources, of finance is best? In his *Wealth of Nations* (1776), Adam Smith argued that when a war is financed by debt, there is only a small increase in taxes: the increase needed to meet the interest on the debt. The smallness of the increase, Smith argued, conceals the cost of the war and weakens opposition to it. Raising taxes high enough to pay expenses as they are incurred ("pay-as-you go") would mean that wars were accompanied by sharp increases in taxes, and that "Wars would be in general more speedily concluded and less wantonly undertaken."

For almost two centuries this was the orthodox view. It was challenged in the 1940s and 1950s by Keynesian economists, but the major challenge is more recent. A number of economists, including Robert Lucas and Marvin Goodfriend, have argued that high wartime taxes distort the allocation of resources. Governments, according to these economists, should smooth tax rates over time by issuing debt during a war and gradually retiring afterwards. Economics has come full circle: the policy that Smith rejected is the new orthodoxy.

What about simply printing money? There has been no reversal on this question: economists, with few exceptions, have rejected it. First, printing money produces inflation, and undesirable redistributions of wealth—the classic problem of widows and orphans living on fixed incomes. Second, inflation produces attempts to economize on use of cash that reduce efficiency. In the extreme case, barter replaces the use of money. But printing money has its advantages. First, printing money, unlike taxing, does not require an administrative bureaucracy. This explains why printing money was the primary source of finance in the * Revolutionary War and for the South in the * Civil War. Second, the government may be able to blame "shortages" or "war profiteers" for the inflation, thus concealing the costs of war. Finally, the distortions produced by a moderate inflation may be similar to those produced by various taxes. For these reasons, printing money has been used to finance part of all wars in the United States.

Economists have also been concerned with how labor is procured for the armed forces. Smith, and the economists who followed him, argued that the state should rely on a paid professional army because normally it could defeat even a much larger part-time militia, another example of the increased efficiency produced by the specialization of labor.

Modern economists have continued to prefer paid professional forces. During the Vietnam era, economists such as Milton Friedman and Walter Oi took an active role in the debate over the draft. One of their points was that the

budgetary savings from conscription are illusory. What the taxpayer saves—the difference between what a conscript would have to be paid to induce him or her to serve voluntarily and the pay the conscript actually receives—does not go unpaid; it is paid by the conscript. Hiring military personnel, moreover, reduces the output loss in the civilian sector because the most highly paid, and therefore most productive, workers remain in the private sector. Thus, the draft illustrates the conflict between efficiency and equity. Efficiency calls for paid professionals, but the result may be a "rich man's war and a poor man's fight." In the Revolutionary War and the Civil War, draftees were allowed to hire substitutes. This reduced the output loss in the civilian economy, but produced bitter resentment. In the twentieth century, the United States chose conscription combined with exemptions designed, in part, to minimize damage to the civilian sector.

During nineteenth-century wars, the United States generally left the allocation of resources within the private sector to the market. In World Wars I and II and the *Korean War, however, the government tried to control the private sector with price controls, rationing, and bureaucratic controls over investment. Partly, these policies reflected the loss of confidence in the market. Some economists argued that wars were a special case in which benefits of planning outweighed the costs. During a war, for example, one of the strengths of a market economy, its ability to generate information about the tastes and preferences of the public, is of great importance. Whether in fact the array of controls imposed during these wars improved the equity or efficiency of the economy is a matter of debate.

Economists have also contributed by measuring the long-term costs and benefits of *war. The main point is to look beyond government budgets to the losses in physical and human capital. In the North during the Civil War, and in the two world wars, the United States suffered little direct damage to its physical capital. In World War II, moreover, it is not even clear that the capital stock was less at the end of the war than it would have been if peace had continued, because the war restored full employment and the government invested directly in new plant and equipment that was useful in peacetime. Losses in human capital have been even harder to assess. One complicating factor is that the United States has been able to make good much of its wartime losses of human capital by altering its immigration policies.

In addition, economists have attended to the institutional legacy of wars. At one time it was believed that the Civil War created an array of institutional changes (freedom for the slaves, transcontinental railroads, a national banking system, and so on) that produced rapid industrialization after the war. That thesis, however, has been challenged and the case remains open. Similarly, it has been argued that World War II left the United States in a unique position in the world economy, which created the basis for rapid expansion until the 1970s. This case also remains open.

These examples may be sufficient to illustrate the value of economics in the study of war, and the challenges that still await economists and economic historians.

DISCIPLINARY VIEWS OF WAR:
FEMINIST AND GENDER STUDIES

Feminist questions about *war and *peace challenge a number of basic definitions, identifications, and exclusions. These challenges are both theoretical and archival; they have changed the way that we understand men's as well as women's experiences.

The traditional doctrine of "separate spheres" for men and women assumed that war was men's business, peace that of women; men were "just warriors," while women were "beautiful souls" (see Jean Bethke Elshtain). As Harriet Hyman Alonso has shown, some women pacifists have embraced the view that the experience or concept of maternity inclines them to pacifism. Combat belonged to the public arena, and was opposed to the private hearth for which war was allegedly waged. In an extension of this paradigm that has sometimes fostered misogyny, men were understood to be at the battle front, while women remained safe at the home front.

These assumptions have all been challenged by feminist studies such as Cynthia Enloe's *Does Khaki Become You? The Militarization of Women's Lives* (1983), the double issue on women's peace studies of *Women's Studies Quarterly* (1995), and "Twentieth-Century Women in Wartime," a special issue of the *International History Review* (1997).

One of the factors enabling a reassessment of the relationship between war and the construction of gender has been the shift by historians from a study of events to the study of social structures, the economy, and mentalities. Feminist historians have as a rule rejected the understanding of war as a set of material or political facts. Critical to their analysis has been the distinction between *military combat*, which in most Western cultures has been an exclusively or predominantly male activity, and the larger phenomenon of *war*, which involves political structures, economic organization, and social hierarchies, and thus affects noncombatants as well as combatants, women as well as men.

Conventional views hold that the knowledge of combat divides male soldiers from women and other civilians. The line is drawn not only in fiction by men, but in that by women, from Edith Wharton's *A Son at the Front* (1923) to Bobbie Ann Mason's *In Country* (1985). This view, however, does not allow for the nature of modern warfare, with blanket bombing, group massacres, and increasingly remote technology that blurs the line between men pushing buttons and women assembling electronic weaponry.

Historians now argue that women's wartime experiences carry them across most of these theoretical lines. Undercutting the distinction between battle front and home front, scholars like Enloe have shown that women of different kinds have always been at "the front," as sutlers

selling provisions, "Camp followers," nurses, wives, or as victims of theft and violence by occupying forces, and sometimes as fighters themselves. In the study of women in the military, interest has revived in controversial women who cross-dressed in order to fight, reaching back to such figures as Deborah Sampson, who fought during the *Revolutionary War; Loretta Janeta Velasquez, whose *The Woman in Battle* (1876) recalled her service as a lieutenant in the "Confederate army; and Emma Edmonds, whose autobiography, *Nurse and Spy in the Union Army* (1865), supported her subsequent campaign for a pension. Women, in short, have not been exclusively passive, pacific, or victimized. The line between battle and home front is also complicated by the "mobilization of noncombatants for military purposes (e.g., in munitions, "communications, and auxiliary services).

A further fundamental challenge comes from feminist work on the coexistence of military structures with peacetime politics. The sharp distinction between war and peace has been eroded. So has that between a formally constituted military force and the network of informal, linked institutions such as prostitution or industrial suppliers. This erosion has necessarily revised the temporal definition of war experience. The aim of war to inflict pain (see Elaine Scarry), forces the examination of the long-term consequences of wartime violence both for those firing guns under fire and for their victims. Once we recognize pain as a goal of warfare, we can better understand the impact of war on women. The memorializing of war in museums tends to fetishize weaponry, but work on the trauma of Holocaust survivors and of Vietnam *veterans (including nurses as well as soldiers) brings us closer to the ramifications of war.

By distinguishing between the social reality and the symbolic construction of gender roles, some scholars have explored how significant social and economic shifts in women's assigned roles during wartime could fail to endure in the postwar period (see Higonnet, et al.). Women have drawn on traditional images of their role as moral (endorsing abolitionism, pacifism, or maternalism) in order to justify wartime entry into the public sphere. World War II images of Rosie the Riveter anchor the heterosexual order while permitting women to enter a male world, according to Maureen Honey and others. The feminist interest in the representation of masculinity and femininity has also fostered fresh work on the wartime gendering of the enemy (as effeminate), of politicians (as impotent), and of women (as unsexed), by feminist scholars such as Susan Jeffords. This turn to questions of language has been accompanied by a renewed study of the eroticization of aggression and violence.

Revisionist historians argue that the variety of women's wartime experiences behind the lines depend? on their class, ethnicity, geographic location, or political alignment. The *Civil War contributions of Northern and Southern women, for example, are now distinguished by such scholars as Elizabeth D. Leonard, in *Yankee Women* (1994), Catherine Clinton, in *Tara Revisited: Women, War and the Plantation Legend* (1995), and Drew Gilpin Faust, in *Mothers of Invention: Women of the Slaveholding South in the American Civil War* (1996).

In order to explore this variety, feminist historians have also turned to new kinds of resources—not only memoirs or letters but oral history interviews, as in Sherna Gluck's

Rosie the Riveter Revisited (1987). While earlier histories focused on elites, this new work extends the reach of history to women of the working classes, including women of different ethnicities, whose lack of literacy, leisure, and a forum prevented them from recording their experiences. These new methodologies aim to revise former exclusions and broaden our understanding of the scope of war.

DISCIPLINARY VIEWS OF WAR: HISTORY OF SCIENCE AND TECHNOLOGY

The history of science had its roots in intellectual history; it studied the ideas of great men. George Sarton launched the field on its modern, independent trajectory with the creation of the journal *Isis* in 1912 and the History of Science Society in 1924. The history of technology had its roots both in the history of science and in economic history. Its autonomy as a field began with the founding of the Society for the History of Technology (SHOT) and the journal *Technology and Culture* in 1958.

Until World War II, historians of science paid little attention to *war and the military, in spite of the fact that both loomed large in the lives and work of scientists as disparate and renowned as Archimedes, Galileo, and Lavoisier. The few exceptions, such as Robert Merton's classic *Science, Technology and Society in Seventeenth-Century England* (1938), prove the rule; Merton, in fact, was a sociologist. In contrast, historians of technology appreciated the importance of military topics before the creation of SHOT. For example, the standard multivolume reference works all have extensive coverage of military topics: Charles J. Singer, et al., *A History of Technology*, 8 vols. (1954-84); Maurice Daumas, éd., *Historiè général des techniques*, English trans. by Eileen B. Hennessy, 3 vols. (1970); and Melvin Kranzberg and Carroll Pursell, eds., *Technology in Western Civilization*, 2 vols. (1967). The last work actually was sponsored by the Department of *Defense.

Lewis Mumford's *Technics and Civilization* (1932) established a benchmark among pre-World War II studies. In this synthetic, richly interpretive overview of Western experience, Mumford identified four loci of what he saw as the deterioration of civilization from its natural, organic state to a perverse, mechanistic, artificial corruption that had set in during the modern era. These loci were the soldier, the miner, the cleric, and the accountant. The soldier was responsible, in Mumford's view, for the regimentation of life and work and the subordination of the individual to the group.

In 1932, Mumford had hoped that the twentieth century, a period he called the *neotechnic era*, would witness a return to natural, organic values. Instead, civilization continued to disappoint him, prompting his two-volume study, *The Myth of the Machine* (1967-70). In the second volume, *The Pentagon of Power*, Mumford portrayed the *military-industrial complex as the sad culmination of the

mechanistic, authoritarian tendencies he had first identified in *Technics and Civilization*. The greening of civilization had failed to materialize.

Other works appearing in Mumford's prime were less judgmental. For example, Carlo Cipolla, an economic historian, argued in *Guns, Sails, and Empire* (1965) that the West had established hegemony over the world's littoral in the early modern period by exploiting the superior military technology of the heavy cannon and the side-gunned sailing ship. Lynn White, Jr., argued in *Medieval Technology and Social Change* (1962) that the introduction of the stirrup in eighth-century Europe empowered the mounted warrior and thus catalyzed the feudal system. Both books have been interpreted as indulging in technological determinism. This claim places them in the same category as Jacques Ellul's *The Technological Society* (1964), an alarmist tract lamenting the loss of human agency in the face of increasingly autonomous technological imperatives.

Against this interpretation has emerged a school of thought generally described as *social constructivist*. Adherents of this school, whose roots are in European sociology, argue that all technologies are socially constructed, that is, they take their form and their role in society from human decisions. An excellent example of this kind of analysis is Donald MacKenzie's *Inventing Accuracy: An Historical Sociology of Nuclear Missiles and Guidance* (1990). That the debate between these two schools remains unsettled is manifest in Merritt Roe Smith and Leo Marx, eds., *Does Technology Determine History? The Dilemma of Technological Determinism* (1994).

Many important works have escaped this controversy. For example, Merritt Roe Smith's *Harpers Ferry Armory and the New Technology: The Challenge of Change* (1977) explored the revolution in small arms manufacture that lay behind the so-called American System. In the process he called into question America's purported love affair with technology.

A related issue, military conservatism, received its most influential treatment in Elting Morison's *Men, Machines, and Modern Times* (1966), especially in his seminal essay "Gunfire at Sea." Morison eschewed the temptation to stereotype the military, arguing instead that "military organizations are really societies, more rigidly structured, more highly integrated, than most communities, but still societies." Their response to technological change, he believed, differed in degree but not in kind from that of other societies. Military officers in general and naval officers in particular had good reasons to cherish proven technologies and to resist innovation; after all, they risked their lives and the lives of their subordinates on that technology. Arms and equipment that had been proven in battle were bound to appear more secure and trustworthy than new technology yet to win its spurs. Morison went so far as to argue in another article that we would do well to recognize "the destructive energy in machinery." His examination of the navy's skepticism about the revolutionary warship *Wampanoag* after the *Civil War presents naval conservatism in a new light, almost as an early aversion to the dangers of autonomous technology.

The great irony about traditional military conservatism toward technological change is that it reversed itself completely after World War II. This was the first war in which the weapons deployed at the end were significantly different from those with which it was launched; the most famil-

iar examples are jet aircraft, ballistic *missiles, proximity fuses, and, of course, the atomic bomb. These developments convinced the services that the desideratum of modern war was shifting from industrial production to technological development. The next war would be won in the research laboratory fully as much as the factory. Thus began the hothouse environment of military research and development that produced a new *arms race, military-industrial complexes in the United States and abroad, and the expansion of military interest and funds into new realms, such as computers, *communications, space flight, microelectronics, astrophysics, and a host of other fields.

Many scholars writing in this environment found their views and conclusions shaped by the *Cold War and the military-industrial complex. Perhaps the most influential was William H. McNeill, whose *The Pursuit of Power: Technology, Armed Force, and Society Since A.D. 1000* (1982) explored the relationship between technology and war through the second millennium. McNeill believed that free enterprise had driven the explosion of military technology in the late Middle Ages and early modern periods, only to be replaced by command economies in the twentieth century. Under state direction, these economies drove the nuclear arms race, which threatened human survival. Implicit in McNeill's work was a belief that historians should understand, expose, and perhaps deflect a military-technical trajectory that seemed headed to Armageddon.

The topic has attracted historians of science as well. Following the lead of scientists themselves, historians of science turned increasingly after World War II to military topics in general, and the moral and political implications of *nuclear weapons in particular. The ethical concerns about developing weapons that some scientists have had throughout history were magnified in the twentieth century as scientific knowledge and expertise were bent on producing weapons of mass destruction—gas in World War I and most especially the atomic bomb in World War II.

Between 1950 and 1990, a significant body of scholarship explored the military-industrial complex, the making of science policy, the ethical position of the scientist, and the militarization of universities and other centers of scientific and technical research. Paul Forman provided a benchmark in this scholarship with his seminal study, "Behind Quantum Electronics: National Security as Basis for Physical Research in the United States, 1940-1960," *Historical Studies in the Physical and Biological Sciences*, 18 (1987). Others have expressed many of the same concerns. Michael Sherry's *The Rise of American Airpower* (1987) finds "technological fanaticism" in the infatuation with strategic bombing that gripped American air force officers after 1930. In *Forces of Production* (1984), David Noble demonstrates the ways in which military imperatives shaped the development of numerically controlled machine tools in the United States. Stuart W. Leslie saw a perverse military influence on two of America's leading research universities in *The Cold War and American Science: The Military-Industrial Complex at MIT and Stanford* (1993). The end of the Cold War seems to have shrunken this branch of scholarship, but it is unlikely to entirely disappear.

Meanwhile, the best scholarship in the history of science and technology combines solid grounding in the technical material with rich contextualization. For exam-

ple, Hugh G. J. Aitken's *Taylorism at Watertown Arsenal: Scientific Management in Action* (1960) explores the military roots of American technological and industrial practice. Daniel Kevles's *The Physicists* (1964) reveals the ways in which physics and war shaped each other in the United States. Richard Rhodes examines the *Making of the Atomic Bomb* (1986) with unprecedented insight and precision, virtues also present in his sequel, *Dark Sun: The Making of the Hydrogen Bomb* (1995). As the Cold War recedes into history, it may be expected that historians of science and technology will be less influenced by the passions of that conflict and even more inclined to see war and the military as important contextual issues.

DISCIPLINARY VIEWS OF WAR: MILITARY HISTORY

Certainly in Western Society, given the frequency of warfare, it could be said with only slight exaggeration that before the eighteenth century little history of any kind was written that was not "military" history, and in antiquity virtually none. Homer might claim to be the first military historian, and Thucydides is still often considered the greatest, while the *Anabasis* of Xenophon continued to be read until the eighteenth century, not only for the heroic story it had to tell of the Greco-Persian conflict, but also for its shrewd advice about the conduct of war. The work of the Romans Polybius, Livy, and of course Julius Caesar also survived the so-called Dark Ages to be revived in the Renaissance for their didactic value, as were the more analytic works of Aelian and Vegetius. Medieval military studies were of less value to the practical soldier. They had consisted, on the one hand, of heroic epics such as the Song of Roland, and the anecdotes of the Crusades put together under the title *Gesta Dei per Francos*, or, a little later, the chronicles of Holinshed and Froissart (to name only the best known); or, on the other, of handbooks of chivalric practice that bore little relation to the grim reality of medieval warfare. It is not surprising that serious students of "war in the sixteenth century turned back to antiquity for guidance, as did Niccolò Machiavelli with his *Discourses on Livy*, and the Netherlander Justus Lipsius, whose studies of Polybius laid the foundation for the military reforms introduced into Europe by the house of Orange-Nassau that were to transform the conduct of war until the age of Napoleon.

The military historiography of Europe in the sixteenth and early seventeenth centuries was as diffuse and episodic as the nature of warfare itself. It was not until the middle years of the seventeenth century that the simplification of the chaotic Thirty Years' War into a century-long contest between the power of France and the Habsburg Empire made it possible to write histories that were more than chronicles of episodic sieges or, very infrequently, of battles. The works of that epoch that have worn best are the memoirs of the remarkably literate and civilized aristocrats who conducted the wars. In 1660, the vicomte de Turenne published his *Memoirs*, and the vicomte de Puységur his historically based *Instructions Militaires*. In 1680, Count Montecucculi produced his own account of the campaigns he had conducted against the Turks. In these works, historical narrative combined with strategic and tactical analysis to lay the foundation for military history as it was to be understood for the next 200 years.

By the eighteenth century, historians were beginning to study contemporary campaigns as they had previously studied those of classical antiquity, as a guide to military action in the future. The foundation by all major European powers of military colleges for the training of officers created a steady demand for their works. Frederick the Great produced dry but useful accounts of his own campaigns, but the first serious analytic study is usually considered to be that of Henry Humphrey Lloyd on the Seven Years' War, *A History of the Late Wars in Germany*, which was published in 1766 and was translated into German with an extended commentary by G. F. von Tempelhoff in 1783. But this was overtaken in the 1790s by the years of almost continuous warfare unleashed on Europe by the French Revolution and then the Napoleonic era, which was to be accompanied by a deluge of military history that even now shows little sign of diminishing.

To single out any single work on the Napoleonic wars would be invidious, although for English-speaking readers William Napier's *History of the War in the Peninsula* (1828-40) will always enjoy pride of place for its spectacular narratives. The most influential near-contemporary study embracing the whole period, however, was certainly that of Antoine Henri *Jomini, whose *Traité des grandes opérations militaires*, initiated in 1804 and constantly revised until 1851, not only covered the Revolutionary and Napoleonic wars in their entirety but collated them with the campaigns of Frederick the Great in a single synoptic overview of "modern war" that was to be immensely influential throughout the nineteenth century. The historical studies of his contemporary and rival Carl von *Clausewitz, mainly published after that writer's death in 1832 and written primarily as preparatory studies for his subsequent masterpiece *On War*, made less impact, even within his native Prussia, until his disciple Gen. Helmuth von Moltke made them compulsory reading for the Prussian General Staff beginning in the 1870s.

With von Moltke (1800-1891), the writing of military history underwent a transformation, which was itself part of the general historiographical revolution initiated in Prussia in the nineteenth century by Leopold von Ranke and his followers. The task of the military historian, in the eyes of von Moltke, was to be of service to the military profession, and that historian's primary duty was to discover exactly what had happened in war; a task, in major warfare, of almost impossible complexity. In Moltke's view, all attempts to glorify armies and their commanders, to recreate the horror and splendor of battle, even to draw broad didactic conclusions, had to be subordinated to the precise, scientific description and analysis of events; a task best carried out, not by individuals—certainly not civilian individuals—but by professional research teams under the auspices of the General Staff. The first such study was that which Moltke commissioned, and very largely wrote himself, on the Franco-Austrian War of 1859, which was followed by immensely detailed works on the Austro-Prussian War of 1866 and the Franco-Prussian War of 1870. Thereafter, the War-Historical Section of the German General Staff earned its keep by detailed archival studies of Prussia's earlier wars, until the turn of the century brought it new wars to study, particularly the Anglo-Boer War of 1899-1901 and the Russo-Japanese War of 1904-05.

In this as in all other military matters, Germany set the standards for other military powers. European armies es-

tablished Historical Sections in their General Staffs to study their own and others' campaigns on a documentary basis, producing works as massive as they are now unreadable. Those of the French are an exception: their studies of military developments in the eighteenth century were models of analysis and readability, and some of their writers, notably Jean Colin, emerged as major military historians in their own right. Colin's *Les transformations de la guerre* (1912) remains one of the best surveys of the development of warfare from antiquity to the twentieth century yet written.

By the beginning of the twentieth century a huge gap had thus opened up in Continental Europe between the narrowly specialized military histories written by military professionals and those addressed to wider audiences by civilian writers, who were often not professional historians at all. It was a highly professional historian who first attempted to reverse the trend, the German Hans Delbrück; who criticized the specialized approach of his military colleagues; and who in 1900 published the first volume of his *Geschichte der Kriegskunst im Rahmen der politischen Geschichte* (*History of the Art of War in the Framework of Military History*). He aroused the wrath both of his academic colleagues and of the German High Command, who were united in the belief that civilians had no business to be meddling in military matters. But his work reintroduced military history into the mainstream of general historiography. Although it would take the best part of half a century for this fully to take effect.

In Britain and the United States, military history never became quite so narrowly specialized as in Continental Europe, for the obvious reason that in those countries the military, let alone its General Staff, commanded far less influence. In Britain it is true that a Historical Section was established at the beginning of the twentieth century under the Committee for Imperial Defence. It published exhaustive studies of the South African and the Russo-Japanese Wars, and did the same with a multivolume history of World War I. Of the latter, the monographs by F. Aspinall Oglander on the Gallipoli and by Cyril Falls on the Salonika Campaigns have some value, but the sheer weight of material overwhelmed the authors of the volumes on the western front, which are now of value only for the source material they provide. In the United States, the War Department first dealt with the history of the *Civil War in a multivolume work, *The War of the Rebellion ... The Official Records of the Union and Confederate Armies* (1880-1901), an invaluable documentary collection that the editors wisely did not attempt to turn into a history, official or otherwise.

Ample material about U.S. military historiography will be found elsewhere in this volume. Here it must suffice to say that, even more than in Britain, military history was regarded as too serious a matter to be left to the military, and even when the U.S. armed forces initiated their massive multivolume surveys of World War II, they employed civilian historians to edit and write them. In both countries the best military history was often written by men of letters who were neither military men nor necessarily academic. For Britain one need only cite Thomas Babington Lord Macaulay's *History of England* (1858-62), with its account of King William's Wars, continued by his great-nephew George Macaulay Trevelyan in *England Under Queen Anne* (1930-34), and the still definitive study of *Marlborough*,

His Life and Times by Winston S. Churchill (1933-34). In the same genre one can cite the works of Francis Parkman on *France and England in North America* (1865-92). The more general work of George Bancroft and Benjamin Lossing also comes into this category. Academic historians who specialized in the history of war, as did Sir Charles Oman at Oxford with his pioneer studies of war in the Middle Ages and the sixteenth century, were rare, and in universities the study of military history remained marginal.

The most prolific military historians in the early part of the twentieth century, especially in Britain, thus tended to be serving or retired military men; and three of these, Col. G. F. R. Henderson, Col. J. F. C. Fuller, and Capt. B. H. Liddell Hart, were responsible for influential historical studies of the American Civil War. Teaching at the British Staff College at the turn of the century, Henderson focused on the Civil War as the best model for the British military to follow in their future campaigns, and in 1903 published a detailed two-volume study of the campaigns of "Stonewall" Jackson to show how small forces skillfully led could defeat larger ones. In 1929, Fuller, as part of a project for devising a new theory of war for the industrial age, published a work on *The Generalship of Ulysses S. Grant*; and the same year Liddell Hart, in vindication of his own theory of "The Indirect Approach," produced a study of William Tecumseh Sherman. Both these writers, however, were too concerned with promoting their own new approaches to military strategy to write entirely dispassionate appraisals.

After World War II such detailed and didactic analyses fell out of favor. The scope of that war was too vast to be covered by detailed campaign histories; and although these appeared in plenty from both official and unofficial authors, the planners of both the American and the British official histories arranged to cover political, economic, and social aspects of the war as well. The official German history, *Das Deutsche Reich und der Zweiten Weltkrieg*, which began to appear in 1979 and is also written by civilian historians, is even more eclectic in its approach. These cooperative projects not only broadened the scope of military history; they introduced the subject to many young professional historians who were later to make it their life study.

It was now that Delbrick was to come into his own. *Military history* became almost too narrow a term to embrace the expanded studies of war that were written by professional historians after World War II. Seminal was Karl Ritter's four-volume study of the German military before and during World War I, *Staatskunst und Kriegshandwerk* (1954-68), which followed Delbrick in placing the history of the German army in its political and social context. Also influential was a new translation of Clausewitz's *On War* (published by Princeton in 1976), which revived interest not only in Clausewitz's definition of war as a political act, but in his reminder that the conduct of war varies, chameleonlike, with differences in national and regional culture. In Britain and the United States, military historians cooperated with their colleagues in the political and social sciences in joint projects of war studies, strategic studies, war and society studies, and even peace studies. In the disturbed international environment of the "Cold War, some of those attracted the support of the armed forces and of private foundations.

Past eras were reexamined to discover, not so much how wars were fought as why they were fought in the way that

they were, and how warfare influenced and was influenced by the structure and ideology of the societies that fought them. The work of Geoffrey Parker on Europe in the early seventeenth century, of André Corvisier on France in the *ancien régime*, of Peter Paret on Prussia in the Revolutionary and Napoleonic era, are only a few examples of what was becoming known in the United States as "the New Military History." The old military history, however, did not fall out of favor, as much of the huge quantity of studies published about the Civil War during and after the centenary of that conflict bears ample witness. Meanwhile, British military historians continue to rake over the embers of the campaigns of World War II in search of relics of their nation's era as a great military power. Recently, however, military historians of various nationalities have been devoting increasing attention to the complex and tragic campaigns of World War I, while writers of American military history have also reexamined the Korean and Vietnam Wars.

Military history, in fact, for long an area neglected by professional historians, has now become a nucleus whose splitting and expansion is causing an explosion, the creative potential of which is still far from being exhausted.

DISCIPLINARY VIEWS OF WAR: PEACE HISTORY

Only recently have some historians begun to integrate peace research into scholarship as a legitimate alternative perspective on the past. Previously, to the extent that pacifists, peace advocates, and peace movements were even included in historical monographs and textbooks, they were usually treated negatively—denounced as misguided idealism or even traitorous.

Since the 1960s, however, the number of peace history scholars has grown significantly. The field itself—defined as the historical study of nonviolent efforts for peace and social justice—has become widely recognized, accepted as a subfield of the discipline of history, and as part of a larger multidisciplinary approach known as Peace Studies.

In 1995, the primary professional association, the Peace History Society (PHS; formerly the Conference on Peace Research in History) had nearly 300 members, mainly in the United States and Canada. Founded in 1964 after the "Cuban Missile Crisis, the organization grew during the "Vietnam War, and again during the international tensions of the late 1970s and early 1980s. An affiliate of the American Historical Association, recognized as a significant non-governmental organization by the "United Nations, the Peace History Society sponsors sessions at the annual conferences of leading historical associations. It also publishes a newsletter and a quarterly journal, *Peace & Change: A Journal of Peace Research*.

Peace historians generally see themselves as engaged scholars, involved in the study of "peace and "war, and in efforts to eliminate or at least restrict armaments, "conscriptio, nuclear proliferation, colonialism, racism, sexism, and war. As a social reform movement, the work of peace historians presents alternatives to the policies they oppose.

Peace history can be classified into three categories. First, *conflict management*, which involves achieving peace through negotiation, mediation, arbitration, international law, and "arms control and disarmament. Second, *social*

reform, which involves changing political and economic structures and traditional ways of thinking. Third, a *world order transformation*, which incorporates world federation, better economic and environmental relationships, and a common feeling of security.

The discipline's basic focus has been historical analysis of "peace and antiwar movements and individuals, international relations, and the causes of war and peace. Two pioneering works in the field were Merle Curti, *Peace or War: The American Struggle, 1636-1936* (1936), and Arthur A. Ekirch, Jr., *The Civilian and the Military: A History of the American Antimilitarist Tradition* (1956).

In the 1960s, a new generation of peace historians, seeking to understand and legitimate past movements for peace and social justice, produced monographs about peace movements and biographies of pacifists and other social activists. Among the pathbreaking works were the 328-volume reprint series, *The Garland Library of War and Peace* (1973-75), edited by Charles Chatfield, Blanche Wiesen Cook, and Sandi Cooper; Peter Brock's study of religious sectarian views, *Pacifism in the United States: From the Colonial Era to the First World War* (1968); Sondra R. Herman's study of peace advocates, *Eleven Against War* (1969); Charles Chatfield, *For Peace and Justice: Pacifism in America, 1914-1941* (1971); Lawrence S. Wittner, *Rebels Against War: The American Peace Movement, 1933-1983* (1969, 2nd ed. 1984); and the PHS-sponsored reference work, *Biographical Dictionary of Peace Leaders* (1985), edited by Harold Josephson.

Numerous monographs surveyed the secular and religious peace movements in the United States in the decades between the 1880s and the 1960s. One of the most prolific authors was Charles DeBenedetti. Before his early death, DeBenedetti edited a work about *Peace Heroes in Twentieth-Century America* (1986); wrote a synthesis and textbook, *The Peace Reform in American History* (1980); and started a study of the *Vietnam antiwar movement, *An American Ordeal* (1990), (completed by Charles Chatfield). A memorial conference to DeBenedetti resulted in Melvin Small and William D. Hoover, eds., *Give Peace a Chance: Exploring the Vietnam Antiwar Movement* (1992).

New subspecialties have appeared in the 1990s, including studies of women and peace, such as Harriet Hyman Alonso, *Peace as a Womens Issue* (1993); and studies of * conscientious objection, such as Charles C. Moskos and John Whiteclay Chambers II, *The New Conscientious Objection* (1993).

The new frontiers in the field today also include transnational studies such as Lawrence S. Wittner's trilogy, *The Struggle Against the Bomb: A History of the World Nuclear Disarmament Movement Through 1953*, 3 vols. (1993-); the relationship between political culture and peace movements, as in Charles Chatfield and Peter van den Dungen, eds., *Peace Movements and Political Cultures* (1988); and the linking of peace movements with social movement theory, as in Charles Chatfield with Robert Kleidman, *American Peace Movement* (1992).

A recent debate, initiated in the January 1995 issue of *Peace & Change*, involves the degree of influence peace history has had on foreign policy or attitudes toward international relations, and whether peace history should seek greater acceptance and influence within mainstream American history or emphasize a separate, activist ethos.

DISCIPLINARY VIEWS OF WAR:

POLITICAL SCIENCE AND INTERNATIONAL RELATIONS

The study of *war in the West goes back to the time of Thucydides, who averred that the cause of the Peloponnesian War was "the growth of Athenian power and the fear this caused in Sparta." The founding of the modern discipline of international relations, however, did not occur until the end of World War I with the endowment of the world's first chair in International Politics at Aberystwyth, Wales. This institutionalization of the field was a result of Wilsonian thinking prevalent at the end of the war that through the use of reason and the spread of education the causes of war could be discovered and eliminated. The rise of Nazi Germany and militaristic Japan led to the collapse of the *League of Nations and the emergence of a "realist" school, which criticized the "idealists" for failing to understand and use power. The credit for shifting the field of international relations from idealist advocacy to realist analysis is usually given to Hans J. Morgenthau's *Politics Among Nations* (1948).

Explanations that emphasize the shifts in power and the struggle for power are the hallmark of the realist school of international relations, which claims Thucydides, Machiavelli, Hobbes, and Carl Von *Clausewitz as its forebears. Realists tend to see war as endemic and a natural occurrence with shifts in power often associated with the onset of war. In the contemporary period, Hans J. Morgenthau, Kenneth N. Waltz, and Robert Gilpin represent the most important thinkers of this school, but none of them has a precise explanation of war. Waltz sees the anarchic nature of the international system (the absence of some form of world governing structure) as a "permissive" cause of war, that is, there is nothing in the system to prevent states from resorting to war any time they choose. But what brings about war in any given instance is not specified. Gilpin comes closest to stipulating the conditions that lead to war by maintaining that the largest wars come about when a rising ascendent *state challenges the dominant hegemony of the system. However, he sees this as only a necessary condition of war, which means that the sufficient conditions are unspecified. Likewise, his explanation leaves unexplained the vast number of interstate wars that do not involve the two strongest states in the system.

Realist work often tends to support its explanations with argumentation and historical analysis. In the late 1950s and early 1960s, the behavioral movement in political science criticized this approach because it tended to "ransack history" by looking for cases that would support its explanations while ignoring evidence that contradicted them. These "behavioralists" wanted to apply the scientific

method to the search for the causes of war. They were inspired by the early work of Lewis F. Richardson, who pioneered the use of mathematical models and statistical data analysis to study war and by Quincy Wright, who employed a broad interdisciplinary approach in his seminal study on the causes of war. J. David Singer founded the Correlates of War project and, building on the efforts of Richardson and Wright, began collecting data on war, capability, and alliances in the hopes that empirical research would be able to delineate patterns as a step toward constructing scientific explanations. A number of other researchers developed and tested scientific explanations of war focusing on capability. These included Organski and Kugler's *power transition*, Modelski and Thompson's *long cycle*, Charles Doran's *power cycle*, and Bueno de Mesquita's *expected utility models* (see Midlarsky, 2000).

Empirical research has produced a number of findings that have not been supportive of simple realist explanations, particularly the notion that a balance of power is associated with peace, or that a disruption of it is associated with war. Singer, Bremer, and Stuckey (in Singer, 1979) find that parity (relative balance) in the international system is associated with a *low magnitude* of war in the nineteenth century, but with a *high magnitude* of war in the twentieth century. Neither parity nor a preponderance of power in the system is associated with the complete absence of war. A follow-up study by Bueno de Mesquita (1981) found no relationship between capability distribution and periods of war or peace in either century. The evidence overall implies that while capability distributions may in certain contexts be associated with wars of high or low magnitude, no particular type of capability distribution is associated with *peace. One of the reasons for this, as Bueno de Mesquita points out, is that a balance of power usually implies a fifty-fifty chance of winning a war, and thus will only inhibit risk-averse leaders. Later work by Buena de Mesquita and Lalman demonstrates the importance of supplementing power calculations with an analysis of domestic political factors in order to explain the decision to go to war.

Realists often assert that alliance making, because it is usually a result of attempts to balance power, can be a force for peace. The research of Jack Levy (1981) raises questions about this claim since he finds that from 1495 to 1975, with the exception of the nineteenth century, most great power alliances (56 percent to 100 percent) have been followed by war within five years. An even more pernicious effect of alliances uncovered by researchers focusing on the post-1815 period is that once war breaks out, alliances can act as a contagion mechanism to expand war.

Among the major states, war does not usually break out with the first crisis. Leng (1983) and Brecher and Wilkenfeld (1997) show that as states go from one crisis to the next, the probability of war goes way up. To date, empirical research has found that the crises that escalate tend to have the following characteristics: they are triggered by physical threats to vital issues; they are one in a series of repeated confrontations, with realpolitik tactics becoming more coercive; a hostile interaction spiral emerges; and there is an ongoing *arms race.

Of these findings, the most controversial is that linking arms races and crisis escalation, first enunciated by Michael Wallace. Paul Diehl (1983) has questioned the validity and reliability of Wallace's (1982) arms race index

and was unable to replicate it. Nevertheless, Diehl's own research shows a relationship between escalation to war and some sort of measure of military buildup and defense burden. Subsequent research by Susan Semple (1997), using Diehl's index shows that, except for where nuclear weapons are present, most disputes occurring in the presence of an ongoing mutual military build up will result in war within five years. She, as with others, also finds that it is extremely rare for disputes in the absence of a military buildup escalate to war.

The findings on alliances, crises, and military buildups have led Vasquez (1993) to argue that power politics itself constitutes a series of steps to war, each of which when taken increases the probability of war between equal states. This suggests that in order to bring about a peaceful system, states must transcend the power politics game and develop ways of making authoritative decisions in the absence of government on some basis other than coercive diplomacy. Research that tries to identify the characteristics of peaceful systems has shown that such systems exhibit efforts to develop a set of "rules of the game" among major states, and embody an acceptance of the *pacta sunt servanda* (agreements must be kept) norm in international law. This suggests, contrary to realism, that the world is not always in a constant war of all against all.

Other research shows that war may be confined to states that have a certain kind of relationship or contend over certain types of issues. Research by Russett (1993) and by Ray (1995) has shown that democracies rarely fight each other. This is thought to be a result of domestic constraints placed on democratic governments by their publics and/or that democratic states develop norms in dealing with each other that promote the resolution of conflict without resorting to armed force. This set of findings supports the idea of a liberal peace promulgated by Kant and recently articulated by Michael Doyle.

Such findings raise the possibility that there might be other zones of peace. Most interstate wars are fought between neighbors; in fact, the only wars not fought between neighbors are those involving major states. For some, this finding suggests that states fight primarily over territorial issues (see Hensel, 1996) and that the probability of war is highest when territorial disputes between equals are handled in a power politics fashion. Vasquez predicts that once neighbors settle their border claims, the probability of their fighting will go way down even if other contentious issues arise.

Research on the termination and impact of war has produced clearer findings than those on the causes of war. States with more revenue have won almost 80 percent of their wars, and states that have suffered a lower percentage of battle deaths in proportion to their population have won about 75 percent of their wars. Being both wealthier and having lost a lower percent of population increases the probability of *victory to 84 percent. Typically, major states defeated in world wars recover, in terms of economic power, in about fifteen to twenty years. World wars are frequently associated with shifts in global leadership, with third parties sometimes benefiting the most. Domestically, world wars tend to increase the power and size of the state, giving it a permanent increase in its tax revenue and expanding its expenditures (Rasler and Thompson, 1989).

DISCIPLINARY VIEWS OF WAR: PSYCHOLOGY

Psychology in the United States became a recognized discipline mainly through work during World War I with the War Department, which needed psychological tests to identify trainable recruits. Work to support American military efforts continued in subsequent decades, particularly during World War II, on such issues as personnel selection, combat training, psychological warfare, and therapy for war-affected soldiers. After 1945, researchers increasingly analyzed the psychological origins of "war. Psychological study of war has expanded recently in part because of the brutality and pervasiveness of ethnopolitical wars, which have powerful emotional dimensions.

Such studies of the origins of war and paths toward "peace employ diverse methodologies. Although much research has focused on individual leaders and their decisions, questions have been raised about the accuracy of psychohistorical studies; the limits of retrospective case studies, interview methods, and content analyses of archival documents; the difficulties of extrapolating from laboratory studies and computer simulations to the real world; and the problems of separating individual actors from the multifaceted, institutional context in which they function. To move beyond individual analyses, psychologists have adopted more appropriate strategies of conducting actual field experiments and case studies of groups, or of measuring attitudes and group behavior in situations of armed conflict. Political psychologists have emphasized the need to embed psychological analysis in a multidisciplinary matrix.

Reflecting the "nature-nurture" controversy that has pervaded psychology, research has examined whether human aggression and war are biologically determined or rooted in learning and political socialization. Studies suggest a universal tendency to separate the in group from the out group and to favor the former while derogating the latter. Some individual "aggression and violence stems from genetic factors, although these interact extensively with ex-

periential factors throughout life. Yet little evidence supports the universality of war, as nearly 20 percent of preindustrial societies neither fight wars nor engage in preparations for war.

Controversy exists over the extent to which destructive conflict arises through competition over scarce resources. Henri Tajfel established that destructive conflict also stems from social categorizations that order one's social world and define one's identity and place in society. Social identity theory posits that people strive for a positive identity and compare their in group with relevant out groups, creating status competition that animates conflict. The quest for positive social identity helps to fuel "nationalism. These theories may be integrated into a more comprehensive framework, since groups compete both for positive identity and status and for scarce resources. Groups often compete for legitimacy, too, and violence may result when a group's identity needs go unmet. Morton Deutsch has integrated cognitive and social competition processes by establishing that conflicting groups often create a malignant social process characterized by excessive competition, cognitive rigidity, misjudgments and unwitting commitments, self-fulfilling prophecies, and vicious, escalating spirals.

Socially constructed memories and perceptions also contribute to inter-group tensions and war. Vamik Volkan noted that unjustly treated groups often enshrine their victimization in chosen traumas that are passed down through generations and that invite future conflict.

Misperceptions contribute to tensions and war. Although real divergences of interest and enmities fuel wars and arms races, biased perceptions often lead to exaggerated fear, hostility, and enmity. In *Fearful Warriors*, Ralph K. White established that strong fears on both sides during the "Cold War created images that portrayed the other as thoroughly diabolical, aggressive, and untrustworthy. Enemy images encouraged the attribution of hostile motives for diverse behaviors, blocked empathy, dehumanized the other, enabled blaming and human rights abrogations, and provided a tool for politicians to stir public fears and rally support for sustained, high levels of military spending. This suggests that it is psychologically advantageous to have enemies, leading people to create enemies even where none exist in reality. When fear and dehumanization are particularly strong, groups may exclude their adversaries from the moral universe, thereby removing restraints that ordinarily limit atrocities. Still, some have criticized White for emphasizing perceptions over hard realities in a Hobbesian environment and for privileging fear over power as the dominant motive behind war.

Diverse processes can skew a leader's decision making particularly under conditions of high stress and uncertainty. Flawed decisions often reflect cognitive limitations, which lead people to use mental heuristics or shortcuts. For example, in the *availability* strategy, one judges a current situation by comparing it with a well-established, readily available pattern in memory. Thus, leaders concerned over the appeasement of Adolf "Hitler at the Munich Conference and his escalating demands might interpret present crises in terms of that pattern, even if the new case does not actually apply. Because of memory limitations, human beings often function as "cognitive misers," who oversimplify and draw lessons from history on a highly selective basis.

Robert Jervis, Richard Ned Lebow, and Janice Gross

Stein have criticized nuclear *deterrence policies by showing that leaders frequently make biased estimates of their adversary's strength, intent, and willingness to fight. However, Philip Tetlock noted that debates about nuclear deterrence are highly speculative since they typically rely on counterfactual arguments such as "What would have happened if event X had or had not occurred?" Much debate continues about whether psychological research is policy-relevant and when it is legitimate for scientists to advocate particular policies.

The interplay of cognitive and small group processes was emphasized by Irving Janis, who showed how U.S. leaders sometimes succumbed to making flawed decisions (e.g., the Bay of Pigs invasion) due to groupthink—a group process in which there is an illusion of invulnerability, unquestioned belief in the group's morality, censorship of dissent, and premature quest for consensus, among other factors. Although Janis underestimated subtle political influences on decision makers' judgments, he identified significant, preventable sources of bad decisions.

Recently, significant growth has occurred in the nascent field of peace psychology, which seeks to prevent destructive conflict at all levels. Scholar-practitioners such as Herbert Kelman have pioneered the use of problem-solving workshops to advance the nonviolent resolution of the Israeli-Palestinian conflict. Recognizing that victims often become perpetrators of violence, some psychologists have developed interventions for healing psychological wounds of war and for promoting collective forgiveness and reconciliation. Interested readers should consult *Peace and Conflict: Journal of Peace Psychology*.

DISCIPLINARY VIEWS OF WAR: SOCIETY STUDIES

Although *war is one of the most important human social activities, the study of war in its social context has remained marginal to both sociology and war studies. Sociology has tended to treat war as an abnormal intrusion into the regularities of social life, rather than a major social institution in its own right. War studies have tended to focus on political, military-strategic, and technological aspects more than on the social or cultural aspects of war.

War and society represents an interdisciplinary area with diverse inputs, and the body of theory is diffuse in origin. Classic strategic thought contains important sociological insights, notably in Carl von *Clausewitz's presen-

tation of war as a type of social action with a distinct logic centering on the mobilization of aggression and violence. He saw war as a unique means of pursuing political goals, but also as analogous to commerce—war is produced in the social organization of men and weapons, which have to be tested in battle rather than the value of commodities has to be realized in the marketplace.

Few social theorists have followed Clausewitz in addressing the character of war as a social activity. Rare exceptions include the Marxian approach of Mary Kaldor, in her study of the oversophistication of Western military technology, *The Baroque Arsenal* (1982), and Martin Shaw's *Dialectics of War* (1988). More orthodox Marxists have tended to reduce war to its political and economic context—looking for social causes—rather than understanding the peculiarities of the kind of social action that war involves. Major sociological theorists of the late twentieth century, such as Theda Skocpol, *States and Revolutions* (1979), Anthony Giddens, *The Nation-State and Violence* (1985), and Michael Mann, *The Sources of Social Power* (1986 and 1993), have also followed this trend by addressing the role of war in the development of states, rather than the nature of armed violence.

More empirically, the field of military sociology has examined military organizations as social institutions. Originating in sociological and psychological studies during World War II, this field burgeoned from the 1960s as Western militaries began the transition from mass armies to an * All-Volunteer force, with such seminal works as Morris Janowitz's *The Professional Soldier* (1961) and Jacques van Doorn's *The Soldier and Social Change* (1975). Military sociology is institutionalized in an international network, the Inter-University Seminar on Armed Forces and Society, which promotes institutionally focused comparative research. It deals less with issues of the wider influence of military values in society, explored for example, in Shaw's *Post-Military Society* (1991).

The majority of war and society studies are historical in character. A few major synthetic social histories, such as William H. MacNeill's *The Pursuit of Power* (1982), have demonstrated the relationships between military organization and weaponry and social, economic, and political change over the modern period as a whole. Some military historians, such as Michael Howard, have written about war in a way that emphasizes its social contexts. Rarely, sociologists have also applied their theoretical insights to past conflicts, as in Tony Ashworth's *Trench Warfare 1914-18: The Live-and-Let-Live System* (1982).

Most historical work is by social historians specializing in a particular period, and concerned with the social effects rather than the causes of war. The largest number of works concerns the two world wars, especially World War II. A central concern is the role of war in causing or accelerating socioeconomic transformations. In a series of works including *War and Social Change* (1974), Arthur Marwick has made a wide-ranging and influential exploration of these relationships. More specialist authors have addressed particular issues such as propaganda, media and culture, and the changes in the status of women and ethnic minorities through participation in war. Feminist historians have particularly contested the assertion of a positive relationship between war and social change, in respect of gender roles.

This assertion is, in any case, a culturally specific

notion, strongly linked to experiences of war in societies like America and Britain that were victorious and uninvaded in both global conflicts. Other experiences of world war—notably in Continental Europe and East and Southeast Asia—were manifestly more disastrous for social groups and entire national societies. The links between total war and *genocide, not only in the politically calculated mass murders of the Nazis and others but also in the technological mass killings of strategic and atomic bombing, bring into question many of the assumptions in studies based on Anglo-American experiences.

A similar problem is manifest in the general absence of studies of post-1945 conflicts. Because these wars have occurred mainly in the so-called Third World and outside advanced Western countries, less academic attention has been devoted to relationships between war and social change here. During the *Cold War period, distant conflicts were mainly of interest for their strategic relevance to the central world division.

Since 1989, it has become evident that wars, in the former Yugoslavia and Soviet Union as well as in Africa, concern complex ethnic, religious, and other social divisions as well as the rivalries of political and military elites. The relationship between war and genocide has once more come to the fore. The role of mass media—not only as propaganda machines in combatant states, but as sources of critical information propelling Western states and the *United Nations into action—has been the subject of numerous studies. This reflects the central fact that for Western societies, wars are no longer arenas of mass *mobilization and direct participation, but mediated experiences.

With the end of the Cold War, therefore, military studies and international relations have partially shifted their focus from strategic and weapons-related issues to the broader social and political context of armed conflict. In this sense, a broadly sociological approach has become more widely influential. The more disciplinary based sociological or sociohistorical study of war, however, remains concentrated on past conflicts and has yet to show much of its relevance to contemporary wars.

DISEASE, TROPICAL. Tropical disease has plagued American forces from the colonial period to modern times. Malaria, dysentery, dengue, and yellow fever (all endemic to the United States), as well as schistosomiasis, yaws, leishmaniasis, filariasis, and scrub typhus (all from other areas), have decimated garrisons and overwhelmed combat troops. To conquer or contain tropical disease, the U.S. military, sometimes cooperating with civilian scientists, developed preventive techniques, therapies, and cures. Collaborative research controlled and even vanquished most tropical diseases except for malaria, whose parasite became immune to traditional antimalarials, and whose prevention and cure remain elusive.

The military historically follows standard civilian practice regarding contagion, diagnosis, and treatment. Before the *Civil War, physicians did not suspect mosquitoes as transmitters, blamed fever on the climate or air, and often could not distinguish one fever from another, treating them with emetics, chinchona bark, bleeding, mercury,

wine, aromatics, snakeroot, or arsenic compounds. During the *Mexican War, physicians at the Veracruz hospital treated yellow fever with quinine sulfate, first extracted from chinchona bark in 1820, to reduce the fever; mustard plasters and baths to help the circulation; and mercurials to evacuate the bowels. About 28 percent of victims died in the spring and summer of 1847. More prevalent was diarrhea or dysentery, which accounted for one-third of all hospital admissions. Quinine proved highly beneficial in treating malaria. During the Civil War, the *Union army had plenty of quinine, but the disease scourged the *Confederate army, which occupied infested areas and had limited supplies. Better sanitation in the post-Civil War period helped curtail communicable disease among troops.

The *Spanish-American War (1898) forced the U.S. Army to lead a fight against tropical disease. American forces could not garrison the islands they had won without controlling yellow fever, typhoid, malaria, and dengue. The work of Maj. William C. *Gorgas of the Medical Corps in Havana (1899) and (as colonel) in Panama (1904-06) in preventive medicine halted epidemics of typhoid, dysentery, and yellow fever, and made possible construction of the Panama Canal. Maj. Walter *Reed and the Army Medical Board in the autumn and winter of 1900-1901 proved scientifically that the mosquito served as intermediate host for the yellow fever parasite. Reed was indebted to Dr. Carlos Finlay of Cuba, Sir Patrick Manson of Britain, and Maj. Ronald Ross of the British army, each of whom had helped prove that the mosquito was the carrier of disease. Their research pioneered the science of tropical medicine. During the early twentieth century, army medical research boards, such as the Philippine Tropical Disease Board, conducted investigations and began control measures that drastically reduced disease around U.S. bases at home and overseas.

By World War II, the development of vaccines, due largely to support from the Rockefeller Foundation, had eliminated yellow fever and typhus. Improvement of field sanitation controlled the dysenteries. Wartime research under the aegis of the National Research Council improved chemotherapy for the prevention and treatment of malaria and secured development of a powerful insecticide: DDT. Those advances, plus the work of army and navy malaria control units, and the enforcement of malaria discipline by personnel (taking atabrine tablets and wearing protective clothing) reduced incidence to historic lows. In the Southwest Pacific, monthly rates fell from 251 per 1,000 in December 1943 to 62 per 1,000 in November 1944; malaria no longer impeded campaigns.

During the *Vietnam War, however, despite research to find better antimalarial drugs or a vaccine, chloroquine-resistant falciparum malaria from Southeast Asia threatened the U.S. armed forces. Drug-resistant malaria continues to be the most important military medical problem of the tropics.

DISEASES, SEXUALLY TRANSMITTED. Venereal diseases, or as the military currently defines them, sexually transmitted diseases (STDs), occur most often in sexually active people less than twenty-four years of age. Because military forces historically have consisted of mostly young people, predominantly young men, often sexually active, the incidence of STD in military personnel has always been two to three times that of a similar matched group of civilians. This rate can rise five to eight times higher during wartime.

Some form of STDs seems to have plagued military forces from earliest recorded history. Herodotus in the fifth century *b.c.e.* wrote that Scythian soldiers who pillaged the Celestial Temple of Venus were infected with a "female disease" that afflicted all of their descendants. The first recorded cases of syphilis appeared in Europe in 1493 supposedly among Spanish sailors returning from the New World. Spanish and French armies soon spread what was called the "Neapolitan disease" or the "French pox" throughout Europe.

Historically, two methods have been advocated for controlling rates of STDs in the U.S. military: punishment of soldiers and support for regulation of civilian conveyors of the disease through regular examination and treatment of prostitutes. Traditionally when rates became high, particularly in wartime, regulation was enforced; when rates returned to baseline levels, the military either ignored the problem or relied upon punitive action. Such shifts in policy occurred during the "Civil War, the "Spanish-American War, and World War I. The primary reason was that the methods of treatment, which consisted chiefly of local applications of antiseptics (containing arsenic, mercury, and bismuth), were only marginally effective. In addition, infected soldiers often did not develop a persistent and immediately debilitating illness, although they often became asymptomatic and infectious carriers. During World War I, the military public health authorities sought to eliminate prostitution in the areas around U.S. military and naval bases.

During World War II, the public health authorities encouraged publicity about venereal disease, breaking a long taboo on public discussion. The advent of antibiotics, especially penicillin, had a dramatic impact on STDs, primarily gonorrhea and syphilis. Another effective preventive measure was the use of condoms, which were distributed to all members of the armed forces.

STDs reemerged as a major problem in the military in the 1960s and 1970s as a result of several new developments. In the wider society, the "sexual revolution" in attitudes and behavior meant that sexual encounters were more readily accepted as a social norm. There was also indiscriminate use of antibiotics, thus reducing their effectiveness. And in 1976, new resistant strains of gonorrhea emerged first in the Far East, then in the United States which within a decade rendered many antibiotic treatments useless. Further, new sexually-transmitted viral agents emerged: herpes; venereal warts (Papilloma virus); hepatitis B; and the deadly "AIDS virus, HIV.

STDs have always been a problem for the military. At-

tempts to control them by changing behavior have had a significant, if temporary, impact. But recent resistant microorganisms and new STDs threaten to bring back the high prevalence rate that existed before antibiotics.

DIX, DOROTHEA (1802-1887), humanitarian, Union Superintendent of Women Nurses in the "Civil War. Born in Hampden, Maine, Dix spent her life as a social activist, dedicated to improving the care and treatment of the insane. Beginning in 1841, she spearheaded the movement to establish asylums—as a social responsibility and financed by public funds—to replace the jails and almshouses in which the mentally impaired were confined. She was responsible, through her remarkable ability to influence people and legislatures, for the founding or enlarging of more than thirty mental hospitals in the United States and abroad.

With the outbreak of the Civil War she offered her services, gratis, to the secretary of war in April 1861. She was given the responsibility "to select and assign women nurses to general and permanent military hospitals." Two months later, she was named Superintendent of Women Nurses.

Dix rented a house in Washington at her own expense, advertised nationally for volunteers, and weeded out those she thought physically or morally unsuitable. She accepted only nurses over thirty years of age and refused to allow Roman Catholic nuns or other religious orders to serve. Independent, autocratic, eccentric, working outside of established lines of authority and assuming powers beyond her responsibility, she antagonized the medical establishment. Military doctors, supported by the U.S. Sanitary Commission, resented her domineering intrusions. Although her authority was reaffirmed by Surgeon General William A. Hammond in July 1862, in October of that year Secretary of War Edwin M. "Stanton issued an order that gave the appointment, assignment, and control of nurses to hospital surgeons and medical directors. Dix was left without authority. She continued to work in the hospitals in the Washington area, however, and did not relinquish her title as superintendent until September 1866.

Dix returned to her interest in the insane. In 1881, ill, she accepted an apartment offered to her at the New Jersey State Hospital in Trenton, where she lived until her death.

DOCTRINE, MILITARY. In any modern army's hierarchy of professional concerns, military doctrine is ranked near the top. Theoretically, a nation's grand strategy sets the terms of reference for its military strategy, which in turn dictates the character of its military doctrines. As a practical matter, however, doctrine behaves much like any other complex of ideas and is governed by the same

considerations as those that influence evolving schools of thought. Framed in this way by its historical and strategic context, military doctrine aims at prescribing the manner in which an armed force will fight.

Fighting doctrines always have been expressions of their time and place, much as any other artifact of military history. Any armed force operates in accordance with a conception of war that evolves as a consequence of its history, the state of military knowledge available to it, the technology at hand, the objectives to which the force expects to be committed, and, not least, the caliber of those who must attempt to give it life on the battlefield. Although modern soldiers expect their doctrines to be explicit, professionally authoritative, and officially sanctioned, for the greater part of American military history the doctrines under which soldiers fought were rarely so all-encompassing, prescriptive, or explicit as they are today. These earlier doctrines are best regarded as loose collections of military folkways. The history of U.S. military doctrine describes a rough evolution from these folkways toward its contemporary forms.

The military doctrines that were brought to America during the colonial period reflected the orthodox European military interests of the day: limited dynastic wars emphasizing sieges and battles between drilled formations of soldiers armed with pike and musket. Important early colonists—John Smith, Roger Williams, John Underhill, and Lion Gardiner among them—had learned their military skills on the Continent.

Implicit in their military orthodoxy was the assumption that one's enemies were mostly like oneself. Colonial warfare against Native Americans permitted no such assumption, however. American Indians possessed their own military habits, most of which were at great variance from those of their European enemies. Native doctrines reflected their tribal origins, in which individual rather than collective purpose governed action. Most often, natives fought for the achievement or preservation of honor or self-esteem within the tribe, and not the kind of state policy war so familiar to the Europeans. Native American warfare favored fighting to satisfy individual aims: skirmish, raid, and ambush; single rather than the collective, orchestrated combat his enemies attempted. And although both sides did militarily acculturate themselves, the Europeans were loathe to forsake their Continental military heritage. The colonial experience thus induced a certain schizophrenia, where a tension persisted between the new world of warfare and the traditions of European orthodoxy.

George Washington and Nathanael Greene embodied this tension during the Revolutionary War. It was Washington's ambition to transform the tiny American Army into one that could stand against British regulars in the stylized tactical fashions of the day. Greene was happier with practicality: he would fight in the orthodox mode when the occasion suited, but he was not so enamored of the European style as his general in chief. Greene developed a form of guerrilla warfare in the south. Washington pined for the climactic, war-winning battle.

The Americans' quest for military respectability led to the appearance of military doctrine in a form that modern soldiers would recognize. In 1778-79, Friedrich Wilhelm von Steuben, Washington's Inspector General, wrote his *Regulations for the Order and Discipline of the Troops of the United States*, a drill manual that would ever after be

known simply as "The Blue Book." Von Steuben based his drills on those he had learned in the Prussian Army, but he tried to tailor them to the particular needs and character of the American soldier. The practical results never quite produced the army Washington wanted, but "The Blue Book" represented the European military ideal for a generation, until in 1812 it was finally superseded by a French manual of arms.

The advent of French military texts in America coincided roughly with the Napoleonic Wars, when the few professional military officers in America began seriously to study the arts of war. The French style became the fashion and remained so for the next several decades. After the War of 1812, Gen. Winfield Scott published the first edition of his *Tactics*, generously indebted to French tactical manuals, which held sway until the eve of the Civil War. *Tactics* hardly acknowledged the realities of war in America, nor did the other tactical manuals produced in the United States during the antebellum years. The dichotomy between European orthodoxy and American necessity achieved its fullest expression when in 1836 Scott himself attempted to employ Napoleonic tactics during the First Seminole War—with predictably dismal results.

American doctrinal thought exhibited a certain retrograde character during the years before the Civil War. Very like their European colleagues, American officers looked nostalgically over their shoulders at Napoleon even as the conduct of battle was changing before their eyes. Technological progress improved the speed, range, and deadliness of small-arms and artillery fire. However, American military writers—Henry Halleck and Dennis Hart Mahan among them—took little notice of these advances. When William J. Hardee's *Rifle and Light Infantry Tactics* finally replaced Scott's *Tactics* in the 1850s, troops were to be arranged in the same close orders as before: Hardee's remedy for the new, deadlier battlefield was to move the troops faster, and his *Tactics* was the definitive Civil War text for citizen officers on both sides.

American soldiers of both armies entered the Civil War thus ready to fight a version of war more than half a century old. A few officers applied themselves to rectifying the disjuncture between doctrine and reality, among them Emory Upton. A reactionary military aesthete, Upton understood the essential tactical problem of his day: how to advance across the fire-beaten zone to close with the enemy. Upton understood that formations must disperse themselves more widely if they were to survive the assault. But dispersing or "opening" formations meant surrendering one's tactical control. Close formations cost casualties; open formations threatened purposeless action. In either case, tactical failure awaited.

Upton was the first to offer solutions. Two years after Appomattox, an army board approved his *Tactics*, the most notable feature of which was his "system of fours," combat groupings of eight or twelve soldiers—forerunner of the modern infantry squad. Upton's "fours" forced combat direction toward the lower ranks.

For the rest of the nineteenth century and well into the next, professional soldiers argued over the proper balance of firepower, mobility, and shock. Where one stood on this question fixed one's views on a host of subordinate issues: whether the offense or the defense was superior in modern war; the benefits of individual marksmanship versus those of massed volley fire; whether formations should be dense

and "robust," or whether they should be "fragile," articulated organizations susceptible to precise tactical control. Such concerns were by no means confined to Americans alone. In all of the advanced industrial nations, soldiers worried over the new shapes of battle.

Some would grumble at the pedantry of these debates, but this intellectual foment also gave rise to schools of higher military education and an institutional home for doctrinal studies. At Fort Leavenworth in the School of Application for Cavalry and Infantry, doctrine boards produced field manuals that culminated in 1891 with the publication of *Infantry Drill Regulations*, as well as manuals for artillery and cavalry. These boards set a new course for field manuals, which previously had aimed only to prepare troops to fight; the new manuals also addressed how to fight. Too, earlier manuals had been known by the names of their authors. The new manuals were regarded as the product of the corporate mind of the army, officially approved and sanctioned, a point driven home in the 1905 edition of *Field Service Regulations* that first carried the imprimatur of the army's newly formed General Staff.

Meanwhile, nearly three centuries of frontier soldiering had produced its own unique school of practices, few of which were reduced to formal knowledge. Horseborne warfare and western geography lent a different character to frontier conflicts after the Civil War, but the clash of military cultures was every bit as dangerous as when Europeans and Native Americans had first met in combat. Although much professional energy was devoted to codifying orthodox military knowledge, frontier doctrines remained mostly implicit, the kind of knowledge communicated informally in garrison and in the saddle, over campfire and on the trail. A collection of beliefs and prejudices, tricks of the trade, fieldcraft, and frontier field doctrine was wholly vocational and often quite ephemeral. There was precious little theory in it.

For all that, it would have been a rare soldier (or sailor) before World War I who could have provided a definition of doctrine or its functions. In truth, the nature of military doctrine was being transformed in those years. Only a few perceived that armies might create doctrine as an expression of their operational philosophy. Navy commander Dudley Knox, and Army captain John McAuley

* Palmer were exceptions who did grasp the larger potential of doctrine. As early as 1914, Knox wrote that the "object of military doctrine is to furnish a basis for prompt and harmonious conduct by the subordinate commanders of a large military force, in accordance with the intentions of the commander-in-chief." Palmer, a pivotal figure in the army, saw how modern warfare demanded a doctrine that transcended training routines. Knox and Palmer agreed that doctrine ought to provide a common basis of understanding and communication for professional soldiers. Palmer especially thought that one dividend of regularly returning General Staff officers to line units was to "spread a common doctrine as to the purposes and ends of training, the means to be employed, and the results to be attained."

Despite such high-minded sentiments, Americans soldiers wrote practical, vocational manuals during World War I. Driven by the necessities of industrialized warfare, twentieth-century armies were forced to learn new technical tasks. The grafting of millions of civilians upon the old professional army demanded instructional literature free

of the empty formalism all too typical of earlier field manuals. The means by which technical military knowledge was rendered into doctrine was already in place, however, dominated by the various branches and their schools, as well as the staff and war colleges and the General Staff itself. The progressive doctrine that Knox and Palmer had envisioned was out of the question. By war's end, doctrine had been thoroughly domesticated: its role was not so much the advancement of military thought and practice as the ratification of orthodoxy.

Thus, military knowledge after World War I advanced without the assistance of doctrine. In only one particular could doctrine be said to have lent itself to innovation. The 1921 edition of *War Department Regulations No. 10-5* contained a list of nine "principles of war." For nearly a generation, Western military thinkers had been calling for a "scientific" approach to the study and practice of war. This, they believed, would lead them to battle's universal characteristics, said to have been embodied in the "principles" of war. The British military historian J. F. C. Fuller had noted them as early as 1914 and after the war had codified eight such principles. Fuller and others held that these were immutable, and that although their actions had always guided the conduct of war, only now had military knowledge advanced sufficiently to recognize and appreciate their existence.

However compelling the scientific analogy, the principles of war kept changing, both in number and content, from edition to edition of American field manuals. This approach to understanding war, while no doubt appalling to philosophers, was highly attractive and deeply satisfying to soldiers. And although the precise meaning of each "principle" was subject to an infinity of interpretations, their most appealing feature was that one could possess in shorthand the military wisdom of the ages.

After World War I, doctrine was of marginal importance to military innovation, becoming instead the creature of anonymous official boards and committees, far from "the best available thought that can be defended by reason"—as one official definition had it. Whether addressing subjects grand or mundane, doctrine was aimed at providing not the best available thought, but the most acceptable thought. By the time a solution to any important question of theory or practice was committed to doctrine—and there were many between the world wars—it bore the army's stamp of official approval. Military intellectuals might have disapproved of chaining doctrine to orthodoxy, but doctrine had become the means by which the army established and enforced military standards. "Doing it by the book" became a figure of speech, and "the book," the field manual was always available if imagination failed, specifying in detail the minimum acceptable standard.

Thus one may read official army doctrines after World War II as a text from which the intellectual state of the army may be deduced. The advent of nuclear weapons quite naturally posed the most extreme challenge to concepts of land warfare and the doctrines that might implement them. But the army failed to offer a credible vision of how it might conduct itself in a nuclear battlefield. The army's chief of staff in the late 1950s, Maxwell *Taylor, was forced to "conjure up" a specious concept whose name was more important than its substance: his "Pentomic" army was merely a reorganization scheme with a Madison Avenue adjective attached. Within five years, even the

army was unable to sustain the fiction that Pentomia had doctrinal credibility.

The Pentomic reorganization might have been the low point in the postwar history of doctrine but for the war in Vietnam, where the U.S. Army clung to the orthodoxies of conventional warfare. The army was reluctant to contend with the doctrinal problems of guerrilla war: that belonged to the class of unorthodox conflict for which it had never felt much affinity. As early as 1962, President Kennedy had directed the army to pay more attention to these forms of conflict. But during the first few years of the Southeast Asian conflict, the military leaders still focused upon the defense of Europe. When the army did finally commit its orthodox forces to Vietnam, it turned a war it did not approve of into one that it did. The agency of this transformation was the heliborne "air cavalry" division, whose innovative design and striking mobility were offset by the stolid manner in which it was employed, applying conventional tactics more quickly. The unreality of this doctrine in the final years of the war contributed importantly to one of the darkest and most frustrating periods in the history of the U.S. Army.

In the aftermath of the "Vietnam War, strategic retrenchment narrowed the scope of American interests once again toward European defense. Against this backdrop, the Arab-Israeli War (1973) offered a glimpse of what might be expected in modern, orthodox warfare: combined arms conflict, characterized by armored speed, high lethality, and precisely guided munitions. That war also seemed to show how far out of date the U.S. Army had become during its years in Vietnam. A group of American generals led by William E. DePuy began a decade-long campaign to modernize the army and, not incidentally, erase the legacy of the lost war in Southeast Asia. DePuy believed military doctrine might be one important means of rejuvenating an army that, everyone agreed, was an institutional wreck.

This high-ranking interest in doctrine in the 1970s and 1980s heralded a new conception of its nature and functions. DePuy and his colleagues harnessed doctrine to several purposes. Doctrine would be made to serve its traditional role of describing how an army fights. But doctrine would also establish the army's public and operational *raison d'être*. Like Dudley Knox and John McAuley Palmer, nearly a century earlier, DePuy thought that doctrine could be progressive, that it could promote the army's modernization, both materially and intellectually. DePuy and his colleagues took a direct, sometimes peremptory, hand in doctrinal reforms from the beginning, and often wrote it themselves. They called their new doctrine "the Active Defense." Doctrine had become generals' business.

It had also become everyone else's business—including civilian scholars and military writers. Because the army had elevated the Active Defense to such a prominent role in its modernization campaign, it achieved an unprecedented degree of public exposure in the late 1970s. The flowering of doctrinal debate did not sit well with DePuy and his colleagues, but the new doctrine, which was widely criticized as unimaginative, and as a defensive prescription for disaster, did galvanize public attention.

Doctrine was no longer of negligible importance in the professional lives of American soldiers. Perhaps inevitably, reaction set in. More than any other American soldier since Upton, DePuy's name was associated with military

doctrine; evidence suggests that part of the reaction against it was reaction to DePuy himself. When DePuy retired in 1978, the critics hoped his doctrine would be overturned. DePuy's successors nevertheless did manage to exercise control over the next doctrinal evolution, which was to be named "AirLand battle."

That new doctrine was published in FM 100-5 to generally favorable reviews in service and defense journals in 1982. The AirLand battle was imagined as a sophisticated, highly orchestrated application of all the army's combat power in conjunction with that of the air force in order to build a chain of successful engagements all pointed toward one operational objective. As a doctrine, AirLand battle was more sophisticated, certainly more attuned to the sort of enemy the U.S. Army might have to face in the years ahead, and it was not so exclusively fixed upon European defense. Ideally, it was hoped, many of its precepts could be utilized anywhere the army might fight. Intellectually, the new doctrine was the product of a cadre of young military intellectuals that had collected at the staff college during the late 1970s. And while the highest-ranking officers of the army acted as the doctrine's patrons, the new field manual was regarded as much less the result of one man's passion.

AirLand battle doctrine has not been substantially revised since 1982. The success of American arms in the "Persian Gulf War, many have argued, can be directly traced to the doctrinal "renaissance" of the 1970s. Modern American soldiers do have a certain appreciation for a fighting doctrine that enjoys credibility and authority; but none would go so far as to argue that doctrine alone can win a war, any more than doctrine alone could lose one.

DOMINICAN REPUBLIC, U.S. MILITARY INVOLVEMENT IN THE. The Dominican Republic, a colony of Spain until the early nineteenth century, shares the Caribbean island of Hispaniola with the republic of Haiti, with which it has had a long rivalry. The two principal U.S. military incursions into the Dominican Republic were the occupation of 1916-24 and the invasion of 1965. The first was integral to the increasing U.S. involvement in the Caribbean, resulting from economic expansion and strategic concerns. The Dominican Republic figured centrally in this process, with its near annexation by the United States in 1871, the announcement of the "Roosevelt Corollary to the Monroe Doctrine (1904) as a foil to the European influence in Dominican affairs and the gradual imposition of U.S. control over the republic's internal political and economic affairs. U.S. corporations had taken over much of the republic's large sugar industry and increasingly domi-

nated its trade. When U.S. efforts at direct control over Dominican internal affairs were thwarted, Washington responded with military threats and actual intervention. Brief armed incursions occurred in 1904, 1905, 1912, and 1914, under Presidents Theodore * Roosevelt, William Howard Taft, and Woodrow * Wilson.

The occupation of 1916-24, initiated by Wilson and his secretary of the navy, Josephus Daniels, was inspired both by previous policy and by growing U.S. fears of Germany's influence in the Caribbean. A military government headed by U.S. Navy and Marine officers, backed by several thousand Marines, displaced the constitutional Dominican government in 1916. Although there was limited resistance initially, opposition became important later in two distinct forms. The first involved a political struggle waged by nationalist elements of the elite and middle class. The second was a five-year guerilla war (1917-22) fought by peasants in the country's eastern region. The event bought the first use of U.S. military aircraft in a guerrilla conflict. Both types of resistance, plus the general unpopularity of U.S. interventionist policy in Latin America and elsewhere, helped cause Washington to negotiate a withdrawal in 1924.

The U.S. occupation government, pursuing goals of stability and development, had implemented various reforms. The principal efforts involved education, public health, public works, and improvement of the weak and highly politicized military. Though serious problems affected all these endeavors, the two most successful were the creation of a modern road network and of a more effective but still politicized military. Both of these accomplishments became crucial to the creation of a dictatorship in 1930, by Gen. Rafael Trujillo, who had risen to power in the mid-1920s within the U.S.-created Dominican military, the National Guard.

There were differences within the U.S. government over Trujillo. Some members of the Congress and elements of the Marine Corps were enthusiastic supporters, with several ex-Marine officers actually holding influential positions in his government. However, the State Department frequently opposed Trujillo, at least until the 1950s when his unconditional support for U.S. positions during the *Cold War led Washington to ignore the abuses and megalomania characteristic of his regime. About 1960, following the Cuban revolution, the inauguration of President John F. *Kennedy, and the formation of internal Dominican forces of resistance, the U.S.-Trujillo relationship shifted. In 1961, Trujillo was assassinated by Dominicans aided by the *Central Intelligence Agency.

In April 1965, a rebellion meant to restore the short-lived (1963) constitutional government of President Juan Bosch was suppressed by the intervention of nearly 23,000 U.S. Marine and Army troops. President Lyndon B. Johnson's decision to intervene, like Wilson's in 1916, had strategic and economic roots, with the difference that the anti-Communist fears of U.S. national security policymakers led Johnson to exaggerate the possibility of the Dominican Republic becoming a "second Cuba." The intervention was unilateral, although Washington soon pressured the Organization of American States to create an Inter-American Defense Force, to which six Latin American countries contributed token forces.

The U.S. role in the events of 1965 remains disputed. The State Department claimed to act as a neutral broker by

separating the warring factions and arranging for elections; yet most scholars conclude that U.S. actions distinctly favored more conservative elements. Their triumph in the 1966 elections, followed by the withdrawal of foreign troops, led to stable but repressive civilian rule. A U.S. Military Advisory and Assistance Group (MAAG) has maintained close ties with the Dominican military since the early 1960s. This relationship has proved important in recent decades as Washington has used its influence to pressure the Dominican military, and its civilian allies, to accept a policy of stability, gradual democratization, and strengthened ties to the U.S. economy.

DONIPHAN, ALEXANDER (1808-1887), lawyer, soldier, and statesman. Born in Kentucky, Doniphan became a prominent attorney there and after 1833 in Missouri. At the beginning of the Mexican-American War, he organized the 1st Regiment of Missouri Volunteers and was elected its colonel.

During a campaign that began in late October 1846 at Santa Fe, New Mexico, and would end at Saltillo, Coahuila, in late April 1847, Colonel Doniphan led an American force that seized control of the capital of the Mexican state of Chihuahua. He also marched into Navajo Territory and obtained a treaty recognizing the U.S. government.

Doniphan then led his troops back to the Rio Grande, on to Socorro and toward El Paso. On Christmas Day, his troops, numbering 856, fought a Mexican force at Tamascalitos outside El Paso del Norte, killing 43 and wounding 150 Mexican soldiers. His force suffered only seven wounded. On 27 December they occupied the city.

On 8 February 1847, Doniphan marched south toward Chihuahua City. On 28 February, he routed the Mexican army in the Battle of Rio de Sacramento and occupied the state capital the next day. The Mexicans suffered 300 killed. After occupying the capital for nearly two months, Doniphan and his men departed for Saltillo on 28 April. They then returned to New Orleans by ship via Brazos Santiago. In one year, Doniphan and his men had covered 3,600 miles by land and 2,000 by water—one of the most successful military marches in U.S. history.

DOOLITTLE, JAMES (1896-1993), Army Air Force Officer. Doolittle, a man of brilliant scientific ability, received one of the first U.S. doctorates in aeronautical engineering from MIT in 1925. He also possessed immense physical and moral courage. After joining the air service in 1917, he transferred to the reserves in 1930. He pioneered instrument flying and won several airplane races. In the 1930s, as

a manager in Shell Petroleum, "Jimmy" Doolittle pushed the development of high-octane aviation fuels, which permitted the creation of the advanced piston engines powering World War II U.S. combat aircraft. He continued to fly as a test and racing pilot, establishing flight time and speed records. After returning him to active duty in 1940, the Army Air Forces in January 1942 selected him to lead the first bombing mission against Japan. The "Doolittle Raid" on Tokyo by B-25 bombers launched from U.S. *aircraft carriers earned him a jump in rank to brig. general and a Medal of Honor. It helped convince the Japanese to launch their disastrous Midway.

In November 1942, Doolittle led the U.S. Twelfth Air Force into North Africa, and in November 1943 he headed the Fifteenth Air Force in Italy. In January 1944, he took command of the Eighth Air Force in Britain, which he controlled until V-E Day. His promotion of aggressive fighter escort tactics gained the Americans air superiority over Germany. After the war, he served on numerous government commissions.

DOUGLASS, FREDERICK (1818-1895), abolitionist, journalist, and orator. Born in bondage on the eastern shore of Maryland, Douglass worked for several different slaveholders in both eastern Maryland and Baltimore between 1818 and 1838. During his youth, Douglass became proficiently literate by reading the Bible and classic orations and listening to the sermons of antislavery black preachers and *Quakers. These experiences later contributed to his unyielding abolitionism and fierce egalitarianism. In 1838, while a ship caulker's apprentice, Douglass acquired free seaman papers and escaped to New York City. He then moved to Massachusetts and became involved in antislavery activism, under the tutelage of William Lloyd *Garrison. Eventually rejecting the apolitical nature of Garrisonian abolitionism, Douglass moved to Rochester, New York, and founded his own abolition journal, *The North Star*. Between 1847 and 1863, he edited that journal and subsequently the *Douglass Monthly*.

A tireless abolitionist, Douglass campaigned for the Liberty, Free Soil, and Republican parties in the 1840s and 1850s, although he opposed a nonextension, gradualist approach to slavery. His activist approach to abolition contributed to his hawkish position once the slaveholding states seceded in 1860 and 1861. Douglass stressed the importance of black loyalty during the *Civil War and actively recruited Northern blacks—including his two sons, who volunteered for the 54th Massachusetts Infantry—for the Union effort. His egalitarianism, however, led to his criticism of the discriminatory pay and promotion practices of the Federal army. Nevertheless, Douglass's investment in assimilation through self-help and racial uplift undergirded his conviction that the rights of citizenship would accompany black military participation—a rationale that, according to one of his intellectual biographers, anticipated W. E. B. *Du Bois's "Close Ranks" argument concerning World War I and the "Double Victory" campaign of the black press during World War II.

DOUHET, GIULIO (1869-1930), Italian general and early air power theorist. Giulio Douhet is remembered best for propounding a doctrine of offensive strategic air attack as a preferable, even more humane, form of warfare than the massive battles of attrition that marked World War I. His bold ideas about *air warfare injected a tremendous energy into the usual strategic discussions of nations able to produce, or procure, such advanced technology. Although it would be incorrect to say that this approach to armed conflict originated with Douhet, his ability to integrate a rapidly expanding body of concepts about aerial warfare provided airpower advocates with a cogent theoretical foundation upon which to build.

Like American airpower adherent Billy *Mitchell (1879-1936), Douhet began his army career at an early age and during a period of national transition. In addition, both men were moved by their advocacy of aviation to dissent vigorously, at times even recklessly, from military orthodoxy. This course eventually led to court-martial, suspension from active duty, and in Douhet's case imprisonment for one year. Unlike Mitchell, however, World War I resurrected Douhet's career. In 1918, he was made chief of the Italian Army's Central Aeronautical Board, a post he held until retiring from service as a general in 1921. Also in 1921, his seminal work on aerial warfare, *The Command of the Air*, was published. In 1922, the Fascist leader Benito Mussolini appointed him head of Italy's aviation program.

Douhet's central argument that future conflicts would be decided by the nation most able to destroy an opponent's means and will to resist through airpower still engenders much debate. Moreover, the ongoing struggle to validate or refute the concepts set forth in *The Command of the Air* suggests a transcendent quality unmatched by other air war theorists. For airmen, in particular, his views gave rise to a tenacious search for the enemy's "vital center"—the perfect target set.

DRAFT. See Conscription.

DRAFT RESISTANCE AND EVASION. Draft resistance in American history has taken many forms, including deliberate lawbreaking for the sake of conscience (*civil disobedience*); direct action to disrupt the draft; noncooperation; and individual efforts to avoid military service (*draft evasion*).

Draft resisters in America have emerged from several distinct traditions. These have included *Quakers, and other religious pacifists, who have been active since the colonial period; abolitionists, who opposed slavery from 1815 until the *Civil War; the social progressive movements from 1880 until World War II; the trade union movement from the turn of the century until the 1950s; and the civil rights and *peace and antiwar movements after World War II.

The Colonial Period and the American Revolution. In the colonial period and the early days of the republic, middle- and upper-class unwillingness to serve in the military

was widespread. Despite George "Washington's frequent complaints about his inability to raise an adequate army, the early Congresses refused to institute a national draft. At the state level, state militias were staffed largely by volunteers, but during specific emergencies such as the Indian wars and the "Revolutionary War, coercive methods were also used. However, men who could afford it could pay fees or hire substitutes to fight in their place.

It was in response to local and state militias that the first draft resisters appeared. The earliest resisters were primarily from religious groups, including the Quakers, who arrived in the 1650s; the Mennonites, including the Amish and Hutterites (1683); and the Brethren (1719). These early religious pacifists refused to fight in the "Native American Wars. Widely considered to be heretics, they suffered many forms of punishment, including fines, whippings, and occasionally executions. Gradually, however, their consistent commitment to nonviolence won grudging acknowledgment from colonial legislatures, which increasingly permitted them exemption from service in militias—Massachusetts in 1661, Rhode Island in 1673, and Pennsylvania in 1757. Such exemptions began the tradition that continued until the 1960s of providing legal exemptions for religious groups while denying them to secular objectors.

The Abolitionist Movement and the Civil War. Opposition to war and a compulsory draft remained widespread in the early days of America, exemplified in the Madison administration's unsuccessful attempt at a national draft for the "War of 1812. From 1812 to 1860, abolitionist organizations such as the American Anti-Slavery Society (1833) and the New England Non-Resistance Society (1838), as well as pacifist organizations such as the Massachusetts Peace Society (1812) and the American Peace Society (1828), included many individuals who opposed war and conscription. During this period, all states and territories required men who wanted to avoid military service in the militias to pay fees or to hire substitutes.

An important influence on draft resistance was Henry Thoreau's article on "Civil Disobedience" (1849). Written during the "Mexican War, the essay was a classic analysis of the individual's duty to refuse to cooperate with immoral government policies.

The Civil War brought the first national draft, with both the North and the South passing "conscription laws. A popular means of avoiding military service was physical disability: of almost 777,000 names drawn in four Northern drafts in 1863 and 1864, 159,400 men gained physical exemptions. Draftees could also hire a substitute or pay a commutation fee (\$500 in the South, \$300 in the North). In the North, 86,700 men paid the fee, while 73,600 provided substitutes. But the most common form of evasion was failing to report. More than 161,000 of the 777,000 draftees simply did not show up for service.

The system of fees and exemptions meant that most soldiers were recent immigrants and the poor. Such a system met violent resistance, most significantly in the 1863 antidraft riots, the worst rioting in the nation's history, in which armed resistance to the draft and to government authority erupted in New York City, Boston, Albany, and elsewhere from the East Coast to the Midwest. Hundreds were killed, including thirty-eight federal draft officials. In the "New York City antidraft riots, poor and working-class immigrants overwhelmed the police for four days, finally re-

treating only when six regiments of troops brought from the Battle of "Gettysburg arrived to restore order.

An additional form of evasion was flight to Canada. Although the total number is unknown, accounts of local draft board proceedings in states bordering Canada are filled with references to men fleeing to Canada to avoid conscription.

Civil War inductees who refused to cooperate were sent to military camps, where many were subject to starvation and torture at the hands of hostile military commanders. In 1864, President Abraham "Lincoln signed the first law offering religious resisters alternative service in hospitals or with freed slaves. Still, a core of "absolutists" refused to cooperate with the draft in any way. Eventually, the Union government exempted them from fees or service of any kind for the duration of the war.

Industrialization and World War I. After 1880, economic and labor conflicts associated with industrialization increasingly influenced the movement against war and conscription. The World War I draft law of 1917 provided exemptions from combat only for "well recognized" religious groups. Payment for substitutes was not permitted. Exempt individuals were required to report for noncombatant service in military camps, where conditions were harsh and pacifists were often treated poorly. Resisters who refused such service were sent to federal prisons, where many were chained to prison walls, sprayed with cold water from fire hoses, made to stand naked outside at night, and beaten. Some prisoners died.

Near the end of World War I, "alternative service" was made available only to members of a small group of traditional religious organizations, thereby splitting opponents of the draft into two groups: those legally qualified for exemption, who were now called *conscientious objectors* (COs), and those with no legal means of gaining exemption.

Despite harsh government repression during World War I, opposition to military conscription expanded beyond the traditional religious groups. Large numbers of political resisters appeared, including socialists and members of labor groups such as the International Workers of the World (IWW), who believed that the war primarily benefitted big business, and the United Mine Workers (UMW), who resented use of the military to break strikes. Among the political resisters, Eugene V. "Debs (of the railway workers union, the IWW, and the Socialist Party of America) was especially influential. Though imprisoned for his speeches urging opposition to the war and the draft, he ran for president while in the Atlanta Penitentiary, receiving nearly 1 million votes in the 1920 election.

Many important antiwar and antidraft organizations were founded during this period, including the "War Resisters League, the American Friends Service Committee, and the "Women's International League for Peace and Freedom, begun by Jane "Addams. The "American Civil Liberties Union (ACLU), created in 1920, grew out of the American Union Against Militarism. Roger Baldwin, ACLU director until 1950, served a year in prison for refusing induction in 1918.

Although 24 million men registered for the draft during World War I, as many as 3.5 million failed to do so, thereby successfully evading induction. Most of these were poor or working-class agricultural and industrial laborers. Among draft resisters, at least 17 were sentenced to death (none

was executed) and approximately 150 received life sentences; hundreds of others received sentences ranging from 10 to 20 years. It was not until 1933 that the last World War I draft resister was released from prison, pardoned by President Roosevelt.

World War II and the 1950s. World War II was the only period in which the draft did not offer middle- and upper-class men legal means for avoiding conscription through deferments or payment of substitutes. With the draft law permitting * conscientious objection on religious grounds, approximately 5,000 men were imprisoned for draft offenses. This group included those who were denied CO deferments, as well as resisters who refused to cooperate with the draft or with alternative service.

Four important trends characterized draft resistance after World War II, culminating in the massive resistance to the * Vietnam War. First, secular resisters became more numerous than religious pacifists and, in a series of important Supreme Courts cases, gradually gained limited legal acceptance. In the most important case, the Supreme Court ruled in its *Seeger* decision (1965) that philosophical and moral—rather than religious—beliefs were sufficient to justify exemption from military service.

Second, “selective” objection to a specific war rather than to all wars became widespread, with many individuals basing claims for exemption upon the Nuremberg War Crimes Trials. To date, however, the courts have refused to permit selective objection.

Third, opposition to the draft spread to many new groups, including opponents of the testing and proliferation of *nuclear weapons. These groups wrote letters to politicians and the press, lobbied Congress, organized protests, and provided direct assistance to draft resisters and military deserters.

Fourth, opposition to the draft was predominantly a middle-class phenomenon, yet the system of channeling upper- and middle-class men into educational and occupational categories that permitted draft deferments meant that draftees were drawn primarily from among the poor and minorities.

The Vietnam War. With opponents of the Vietnam War arguing that draft resistance was a moral and civic duty, opposition to the draft reached a peak in 1964-73. Because so many Americans opposed the draft, individual avoidance of induction became a popular form of resistance. Many men publicly burned their draft cards or illegally returned them to the government; draftees either did not appear for physical exams or devised innovative ways to fail their exams; thousands refused induction. Between 30,000 and 50,000 men fled to Canada or Sweden to avoid conscription. Approximately 600,000 individuals violated the draft laws during this period; 210,000 were formally charged. During the height of prosecutions, draft cases accounted for approximately 10 percent of all cases in the federal courts. Among the hundreds of groups that advocated draft resistance were radicals such as the Resistance and * Students for a Democratic Society; liberals such as Clergy and Laity Concerned; local and regional groups such as New England Resistance; and dozens of groups on college campuses.

Despite the scope of opposition to the draft, the baby boom surplus of draft-age men meant that the Selective Service System was able to provide sufficient manpower for the military. Nevertheless, widespread draft resistance

was a significant influence upon President Nixon's decision in 1973 to end the draft, thereby eliminating one of the major reasons for protest.

In 1980, a system of compulsory registration for the draft was instituted. The major issue facing draft resisters was whether eighteen-year-olds should register with the government, as required by law. Despite the failure of several hundred thousand men to register, only a few outspoken resisters were prosecuted.

In their classic book *Nonviolence in America*, Staughton and Alice Lynd observe that draft resistance has been linked throughout American history to civil rights and labor movements. The *Quakers who refused to fight in the *French and Indian War of 1756 also opposed slavery. Labor leaders and social progressives were among the most outspoken opponents of the World War I draft. Many of the early leaders of the Congress of Racial Equality (CORE), formed in 1943, were from the pacifist *Fellowship of Reconciliation. Abraham J. *Muste, one of the signers of the influential 1964 “Declaration of Conscience” pledging support for men refusing service in Vietnam, began his activism as a labor organizer during the 1930s. The national director of the 1967 Mobilization Committee to End the War in Vietnam was James Bevel of the Southern Christian Leadership Conference, which was directed by Martin Luther King, Jr. From the long history of such links, it is clear that draft resistance and evasion in America have not only been the acts of individuals seeking to avoid military service, but have often been important expressions of broadly based movements for social change.

DREW, CHARLES (1904-1950), physician, surgeon, scientist, and educator. Drew was a pioneer in the field of blood plasma preservation. Born in Washington, D.C., he earned a B.A. from Amherst College in 1926, a medical certificate from Montreal's McGill University in 1933, and a doctorate in medical science from Columbia University in 1940. While studying at Columbia, he theorized that blood plasma could replace whole blood in transfusions because of its long shelflife. During the early days of World War II, Drew became project supervisor of a joint American *Red Cross and Blood Transfusion Betterment Association (BTBA) program to supply war-torn Great Britain with plasma. By January 1941, Drew's efforts proved so successful that Britain no longer needed American blood. Shortly

thereafter, he briefly served as assistant director in a project supported by the Red Cross, the National Research Council, BTBA, and U.S. armed forces.

Previous historical accounts have considered Drew's resignation of his directorship in March 1941 as a protest by an African American against a Red Cross and military edict that ordered blood supplies be separated by race. Although evidence suggests that Drew voiced displeasure at the racial mandate, his departure was also shaped by the desire to pursue a surgical and teaching career at Howard University. Drew died in an automobile accident in 1950.

DRUG ABUSE. *See* Substance Abuse.

DU BOIS, W. E. B. (1868-1963), civil rights leader and author. Born in Great Barrington, Massachusetts, W. E. B. Du Bois earned undergraduate degrees at Fisk University (1885) and Harvard (1890), and a doctorate in history from Harvard in 1895. Du Bois taught history and economics at Atlanta University in 1897-1910 and 1934-44. From 1910 to 1934, he served as founding editor of the *Crisis*, the official organ of the new National Association for the Advancement of Colored People (NAACP).

When his most influential book, *The Souls of Black Folk*, was published in 1903, Du Bois became the premier architect of the civil rights movement in the United States and among the first thinkers to grasp the international implications of the struggle for racial justice. The problem of the twentieth century, he wrote then, was the problem of the "color-line."

Du Bois's legacy is complex. A severe critic of racial segregation, he still enjoined other African Americans to accept, if temporarily, the segregated units and officer training facilities of the U.S. Army in 1917-18—in the hope that wartime military service would lead to full civil rights. An elitist who emphasized the leadership role of a "talented tenth" in the liberation of black people, Du Bois moved increasingly to the Left after World War II, denouncing U.S. "Cold War policies as imperialistic and espousing Communist solutions to problems of race and class. He joined the U.S. Communist Party in 1961 and spent the last two years of his life in Ghana.

DULLES, ALLEN WELSH (1893-1969), lawyer, foreign service officer, and intelligence official. The grandson of one secretary of state and nephew of another, Dulles entered the foreign service in 1914. He spent World War I collecting intelligence in Bern, Switzerland, and subsequently assisted the U.S. delegation to the Versailles Conference and served in several embassies before resigning from the State Department in 1926. A Wall Street lawyer until the United States entered World War II, Dulles enlisted in the Office of Strategic Services. Returning to Bern, he earned a reputation as a master spy and covert operator, especially after his Operation Sunrise produced

the secret surrender of Germany's forces in Italy without Soviet Knowledge.

In 1947, Dulles helped to draft the section of the "National Security Act (1947) creating the "Central Intelligence Agency, and in 1951 he became its deputy director for plans, charged with covert operations and clandestine collection. These were the priorities of 1953-61, his tenure as CIA director. Encouraged by President Dwight D. "Eisenhower and supported by his brother John Foster "Dulles, the secretary of state, he presided over the overthrow of governments in Iran and Guatemala, and the initiation of "U-2 spy planes to overfly the Soviet Union. He neglected research and analysis, however, and the 1961 Bay of Pigs fiasco in Cuba culminated a string of failures. Forced out by President Kennedy, Dulles's final government assignment was to investigate Kennedy's assassination as a member of the Warren Commission.

DULLES, JOHN FOSTER (1888-1959), lawyer, senator, diplomat, and secretary of state. Deeply influenced by his grandfather and uncle, secretaries of state under Benjamin Harrison and Woodrow "Wilson, Dulles devoted his life to foreign affairs. As a young lawyer, he was counsel to the Reparations Commission that helped draft the "Treaty of Versailles (1919). As chairman of the Federal Council of Churches' Commission to Study the Bases of a Just and Durable Peace, he presented to President Franklin D. "Roosevelt a blueprint for the postwar order.

An internationalist, the Republican Dulles frequently served in a bipartisan capacity. From the 1945 "United Nations conference, he represented Democratic president Harry S. "Truman at virtually every major international meeting. Dulles was foreign policy adviser to Republican nominee Thomas Dewey (1948), but after a brief Senate stint, he negotiated for Truman the "Japan Peace Treaty (1951) that ended the occupation while retaining U.S. military bases there.

In the 1952 U.S. election campaign, Dulles attacked the Truman administration for failing to exploit U.S. atomic supremacy in the "Cold War, insisting that liberation should replace "containment" as America's strategy toward the Soviet bloc. In 1953, he became President Dwight D. "Eisenhower's secretary of state.

Dulles did not dominate Eisenhower on foreign policy, as the conventional wisdom once held. The two were agreed on collective security and the need to build strength and cohesion among non-Communist nations. Nor was Dulles a reckless saber-rattier. He did strongly believe in what came to be called the "New Look": the threat of U.S. "massive retaliation" as the most effective means to deter Soviet expansion and aggression. Yet he understood that the threat of "nuclear weapons was not always an appropriate response, and that overseas deployment of U.S. conventional forces was both militarily and politically necessary. Indeed, by the late 1950s he was anticipating the "flexible response" strategy associated with John F. "Kennedy's presidency. Moreover, although Dulles was a "covert operations enthusiast like his brother, Allen Welsh

*Dulles, the CIA director, he opposed direct U.S. military intervention, notably during the 1954 Indochina crisis, but he supported South Vietnam and refused to sign the *Geneva Agreement on Indochina (1954).

Dulles was largely responsible for negotiating U.S. security pacts with Middle Eastern countries and Southeast Asia. But he was usually reluctant to negotiate with the Soviets, and he thrived on crises—the last over Berlin

in 1958-59 even as he battled with cancer. He died in May 1959.

EASTER OFFENSIVE (1972). Knowing that the United States was losing its will to continue the war in Vietnam, the North Vietnamese government in Hanoi decided in January 1972 to attack South Vietnam and thus started the war's largest battle to date. American intelligence knew Hanoi's general intentions, but was wrong on the estimates of the time and place of the offensive. On 30 March 1972—three days before Easter—the North Vietnamese Army (NVA) committed fourteen divisions backed by several hundred tanks and heavy artillery to a three-pronged assault to gain territory and possibly win the war outright.

NVA Gen. Vo Nguyen *Giap, directed spearheads toward Quang Tri and Huế in the northern provinces of South Vietnam, Kontum in the central highlands, and An Loc northwest of Saigon. Initially, South Vietnamese resistance failed, but American advisers such as John Paul Vann and Maj. Gen. James Hollingsworth helped stabilize the ground defense, supported by American airpower and naval bombardment.

Still, in early May, Gen. Creighton *Abrams, American commander in Vietnam, cabled Washington that Saigon had lost the will to fight and the war might be soon lost. The NVA had taken Quang Tri and had put Huế, Kontum, and An Loc under siege. The situation at An Loc was particularly dangerous. If it fell, there was little standing between Hanoi's forces and Saigon. President Richard M. *Nixon authorized a major buildup of American airpower, plus heavy air strikes against Hanoi and Haiphong for the first time since 1968. On 8 May, with Saigon fighting for its life, the U.S. Navy mined Haiphong Harbor to block the flow of Soviet supplies. Ultimately, the South Vietnamese, supported by American airpower, drove the NVA back from the cities and recaptured Quang Tri.

The Easter Offensive cost the NVA dearly. Americans estimated Hanoi lost 100,000 men killed and 400 tanks destroyed. The failure to end the war on the battlefield undoubtedly prodded Hanoi toward the negotiations that led to the *Paris Peace Agreements in January 1973. Three years later, forced to fight without American aid, Saigon could not duplicate its defensive victories of 1972.

During the Easter Offensive, American forces for the first time employed sizable numbers of *precision-guided munitions, "smart weapons." U.S. warplanes used wire-guided bombs to destroy North Vietnamese bridges that had withstood years of attack by conventional ordnance, and American helicopter gunships and South Vietnamese infantry employed TOW * antitank weapons with deadly effect.

EASTMAN, CRYSTAL (1881-1928), labor lawyer, feminist, antimilitarist. Born in Marlborough, Massachusetts, the daughter of two ordained Congregationalist ministers, Eastman was raised in Glenora, New York, graduated from Vassar College, earned an M.A. in sociology at Columbia and a law degree from New York University in 1907. A labor lawyer and reformer, Eastman's first book, *Work Accidents and the Law* (1910), established her reputation and helped create workmen's compensation. A brilliant and dynamic activist, Eastman was a committed socialist, suffragist, feminist, and antimilitarist. She believed military establishments and wars defended business interests and threatened the values she most cherished. In 1914, she was one of the founders of the Woman's Peace Party (later the *Women's International League for Peace and Freedom) and became president of the radical New York branch (1914-19). She also served as executive director of the American Union Against Militarism (1915-17) and helped commit its wartime successor, the National Civil Liberties Bureau (1917-18), to the protection of * conscientious objection and free speech. After the war, she organized the First Feminist Congress in 1919, and helped found the American Civil Liberties Bureau in 1921 (renamed the American Civil Liberties Union in 1923). From 1918 to 1922, with her brother, Max Eastman, she co-owned and coedited the *Liberator*, a radical journal of politics, art, and literature. Until her death in 1928 of nephritis at forty-eight, Eastman worked tirelessly for feminism, social justice, and world peace.

ECONOMY AND WAR. This essay offers a historical description of both the economic consequences of American wars and the manner in which the state of the economy and its mobilization sustained or hindered war's conduct. That approach reveals that war sometimes produced a prosperity that reduced the harmful economic effects of population loss, destruction of capital, disruption of trade, and financial distress.

During the seventeenth century, Native Americans posed the principal military threat to European colonists, who lived mostly in isolated frontier villages. An agricul-

tural economy and physical dispersion left the colonists unable to maintain trained forces. Because Native Americans refused to fight in a European manner, the colonists' slim technological advantages were negated, causing poorly trained militia to adopt savage economic warfare. They attacked the Native Americans in their winter quarters, endangering families and food stocks. The Indians had to submit or starve. Economically, Indian attacks on frontier settlements meant loss of life and destruction of property. In addition to the expense of largely ineffective stockades, countering Indian raids entailed outlays for military supplies and indirect losses when extended conflict took males from farms and shops.

During the late colonial period, Great Britain began calling upon colonists to supply expeditionary forces for imperial campaigns in Canada and the Caribbean. The wartime infusion of British gold and colonial issuance of paper money to pay volunteers and buy supplies usually brought temporary prosperity, and war's death and destruction affected only small bodies of soldiers and a few frontier communities. The imperial wars left Britain deeply in debt and possessed of a vast undefended territory, which prompted its attempts to impose on the colonists the policies that led to the "Revolutionary War.

By 1775, American farmers and craftsmen could provide nearly all of the military goods for American ground forces of sufficient size to counter the army that Britain could maintain in North America. Unable to mobilize those resources, however, Congress failed to bring the Revolutionary War to a speedy conclusion, compounding the loss of life and property.

With foreign loans difficult to obtain and citizens reluctant to buy its bonds, Congress mobilized economic resources by printing bills of credit—paper money—with which to pay troops and purchase supplies. Because state governments failed to impose taxes to return those notes to Philadelphia—and instead issued fiat money of their own—military reverses caused the value on paper money to decline precipitously.

Unable to buy supplies, military commanders resorted to impressment (seizure) of food and animals, undermining civilian morale and burdening farmers nearest the troops. When a forty to one devaluation and specie loans from foreign sources failed to stem inflation the "Continental army remained ill-clothed, ill-shod, and ill-fed.

Independence, once gained, injured the economy by ending British subsidies and American access to British markets, but brought benefits by freeing Americans to sell their goods in any open port. Without access to British merchants, businessmen created new networks within the United States, and tapped a promising national market. Wartime self-sufficiency had forced Americans to manufacturing as never before—at least until postwar British dumping undermined that activity. The war's principal economic victims were the infrequently paid Continental soldiers and their families.

Although the United States lacked the ability to mobilize the necessary resources to achieve its goal of conquering Canada in the "War of 1812, the nation suffered little loss of life and—despite the burning of Washington—property destruction. Financed mostly by the sale of bonds and new excise duties, the war also created relatively few financial problems. The British blockade and prewar trade embargoes led to a revival of American manufacturing and

a postwar commitment to maintain self-sufficiency with protective tariffs.

A stronger administration and an improved economy enabled the United States in 1846 to project its military power deep into Mexico and the Pacific coast. With all but two battles fought on Mexican territory, the United States suffered little property damage during the "Mexican War. Its "casualties were light as was the financial cost of a war that increased the national domain by over a half million square miles.

To achieve its aims during the "Civil War, the Federal government relied upon bond sales, heavy taxes, minimal issue of "greenbacks," and generous contracts to mobilize its superior economy sufficiently to defeat and occupy an area roughly equal to western Europe. Despite unprecedented governmental controls over railroads, foreign trade, agriculture, and business, the Confederacy repeated Revolutionary War financial errors and failed to make effective use of its limited resources.

Along with 260,000 deaths, the Confederacy suffered virtual economic collapse. Military operations and the end of slavery devastated Southern agriculture and destroyed its rail net and nascent industry. Despite a slowdown in the growth rate of the entire nation's economy, wartime inflation created the illusion of greater growth in the Union, whose farmers, meat packers, canneries, railroads, canals, and farm implement makers made substantial profits.

The loss of over 600,000 lives and the intangibles make it difficult to assess precisely the Civil War's economic legacy. What talents fell on the battlefield? What benefits resulted from postwar investment of wartime profits? From skills businessmen acquired when filling large military contracts and distributing goods to far flung armies? From wartime legislative enactment of protective tariffs, a national banking system, a transcontinental railroad, and free homesteads? From the electoral triumph of a political party committed to using Federal power to promote economic development?

Despite the greater intensity of "World War II the parallel circumstances, policies, and consequences of both it and "World War I justify joint assessment. Particularly in World War II, an effective, if gradual, mobilization of its industrialized economy offered the United States a range of strategic options and permitted it to fight a modern, mechanized war, eventually on several global fronts, while also sustaining the military efforts of its allies.

The United States, confounded by economic downturns in 1914 and 1938, first felt the economic stimulation of war while still a neutral. By wars' end, the nation enjoyed unprecedented prosperity, a booming economy pressing on the short-term limits of its capacity, and a vast improvement in its global economic and financial position. In nominal terms, both wars doubled the gross national product. By 1916, the United States had become a creditor nation and seized many formerly European markets in Latin America. By the end of World War II, due to allied losses, America's wartime industrial expansion, and new technology resulting from scientific research and engineering development, the United States dominated its former economic competitors.

While most traditional economic sectors benefited from mobilization, World War I prompted the United States to create a chemical industry, and both wars led to vast expansions of shipbuilding and aircraft production. To meet the

wars' demands and compensate for loss of workers to the armed forces, agriculture increased its mechanization and applied new technologies that boosted output. Though making limited use of government corporations, Washington gained the compliance of private producers largely through controlling scarce raw materials, banning production of inessential goods, offering lucrative contracts, subsidies, and tax breaks; patriotic appeals, and suspending antitrust laws. To win workers' cooperation, the government encouraged unionization and placed labor leaders on various government boards, while overlooking use of various devices to escape the worst effects of wage controls. By wars' end, the War Industries Board of World War I and the World War II's Office of War Mobilization sought to coordinate economy and allocate production among the armed forces, the civilian sector, and the Allies. Washington financed both world wars largely through new taxes and loans. Though applied too gradually in both cases, government management of the economy—to include rationing of consumer goods in World War II—reinforced sound war finance and helped limit wartime inflation.

Although early "Cold War programs like the "Marshall Plan had a limited stimulative effect on the economy, the four-decade confrontation with the Soviet bloc began to produce significant economic effects with the onset of the *Korean War and concurrent American rearmament, which led to sustained high levels of defense spending and the nation's first large peacetime armaments industry. Many feared this *military-industrial complex might threaten democracy or prolong Soviet-American hostility for the benefit of the military, arms manufacturers, defense workers.

When the Cold War turned "hot" in Korea, defense spending, a civilian buying spree prompted by recent memories of wartime shortages, and a delay in tax increases and governmental controls resulted in a burst of inflation. By 1951, however, a tax hike, wage and price controls, and a significant spending-induced increase in the gross national product (25 percent above the 1948 level) kept inflation below 3 percent.

Sharp limits on defense spending during the administration of President Dwight D. "Eisenhower cut that rate in half—and contributed to three recessions—until the "Vietnam War, when President Lyndon B. "Johnson sought to manage the Southeast Asian conflict and the Great Society domestic programs without resort to typical wartime economic controls. By war's end, with the economy no longer booming and the fight against inflation seemingly lost, government offered automatic cost of living adjustments for workers and government beneficiaries until, in the Cold War's final decade—the 1980s—high interest rates and limits on social programs helped tame inflation even as defense spending surged during the presidency of Ronald "Reagan. With the reduction of military spending at the end of the Cold War, many feared a major recession, but the American economy boomed throughout most of the 1990s.

EDISON, THOMAS ALVA (1847-1931), prolific inventor, entrepreneur, and industrialist. A pioneer in team industrial research, Edison made significant innovations in communications technologies (telegraph, telephone, phonograph, and motion pictures) and in electric lighting and electric power systems.

Edison's laboratories in New Jersey and his worldwide acclaim as a successful inventor reinforced an aura of American industrial progress through research that fostered application of systemized research to military technology in the first half of the twentieth century. In 1915, naval secretary Josephus Daniels enlisted Edison to organize and chair a Naval Consulting Board to provide technical counsel to the navy. Edison lent his name to board activities, personally engaged in sonic research for detection of submarines, and vigorously promoted creation of a Naval Research Laboratory. His group was outflanked, however, by the National Academy of Science, representing younger, academically oriented scientists. They created a presidentially appointed National Research Council, led by the politically astute George Ellery Hale, which attained a power and influence that eclipsed the Edison group and ultimately led in World War II to establishment of Vannevar *Bush's powerful Office of Scientific Research and Development. Nevertheless, some of the Edison's companies were organized into the General Electric Company, which became a major defense contractor.

EDUCATION, MILITARY. Military *education* involves the professional preparation of officers to lead armed forces effectively in peace and war. It can be distinguished from *indoctrination* (the transmission of group values, traditions, and attitudes) and *training* (the development of concrete manual and mental skills) in that it seeks to instill an understanding of abstract principles and theory and to develop effective patterns of thought and communication.

Education has been linked closely with the growth of professionalism in the military forces of the United States since the mid-nineteenth century. Its principal purpose is to ensure the mastery of a body of specialized knowledge, one of the characteristics of any profession. Accordingly, the principal subject areas of professional military education include: the art of command (leadership); the organization and management of military forces; strategy, tactics, and logistics; military history; national security policy; the relationship of armed forces and society; and individual analytical and communication skills. The approach to these professional topics becomes broader, more complex, and more abstract at each successive level of formal military schooling.

Before World War II, the pace of peacetime garrison life or duty at sea left a good deal of time for individual professional study. Since 1945, the pace of active service and the

resulting demands on an officer's time have increased tremendously, as have the breadth and complexity of the body of knowledge that must be mastered. Consequently, formal military schools now provide the principal venue for professional development.

Each of the military services has its own integrated, progressive program of formal education, which includes attendance for selected personnel at formal courses at the undergraduate, service school, staff college, and senior service college levels, as well as technical courses and courses at joint postgraduate schools. The four undergraduate national service academies (the Military Academy at West Point; the Naval Academy at Annapolis; the Air Force Academy at Colorado Springs; and the Coast Guard Academy at New London), the *ROTC programs found on many college campuses, and officer candidate schools run by each of the services prepare young men and women for initial entry to the services as commissioned officers. Basic service school courses, such as those for army infantry officers at Fort Benning, Georgia, and for Marine Corps officers at Quantico, Virginia, prepare newly commissioned junior officers for duties in operational units and aboard ship. Advanced service school courses, such as those offered by the Air Force Squadron Officers School at Maxwell Air Force Base, Alabama, and the army's Transportation School at Fort Eustis, Virginia, prepare senior company-grade officers for small unit command and staffwork through battalion level. Staff colleges—the army's Command and General Staff College at Fort Leavenworth, Kansas, for example—prepare selected mid-level career officers for service at battalion, brigade, and division level, and equivalent navy and air force echelons. Finally, the three senior service colleges—the Naval War College at Newport, Rhode Island; the Army War College at Carlisle Barracks, Pennsylvania; and the Air War College at Maxwell Air Force Base, Alabama—prepare selected senior field-grade officers for the highest command and staff positions. In addition, three joint service colleges—the Armed Forces Staff College in Norfolk, Virginia, and the National War College and the Industrial College of the Armed Forces, both in Washington, D.C.—seek to improve joint operations through interservice understanding and cooperation. A limited number of American officers are also selected to attend the military schools of other nations or the *NATO Defense College in Rome. Specialist courses, graduate degree programs at civilian universities, and training with industry complete the array of formal military schooling.

In the United States, military education has always been closely linked to developments in the civilian educational community, and military educators have often been caught up by the fads in educational theory that have swept the civilian community periodically. For example, the development in the late nineteenth century of both civilian graduate education and the military war colleges was based on German models: the seminar method of the German universities and the Prussian *Kriegsakademie*, respectively. And today the call for "back to basics" rings in the halls of military schools as loudly as in our elementary and secondary schools and colleges.

Military educators have often led the exchange of ideas with their civilian counterparts. In 1817, the U.S. Military Academy at West Point, then under the direction of Sylvanus *Thayer, established the first formal program of engineering instruction, a program later copied by civilian

institutions. At the turn of the century, the army's School of the Line at Fort Leavenworth (now the U.S. Army Command and General Staff College), under the leadership of Arthur L. Wagner and Eben Swift, stressed active student learning through practical exercises in place of passive lectures. This so-called applicatory method was much admired and emulated by civilian academicians, as were the methods of standardized testing developed by the army and navy in the two world wars.

Although most civilian and military leaders agree on the ultimate goal of military education, there is considerable controversy over how that goal should be attained. One of the fundamental issues is time. Some officers (particularly in the navy) view formal schooling as a waste of time and argue that the best means of developing professional competence is on-the-job experience in active service in units and at sea. This view is reflected in all the services in the reluctance of some officers to attend formal military schools, and in lower selection and retention rates for those who "waste" too much time attending or teaching in the military educational institutions. Debate also exists over the relative value of "education" versus "training." Many critics maintain that the various military schools should train officers for their next assignment rather than educate them for greater professional contributions at some indefinite future time and place. Others insist that military education should focus on operational military matters to the exclusion of "soft" subjects such as international relations, economics, and management.

EISENHOWER, DWIGHT D. (1890-1969), World War II general and thirty-fourth president of the United States. Dwight David Eisenhower was born to David and Ida Stover Eisenhower in Denison, Texas, 14 October 1890. The following year, he, his parents, and two brothers moved to Abilene, Kansas, his father's childhood home. After graduating from high school, Eisenhower received appointment to the U.S. Military Academy at West Point, and in 1915, he was commissioned second lieutenant. Following U.S. entry into World War I, he commanded the U.S. army tank corps training center at Camp Colt near Gettysburg, Pennsylvania. In the postwar years, Eisenhower held staff positions under the most accomplished and influential officers in the U.S. Army, including Generals John J.

* Pershing, Fox Conner, and Douglas *MacArthur. In the process, he became a military strategist, rising slowly through the ranks from major to brigadier general. In World War II, Gen. George C. *Marshall, army chief of staff, appointed Eisenhower to command of the War Plans Division (later the Operations Division) of the Army General Staff; then to supreme command sequentially of the Allied invasions of North Africa, Sicily and Italy, and of Normandy, France, as well as being Supreme Allied Commander in Europe.

Eisenhower accepted the German unconditional surrender for the Western Allies on 8 May 1945. Returning to the United States as a five-star general (general of the army), he accepted appointment as army chief of staff. After overseeing the demobilization of the army and writing a best-selling war memoir, *Crusade in Europe*, in 1948, Eisenhower retired from the army and became president of Columbia University.

Not long after the outbreak of the "Korean War in June 1950, President Harry S. Truman called him back to active duty as the first supreme commander of the North Atlantic Treaty Organization ("NATO), a position Eisenhower retained until May 1952, when he announced his candidacy for the Republican presidential nomination. He was elected thirty-fourth president of the United States and served two terms. His health became a problem beginning in the mid-1960s, and he died on 28 March 1969.

A man with two distinguished careers—one as a professional soldier and the other as political leader and statesman—Eisenhower was the subject of more than the usual amount of controversy, much of which was unnecessary. The first area of controversy concerned his performance as Supreme Allied Commander. American critics observed his swift rise through the ranks after the outbreak of World War II despite a lack of combat experience and erroneously attributed it mainly to "Ike's" genial manner. The British, especially Gen. Bernard Law "Montgomery, whose army had defeated the Germans and Italians at El Alamein in 1942, questioned Eisenhower's strategy for the Battle for "Germany. Instead of Eisenhower's planned broad advance, aimed at surrounding the Ruhr industrial heartland and destroying the German Army, Montgomery advocated a narrow ("pencil thrust") aimed across the northern European plain at Berlin. Eisenhower had read military history, including the works of the Prussian military intellectual Carl von "Clausewitz, and had studied the art of war under the supervision of the leading American strategists. Accordingly, he stayed with his objective and methods of attaining it. The British High Command later admitted—and American historians agree—that Eisenhower's approach was correct. Like most commanders, he had some setbacks, but his achievements were large. They included the movements that turned back the unforeseen German attacks at the Kasserine Pass in Tunisia in February 1943, and at the Ardennes—the Battle of the "Bulge in December 1944. That month, Congress bestowed on him a fifth star and the rank of general of the army.

The Eisenhower presidency, in retrospect one of the most successful of the modern era, also involved controversy, reflected by the fact that not long after he left office, historians ranked him only twenty-second in polls of presidential effectiveness. Many contemporary critics focus on his frequent relaxations, golf and trout fishing. And after his heart attack in 1955 and a slight stroke in 1957, pundits doubted his stamina. They condemned his failure publicly to repudiate the anti-Communist demagogue, Senator Joseph R. McCarthy of Wisconsin. Civil rights advocates criticized the Civil Rights Acts of 1957 and 1960 for not going far enough. Other critics incorrectly said Eisenhower turned over U.S. foreign policy to John Foster "Dulles, his secretary of state. The Soviet launching of Sputnik, the world's first artificial satellite, testing of intercontinental "missiles, and shooting down of an American U-2 reconnaissance airplane (1960) brought

charges that Eisenhower had weakened American defenses, allowing an alleged "missile gap" to develop with the Soviet Union. The president, they also charged, used the "Central Intelligence Agency to put the United States on the side of right-wing dictators in Third World nations such as Iran and Guatemala.

More recently, history has been kinder to the Eisenhower presidency. Eisenhower retained many of the approaches to social, economic, and foreign policy that the American people had come to accept during the Great Depression and World War II, while at the same time altering those laws and policies that discouraged economic growth and stifled initiative. Congress, with administration prodding, strengthened and expanded Social Security, authorized the national system of interstate highways and the St. Lawrence Seaway, and brought Alaska and Hawaii into the Union. The economy flourished, the gross national product growing 70 percent to \$520 billion from \$365 billion. As a Republican and a conservative, Eisenhower received criticism from the liberals. But since he refused to roll back the social policies of Franklin D. "Roosevelt, he also irritated the right wing of the GOP. To the dismay of both, he refused to confront McCarthy, working instead to bring "McCarthyism" to an end by terminating executive branch cooperation with the senator's scattershot investigations. And though Eisenhower doubted the capacity of federal legislation to bring racial justice, his appointment of Earl Warren as Chief Justice of the Supreme Court and the enactment of the Civil Rights Acts of 1957 and 1960 encouraged some hope for blacks against discrimination. In his national security policies, Eisenhower obtained a negotiated armistice in Korea, increased U.S. military readiness, especially in airpower, and completed his predecessor's policy of containing Communist expansion by establishing a worldwide system of treaties and alliances. He increased U.S. assistance to South Vietnam but refused to authorize the use of U.S. combat forces there. The archival record shows that Eisenhower, not Dulles, was in active charge of U.S. foreign policy. The CIA did assist undemocratic forces in the Third World, but the allegations about a "missile gap" were without merit. The United States had a commanding lead in missile development when Eisenhower left office. By the 1980s, he had moved to ninth place in the ranking of presidential performance.

EISENHOWER DOCTRINE (1957). After the Suez Crisis of 1956, President Dwight D. "Eisenhower, citing the danger of the spread of "international Communism," told Congress on 5 January 1957 that the United States regarded "as vital to the national interest and world peace the preservation of the independence and integrity of the nations of the Middle East." He asked for authorization to develop

economic and military programs, including the use of armed forces, to assist any "nation or group of nations in the general area of the Middle East desiring such assistance" to preserve their independence. After two months of acrimonious debate, Congress approved the "Eisenhower Doctrine" in a joint resolution on 9 March 1957.

The United States first invoked the Eisenhower Doctrine in the Jordanian crisis of April 1957, and again in August 1957 when a perceived Syrian-Soviet rapprochement threatened the stability of the region. But Eisenhower did not dispatch armed forces. A military coup against the pro-Western regime in Iraq on 14 July 1958 sparked the most visible manifestation of the Eisenhower Doctrine during the *Lebanon Crisis, when Lebanese president Camille Chaumon requested immediate military assistance to counter perceived Egyptian-Syrian attempts to destabilize his government. On 15 July, Eisenhower deployed the Sixth Fleet and landed nearly 15,000 U.S. troops to ensure that Lebanon could elect its own president without external interference.

Seldom mentioned after 1958, the Eisenhower Doctrine was indicative of American preoccupation with the *Cold War. Characterized by some historians as an extension of the *Truman Doctrine, Eisenhower's policy lent credence to the belief that the United States had assumed a global role in the preservation of regional stability and the promotion of its own national interests.

ELLIS, "PETE" EARL HANCOCK (1880-1923), Marine officer and amphibious warfare specialist. Ellis was a prophetic strategist and tactician whose 1921 plan anticipated the U.S. *Navy's Central Pacific campaign of World War II. He enlisted as a private in the U.S. * Marine Corps in 1900 and was commissioned a year later. Five years' service in the Philippines and eighteen months with the Asiatic Fleet acquainted him with the Far East and with the Defense of Subic Bay. While at the Naval War College from 1911 to 1913, as student and a faculty member, Ellis developed his vision of amphibious assault operations and prepared studies for the defense of such Pacific islands as Guam, Peleliu, and Samoa. In 1914, after participating in the first advanced base exercise he reported to Guam to help plan its defense. He joined the staff of Marine Gen. John A. *Lejeune in Washington and later accompanied Lejeune to France in 1917-1918. In 1920, Maj. Ellis was assigned to USMC headquarters, under now Commandant Lejeune. There Ellis prepared his major work, a seminal report entitled "Advanced Base Operations in Micronesia," in which he prescribed amphibious assault operations to seize islands needed as advanced bases to support the naval campaign against Japan. In 1922, Lejeune granted Ellis permission for a covert mission to Micronesia to ascertain if any of the bases had been fortified. Ellis died on the trip in 1923 under mysterious circumstances. Despite rumors, no evidence exists of Japanese involvement in his death, which was instead consistent with Ellis's accelerating alcoholism.

ELLSBERG* DANIEL (1931-), military analyst, nonviolent activist. Ellsberg graduated from Harvard in 1952, served as a Marine infantry commander (1953-56), then returned to Harvard for his Ph.D. An expert on crisis decision making at the Rand Corporation think tank, he was a consultant on *nuclear weapons to the *Pentagon and Kennedy White House, notably in the *Cuban Missile Crisis. Early in the *Vietnam War (1964-65), he was special assistant to the assistant secretary of defense responsible for Vietnam policy. He spent two years in South Vietnam as a State Department adviser (1965-67), then rejoined Rand and contributed to the Pentagon's internal classified history of the war ordered by Defense Secretary Robert S. *McNamara.

In October 1969, Ellsberg tried to release the secret Pentagon history to Congress, but lawmakers refused the material. Drawn more deeply into the antiwar movement, he provided the so-called *Pentagon Papers to the *New York Times* and *Washington Post*. Its June 1971 publication revealed a history of presidential failures and deceptions and was critically important in mobilizing public opposition to the war. President Richard M. *Nixon and his national security adviser Henry *Kissinger feared further leaks by Ellsberg. To silence and slander Ellsberg and block future "leaks," they created the White House "Plumbers" unit. At Nixon's instigation, the unit conducted an illegal break-in of Ellsberg's psychiatrist's office in Los Angeles in September 1971. The same "Plumbers" unit carried out the June 1972 Watergate burglary, which led to President Nixon's resignation in August 1974. Ellsberg was tried for espionage, but because of White House tampering, the federal judge dismissed the charges. During the 1970s and 1980s, Ellsberg lectured widely and was arrested for antiwar and antinuclear civil disobedience protests.

EL SALVADOR, U.S. MILITARY INVOLVEMENT IN. Unlike most other Central American republics, El Salvador never had U.S. troops land on its territory, even during the 1932 Communist uprising. Internal security was left to various gendarmeries and the regular army, acting at the behest of a tiny planter elite. However, during the *Cold War, Salvadoran officers trained in U.S. installations and received minor amounts of military aid, and in the 1960s, the *Central Intelligence Agency helped found a rural paramilitary organization, ORDEN, birthing the "death squads" of the next two decades.

In the late 1970s, various small left-wing insurgent groups allied to "popular organizations" of peasants, students, and slum dwellers began challenging the military government. Following the 1979 Sandinista victory in Nicaragua, U.S. national security experts feared El Salvador would be the next "Cuban-Soviet proxy" on the

American mainland. From late 1979 on, the Carter administration shipped arms to weak civilian-military juntas, while death squad killings reached 1,000 per month, including 4 U.S. Catholic churchwomen and the country's archbishop, Oscar Romero, killed in March 1980 after requesting that President Jimmy * Carter cut off aid.

In October 1980, five Marxist-Leninist guerrilla organizations formed the Farabundo Martí National Liberation Front (FMLN). In January 1981, they launched a "final offensive," just before Ronald * Reagan assumed office. This attempt failed due to lack of arms and trained troops, and the guerrillas turned to consolidating their control over parts of the countryside.

Meanwhile, U.S. *counterinsurgency experts and aid flooded in, as El Salvador became the first showplace for the new "Reagan Doctrine" of stopping and rolling back Third World revolutions. Eventually, \$6 billion was funneled into a country the size of Massachusetts, with a population of 5 million. U.S. advisers managed the war down to the company level, and trained ten air-mobile "hunter-killer" battalions to seek out the elusive FMLN units. For all sides, from a widespread protest movement in the United States to North American military planners to the guerrillas, it seemed a replay of Vietnam. The one signal difference was that U.S. officers at all levels, and the president himself, were deeply committed to avoiding a ground war involving U.S. troops and casualties. This was the major innovation of the so-called *Low-Intensity Conflict doctrine.

Between 1981 and 1989, the FMLN and U.S. specialists played a minuet involving all the classic elements of peasant-based insurgency and counterinsurgency. A skirmishing war or "permanent offensive" by guerrilla columns drove demoralized government forces back in 1982-84, threatening a seizure of power. It was met by an effective political charge when a pro-U.S. Christian Democrat, José Napoleon Duarte, defeated extreme rightist Roberto D'Aubuisson for president in a carefully staged 1984 election, promising peace. Meanwhile, a sophisticated air war utilizing U.S.-supplied helicopter gunships, "Puff the Magic Dragon" minigun platforms, and the heaviest bombing in the hemisphere's history punished the FMLN's "zones of control," driving out civilians and inflicting heavy losses on main force guerrilla units, which had reached a peak of more than 12,000 in 1984.

In response, the FMLN dispersed its troops throughout the country and focused on rebuilding an urban political base. Mines and constant ambushes depleted the government forces, which had quadrupled in size to 60,000 through heavy conscription. Army bases were periodically overrun, to demonstrate the guerrillas' capacity, while "solidarity organizations" in the United States and Europe supported the FMLN's civilian network. But the Left's popularity was limited by the growth of mass-based electoral politics for the first time in Salvadoran history, led by the right-wing ARENA Party, and containment of FMLN forces within thinly populated rural zones.

Growing urban unrest, the collapse of the Christian Democrats, and an increasingly professional FMLN army all led toward a massive guerrilla offensive in November 1989. In an odd valedictory for the end of the Cold War, rebel units held large parts of San Salvador for a week before retreating, their hopes for a popular uprising dashed. But the vigor of FMLN attacks, and the bankruptcy of the govern-

ment forces—the U.S.-trained Atlacatl Battalion butchered prominent Jesuit priests at the offensive's height—encouraged the Bush administration to support peace negotiations with a chastened FMLN.

The negotiating process, under UN auspices, lasted from spring 1990 through New Year's Day, 1992. It was punctuated by a renewed FMLN offensive late in 1990, using surface-to-air *missiles obtained in Nicaragua, which threatened the government's air superiority. Eventually, an accord was signed that led to the retirement of most of the armed forces' senior officers, and the creation of a new civilian police incorporating members from both sides. In return, the FMLN gave up its armed struggle, and in the 1994 elections became the country's second-largest civilian political party. The bitterest military conflict in late twentieth-century Latin American history came to an end with all sides claiming a measure of victory.

EMANCIPATION PROCLAMATION (1863). Abraham

• Lincoln's presidency began in March 1861 with a pledge to maintain slavery by enforcing the federal fugitive slave law. By May, however, Lincoln accepted a de facto "contraband" policy that permitted Union commanders to protect and employ black fugitives who came within their lines from disloyal regions. Congress suspended federal enforcement of the fugitive slave law and provided in the summer of 1862 for the confiscation and emancipation of "contraband" slaves. Gen. George B. *McClellan vehemently opposed these measures, but Lincoln soon acted as commander in chief to declare emancipation a Union war aim.

On 22 September 1862, Lincoln declared that all slaves would be freed in states or regions of states still in rebellion on the first day of the following year. After this proclamation, the prospect of pro-Southern intervention by Britain faded. The proclamation also marked a fundamental shift in Union military policy. Initially opposed to enrolling any blacks as soldiers, Lincoln authorized an aggressive recruitment campaign immediately following the issuance of the final proclamation on 1 January 1863.

The Emancipation Proclamation was Lincoln's most direct action to hasten the end of slavery. Historians have offered varied interpretations of its relative significance in the process of wartime emancipation. Louis Gerteis in *From Contraband to Freedman* argues that military necessity created the conditions that first prompted Congress and later required Lincoln to adopt emancipation policies. Ira Berlin and his colleagues in *The Destruction of Slavery* emphasize the roles played by African Americans in securing their own liberation within the conditions created by war and federal policy. In his Pulitzer Prize-winning *Battle Cry of Freedom*, James McPherson insists that emancipation—and the Union victory necessary to obtain it—rested fundamentally on Lincoln's leadership.

ENEMY, VIEWS OF THE. All cultures dehumanize their enemies to some degree. They do this by portraying them as aggressors or even devils, savages, torturers, rapists, or vermin. These attributes may be applied to the enemy's entire society or only to its ruler or ruling elite. Americans have typically applied this more focused view of the enemy to countries that mirror themselves racially, culturally, or ideologically. Peoples who seemed alien were more likely to be regarded all-inclusively as the enemy.

Adversaries who have most nearly resembled Americans include the British during the "Revolutionary War and the "War of 1812, the Germans of World War I and II, and of course the Northerners and Southerners of the "Civil War. In each case, the true enemy was ordinarily identified as the opponent's leadership rather than population. Thus, revolutionaries fixed most of their hostility on the British king, "George III, and his ministers, who were said to be pursuing a grand design aimed at the political enslavement of Americans. Parliament got less censure and the British public scarcely any at all. During the two world wars, the enemy was not so much the German people as "Kaiser Bill," the Prussian warlords, Adolf "Hitler, and the Nazi Party. In each case, these entities were perceived as aggressive and tyrannical. Southerners reserved most of their anger for Abraham "Lincoln, the "black Republicans," and the abolitionists. Northerners considered the common people of the South the dupes of Jefferson "Davis and the slaveholding aristocracy. The consistent common thread was a perceived threat to liberty, sometimes generalized into a threat to everything that was good, just, and holy.

This does not mean that Americans had no opinion of the soldiers who actually fought against them. In the Revolutionary era, the belief that the British government was trying to enslave them encouraged Americans to fix upon the fact that the British soldier was a professional who might receive pay but who otherwise resembled a degraded bondsman. "Hiringling" was a common epithet. The fact that the British employed German mercenaries won particular opprobrium, and "hateful Hessian" was a phrase spat in anger for decades after the American Revolution. Southerners resurrected the image of the "hiringling"—often extended to include the idea that Union soldiers were foreign immigrants—during the Civil War. Northerners sometimes viewed Southern soldiers as reluctant conscripts, forced into service by a planter oligarchy. German soldiers were called "Huns" or "Krauts" and were considered more prone to atrocity than Americans. In general, however, Americans tended to regard most of these enemy soldiers as honorable opponents, worthy of respect.

Much the same was true for the French, who were a major American opponent during the colonial period. One difference stemmed from the Catholicism of the French, which imparted overtones of a religious crusade to the struggle. Convinced that Catholicism represented a corruption of Christianity, many American Protestant clergymen decried the "Papists," viewed the French presence in North America as a threat to sound religion, and urged their parishioners to participate in or support expeditions against French possessions. A somewhat stronger version

of this image applied to the Catholic Spanish. Fired in part by the "Black Legend" of Spanish cruelty in South America and in part by perceptions of Spain as a civilization in decline, many Protestant Americans tended to view the Spanish as decadent and wicked. This imagery colored all American conflicts with Spain, from colonial contests to the "Spanish-American War. As an offshoot of Spain, Mexicans were seen in a similar light during both the "Mexican War and the Punitive Expedition (1916). Many North American disdained the fact that Mexicans were often of mixed Spanish and Indian heritage.

Perhaps the single most dominant American image of the enemy was that of the Indian, partly because white Americans fought Native Americans for nearly four centuries, and partly because white imagery of Native Americans would prove an important influence on subsequent images of Asian adversaries. American views of Indians were complex. On the other hand, they saw Indians as savage, cruel, and treacherous; on the other hand, many Americans perceived a noble stoicism and simplicity about them. Americans thus viewed Indians with a mixture of revulsion and admiration.

The view of the Indian as noble savage was strongest in the East; that of the Indian as just plain savage was most pronounced in frontier districts. So easterners decried the plight of the Indians while westerners called for their extermination. Nineteenth-century American Army officers often oscillated between both perspectives. Gen. Philip H. "Sheridan, for example, believed the only good Indian was a dead Indian, but also acknowledged that if he were an Indian, he would respond to the white invasion with violence, just as they did. Some officers even became involved with philanthropic projects, especially those aimed at educating Native Americans to assimilate into white society.

Most white Americans, whether animated by hatred toward Indians or a patronizing goodwill, united in the belief that Native Americans represented an inferior people. This belief grew especially pronounced in the first half of the nineteenth century, as white America became a self-consciously racist society. This is one reason that most Americans reacted with such shock to the annihilation of Gen. George Armstrong "Custer's command in 1876. It seemed impossible that Indians could utterly destroy even a heavily outnumbered force of white soldiers; some, indeed, credited rumors that the Indian battle leader had received training at West Point. The explicitly racist view of Indians extended to a heavy emphasis on sexual atrocity, something noticeably missing from earlier images of Native Americans. Although Indians had captured white women and children since colonial times, only in the nineteenth century did it become common for whites to assert that Indians raped captive females.

The dual attitude toward the Indian as a savage capable of the most wanton crimes and as an inferior human being in need of civilization was part of the dominant European attitude to nonwhite peoples during the Victorian era. It is best captured by Rudyard Kipling's poem "The White Man's Burden," which urged the reader to fight the "savage wars of peace" in order to impart by force education, technological improvement, and Western conceptions of law and order to the nonwhite peoples, "half-devil and half-child." Kipling composed the poem specifically to encourage the United States to annex the Philippine Islands after the Spanish-American War.

The American decision to annex the Philippines resulted in a prolonged pacification campaign from 1899 through 1902. Americans viewed the Filipino people as unready for self-government and saw themselves as benevolent tutors who would prepare the country for eventual independence. When Filipinos reacted with violence to this program, the United States responded harshly to them as "goo goos," an epithet that was the origin of the word *gook* of later Vietnam infamy. The degree to which American troops engaged in atrocities remains a hotly debated issue, but it is agreed that they regarded the Filipino insurgents as mere brigands and invoked the full severities available under the laws of war, including reprisals and summary executions.

Until the twentieth century, views of the enemy were disseminated principally through folklore, pamphlets, sermons, and newspapers. During World War I, however, the U.S. government played a major role in consciously shaping images and attitudes toward the enemy. The Committee of Public Information was the first governmental entity charged with this task; by World War II, propaganda was manufactured on a wide scale, using radio, film, and print media. Where the Germans were concerned, the principal emphasis was on the enemy leadership; but in the case of Japan, the entire Japanese people were characterized as inherently treacherous, vicious, and utterly inhuman. The most common image was one of vermin to be exterminated.

Implacable warfare was justified not only on the grounds that Japan deserved it for having begun the war with a "sneak" attack on Pearl Harbor (1941), but also because the Japanese were supposedly a barbaric people bent on conquest and with no regard for human life, including their own. The kamikaze (suicide) attacks of 1944-45 reinforced this view, as did the fact that Japanese soldiers seldom surrendered. It is likely that the widespread view of the Japanese as vermin made it easier to unleash nuclear destruction in the bombings of Hiroshima and Nagasaki in August 1945.

The wartime view of the Japanese proved readily adaptable to subsequent Asian adversaries, including the North Koreans, mainland Chinese, and North Vietnamese. The prevailing American image of the Vietnamese in particular mirrored aspects of previous U.S. encounters with non-white adversaries. As with the Indians and Filipinos, Americans believed they could improve the Vietnamese by fostering democratic, economic, and technological development. As with the Japanese, Americans reacted to the unexpected military prowess of this "backward" people during the Vietnam War by endowing "Charley Cong" with superhuman determination and skill.

After World War II, however, a reaction to Nazi racism had discredited portraying the enemy in explicitly racial terms. And indeed, American views of the Koreans, Chinese, and Vietnamese, as well as the Russians, were all primarily shaped by the fact that they were Communist adversaries. Propaganda and popular perspectives during the Cold War era portrayed the Communist adversary as faceless, godless, implacable—dedicated to nothing less than the utter destruction of the American way of life, even at the cost of unleashing an unprovoked, full-scale nuclear strike. NSC-68, the top-secret American blueprint for military containment, portrayed the Cold War as a struggle between "the idea of freedom under a government

of laws, and the idea of slavery under the grim oligarchy of the Kremlin."

Paranoia played a major role in the American image of the Communist menace. It was widely seen as a monolithic whole, with Communists everywhere pursuing a master plan orchestrated from Moscow. This view had enormous consequences. It encouraged Americans to view all Communists as a threat, so that any struggle for national liberation, if it contained a Communist presence, was viewed as a direct threat to American interests. It also rendered it difficult to perceive conflicts and cleavages between Communist countries, so that U.S. policymakers were painfully slow to recognize the hostility between, for example, the Soviet Union and China and between China and North Vietnam. It also sustained a destructive search for homegrown "Comms," of which the House UnAmerican Activities Committee and the McCarthy Hearing are just two of the best-known examples.

The 1970s ushered in yet another American enemy: the Islamic terrorist. Already angered by OPEC's threat to petroleum consumption, Americans reacted with fury to the taking of fifty-eight American hostages by Iranian revolutionaries in 1979. Islamic terrorists became the villain of choice in American films and television, and were generally portrayed as religious fanatics devoid of respect for human life. Yet the media avoided portraying the common people of the Islamic Middle East as anything much worse than backward and dirty. The U.S. government, well aware of critical economic and national security interests in the Middle East, carefully focused on specific terrorist groups or rogue dictators such as Libya's Muammar Gaddafi or Iraq's Saddam Hussein, famously characterized by President Bush during the prelude to the Persian Gulf War as resembling Hitler. Given a growing consciousness of cultural pluralism in the United States and an awareness of its economic interdependence on non-European countries, it is likely that future enemies will be portrayed in as focused a fashion as possible.

ENGINEERING, MILITARY. The U.S. Army's basic manual on what engineer troops should do in wartime defines five general tasks: mobility, countermobility, survivability, topography, and general engineering. The primary imperative is the offensive: movement. The obverse—impeding the movement of the enemy—is the engineer's second task. If the battlefield situation requires it, engineers must also provide expedient field fortifications, which will protect troops and equipment from enemy fire. Assisting the

army in locating positions and understanding terrain is the engineers' fourth task. And finally, military engineers perform a variety of other duties, which change over time but are related to construction or destruction.

These five tasks, or "missions," are relatively straightforward and have defined in a general sense the responsibilities of military engineers for centuries. But the relative importance of each task has changed during the more than 200-year history of engineering in the U.S. Army.

Modern military engineering originated in seventeenth-century France under the influence of Louis XIV's great engineer, Marshal Vauban. French military engineering had a particularly strong influence on the development of engineering in the American Army. As Gen. George *Washington attempted to cobble together something approaching a respectable eighteenth-century standing army, he included on his staff a chief engineer and two assistants. Because Washington could not find Americans formally trained in military engineering, he recruited foreign, mostly French, professional military engineers.

The hallmarks of French engineers in the eighteenth century were the great bastioned *fortifications and the elaborate sieges required to capture them. In the primitive colonial environment, engineers had few opportunities for such sophisticated military engineering, but Continental army engineers made important contributions to American victory in the * Revolutionary War. They mapped terrain, designed field fortifications such as those at Saratoga, and cleared roads until they achieved preeminence in the final battle of the war. At the Battle of *Yorktown (1781), the American and French forces conducted a classic siege of the British positions and by their success ensured the independence of the American colonies.

For two decades after the Revolution, the U.S. *Army Corps of Engineers existed sporadically, for awhile in a union with the artillery. The threat of war with European powers helped revive it in 1802 when President Thomas *Jefferson and Congress reestablished the Corps at West Point, New York, where it would also "constitute a military academy" training especially military engineers. Until 1866, the Corps of Engineers ran the U.S. Military Academy and made it the first American college with a curriculum emphasizing engineering. The Corps modeled the academy on the Ecole Polytechnique and subscribed to the French view that a mathematically inclined, technical education best equipped young men to be army officers.

The Corps' French roots were demonstrated in its major activity in the early nineteenth century—designing and building brick and masonry seacoast fortifications. In a peculiarly American development born of the scarcity of native professional civilian engineers, the Corps of Engineers also became involved after 1824 in internal improvements on the rivers and harbors of the new nation. In another peculiarly American development, the army had two Corps of Engineers from 1818 to 1863: a Corps of Topographic Engineers, which devoted much attention to exploring and mapping the expanding country and to improving its rivers and harbors; and a Corps of Engineers, which concentrated on fortifications. Both groups were small and their bureaucratic domains sometimes overlapped. Both fought in the * Mexican War, and both supported the Union military effort in 1861.

Although the Corps of Engineers was reunited in 1863 and expanded during the * Civil War, most engineer troops,

like those in the rest of the "Union army, were volunteers. As in other wars, engineers mapped the theaters of operations and built bridges, but changing technology lent new urgency to some of their tasks. As rifling and breechloading increased the destructiveness of weapons, soldiers often improvised field fortifications. The war brought some grand sieges, which had been so much a part of the engineer tradition, but with ominous new dimensions. In the Confederate capture of *Fort Sumter and the Union siege of Fort Pulaski, the new artillery rapidly demolished the carefully designed battlements. These setbacks did not deter classically trained engineers, both during the war and after, from promoting the construction of more seacoast fortifications, which they attempted to protect from the growing threat of more powerful artillery. Other sieges, like the one at Petersburg, presaged the *trench warfare of the future; but Union engineers, like their peers in Europe, did not fully apprehend that new direction.

When the United States entered World War I, the great trench systems on the western front—the improvised and then improved field fortifications to protect soldiers from artillery and machine guns—were already in place. American engineers fought as infantry in the Allied assaults on the German lines and built bridges under fire, but the bulk of their work supported the enormous logistical effort required to supply the huge forces in northern France. The first engineers to France built railroads. They were followed by engineers who built roads, ports, and depots, and harvested lumber, their basic construction material. World War I made clear that engineers were critical not only in the front lines of combat but also behind those lines, where the huge logistical apparatus to support the insatiable appetites of modern industrialized warfare would require construction of all types.

On the eve of World War II, engineers could anticipate some of the growing combat and construction requirements of warfare. After the defensive deadlock of World War I, armies developed new tactics and new equipment, which emphasized movement and speed. Armored and mechanized engineer units had to keep up with the rapid movement of forces as the U.S. Army emulated the blitzkrieg warfare of the Germans. Engineers had to build bridges quickly, and these bridges had to be strong enough to carry heavy tanks. Specially equipped aviation engineer units trained to build front-line airfields quickly. No longer would combat be static and circumscribed.

Behind the front lines, the new pace of warfare and the new technology increased the demand for engineers. Dozens of highly specialized units rehabilitated ports, built petroleum pipelines, repaired and maintained equipment, supplied parts, produced highly sophisticated maps and charts, and performed a wide variety of other tasks required by the most technologically advanced army of its day. Although promoting the mobility of American forces and impeding the mobility of their enemies became the engineers' primary tasks in World War II, support for the huge military infrastructure that made that mobility possible also placed great demands on them.

Engineers had always built the military infrastructure in combat theaters, but World War II brought new responsibility for constructing the facilities required at home to mobilize and deploy American armies. Before the war, most of this task belonged to the Quartermaster Corps, but the heavy demands of wartime mobilization led the

army to transfer this mission to the Corps of Engineers. The Corps had also constructed coastal defenses and kept available a large, experienced civilian workforce, which was devoted in peacetime to navigation improvements and flood control construction programs. Now this combined military and civilian group was in charge of all army and Army Air Force construction. Besides designing and supervising the construction of the "Pentagon and hundreds of mobilization facilities such as barracks, ammunition plants, and airfields, the engineers built the technologically sophisticated structures needed in the "Manhattan project to develop the atomic bomb. World War II found military engineers working around the world to perform the largest array of missions in their history.

Within five years of demobilization in 1945, engineers were fighting another war with much the same tactics and equipment used in World War II. Until the military stalemate that led to de facto peace in Korea, engineers honed their traditional skills.

A little more than a decade later, the engineers, like the rest of the U.S. Army, confronted in the "Vietnam War a conflict that was not traditional and not entirely tractable to the techniques of the two previous wars. Although the engineers built hundreds of miles of highways in South Vietnam and an elaborate logistical network that expanded beyond that typical in World War II, they struggled to best an elusive enemy that used "guerrilla warfare. Adapting to the new tactics, engineers cleared landing zones for the newly important "helicopters and cleared jungle from roadsides using massive Rome plows. Ultimately, however, their efforts accomplished little, as American troops were withdrawn from a war that bitterly divided the nation.

At home, the engineer role in prosecuting the "Cold War against the Soviet Union was more successful. After the separation of the air force from the army in 1947, the Corps of Engineers remained the primary construction agency for both services. Besides routine construction for the army, the engineers built the sophisticated facilities required by the air forces' strategic missions—airfields for heavy bombers, launch facilities for intercontinental ballistic "missiles, and "radar installations. The Corps of Engineers also built many of the facilities for the National Aeronautics and Space Administration. The Cold War kept the engineers busier with peacetime military construction than ever before in their history.

The last conflicts of the Cold War, or perhaps the first war of the post-Cold War era in the case of the "Persian Gulf War, brought the engineers like the rest of army back to their metier. Using a new generation of equipment and weapons developed during the Reagan defense buildup, the engineers assisted the Allied Coalition army in launching an air-ground blitzkrieg in the deserts of the Middle East. In a reassuring victory, which demonstrated that America could still fight a conventional war against conventional foes, the engineers maintained a secure place in an army that still needed massive logistical support and the apparatus that would allow its heavy equipment to move rapidly despite the vagaries of terrain. Though the end of the Cold War and the reduced size of the armed services lessens the need for engineer construction in the United States and abroad today, doctrine assures, as it has done since the Revolution, that engineers will have a place in the army of the future.

ERICSSON, JOHN (1803-1889), engineer and inventor. Born in Sweden, Ericsson left for England in 1826 seeking sponsorship for his ideas. In 1829, his locomotive *Novelty*, with a forced-draft boiler, reached a speed of 50 miles an hour. And in 1837, his *Francis B. Ogden* successfully tested a new marine propeller. Another *Novelty* (1839) was the first propeller-driven commercial vessel. Yet Ericsson failed to interest the British Admiralty.

In 1841, Capt. Robert F. Stockton, USN, had him work for the navy designing the USS *Princeton*, the first screw-propelled naval steamer. All of its propulsion machinery was below the waterline, safe from enemy shot. Ericsson developed a stronger gun barrel using wrought iron. The *Princeton's* main battery consisted of two 12-inch wrought-iron smoothbore guns, Ericsson's "Oregon" and Stockton's similar but weaker "Peacemaker." In 1844, during a dignitary cruise, the Peacemaker exploded, killing Secretary of State Abel P. Upshur, Secretary of the Navy Thomas Gilmer, and several others.

At London's Great Exhibition in 1851, seven of his inventions on display earned him a prize medal.

Ericsson's ironclad *Monitor*, with the first revolving iron turret on a naval ship, sparked a naval ordnance revolution. It fought the CSS *Virginia* (the former USS *Merri-mack*) to a draw on 9 March 1862 at the Battle of Hampton Roads and brought its inventor fame. Yet the earlier *Princeton* disaster was a factor in not using powder charges heavy enough to disable the *Virginia*.

In 1878, Ericsson's *Destroyer*, designed to fire underwater torpedoes from a 16-inch gun mounted in its bow, failed the navy's acceptance. He invented a successful shipboard depthfinder and surface condensers for marine engines, as well as pioneering solar energy. His marine steam and screw propulsion system brought the age of sail to a close.

ESPIONAGE AND SEDITION ACTS OF WORLD WAR I (1917, 1918) were the first forays since 1798 into federal regulation of First Amendment rights. These criminalizations of certain forms of expression, belief, and association resulted in the prosecution of over 2,000 cases, but in reaction they also produced a movement to protect the civil liberties of all Americans.

The Espionage Act (15 June 1917), enacted quickly by

Congress following the U.S. declaration of war on Germany, authorized federal officials to make summary arrests of people whose opinions "threatened national security." The measure prohibited willfully making false reports with intent to interfere with the success of the military or naval forces, inciting insubordination, disloyalty, or mutiny in the military, and obstructing recruitment or the enlistment service of the United States. Further sections authorized the Postmaster General to ban from the mails material advocating resistance to any law of the United States. This gave Post Office officials in the Wilson administration virtual dictatorial control over circulation of the nation's subsidiary press.

Realizing that the vagueness of the Espionage Act opened up opportunities for broad repression by government officials, as well as for mob violence and vigilante action, Congress augmented it with the Sedition Act on 16 May 1918. This set forth eight new criminal offenses, including uttering, printing, writing, or publishing any disloyal, profane, scurrilous, or abusive language intended to cause contempt, scorn, contumely, or disrespect for the U.S. government or the Constitution.

Before its repeal in 1921, the Sedition Act led to numerous arrests, particularly of dissident radicals, but also of important figures such as the socialist leader Eugene V. Debs. The Espionage Act remained on the books to be invoked in the post-World War II period to charge certain controversial figures such as Julius and Ethel Rosenberg, accused of atomic espionage, with being a threat to the United States in the *Cold War.

ETHNICITY AND RACE IN THE MILITARY. Ethnicity and race have been less troubling military questions for the United States than for nations where ethnic and racial competition, political power struggles, or caste systems have had a military dimension. Nonetheless, both factors have created military dilemmas for Americans from the earliest colonial settlements. Before the *Revolutionary War, many white colonists, who considered blacks biologically and culturally inferior and poor material for soldiers, were also afraid of arming slaves and free blacks and of losing their labor services. Sometimes blacks were excluded from the colonial militias, particularly in the South, but military need could overshadow racial fear, such as during the *French and Indian War. Some slaves were even granted their freedom for wartime military service.

Ethnocentrism, suspicion of loyalties, and loss of labor also militated against the military use of some non-English immigrants, but the need for frontier defense in the eighteenth century contributed to the settlement of Scotch-Irish, German, Swiss, and French Huguenot groups on the frontier to blunt Indian attacks and discourage slave rebellions. As the frontier moved westward and expeditions to distant places became the military norm, much of the actual fighting was done by recent immigrants on the fringes of the social order.

The Revolutionary War was justified as a war for liberty; but while northerners enlisted blacks, the South was op-

posed to arming African Americans. Diminished enlistment by whites and British offers of freedom for blacks who would desert and bear arms overcame initial attempts by southerners in the Continental Congress and the *Continental army to exclude blacks from military service. Approximately 5,000 African Americans fought with the Continental army or the militias (primarily in northern integrated units), although 1,000 joined British forces. Fighting for their freedom, many blacks were successful, although some masters sought to repossess their slaves and some blacks who fought for the British were later sold into slavery in the West Indies.

The Revolution set an enduring pattern of granting conscientious objector status to pacifist religious groups, some of whom, like the German Mennonites and Brethren, were non-English, with an obligatory commutation fee, the furnishing of a substitute, or special taxes. The war also established the principle of offering citizenship for military service, especially for enemy troops who would switch sides and to Europeans who came to join the Continental forces. The service of several European military experts in the American army during the Revolutionary War later became a source of pride to their ethnic groups in the United States. Among the most famous of these foreign officers were Marquis de *Lafayette of France, "Baron" Johann de *Kalb and "Baron" Friedrich Wilhelm von *Steuben of Germany, and Thaddeus *Kosciuszko of Poland.

Attempts to exclude immigrants and blacks from military service resurfaced after the Revolution because of decreased need for manpower in the small regular army of the early national period. An 1825 regulation banned foreigners from enlisting in the army without special permission; but the reluctance of native-born Americans to enlist in an expanding economic era, combined with a wave of immigration from Northern and Western Europe beginning in the 1830s, resulted in the foreign-born constituting a majority of the army's enlisted ranks by the 1850s, with Irish and Germans predominating. This pattern reappeared in the post-Civil War army and navy, and was beneficial for the foreign-born, who learned English and American customs, received some vocational training, and gained geographic mobility to the frontier.

Blacks were barred from army enlistment by a general order from Secretary of War John C. *Calhoun of South Carolina in 1820, although the army continued to retain black veterans and to employ black labor. The navy was not happy about recruiting African-American sailors, but its need for black labor was even greater than the army's, and black sailors were less visible to the public than black soldiers. The *War of 1812, the *Mexican War, and especially the *Civil War escalated military need for manpower. Aliens who had started the naturalization process were eligible for the draft during the Civil War, although there was a high rate of volunteering among some of the foreign-born. About 200,000 German Americans and over 170,000 Irish Americans served in the *Union army, often in highly visible ethnic units promoted and led by politically astute immigrant leaders. There was considerable draft resistance in the North, and draft riots, especially the *New York City Anti-Draft Riots in 1863, were often led by Irish and sometimes German Catholic immigrants. The Confederacy was less enthusiastic about ethnic units, although the military participation of immigrants helped to change Southern attitudes toward immigration and led to a limited recruiting

campaign to encourage European migration into the South. In the North as well, suspicion and hostility toward immigrants declined, and self-conscious Americanization was furthered.

Although initial attempts were made to exclude African Americans from the Union army, the flooding of ex-slaves into Union lines, mounting "casualties," the slowing of white recruitment, as well as the growing acceptance of the abolition of slavery as a war aim, led to the ultimate enlistment of approximately 186,000 black troops, nearly 10 percent of the Union army. Blacks constituted about one-fourth of the "Union navy, and a few ships were manned almost entirely by African Americans. By 1865, desperation forced the Confederate Congress to authorize black combat troops, although the war ended before any saw service. In the North, discrimination in pay, assignments, and treatment was prevalent, and Northern appreciation for black military service soon diminished, although the temporarily favorable climate of opinion aided in the passage of the Thirteenth and Fourteenth Amendments and the Civil Rights Act of 1868.

Military need on the postbellum western frontier resulted in the retention of four black army regiments. Despite hostility by white westerners and the reluctance of some white officers to command the four black regiments, the army did make an effort to evaluate the capabilities and performance of "Buffalo" soldiers on military rather than racial grounds, and black soldiers were military effective, with a high esprit de corps and reenlistment rate, as well as proving highly visible heroes to the black community. By the late nineteenth century, however, racial and ethnic lines were hardening in both the military and civilian worlds. New imperial roles heightened racist sentiments in the army and navy, and the "new immigration" from Southern and Eastern Europe increased ethnocentric fears. In 1894, nondeclarant aliens were banned from first enlistment in the army, and in 1906, three companies of black soldiers were dismissed without adequate investigation following a riot in Brownsville, Texas. The navy began to curtail black enlistments, segregating African Americans aboard ships and favoring Filipinos instead of blacks as stewards.

U.S. entry into World War I created a major need for manpower, met largely by the draft, and also sizable minority problems. The General Staff estimated that one-fourth of those drafted were non-English-speaking or functionally illiterate; this led to unprecedented cooperation with civilian social welfare, religious, and ethnic organizations to increase efficiency by meeting the varied needs of the immigrant soldier. "Development" battalions were created for those with insufficient knowledge of English; organized by ethnic groups, they were instructed in English. The army rejected the idea of single ethnic combat units with their own officers (Polish American leaders offered to raise a Polish legion in the United States). Ethnic National Guard units like New York City's "Fighting 69th" (Irish American) Regiment continued to exist, however. After the conclusion of the war, recruit educational centers were established to induct recent immigrants, conduct military training, teach English, and inculcate the army's version of good citizenship. Psychological tests introduced by civilians to screen mental incompetents from the army and classify inductees on the basis of intelligence were used for racist purposes after the war.

Although initially divided, the black community, like the immigrant community, ultimately supported the war effort for patriotic reasons and in hopes of bettering their condition; a number of violent racial incidents occurred, however, such as the riot in Houston, Texas, in the summer of 1917. The military initially tried to confine blacks to supporting labor roles. Ultimately, a training camp for black officers was established and two black divisions were sent to France, although one lacked divisional trains and artillery and was brigaded with the French. The Marine Corps barred the enlistment of blacks entirely, and from 1919 to 1932, the navy suspended their enlistment. The four black army regiments were retained, although the army continued to assert, based on the failure of one black regiment in France, that African American soldiers were cowardly in combat and fit only for menial labor. Discrimination and violence again awaited returning black servicemen, and race riots erupted in 1919.

After the U.S. entry into World War II, blacks were determined that there be a "Double V" campaign for victory against racism at home as well as victory abroad. Unlike World War I, blacks were underrepresented in the draft, although over million black men and women served in the armed forces, half of them overseas. The Marine Corps and the Army Air Corps admitted blacks for the first time; the army integrated its officer training schools; and during the Battle of the "Bulge" (1944-45), units were integrated to the platoon level.

Ethnic issues were also more muted during the war (except for the Internment of enemy aliens, particularly Japanese and Japanese Americans). Many groups were better assimilated, there was unprecedented unity in the war effort, an emphasis on ethnic pluralism, and little ethnic discrimination in combat zones, although it persisted in civilian life at home. Military service hastened the Americanization of some groups previously outside the mainstream, creating group cohesiveness and a sense of possible upward mobility. The rate of volunteering among groups such as Native Americans and Mexican Americans, who had the largest number of Congressional Medal of Honor winners of any ethnic group, and the service of more than 33,000 Japanese Americans (the 442nd Regimental Combat Team of Nisei soldiers was the most decorated unit in the army), earned the nation's gratitude.

After the war, veterans groups, such as the G.I. Forum of Mexican Americans and Club 100 of Hawaiian Japanese Americans, were organized to promote civil rights, political participation, and group interests, and the services ultimately established personnel centers to compile computerized data on ethnic and racial groups. The military, however, was less concerned than in previous decades about the assimilation of the foreign-born, as massive immigration from Europe had ended in the 1920s and ideology began to eclipse ethnicity in the "Cold War" era. Ethnicity also ceased to be a factor in "conscientious objection" (CO) when the Supreme Court decreed in *Welsh v. United States* (1970) that religious pacifism was no longer necessary for CO exemption from military service.

Racial issues were more troublesome, although the services were finding segregation difficult in an age with increasingly specialized technological requirements, and President Harry S. Truman, in July 1948, issued Executive Order 9981 for the racial integration of the armed forces. Integration was finally achieved during the exigencies of

the "Korean War, although the "Vietnam War created new tensions. High casualty rates, especially among nonwhites, and the influence of the ethnic rights and Black Power movements, led to protests and antiwar activities within the military. Unrest—especially protest against allegedly unequal military justice—continued after the war. The military responded with seminars on race relations, basic skills, and management training programs, and affirmative action goals that led to improved racial relations. The military was the first federal body in the United States to be officially desegregated, and today it has a higher percentage of black generals and admirals than African American executives in large corporations.

Military service has also been attractive to Native Americans, whose enlistment rates during the twentieth century have been about three times as high as for non-Native Americans. Military service has revitalized the tradition of warrior societies, which performed vital military functions in preceding centuries, and service in World War II, as well as employment in war industries, brought Native Americans much more into the mainstream of American life. Veterans have provided leadership in the movement for self-determination. The Vietnam War created a generational split as many draft-age Native Americans clashed with their pro-war parents; but rejection of the war did not lessen the continuing popularity of military service.

It seems likely that the military services will continue to contain ethnic and racial minorities in excess of their percentage of the total population, and that they will serve in an environment more harmonious and welcoming than in the past. The structured and disciplined environment has always potentially enhanced the military's capacity to eliminate prejudice and discrimination, and the services seem more willing than ever before to define equality as a desirable goal.

ETHNICITY AND WAR. Throughout American history, war has often had a strong Americanizing influence on ethnic groups, increasing each group's acceptability and promoting assimilation and acculturation. Support for the war effort by the ethnic group itself has been well received by the majority. But assimilation and acculturation usually mean the erosion of the cultural and social life of the immigrant group. In addition, during wartime, pressures to conform have often become oppressive, and discrimination against immigrants—and sometimes ethnic groups—from countries with which the United States is at war has at times been appalling.

Although non-English immigrants to America during the eighteenth century helped legitimize the ideal of a composite national identity, in the succeeding century pressures for cultural conformity increased, partly as a result of America's wars. The greatest pressures on cultural diversity occurred in the late nineteenth and early twentieth centuries, when identity was most narrowly and rigidly conceived and group loyalties the most suspect. Since World War I, the United States has moved toward less rigidly defined ethnic and racial boundaries and a more inclusive sense of national identity, with the notable exceptions of the treatment of Japanese Americans during World War II and the increase of ethnic and racial tensions during the "Vietnam War.

During the colonial period, the homogeneity resulting in part from the English cultural background of most colonists and the common dangers encountered in the New World began to change by the eighteenth century. As the frontier moved westward, much of the fighting was done by recent non-English immigrants who joined expeditions or settled in frontier areas. Engagement in warfare, particularly during the "French and Indian War of 1754-63, drew many new immigrants into the political and social life of the general community. At the same time, the English language, customs, and dress became more common and new heroes, traditions, and memories were created.

The "Revolutionary War was even more significantly Americanizing. Despite a greater tendency among non-English immigrants toward loyalism or neutrality than among those of English ancestry, immigrants responded during the crisis to their immediate situation rather than to Old World loyalties or antipathies. The Revolution resulted in increased immigrant participation in the political and economic life of the new nation; it also furthered geographic mobility, and, with France as an ally, lessened anti-Catholicism. Ties with Europe were disrupted, snapping religious and cultural bonds, and leading to a further decline of European languages and the ethnic press. Although the Revolution was conceived of largely in ideological, not ethnic, terms, it did legitimize the idea of a composite national identity and gave new emphasis to the concept of America as an asylum for oppressed peoples. Group identity, however, was discouraged, and a common and effective "melting pot" was assumed.

The "Mexican War in the mid-1840s coincided with an emerging nativist movement and heightened suspicions of Roman Catholics, although the winning of the war resulted in the addition of a large Spanish-speaking Catholic minority to the United States. In the 1850s, tensions over the issue of slavery led to the decline of nativism, and immigrant groups largely reacted to the outbreak of the "Civil War in 1861 with strong sectional loyalties. In addition to patriotism, gratitude for the benefits of living in the United States, and a relative lack of local attachments, Northern immigrants responded to recruiting appeals, bounties offered, and the trade depression at the beginning of the war. Initial British hostility toward the Union cause heightened Irish support in the North for the war, and Irish American nationalists saw it as a way to further the Fenian movement to overthrow British rule in Ireland.

Strong immigrant support for the war—except for a minority of Catholic Democrats—also led to new prestige and improved status for ethnic groups in the North. Because their patriotism was often expressed collectively,

many groups remained distinct and conscious of their identity and separateness. Latent hostility toward the foreign-born would again be triggered by a new wave of immigration from Southern and Eastern Europe beginning in the 1880s, but the immediate postwar period was one of relative calm. In the South, foreign-born participation in the war and a postwar need for labor led to attempts to recruit European migration to the southern states. In general, immigrants were seen as supporters of the existing order, not threats to stability.

During the *Spanish-American and *Philippine Wars, the pressure to conform was great, especially for Catholics. There was, however, a greater reluctance among ethnic groups than among the general population to support American entry into the Spanish-American War, and a greater tendency to be more critical of American imperialism, especially in the Philippines. In some instances, intraethnic issues played a role, such as the realization by the largely Irish clerical hierarchy that an appeal for unity would help to undercut the "Cahenslyite" controversy, in which non-English-language groups were seeking more autonomy within the Catholic Church. Much stronger reactions occurred among immigrants when war broke out in Europe in 1914: whatever choices the United States might make would raise strong ethnic feelings and loyalties, particularly among immigrants from the central powers and among subject groups from the Habsburg Empire.

The strength of ethnic feelings, combined with fears of the "new immigration" from Southern and Eastern Europe, and the dislocating effects of rapid industrialization and urbanization, led to a movement to "Americanize" the immigrant and thus dissipate group loyalties. Particularly unsettling, as the United States was drawn closer to the Allied cause, were anti-British sentiments and calls for *neutrality by German Americans and Irish Americans. After American entry into the war in April 1917, a wave of hysteria against all things German engulfed the nation, resulting in a permanent weakening of German culture and identity in America. Although groups not from the central powers found increased acceptability during the war by displaying "100% Americanism," this did not protect them after the armistice as a wave of antiradicalism, often targeting aliens, swept the nation; a renewed and virulent nativist movement emerged by the early 1920s.

The war strengthened the Zionist movement in the United States, and for groups such as Italian Americans, resulted in the creation of a hyphenated national identity. Such group strengthening, however, occurred within the larger context of enhanced loyalties to the American nation. The increased visibility of ethnic groups made the native-born more aware of Old World ties and of the fact that American foreign policy inevitably affected the social order. Although the Americanization campaign, which continued after the war, aimed at eradicating foreign languages and customs, it did emphasize education and vocational training to the benefit of ethnic groups. Illiteracy declined during the war years, secondary education became almost universal, and higher education also expanded after the war. The excesses of the Americanization movement led liberals largely to reject the ideal of thorough assimilation and the melting pot, and concepts of cultural relativism began to emerge.

In the late 1930s, uneasiness about the loyalties of ethnic minorities, increased as Americans reacted to the activities of the German American Bund, to a suspected "fifth

column" in the United States, and to the open sympathy for Mussolini shown by many Italian Americans. Pro-Fascist sentiment was always limited, however, and almost disappeared as the horrors of Nazi Germany became better known. Most immigrants increasingly favored aid to the Allies, and the attack on *Pearl Harbor created unprecedented unity among all *mericans.

World War II, was perceived primarily in ideological rather than ethnic, racial, or class terms, as reactions to the Axis powers led Americans to reemphasize a common unity based on such shared values as democracy, individual liberties, and respect for minority rights. Ethnic groups were represented on the Common Council for American Unity to foster cooperation, and even substantial tension and violence, such as the "zoot suit" riots of servicemen against Mexican Americans in Los Angeles in 1943, did not disturb a generally harmonious pattern of ethnic relations. Wartime prosperity also muted tensions.

Mobility during the war, especially into the military and to cities to join the urban labor force, brought previously isolated groups into the mainstream. Mexican Americans, for example, were drawn out of a rural agricultural and urban barrio existence. In response to an acute manpower shortage, Mexican "braceros" were recruited for agricultural labor, creating an emigration pattern that would continue after the war as large numbers migrated to cities to work in industries. Italian Americans, especially after being removed from the "enemy alien" category on Columbus Day, 1942, also moved rapidly toward assimilation. German Americans experienced much less hostility than in World War I, as they were now better assimilated and politically and economically important, and as Americans distinguished between the Nazi regime and the German people. The same distinction was not made about Japanese Americans, however, as more than 110,000, two-thirds of whom were American citizens, were removed from the West Coast and incarcerated in ten relocation centers in isolated parts of the western, mountain, and plains states. Despite such treatment, the large majority of Japanese Americans remained steadfastly loyal to the United States; a majority returned to the Pacific Coast after the war, although others located elsewhere. Fortunately, prejudice and discrimination against Japanese Americans decreased markedly in the postwar years.

The 1930s pattern of discouraging the entrance of refugees from Nazi Germany continued during and after the war; only 21,000 were admitted during the war years, about 10 percent of those eligible under existing quotas. In January 1944, President Roosevelt created the War Refugee Board, but by then it was too late to save many Jews from the Holocaust.

The ideological orientation of the war years intensified during the *Cold War, and anticommunism never stimulated a strong nativist movement. Senator Joseph McCarthy targeted the establishment rather than the foreign-born, and was even accused of being a "crypto Jew" because two of his closest aides were Jewish. Many immigrants from Eastern Europe were fervently against Soviet expansionism, thus increasing their acceptability. Richard Polenberg has argued that McCarthy's rise to power would not have been possible had it not been for the frustrations of fighting a limited war in Korea, but the * Korean War did not create anti-alien sentiments or inordinate civil tensions, in part because of its brevity.

Unlike the war in Korea, the "Vietnam War tore at the

fabric of American society and created sharp racial, ethnic, and class cleavages. Although the war most notably affected African Americans, leading to the assertion of Black Power and rejection by blacks of racism at home and imperialism abroad, it also called into the question the ideological consensus of the World War II and Cold War years, resulting in the reassertion of ethnic particularism and a promotion of the cohesiveness of the ethnic group as a model. Americans felt obliged to accept a large number of Vietnamese refugees, although attempts to disperse them throughout the country failed, and they migrated to states like California that had significant Asian communities and generous welfare benefits. The continuing turmoil in Southeast Asia after the American exodus prolonged the refugee crisis.

A general trend toward lessening ethnic pressures and tensions since the 1920s is heartening. It has been argued that, given the right conditions, hysteria and a subsequent antiradical scare such as took place in the World War I era could reoccur. It is to be hoped that the pessimists are wrong and that the nation will finally accept its increasingly multicultural nature.

EWELL, RICHARD STODDERT (1817-1872), Confederate general. Born in Georgetown, D.C., Ewell was raised in Virginia. In 1840, he graduated from West Point thirteenth in a class of forty-two and served in the cavalry during and after the * Mexican War. He joined the Confederacy in April 1861 and was promoted to brigadier general. As a major general in the *Civil War, Ewell commanded a division during "Stonewall" * Jackson's Shenandoah Valley campaign and defeated Union troops at Cross Keys in June 1862. A severe knee wound during the Battle of Groveton in August resulted in the amputation of his right leg, but he returned to duty as a lieutenant general in May 1863. After Jackson's death Ewell took over his II Corps, but his failure to attack the Union position on Cemetery Hill during the first day of the Battle of *Gettysburg led to accusations of incompetence. "Old Bald Head" subsequently fought during the *Wilderness to Petersburg Campaign, but poor health and his wife's increasing Unionist sentiments culminated in his being relieved of field command in May 1864. He commanded Richmond's defenses until captured at Saylor's Creek on 6 April 1865. Paroled in July 1865, Ewell settled at his wife's Spring Hill, Tennessee, estate; both died of pneumonia in January 1872.

—Ervin L. Jordan, Jr.

EXPANSIONISM is endemic to an unfinished world of sovereign states in which some nations possess the power and will to challenge the global distribution of land, resources, or people. Centuries of mass migrations and state-building created the modern state system without satisfying the needs and interests of all its members. The resulting instability in international life took its precise form from, the existence of three worlds superimposed on one another. One consists of the economic universe of plains, valleys, rivers, harbors, and waterways—elements that determined the nature, quality, and performance of national economic activity. A second is the world of people, separated by ethnicity, language, and religion into unique cultures that seldom conform to national boundaries. The third comprises the world of nations, more artificial and malleable than the others, with boundaries created over time by natural lines of demarcation or by war.

Leaders of countries whose geographic, demographic, or political status fails to coincide with their ambition, perceived interests, and power can balance the two sets of factors in only one way: through the exertion of force. Highly dissatisfied nations may forego territorial adjustment through war by reason of prudence or morality. When states unleash force in quest of land or ethnic amalgamation, they succeed or fail according to the magnitude of the reaction. For the United States, its expansionist efforts largely preceded twentieth-century precepts of self-determination and peaceful change that rendered resorts to force immoral, and thus unacceptable. The United States, throughout its expansionist career, never faced an invincible coalition committed to blocking its expansion and defending the status quo.

American expansionism in the nineteenth century focused on bordering regions whose acquisition would enhance its security and broaden its economic base. Except for its conquest of Indian lands and its war with Mexico, the United States achieved its continental empire mainly through diplomacy. Europe's declining role in distant North America provided the United States sufficient leverage in its confrontations to assure highly beneficial boundary settlements. France, finding its claims to the vast Louisiana Territory relatively worthless, sold Louisiana to the United States in 1803 for \$15 million. Spain revealed its weakening position in North America by ceding Florida and agreeing, in the Transcontinental Treaty of 1819, to a satisfactory boundary from Louisiana to the Pacific Coast. Britain defined its Canadian boundary with the United States in its acceptance of the 49th parallel from the Great Lakes to the Rockies in 1818; the Maine boundary settlement in 1842; and, in 1846, the line of 49 between the Rockies and the continental shore, then continuing on to the Pacific through the Strait of Juan de Fuca. California and the Southwest were acquired in 1848, in the war with Mexico. Alaska, no longer desired by Russia, was, like Louisiana, largely a windfall.

Expansionists in the 1840s proclaimed the doctrine of "manifest destiny" to rationalize American expansion as the mere fulfillment of the country's destiny. The concept of destiny, in discounting the role of force in the country's expansion, rested on the presumed superiority and appeal of American institutions. Notions of destiny might assuage the doubts of those who abhorred force, but expansion itself required more than convictions of political and cultural superiority. Manifest destiny neglected totally ques-

tions of power or diplomacy. It embodied no need to define ends. The hand of destiny, in promoting the extension of freedom, culture, and institutions, recognized no bounds. Quite typically, journalist John L. O'Sullivan, who is credited with coining the phrase, observed in the *New York Morning News* on 27 December 1845 that it had become "our manifest destiny to occupy and to possess the whole Continent which Providence has given us...."

American expansion across the continent rested not on notions of destiny but on clearly conceived national policies, based on power and diplomacy, attached to specific territorial objectives. In the 1840s, the Polk administration pursued Texas's claims to the Rio Grande and businesses' desire for seaports on the Pacific Ocean, objectives achieved through the "Mexican War. In Oregon, the U.S. goal was the magnificent harbor of Puget Sound, with access to the Pacific through Juan de Fuca Strait. The American demand for a settlement along the 49th parallel assured access to the desired waterways. U.S. purposes in California were no less precise than those in Oregon: the harbors of San Francisco and San Diego. These objectives Polk embodied in his war aims and achieved in the Treaty of "Guadalupe-Hidalgo (1848).

American expansionism entered the vast world of the Pacific in the late nineteenth century. The region seemed to offer limitless opportunities for the expansion of Christianity and civil liberty, and also for the acquisition of new markets to complement the impressive growth of American industrial and agricultural production after the American "Civil War. What rendered the Pacific region especially inviting was the presumption that its civilizations could not resist the power, technology, and organizational skills of the Western world. Unlike other imperial powers, the United States did not create its Pacific empire by conquering previously independent peoples. Instead, it exploited opportunities for economic and territorial expansion already created by internal instabilities and weaknesses in regions regarded as strategically and economically important. Or it overthrew Spanish colonialism. After 1860, the application of American will in the Far East appeared so effortless that it ultimately led to expanded objectives, illusions of omnipotence, and wars exorbitantly expensive.

America's expansion in the Pacific advanced in spurts. By the early 1890s, it had touched China, Japan, Midway, Hawaii, Korea, and Samoa. In February 1893, the Harrison administration negotiated an annexation treaty with Hawaiian commissioners, only to have the incoming Cleveland administration reject it and condemn the previous administration's involvement in Samoa as well. The anti-imperialists demonstrated their dominance by defeating a second Hawaiian annexation treaty in 1897. It required the "Spanish-American War, in April 1898, to break the power of anti-imperialism and project the United States onto the world stage.

Shortly after the outbreak of war, fought ostensibly to free Cuba from Spain, Commodore George "Dewey's Pacific Squadron destroyed the Spanish Fleet at the Battle of "Manila Bay in the Spanish Philippines. This sudden display of naval power in the remote Pacific, and the possibil-

ities it opened for empire-building, were not lost on a group of well-placed expansionists in Washington. During June 1898, Congress annexed Hawaii by joint resolution against little opposition. Meanwhile, President William "McKinley dispatched an army to take control of Manila. On 13 August, Spanish officials surrendered the city to American forces. The decision to destroy Spanish power in the Philippines closed every easy avenue of escape. Having liberated the islands, the United States had either to restore them to Spain, free them, transfer them to another power, or retain them. Expansionists that summer clamored for their retention. On 16 September, McKinley instructed his peace commission that U.S. forces, with no thought of acquisition, had brought duties and obligations to the Filipinos that the country could not ignore. During December, the peace commission in Paris signed a treaty that conveyed the Philippines, Guam, and Puerto Rico to the United States in exchange for \$20 million. The Senate, in February 1899, approved the treaty by a vote of 57 to 27, one more than the necessary two-thirds. Philippine annexation set off a bitter, costly war with Emilio "Aguinaldo's Filipino insurgents for possession of the islands. The American antiguerrilla campaign soon degenerated into a no-quarter struggle of burned villages and the deaths of innocent men, women, and children. At the end, the acquisition of the Philippines demanded a heavy price.

Still, the illusion of easy success received an even more powerful demonstration in the U.S. effort to save China from dismemberment by Russia, Britain, France, Germany, Italy, and Japan. According to the American "open door" notes of 1899 and 1900, those countries accepted, in principle, China's economic, political, and administrative integrity. In the euphoria of "saving" China, the United States accepted a pervading unilateral commitment to China's independence and political integrity against Russia and Japan, whose interests in China were far greater than those of the United States. With its recent territorial accessions, the United States entered the twentieth century as the world's leading satiated power, with objectives—in China and elsewhere—anchored to the territorial status quo, but facing powers whose expansionist interests demanded further changes in the world's treaty structure, even at the price of war. For the United States, the coming century would hardly be peaceful, if no longer territorially expansionist.

FAMILIES, MILITARY. "If the Army had wanted you to have a wife, it would have issued you one!" This often quoted dictum reflects a historical truth: until recently, military families have been excluded from military attention and policy, not just in the army, but in other services as well. Nonetheless, there have been American military families as long as there has been an American military establishment, and the numbers are growing. In the mid-1990s, more than 2 million military personnel (more than 60%) were married, and military families represented at least 3 percent of all U.S. households.

Military families are influenced by a unique set of circumstances. The organization that employs the breadwinner sees itself as a familylike structure, and insists that its mission must come first. Militant values such as violence and hierarchy shape the context within which family members must function, and at times the battlefield encourages stronger bonding between warriors than between family members. In addition, the military family is socially defined by the status of the soldier, and its personal life is constricted by definite rules. The military member faces more danger and a greater likelihood of death than in most other professions, and the family must either recognize or deny this reality. Whichever response it chooses has its effect. Frequent moves disrupt family life, often involve separation, and sometimes require adjustment to foreign cultures. Working hours are unpredictable.

On the other hand, there is job security, coupled with the promise of early retirement for career personnel. Although pay levels are not competitive with civilian rates, income is reliable and in recent years fringe benefits have partially balanced this disparity. A military career often provides the family with a sense of order, social solidarity, and community, as well as an unambiguous social identity based on clearcut ideals and expectations. These long-standing characteristics have varied in wartime and as the larger civilian society became more industrial, powerful, and international.

Although evidence is scant, sources claim that as many as 20,000 women were "'camp followers'" during the "Revolutionary War. Most were the wives, many accompanied by their children, of the soldiers who fought the war; often they had nowhere else to go. These women nursed the sick and wounded, sewed and laundered uniforms, cooked for the troops, and struggled to follow the armies when time came to move on. Although these families were usually tolerated out of fear that the husbands would desert otherwise, only the laundresses received any official notice or recompense.

As the new nation grew, the small military's task changed to guarding ever-shifting borders, taming the West, and protecting against European incursion. Military families (both officer and enlisted) traveled with the armies, although in peacetime fewer officers were tolerant of soldiers' families, and often required permission for marriages and certification for families to accompany troop movements. In the years between 1783 and 1848, pay was low and promotion slow. Few soldiers could afford families. For those who wanted their families with them (or who had no other alternative), shelter and rations were scarce. Indian attacks, traveling mishaps, and disease, as well as death in childbirth, killed off women and children indiscriminately.

Between moves, families settled into whatever housing was possible. At some of the eastern posts, casemate housing in coastal defense forts was particularly crowded, and meals had to be taken elsewhere. Still, these brick and stone lodgings seemed luxurious compared to the sod and mud shelters in the West. Sometimes families (especially enlisted) slept in the open, in tents with the soldiers, or in caves. Laundresses, still the only women given official status, were provided with rough cabins when available. If an officer of higher rank wished, he and his family could "rank out" another family, taking over their housing if it looked more comfortable. This tradition continued at least until World War II.

Military family life was not entirely without its pleasures, particularly for officers' families. As more women followed their husbands west, the antebellum frontier posts reflected their influence. By the 1830s and 1840s, officer housing at larger posts was more spacious and weather-proofed. Flowers and vegetables appeared in gardens. Social life included dinner parties, balls, amateur theatrics, and occasional church services. For children, simple grammar schools were established, often with teachers "drafted" from the enlisted ranks. Wherever wives settled and children played, efforts to transport "civilization" from the East were not far behind.

Military family life in wartime was a different story, as the "Civil War years attest. With every war, the number of families expanded as military ranks swelled. Though many wives (both Northern and Southern) remained at home, others chose to accompany their husbands everywhere possible, or, more frequently, when they camped nearby. Sometimes wives of enlisted men had nowhere else to go. Officers' wives usually had more options, and, like Libby Custer, visited their husbands out of devotion and a desire for adventure. Wherever wives gathered, a social hierarchy based on the husband's rank soon emerged. Except for brief visits, children were left with relatives for safety from

disease and wandering bullets, and thus the war precluded much normal military family life. As usual, rank had its privilege, and many senior officers enjoyed extended visits from their entire families.

After the war, resources declined and the minimal support for families available in the antebellum period decreased. Enlisted men still could not afford families. Although a minority of all military families, many more officers' wives and children went west with their husbands and fathers. Little was provided for family maintenance: minimal travel allowances, inadequate or no housing (with a few exceptions at the larger posts), scant and unhealthy food shipments, poor or nonexistent schools, and only occasional medical care by ill-trained camp doctors often unused to dealing with the health problems of women and children.

Those families without outside resources to make up for such inadequacies were at a great disadvantage, although even the poorest officer families often had the luxury of servants—either enlisted “strikers” or the wives of enlisted men. When they could afford it, officers often chose to send their older children back east (sometimes accompanied by their wives) to be educated. Younger children were often tutored in rudimentary skills by their parents or others on the post.

Yet in their frequent moves from one outpost to another, these families established a sense of community and shared experience that would be a part of professional military life until the enormous expansion of the mid-twentieth century. Most came to know each other and many were related. Their separation from civilian life, heightened by hardship and slow advancement, drew them closer. As in the antebellum period, wives worked hard to make the quarters comfortable, and to influence their environment in whatever ways were possible. Often they viewed their surroundings and “adversaries” differently from their husbands—appreciating the still untouched beauty of the plains and mountains, and empathizing with the Indians.

With the *Spanish-American War, military families found themselves facing the new challenges of empire. By 1900, wives clamored to accompany their husbands abroad, especially to the Philippines, which until the 1980s provided one of the major overseas postings for the American military and its families. Predictably, enlisted men seldom could afford to bring their wives and children with them. Once in the archipelago, however, some soldiers married Filipina women, the first of a long line of “war brides” who, along with the families of the African American “Buffalo” Soldiers after the Civil War, would contribute to the growing heterogeneity of U.S. military families in the twentieth century. Officers, on the other hand, were sometimes allowed to bring their wives and children from the States, at their own expense. Once in the Philippines, these families struggled to find their own housing and food, fight against different diseases such as malaria and dysentery, and learn enough about the new culture to survive within it. As the American presence in the islands expanded over the next forty years, base housing became available, and military families often chose to stay within the confines of the post and try to replicate the lives they had left behind.

Between 1900 and 1941, whether their soldiers were stationed in the United States or overseas, military dependents increasingly chose to live nearby, except in wartime.

Washington still provided only the barest support: travel pay and rental allowances for officers with families, nothing for enlisted men except that granted at the mercy of individual commanders. Nonetheless, on an unofficial level, the “Old Army” continued to offer a sense of identity, order, and community derived from shared experience, common acquaintance, and a feeling of “otherness” from the civilian world.

The World War I era produced little change in military family life, and none in military policy toward families. Twenty years later, however, because of the enormous manpower needs of World War II, many more men with families joined the military. In 1942, the Dependents Allowance Act was passed by Congress—a concrete acknowledgment by the government that military families were a military responsibility. Each wife and child received an established monthly payment; and this allowance, coupled with allotments set aside by the soldiers and augmented by the government, provided some regular support to all military families.

Other conditions improved as well. Although never adequate enough to keep up with the ever-growing numbers of families, large new military bases made provision for better healthcare, shopping, schools, and housing. Since wartime contingencies forced frequent moves within the United States, and families could not accompany soldiers to most foreign postings, many families chose to stay “at home” for the duration. Others followed their soldiers whenever possible.

At war's end, the new U.S. position in the world and the advanced technology that supported it required more career military personnel with more education, who therefore were usually older. The number of military families grew exponentially. The *Pentagon gradually began to develop a more coherent military family policy. Pay rates improved and pensions encouraged long-term careers. More on-base housing was built, and in 1956 Congress passed the Dependents Medical Care Act, which provided full health benefits to families.

Since the end of World War II, life for military families in all of the services has changed. Those who accompany their spouses now are in the majority, and with the advent of the *All-Volunteer Force in the 1970s, keeping them reasonably content has increasingly been recognized as necessary to maintain satisfactory force size and efficiency.

Changes in gender attitudes throughout the society have brought changing conditions for the military. By the end of the 1950s, the traditional wife who stayed home and solved many of the special problems of the military family could no longer be counted on; instead, she often had a career of her own. Indeed, as more and more women joined the military, the spouse might be the husband. Sometimes families were “dual-service” couples. By the late 1970s, as the courts forced the services, one by one, to allow female soldiers to become mothers without discharge, such couples might be raising children. When divorce rates soared in the whole society, more single-parent families occurred in the military. To respond to these issues, the Department of Defense generated new studies and policies, and appointed a deputy assistant secretary for personnel and family matters. Additionally, the National Military Family Association now exists, independent of the government, to highlight and respond to questions especially relevant to the military family.

A fundamental problem remains that in order to survive the stress of its special circumstances, the emotional openness that often strengthens families in other settings is sometimes suppressed in the military family. This has led to higher-than-average rates of alcoholism and other forms of dysfunction. Even in stable military families, frequent separations cause shifts in dynamics that require careful negotiation. As the U.S. armed forces move into the twenty-first century, these family dilemmas will have to be addressed.

FARRAGUT, DAVID (1801-1870), admiral in the U.S. Navy, Civil War. David Glasgow Farragut's Civil War promotions bear witness to his place in the first rank of naval heroes. Congress named him the first U.S. Navy rear admiral, vice admiral, and admiral.

Born in Tennessee in 1801, he grew up as the ward of Adm. David Dixon *Porter. By age nine, he was a midshipman; by age twelve, Porter appointed him prize master to take a captured ship into port.

After the *War of 1812, Farragut's career made slow progress through the peacetime navy's seniority system: lieutenant (1825), commander (1841), captain (1855), while working to establish the Mare Island Navy Yard in California.

He maintained a home in Norfolk, where he married, was widowed, remarried, and fathered a son, Loyall, who would be his wartime secretary and biographer. Faced with a choice of allegiance in 1861, he moved to New York. Even so, his Southern origins created suspicions, which his service in the * Union navy more than overcame.

He commanded the West Gulf Blockading Squadron, which posted ships from St. Andrew's Bay east of Pensacola westward along the Gulf Coast to the Rio Grande. Farragut gained fame by leading the expedition that was successful in the siege of *New Orleans in 1862, one of the most significant Union victories of the war. His leadership was central to the great riverine battles that secured the Mississippi and its tributaries for the Union, especially the siege of

• Vicksburg. At the Battle of "Mobile Bay in 1864, his command—"Damn the torpedoes. Full speed ahead"—elevated his fame to legend.

His postwar appointment as commander of the European Squadron became a triumphal tour of "the American Nelson" through various capitals. Farragut died during a visit to the Portsmouth, New Hampshire, Navy Yard in 1870.

FASHION, MILITARY INFLUENCES ON. American fashion has recruited military style again and again, recognizing the efficacy of military specifications and the charisma of heroic accomplishment. Virtually every factor of the military has been employed in civilian fashion sooner or later, including epaulets, ball buttons, khaki adapted from the British military in India, and olive drab. Special sartorial heroes have included A-2 aviators' leather jackets, navy blue as a standard of modern dress, sailors' drop-front bell-bottom trousers, pea jackets, knit sweaters of sailors and commandos, aviator glasses, and camouflage appropriated to daily use. When the late-twentieth-century fashion editor Diana Vreeland called uniforms "the sportswear of the nineteenth century," she was describing useful adaptations: examples of the cavalry to riding apparel, braid as reinforcement and decoration, plastrons and double-breasted chests as double protection for the heart, and even romantic sashes that served by necessity to carry the wounded from the battlefield.

Military fashion enters the civilian wardrobe in varied ways. With modern, nonmercenary armies, countless veterans return with favorite jackets, trousers, or other items. Paramilitary organizations, including schools and police, have modified military traditions to enforce systematic social identity in forms as varied as middle blouses for school and recreation, tartan for school identity, police outfitting, and even World War I Sam Browne belts for child safety officers.

Military traditions often enter civilian dress in ways that are only partly remembered. The regimental tartans that identified Scotland when England proscribed indigenous Highland dress to Scottish civilians have been a recurring feature of modern civilian dress, with attenuated links to Scotland and to the military source. Not only the plaid, but even the kilt and over-the-shoulder drape are of military origin. The trenchcoat, made first and continuously by Burberry of London for Boer War and World War I service for officers needing protective cloth, closings, and latched wrists and collar, has become a basic of dress for both men and women. Its origins in officers' coats are remembered in name, but many today might more readily associate the coat with glamorous espionage and Humphrey Bogart in *Casablanca*, even as contemporary fashion specifications for most trenchcoats include vestigial D-rings (designed for hand grenades) still worn by modern suburban commuter-warriors. The popular Eisenhower jacket of the 1950s emulated Gen. Dwight D. "Eisenhower's wool field jacket (M-1944), modeled after that of Field Marshal Bernard Law "Montgomery. This popularity benefitted from the "theater of war" picturing Eisenhower as Allied leader; his sartorial decisions assumed his mantle of leadership. Arguably, even exposed T-shirts are sanctioned by sailors and soldiers in World War II and romanticized by photography and such films as *South Pacific*.

Some apparel from World War II waited a generation or more to be accepted in civilian fashion. The fatigue jacket was introduced to service in 1943; the same jacket, beginning with military surplus, became popular fashion in the 1970s, ironically largely associated with militant antiestablishment advocates of Black Power and the "Vietnam Anti-war movement. The subjective but powerful value of military clothing can be demonstrated by the fact that war protesters of the 1970s frequently wore anachronistic military gear to express their opposition to the war of

their time. Camouflage and desert camouflage—especially after the "Persian Gulf War"—has been widely adopted in the 1980s and 1990s. In 1988, fashion designer Stephen Sprouse used Andy Warhol's red-yellow-blue camouflage for clothing that would have made any wearer stand out in a crowd.

If fashion is vested in recent wars, historical warfare also becomes transmuted for peaceful purposes. Christian Francis Roth displayed medieval inspiration in his "soft armor" outfits of 1993, resembling medieval armor in gray flannel. In 1994, Ralph Lauren created armor in silver leather accompanied by Lurex knit gowns akin to knightly mail. In 1968, the "Civil War-inspired dresses, based on Confederate officers' frock coats, by Geoffrey Beene (born in Louisiana). In 1989, Lauren emulated the tailoring of World War I uniforms. Lauren has regularly used band collars, epaulets, braid, pea coats, aviators' jumpsuits, and military tailoring as signs of crisp, effective women's attire. In the 1990s, Jean-Paul Gaultier has returned repeatedly and ironically to the sailor's middie blouse.

American democracy celebrates military officers for their perfect tailoring, but is unique in world fashion in admiring equally the quartermaster's issue to the enlisted man. Abhorring enforced homogeneity, American culture nonetheless revels in the selective possibilities of uniform. Fashion for both men and women admires alike the common soldier or seaman and the officer. Moreover, uniforms for women in the military, including the "WAVES uniforms designed in the 1940s by Mainbocher, have set a standard for orderly, smart dressing.

FELLOWSHIP OF RECONCILIATION (FOR), a religious-pacifist organization, was founded in England (1914). An American branch was established in November 1915 in Garden City, Long Island, by men and women who belonged to mainstream faiths as well as to pacifist faiths like the "Quakers.

In World War I, FOR led by Gilbert A. Beaver, Edward W. Evans, and Charles J. Rhoades, assisted conscientious objectors (COs). Afterward, it became the intellectual arm of the religious peace movement. Its popular journal, *The World Tomorrow* (renamed *Fellowship*, 1935), embodied radical Christian-motivated ideas. Membership averaged 6,000.

During the 1920s and 1930s, FOR helped establish the Committee on Militarism in Education to oppose compulsory "ROTC; it supported the Outlawry of War campaign culminating in the Kellogg-Briand Pact (1928), and cosponsored a peace mission to Nicaragua.

In the late 1930s, FOR cooperated with other peace groups in establishing the Emergency Peace Campaign, calling for strict neutrality, lower tariffs, and international organization contingent on justice. Membership increased to 10,000 during World War II as FOR aided COs, sent supplies to war relief camps in Europe, and sought release of Japanese Americans from relocation camps.

In the early years of the "Cold War, membership dropped to an all-time low of 2,000; but in the 1950s, the Fellowship promoted a nationwide campaign against "nu-

clear weapons testing and gained adherents.

During the "Vietnam War, led by David McReynolds, Allen Brick, Ron Young, Ray Gould, and Reverend William Sloane Coffin, FOR reached nearly 23,000 members, participated in numerous antiwar demonstrations, conducted draft-counseling centers, and established social service schools in South Vietnamese cities. Conflict within the national council erupted when executive secretary Al Hassler urged support for the Buddhist pacifists' "Third Force" solution, while others called for immediate unilateral U.S. troop withdrawal.

After Vietnam, FOR investigated events in Nicaragua between the Sandinistas and contras, and joined the Nuclear Freeze Campaign of the 1980s. Prior to the "Persian Gulf War, the Fellowship led a peace mission with medical supplies to refugees in Jordan and Iraq. In the mid-1990s, it instituted a Civilian Casualty Fund to aid Bosnian Muslims. FOR membership in 1998 was about 8,000—the majority from the Protestant, Catholic, or Jewish faiths.

FERMI, ENRICO (1901-1954), one of the foremost physicists of the twentieth century. Enrico Fermi was born in Rome and educated at the University of Pisa in Italy (Ph.D., 1922), and subsequently at the universities of Göttingen (Germany), Leiden (Holland), and Michigan (United States). In 1926, he made his first major discovery of quantum statistics (now known as Fermi-Dirac statistics). He accepted an appointment to Columbia University in 1939 and from there verified that nuclear fission was possible. The potential applications of this enterprise were immediately evident to the military. At the request of the U.S. government, Fermi took his research team to the University of Chicago, where in December 1942 they demonstrated the first self-sustaining chain reaction. Fermi's discoveries and his ability to apply them made him a key player in the development of the "Manhattan Project, the highly classified research that ultimately resulted in the creation and detonation of the first atomic bomb. The bombings of "Hiroshima and Nagasaki in Japan, cessation of the war in the Pacific, and the start of the Atomic Age followed. After World War II, Fermi was appointed director of what became the Enrico Fermi Institute for Nuclear Studies at the University of Chicago until his death in 1954.

FIGHTER AIRCRAFT. Fighters are aircraft intended to win air superiority by destroying enemy aircraft. The term is generally applied to those aircraft designed to have sufficient performance to destroy enemy aircraft. However, as a result of the threat posed by strategic bombers during and after "World War II—and particularly after the

development of atomic weaponry—a specialized class of fighter, called the interceptor, was developed specifically to counter the bomber threat. Most fighters are small single seat aircraft powered by one or two engines. Interceptors, however, typically have more than one crewman, and tend to be larger and heavier, with longer range. Another category of fighter is the fighter-bomber, which is capable of participating in the air superiority war, but then, when air superiority is no longer an issue, is capable of being applied as a ground attack airplane. Over time, from *World War I to the present, the fighter has gone from a 70 mph frail open-cockpit wood-and-fabric airplane to a Mach 2+ jet-propelled aircraft capable of carrying a sophisticated array of electronics and precision weapons.

Fighters, originally termed “fighting scouts,” initially appeared in World War I. They were developed to counter the emergence of the reconnaissance aircraft, which, as early as 1914, had proven so valuable to ground commanders that a means had to be developed to deny one’s airspace to the prying eyes of enemy airmen. Development of particular technologies to support the emergence of the fighter—specifically the synchronized forward-firing *machine gun—was swift. Indeed, from 1914 through 1918, five clear generations of fighter aircraft were produced, the latter of which were rudimentary all-metal monoplane designs by the German designer Hugo Junkers. By 1916, control of the air was a vital prerequisite for the success of any other air operations. As a rule, the Allies on the Western Front were successful in maintaining control of the air throughout the war, to the detriment of their Central Powers opponents. By 1918, the first “swing-role” air-to-air and air-to-ground fighter aircraft—the predecessors of the fighter-bombers of World War II—were in service, initially with Great Britain’s Royal Flying Corps (the predecessor of today’s Royal Air Force). These aircraft proved terribly destructive in attacks on enemy ground forces. In Palestine, such attacks at the battle of Wadi al Far’a were responsible for the destruction of a Turkish army and laid open the path to Damascus. Specialized doctrine was developed by leading air power teachers and practitioners during the war to govern fighter operations; notable figures include Oswald Boelcke, a great exponent of defensive air warfare, and Edward “Mick” Mannock, the most noteworthy of offensive fighter proponents. American fighter pilots, who flew British or French-designed fighters, established an excellent record for the brief time that they were in combat operations during the war. Notable American fighter pilots included “balloon buster” Frank Luke and America’s Great War “Ace of aces” Eddie *Rickenbacker. An ace is an individual who has downed five aircraft in aerial combat.

In the years between World War I and the outbreak of World War II, the fighter underwent progressive refinement that matched that of aviation in general. Metal replaced wood in aircraft structures, the monoplane layout replaced the biplane, and a variety of specialized refinements were incorporated in fighter design. These included addition of radio communication, better optical gun-sights, multiple guns, a streamlined design approach, internal structural bracing, refined aerodynamics including the provision of wing flaps and, in some cases, wing leading edge slats or slots, retractable landing gears, and high performance air-cooled radial piston engine or liquid-cooled inline engines enclosed within smooth cowlings shapes. Such refinements first appeared—to a greater or

lesser degree—in the early 1930’s on such aircraft as the Polish PZL P-7, the French Morane Saulnier MS-406, the Soviet Polikarpov I-16, the American P-35, the Japanese Nakajima Ki-27, the British Hawker Hurricane, and the German Messerschmitt Bf 109 (popularly known as the Me 109). But by 1939, many of the world’s fighter forces—including that of the United States—still had a large number of biplane fighters in service. Such was particularly true for the U.S. *navy, where the slow landing speeds of such aircraft made them well-suited to the small size of prewar aircraft carriers. Interwar conflicts such as the Spanish Civil War and the Sino-Japanese War confirmed the superiority of newer aircraft technology, but also offered mixed signals that encouraged biplane designers to remain fixed in their thinking for far too long.

The fighter’s influence on World War II was profound. The opening Nazi and Japanese attacks benefited greatly from fighters that seized air superiority, preventing their opponents from contesting control of the air, and allowing Axis ground movements to proceed without much threat of Allied intervention. During the Battle of Britain (1940), British fighter pilots literally saved Great Britain from destruction at the hands of Nazi Germany, the first time that a nation’s fate had been determined by air warfare. Notable American fighter aircraft of World War II included the Republic P-47 Thunderbolt and the Vought F4U Corsair, both outstanding air-to-air fighters and formidable ground attackers; the North American P-51 Mustang, the finest and most refined all-around propeller-driven fighter of World War II; and the Northrop P-61 Black Widow, a specialized radar-equipped night fighter that anticipated the sophisticated interceptors of the post-1945 period. During the war, fighter speeds increased to over 400 mph, and armament went from two or four small machine guns to up to eight .50 caliber machine guns. German fighter designers, confronting the challenge of the Allies’ strategic bomber offensive, emphasized heavy cannon armament, including installations of up to four 30mm cannon firing explosive shells. But Allied fighter operations swept the German air service—and Japan’s as well—from the skies, rendering both Nazi Germany and Imperial Japan vulnerable to highly destructive strategic bomber attacks. Allied fighters next turned to shattering Axis ground movement through wide-ranging fighter sweeps deep into enemy territory.

The German introduction of the turbojet engine and moderate wing sweepback to improve high-speed flight performance was matched by Allied developments. Though no jet-versus-jet combat took place during the war, both Germany and Great Britain fielded jet fighters in service. The United States’ first jet fighter, the Lockheed F-80 (initially P-80) Shooting Star, entered service in 1945. The first American sweptwing jet fighter, the graceful North American F-86 Sabre, followed the F-80 into service in 1948. During the * Korean War, Sabres met the Soviet Union’s Mikoyan and Gurevich MiG-15 in combat over the Yalu, establishing a kill ratio of over 10-1. Korea also marked the last war in which American ground forces lost personnel from enemy air attack.

The technological developments of the 1940’s and 1950’s radically transformed the American fighter. The Air Force fixed on a supersonic future, with fighters becoming nuclear bomb droppers or specialized anti-bomber interceptors armed with sophisticated air-to-air radar-guided or heat-seeking missiles. As a result, virtually all of the so-

called "Century series" fighters—for example the F-101, F-102, F-104, F-105, and F-106—were dedicated to missions in these roles. Only the F-100 was a true swingrole airplane for both conventional war in the tradition of the Second World War's P-47 or Corsair. For its part, the U.S. navy, shocked by its failure to develop a carrier-based fighter capable of confronting the MiG in Korea, embarked on a rigorous development program that led to the two finest fighters of mid-century: the Vought F-8 Crusader, and the McDonnell F-4 Phantom II. Both represented differing design philosophies: the F-8, a single-seat agile "dogfighter" with primarily a gun armament, and the F-4 a two-seat missile-armed fighter with a large * radar and (initially) no gun armament. The Air Force ordered the F-4 with some modifications for its own use, and it became the premier American fighter for all three fighter services—the Air Force, navy, and Marine Corps, by the mid-1960's.

Because of a lack of emphasis on teaching basic skills, the overemphasis on relatively benign missile shots at opponents, the basic limitations of early air-to-air missiles, and controversial rules of engagement, American fighter pilots in the *Vietnam War did not achieve the same level of success that their predecessors had in previous conflicts. By the late 1960's, these problems were so apparent that they had spawned two responses: greater emphasis upon fighter pilot training, and greater emphasis upon designing genuine air-superiority fighters. The former could be done relatively quickly, and the pronounced success of American pilots in air combat over North Vietnam during 1972 attests to the great success that refined training had. The latter, however, required considerably lengthier and complex efforts. However, it spawned a category of "superfighters" that still define the modern standards of fighter excellence: The Grumman F-14 Tomcat, the McDonnell-Douglas F-15 Eagle, the General Dynamics F-16 Fighting Falcon, and the McDonnell-Douglas F-18 Hornet. What made these aircraft possible were more powerful engines, advanced structural materials, improved instrumentation, and, above all, a single-minded dedication to emphasizing the ability of these aircraft to engage and defeat more numerous enemies.

The coupling of the above aircraft technologies with advances in air-to-air missile design, exemplified by the Raytheon AIM-9L Sidewinder of the late 1970's meant that, for the first time, a missile-armed fighter could engage an opponent with the expectations of success that advocates had long anticipated. This was first clearly shown in two conflicts: the Falklands War between Great Britain and Argentina, where AIM-9L-armed British Harriers dominated more numerous Argentinean opponents, preventing the destruction of the British fleet that sailed to liberate the islands; and the Israeli-Syrian war over the Bekaa Valley, where Israeli F-15 and F-16 pilots destroyed over eighty aircraft without suffering a loss in air-to-air combat.

Paralleling this improvement in air superiority fighter operations came developments in ground attack ones. The coupling of the laser-guided precision munition with an airborne laser designator, with advanced space-based navigation such as the Global Positioning System (GPS) and advanced sensor technology now meant that a precision fighter dropping a single high-explosive bomb could achieve destructive effects equivalent to many hundreds of conventional World War II bombers. During that war, to

guarantee a single bomb hit on a specific 60-by-90 foot target required 108 B-17 bombers dropping 648 bombs. In the * Persian Gulf War, a single fighter bomber, dropping a single laser-guided bomb, sufficed. Precision attacks against both strategic and tactical targets paralyzed the Iraqi regime and set the stage for the destruction of Saddam *Hussein's ill-conceived occupation of Kuwait.

The emergence of airborne early warning aircraft, sophisticated *command and control, and advanced space-based navigation and communications have greatly improved the efficiency of the modern fighter. Today, beyond this, lies the incorporation of so-called "stealth" or low observable technology, sensor fusion, and advanced integration of aircraft systems. The first air combat stealth fighter—the F-22A—is under development, and expected to enter service after the turn of the century. (It is important to distinguish this aircraft from the popularly known F-117 stealth fighter which, despite the name, is really a specialized attack aircraft.) Without question, the enduring lesson of air warfare is that without air superiority, all other air operations are impossible; in the modern world, air superiority is the guarantor of success. To that end, the purpose and value of the fighter is unbroken, from Flanders in 1915 to Iraq in 1991 and beyond.

FILM, WAR AND THE MILITARY IN. *This entry consists of two articles, the first, Newsfilms and Documentaries, on how war and the military have been portrayed in newsreels and other forms of news footage as well as documentary films shown in theaters or more recently on television; and the second, Feature Films, on how the armed forces and the motion picture industry have cooperated—and sometimes failed to cooperate—in the production of dramatized feature films involving the U.S. Army, Navy, Air Force, or Marine Corps.*

Newsfilms and Documentaries Feature Films

FILM, WAR AND THE MILITARY IN: NEWSFILMS AND DOCUMENTARIES

Visual depiction of the military has been a preoccupation of filmmakers since the first *actualités*, or nonfiction films, were shown by Louis Lumière in Paris, in 1895. Within a year, newsworthy footage was being shown by enterprising camera operators in makeshift theaters all over the world. Thomas Alva *Edison pioneered another type of newsfilm, the prize fight, as early as 1894. By the outbreak of the *Spanish-American War in April 1898, viewing "actualities"—lasting perhaps a minute or two—was already part of American leisure activity.

These early newsfilms are all documentaries, as are, in one sense, all newsreels. Every selection of subject, every change in camera angle, every decision in editing footage for a final product involves point of view. That hard-to-define word *documentary*, described by the English filmmaker John Grierson as "the creative treatment of actuality," also involves point of view. In short, there is much more to the concept of documentary than simple documented fact, as compared to, say, the official likeness recorded in a passport photograph.

Early depictions of news events made extensive use of re-creations, often amateurish, though this seems not to have provoked much comment. No camera was present at the sinking of the USS * *Maine* when it was blown up in Havana Harbor, 15 February 1898; the best that Edison's operators could do was to film the half-submerged wreck and the funeral procession for the sailors who had died in the explosion. Such dull footage was replaced with more newsworthy reenactments. Two cameramen proudly recalled faking the naval Battle of "Santiago, using cardboard cutouts of U.S. and Spanish warships, pulled by threads across a container filled with water. The proclaimed "authentic" battle footage was enhanced by off-camera cigar smoke. The tension between the viewer's desire to "see" the face of battle and the camera's inability to do so was dear from the beginning, a tension that still exists.

The Boer War (1899-1902) was filmed by pioneering cameramen. W. L. Dickson could not shoot the Boer positions with an early telephoto lens in December 1899 because of poor weather conditions. To remedy the situation, fully equipped armies of mock British and Boer soldiers "fought" each other in the hills around Orange, New Jersey, site of the Edison motion picture company. It is but a short step from newsreel reenactments to soldiers fighting in some Hollywood costume drama.

The first American newsreel premiered on 8 August 1911—an American version of a French newsreel, *Pathé's Weekly*. An enthusiastic review in a trade magazine claimed that the best footage showed German soldiers on review at Potsdam near Berlin. The anonymous reviewer felt this footage allowed the viewer to see the perfection of German arms and discipline in a way possible in no other medium. Also praised in this first American newsreel was footage of an American naval vessel, the battleship *North Dakota*, undergoing repairs at the Brooklyn Navy Yard. From the start, in other words, the depiction of military might and military hardware informed the commercial newsreel in America.

Pathé, a French company that distributed in the United States, was the first of what became five American newsreel companies active until the rise of television in the mid-1950s. Hollywood's Universal Pictures newsreels did not cease operations until 1967. The newsreel was a series of short stories, lasting eight to ten minutes in total, driven by entertainment values and always meant to hold a paying audience that had come to a movie theater to see a feature-length fictional film. Military pageantry proved a favorite subject. The newsreel rarely contributed to serious debate over military policy, and almost never turned such to subjects as "women in the military, or the relationship of the military to the society from which it found its basis for support.

"War posed a special opportunity for cameramen and directors—an opportunity at first missed, thanks to censorship by governmental authorities and the inability of tradition-bound military officers to understand the potential of visual footage for making the battle front comprehensible to the home front. At first, few recognized the propaganda potential. Nor should one overlook the enormous logistical problems involved in moving cameras on tripods to the front, all too visible to soldiers from both sides.

For North Americans, the story of the Mexican guerrilla leader Francisco ("Pancho") Villa, his raid on Columbus, New Mexico, and the resulting Punitive Expedition of

1916—part of the U.S. military involvement in the "Mexican Revolution"—were of intense filmic interest, an interest fueled by a unique contractual relationship between Villa and the U.S.-based Mutual Film Corporation. In an agreement signed on 3 January 1914, Villa promised to fight, whenever possible, only during daylight hours. In one important battle for the city of Ojinaga, Villa actually delayed his attack until Mutual could bring its cameras into position.

Little of Mutual's footage has survived. What has—uninteresting visually—can be seen at the Library of Congress in Washington, D.C. But extraordinary still photographs of Villa can be found in two articles by Aurelio de los Reyes, printed in the 1986 and 1987 *Library of Congress Performing Arts Annual*. The Mutual contract with Villa reminds us that docudrama the combination of documentaries and feature films, is not a concept of entirely recent vintage, and that something more than newsworthiness has shaped the visual record of newsfilm.

World War I represents a turning point for nonfiction film's treatment of the military, a turning point more obvious perhaps for what British filmmakers were able to achieve than for their American competitors, who until 6 April 1917 were recording a war that seemed little more than a curiosity to most U.S. audiences. Most of the footage shot between 1914 and 1918 has long since disappeared. But much of it—the "outtakes"—was never seen by audiences of the day, and has only recently come to light. Those who unthinkingly assume that NBC's *Project XX* or CBS's *The Twentieth Century*—both pioneering television documentary series from the 1950s that are still being rerun—have included the relevant surviving footage of battle will be amazed by the existence of some 440 titles in Anouk van der Jagt and Mette Peters, *World War One on Television: An Index of Non-Fiction Programmes* (1993).

One of the more dramatic rediscoveries of recent years is a forty-minute film shot by German cameraman Oskar Messter of wartime production at a steel mill at Poldhiitte (then part of Austro-Hungary) in 1916. The numerous women workers are shown manufacturing shell casings, step by step. No surviving records indicate what contemporary audiences thought of this film, or how many saw it, but its visual brilliance makes it one of the Netherlands Film Museum's outstanding pieces of wartime nonfiction footage. The skillful editing suggests that it was meant as a documentary; it survives to tell us about the role of women in wartime production, as well as to indicate state-of-the-art steel manufacturing in a time of full-scale war.

The most important documentary to come out of World War I was Britain's *The Battle of the Somme* (1916). We know that the overwhelming majority of the British populace saw this film in the late summer and fall of 1916, and that is seemed genuinely to convey what it was like to fight in a battle that resulted in 100,000 British casualties on the first day. The unanimity of surviving contemporary opinion makes it clear that this was film propaganda that worked. The seventy-three-minute film, available on video from London's Imperial War Museum, has little impact on today's viewer, more eager to recognize the few "over-the-top" attack scenes, which were faked, than to accept the film's historical significance: the first feature-length documentary successfully to justify the meaning of total war to a home front audience.

The impact of this film was not lost on the enemy. Ger-

many responded with a rejoinder, *With Our Heroes at the Somme* (1917), restricted in scope and unsuccessful with German viewers. Nevertheless, its title demonstrates why Adolf Hitler and Gen. Erich Ludendorff believed that in World War I the British were the master propagandists.

American nonfiction filmmaking in 1917-18 represents a lesser level of achievement. *The Battle of the Somme* was shown widely in the United States. The Wilson administration's Creel Committee released a seventy-minute documentary newsfilm, *Pershing's Crusaders*, in 1918, but the uninteresting footage failed to arouse enthusiasm. U.S. Army Signal Corps camera operators spent much of their time pleading with old-fashioned field officers who saw no value in film. As a result, American newsreels carried war stories based on the footage of European news cameramen, with little to show save colorful entries into towns freed from German occupation. French civilians looked appropriately joyous for the camera. The exploits of the black 369th Regiment ("Harlem Hellfighters") are shown (including a sound track with the 369th's jazz band) in William Miles's documentary, *Men of Bronze* (1977), now available on video. The best guide to American footage, curiously enough, is Roger Smith's 1994 catalogue of the film holdings of the Imperial War Museum, which includes a brief summary of every single film item relating to World War I.

Nobody has a problem locating footage for World War II. Indeed, we first recall that war from film images; few could claim never to have seen so much as a single World War II documentary. American newsreels got their battle footage through a pool system. U.S. Army, Navy, Air Force, and Marine Corps photographers shot footage at the front; after careful censorship, it was then shared with all five newsreel companies. This does not mean that every story has a dreary visual sameness, but it helps explain why there are no multiple shots of bombings of Hiroshima and Nagasaki, for example. It is also true that the overall visual record of American battle footage is not particularly impressive, particularly when compared to the Nazi *Wochen-schau*, or newsreel, now available on home video from Chicago's International Historic Films (IHF). Wartime saw no change in the entertainment-driven requirements of the American commercial newsreel. Bathing beauties appeared on screen more often than that symbol of women in the workplace, Rosie the Riveter.

Wartime documentary was official; such films must be considered as propaganda, their avowed purpose. Most were made for the government by Hollywood directors, men who had made their reputations in fictional feature production. Best known was Frank Capra, who produced for the military seven feature-length documentaries explaining the reasons why the United States was at war. The *Why We Fight* series originally included an eighth film, *War Comes to America, Part II*, which survives only as a shooting script. The Capra films (available on home video) seem strident to today's viewers, who perhaps have not thought about what they replaced—plodding, well-meaning lecturers assigned to give recruits fifteen orientation lectures, including all the facts and figures.

Capra's film unit also produced a pioneering documentary, *The Negro Soldier* (1944), describing overstated prospects for black advancement. Nevertheless, the film by its very existence and its high production values served as a threat to official segregation policy. Its radical premise

could not be disguised; career advancement would mark the end of a rigidly segregated military.

The Hollywood director William Wyler directed *Memphis Belle* (1944), the finest documentary about the experience of flying on a bombing raid produced by any combatant nation. John Huston made *San Pietro* (1945), a low-key explanation about how the taking of one small Italian village from its German occupiers explains the grinding attrition of the Italian Campaign, and, by indirection, the meaning of the war to the G.I.s. Some modern viewers miss the skillful reenactments in the film, which is effective precisely because of important scenes shot just before or after the battle. Huston dealt with the problem of battle fatigue in *Let There Be Light* (1946), filmed at a hospital on Long Island. The film was denied public clearance for twenty years because Huston did not get written releases from the soldiers undergoing psychiatric treatment; for years he falsely insisted that the Pentagon had censored his film because it was antiwar.

The most significant nonfiction footage to come out of World War II is a collective enterprise, reminding us how much the horrors of war and views of the enemy are defined through visual media in the twentieth century. In the spring of 1945, the collective footage of skeletal figures, piles of dead bodies stacked like so much cordwood, of a bulldozer pushing countless naked bodies into a mass grave, and of such well as Dwight D. Eisenhower and George S. Patton walking through liberated death camps while inmates were still present, provided documentation for German crimes against humanity presented at the Nuremberg War Crimes Trial, 1945-46. This visual record made clear in the war's aftermath that Nazi Germany had been an enemy worth fighting. Although the word *Holocaust* was not used in 1945, we must count the Holocaust footage shot by American, Russian, and British cameramen as one of the most important military uses of the medium of film.

The Korean War was covered by newsreel cameramen; television news based its limited coverage on newsfilm shot by newsreel cameramen. It might be helpful to point out that similar footage was seen in theaters and on television, remembering that a freeze by the Federal Communications Commission restricted the total number of television stations in the United States to just 108 until mid-April 1952. Korea was an unpopular war. Millions saw Gen. Douglas MacArthur's triumphal motorcade pass through downtown San Francisco, Chicago, and New York City after his dismissal by President Harry S. Truman in April 1951; few found much interest in a war that soon settled into stalemate. The historian Bruce Cumings's 1990 WGBH television series has an appropriate title for Korea: *The Forgotten War*.

For Vietnam, the distinction between television news and documentary begins to erode. Americans learned of France's war in Indochina from the newsreel; the war which came to occupy American attention was covered by three national networks: NBC, CBS, and ABC, the last too weak to attract many viewers, which is worth remembering when one evaluates the impact of the conservative commentator Howard K. Smith, or such unusual ABC Vietnam television correspondents as the photographer David Douglas Duncan.

The Vietnam War resulted in many documentaries protesting the conflict, most of which failed to find much

of an audience. Peter Davis, in *The Selling of the Pentagon* (CBS, 1971), indicted the *military-industrial complex. His feature-length Technicolor *Hearts and Minds* (1974) received an Academy Award for Best Documentary. The film explains American militarism as a direct result of societal enthusiasm for Friday night high school football, and uses an editing trick to jump-cut from Gen. William C. *Westmoreland, who declares that the Oriental places little value on human life, to a Vietnamese woman weeping over the death of her child. Zina Voynow, the film's editor, told me in 1978 that she felt her work on this film to be the most important thing she had done in her life.

Quite different, in what now seems old-fashioned black and white, is Eugene Jones's *The Face of War* (1967), now available on video. The film suggests what it was like to be part of a Marine combat unit in 1966. Jones spent three months in the field with the company; his film does a remarkable job of capturing the aural presence of radio in the life of an American soldier in Vietnam. Emile de Antonio's *In the Year of the Pig* (1969) incorporated archival footage from camera operators from the former East Germany, Hanoi, and the National Liberation Front office in Prague, in a hammer-and-tongs assault on American conduct of the war.

The most important piece of newsfilm to come out of the Vietnam War was certainly the NBC color newsfilm of South Vietnamese Colonel Loan executing a Viet Cong sympathizer, 2 February 1968, on the streets of downtown Saigon, at the start of the *Tet Offensive, the turning point of the war. A three-man camera team from NBC and ABC filmed the event; Associated Press photographer Eddie Adams took a Pulitzer Prize-winning photograph of what seemed to be the instant of death. The visual microcosm of disaster suggested that America supported a government that killed innocent victims with no concern for guilt or innocence.

The Communists' Tet Offensive took the war into the cities of South Vietnam. Peter Braestrup, in *Big Story* (1977), the most comprehensive study of any foreign event ever covered by the American media, indicts both television correspondents and newspaper reporters for missing the meaning of Tet (Braestrup was *Washington Post* bureau chief in Saigon in 1968). The * Persian Gulf War, not Vietnam, was America's first "living-room war." As a general rule, television supported the war up to the fall of 1967; elite opinion in Washington—exemplified by the counsel the so-called Wise Men gave Lyndon B. * Johnson in late March 1968—turned against the war before the majority of Americans did so. Antiwar television and newspaper stories did not make American battlefield victory impossible.

The latest development in television newsfilm occurred in the 1991 Persian Gulf War. Thanks to satellite cable television, CNN's Peter Arnett was able to broadcast directly from Baghdad, and Saddam * Hussein used television to speak directly to President George * Bush and the American people. Endless media prognostications about the upcoming allied Coalition assault on Kuwait City from the sea helped mislead Hussein and his advisers as to where the attack would actually come, contributing importantly to his overwhelming defeat.

The Gulf War to date has produced no memorable documentaries. Vast amounts of television programming about that war, recorded from all over the world, can be

viewed at archives at the University of Leeds in England. Yesterday's newsfilm is tomorrow's archival footage for the day-after-tomorrow's documentaries. A final word of caution may be in order: the recent enthusiasm for faked grainy newsfilm in Hollywood feature films should remind us that never has the distinction between documentary and fictional film been less clear.

FILM, WAR AND THE MILITARY IN: FEATURE FILMS

A symbiotic relationship has existed between the United States military and the motion picture industry in the production of feature films, each institution exploiting and benefitting from the relationship with the other. The services want an attractive portrayal; the filmmakers, particularly the studios, want to use the military's equipment, personnel, and aura. Each service also seeks to build public support for its own particular needs.

During the decade before World War I, each of the services began developing its own approach to filmmakers through regulations governing assistance it might render on a particular production. The U.S. Navy, the first service to see the potential of this visual medium, sent pseudo-documentaries portraying its activities to the 1904 World's Fair in St. Louis. Later, these were used to recruit farm-boys in the Middle West. By 1916, when the navy loaned Syd Chaplin, Charlie's look-alike brother, a submarine during the making of *Submarine Pirate*, the service was regularly providing men and equipment to productions it considered beneficial. On the other hand, it refused to loan a battleship during the making of Mary Pickford's *Madame Butterfly* (1915) because Secretary of the Navy Josephus Daniels felt the story did not reflect credit on the Naval Service.

The aviation branch led the army in exploring film's potential. Lt. Henry "Hap" * Arnold flew one of the first military airplanes in front of a camera in the two-reeler *Military Scout* (1911). Later, Arnold supported the Air Corps' cooperation with filmmakers in such major productions as *Wings* (1927), the first Best Picture Oscar winner, and *Air Force* (1943), a World War II epic flying film.

The Marine Corps, seeking to ensure its survival as a unique body of fighting men, cooperated with films that emphasized this, especially those featuring the rite of passage of young boys to mature men. Shortly before the

United States entered World War I, the Marine Corps allowed filmmakers to shoot *Star-Spangled Banner* at its barracks at Bremerton, Washington. After U.S. entry in April 1917, the service permitted the filmmakers to shoot the combat scenes on its base at Quantico, Virginia, providing the director with 1,000 Marines for his "over-the-top" sequence in *The Unbeliever* (1918). The service's public affairs office helped promote the film by sending news releases to newspapers in all the towns from which the Marine actors had come, explaining that the young men had now arrived in France and were helping to defeat the enemy.

As has happened after virtually every war, Hollywood lost interest in the military once hostilities ceased. Nevertheless, the connection between the two institutions remained. In trying to do for the American Revolution what he had done for the Civil War, D. W. Griffith again approached the army for assistance on *America* (1923). Secretary of War John Weeks ordered the army to give the director every reasonable help, ultimately including 1,000 cavalymen and a military band. The army justified its cooperation by saying the filming allowed officers to study the "Revolutionary War battles with a precision never before possible.

Hollywood ultimately turned to World War I combat to portray dramatic stories of men in combat. The first of these, *The Big Parade* (1925), set the standard. Director King Vidor said that he wanted to make "an honest war picture" showing hostilities from the viewpoint of ordinary soldiers and privates. With the army's help, Vidor was able to portray the spectacle of a large-scale movement of troops and equipment to the front, "the big parade." In the picture, two of the three doughboys die and the hero loses a leg, causing many people to perceive the film as an antiwar treatise, despite its happy ending. From the military's perspective, if the ending is upbeat, even the death of one or more of the characters remains secondary to the images of men and equipment performing valiantly in the nation's cause.

During the 1920s, each of the services formalized its regulations governing cooperation with filmmakers. Once the War Department or the Navy Department, of which the Marines remained a subordinate branch, had approved a script, the local commander assumed all responsibility for providing assistance. But, the amount he gave depended on the feelings the base commander or ship captain had toward film and the production company. Only rarely did a commander object strongly enough for headquarters to rescind its approval. More often, commanders went out of their way to provide the assistance a director needed, recognizing the public relations value of the completed film.

The making of *Wings* illustrated this symbiotic relationship during the interwar years. The Army Air Corps saw the story of American fliers in France as a way to boost its branch of the army, and many of the officers at the flying facilities around San Antonio knew director William Wellman from his flying days during World War I. As a result, the service provided him with a good portion of all the airplanes it owned, as well as the troops necessary to re-create the Battle of "St. Mihiel. For its nine months of assistance, the Air Corps received a film that glorified army aviation.

Hollywood did make other combat stories featuring the U.S. military during the 1920s and 1930s, but most focused

on life in the peacetime armed services. The Marines, for example, assisted on two movies portraying its aviation branch, *Flight* (1929) and *Devil Dogs of the Air* (1935).

Navy aviation, of course, reaped the reward of appearing in the film as well as several other stories set aboard "aircraft carriers. However, the submarine service faced an inherent dilemma; to make an exciting movie, the submarine had to sink, which did little to aid recruitment for the silent service. The only resolution to the problem, whether in Frank Capra's *Submarine* (1928) or later in *Gray Lady Down* (1978), was for the navy to demonstrate its salvage capability. Despite the required love interest, *Submarine D-1* (1937) became little more than a pseudo-documentary, showing how the service was preparing to deal with the sinking of "submarines.

Navy aviation faced similar problems in overcoming the dangers of flight. The service sought to explain its efforts to protect men and equipment. Consequently, in the immediate prewar years, the navy in films such as *Flight Command* (1940), which detailed efforts to improve navigation equipment, and *Dive Bomber* (1941), which portrayed the research by Navy flight doctors to overcome pilot blackout.

Hollywood failed in general to deal with the Nazi threat until late in the 1930s, but by 1940 was turning out such pro-interventionist films as *Sergeant York*, which depicted the heroic doughboy, Alvin "York, of World War I. Isolationists in Congress and across the country accused Hollywood of making propaganda films to draw the United States into the war on the side of Britain. In a Senate hearing in September 1941, the heads of all the major studios denied the charges. While acknowledging that they opposed Adolf "Hitler, they argued that they produced movies to entertain and make money.

The Japanese attack on "Pearl Harbor rendered further hearings moot and freed Hollywood to produce vehemently anti-German films as well as movies portraying the military in combat. Like the World War I-era *The Unbeliever* (1918), which showed Marines in battle before they had actually reached Europe, the initial World War II movies, such as *Bataan* (1943), *Crash Dive* (1943), and *Wing and a Prayer* (1944) contained fanciful stories, usually implausible and lacking basis in fact. *Air Force* (1943), for example, made with the blessing of "Hap" Arnold (now a general), began with the historic reality that a flight of B-17s had left San Francisco in the evening of 6 December, arriving in Hawaii in the midst of the Japanese attack on Pearl Harbor. However, the subsequent adventures of the *Mary Ann* and her crew, culminating in the almost single-handed destruction of a huge Japanese armada had no historic basis.

Sometimes, as in *Wake Island* (1942) and *Destination Tokyo* (1943), filmmakers combined known facts with fabrications. In reality, the last man off Wake Island before its capture had reported how a small band of Marines defended the island up to the day he left. Hollywood's portrayal of subsequent events remained at best an educated guess. An American submarine had sailed to within sight of Japan to report weather conditions for James "Doolittle's raiders. However, *Destination Tokyo* portrayed the submarine entering Tokyo Bay, landing a team of meteorologists on Japanese soil, and later sinking a Japanese aircraft carrier, none of which happened.

By 1943, however, the war had produced dramatic stories, which served as the basis for relatively accurate ac-

counts of American experiences in combat. In particular, MGM's *Thirty Seconds Over Tokyo* (1944), directed by Mervyn LeRoy and written by Dalton Trumbo, closely followed the story of one of the pilots on the Doolittle raid. Nevertheless, for political reasons, the film did not explain that the Chinese Communists had rescued most of the fliers. Whether or not the combat films made during the war contained more fact than fantasy, they did help the war effort by showing how the military carried the war to the enemy.

Each of the armed services had more important things to do than provide men and equipment to filmmakers, even if the assistance lent an authentic ambience to the completed movie and showed how the military was winning the war. Still, each service did cooperate with Hollywood as much as possible. Due to General Arnold's long-standing relationship with filmmakers, the Army Air Force loaned several B-17s, a fighter, and other equipment for the filming of *Air Force*. Although the navy and the Air Corps could not recreate the launch of Doolittle's planes off the deck of the USS *Hornet*, the Air Corps provided 16 B-25s for the training sequences and trundled two bombers to the MGM studio for filming ship-board sequences.

Despite the popularity of such war stories, once Victory loomed on the horizon, Hollywood began cutting back on the production of combat films, believing audiences would lose interest when the war was over. Two critically acclaimed films—*They Were Expendable* and *A Walk in the Sun*—both released in 1945 shortly after V-J Day, failed at the box office.

Only in 1948 did the small-scale *Command Decision* and *Fighter Squadron* appear in theaters. Relying on Army Air Force gun camera footage for their combat sequences, neither film enjoyed much success at the box office. However, in the next two years, four major World War II movies started a cycle of combat stories that lasted into the early 1960s. *Battleground*, *Sands of Iwo Jima*, *Task Force*, and *Twelve O'clock High* received substantial military assistance and each presented a highly positive image of the service being portrayed.

Beyond their re-creation of World War II, two of the films became important for their portrayals of leadership. As the tough father figure, Sergeant Stryker, in *Sands of Iwo Jima* (1949), John Wayne passes his knowledge of war to the next generation of Marines and dies having accomplished his mission. Despite his inglorious death from a sniper's bullet, Wayne's performance established him as the quintessential American fightingman and role model in the eyes of most Americans. In contrast, in *Twelve O'clock High* (1949), General Savage, played by Gregory Peck, falls into the same trap as had the commander he replaced. After rebuilding the confidence and abilities of his bomber group through strict leadership and appropriate distance from his men, Savage begins to see them as human beings and friends. When they die in combat, Savage grieves, albeit internally, and ultimately suffers a mental breakdown. Probably the best film ever made about the U.S. Air Force, *Twelve O'clock High* continues to be used in leadership seminars to illustrate the problems leaders face in commanding subordinates.

Most of the Pentagon's objections to scripts submitted during the 1950s focused on small matters—pilots drinking, rough treatment of recruits—and filmmakers readily

acquiesced to requests for changes in order to receive the needed assistance, which gave their movies authentic military ambience. Occasionally, however, major productions did create problems for one or another of the services that required long negotiations and compromises on both sides.

Hollywood wanted to make two popular novels, James Jones's *From Here to Eternity* and Herman Wouk's *The Caine Mutiny*, into motion pictures as quickly as possible. In the case of Jones's novel, the army did not deny the accuracy of the portrayals, but it saw little benefit in a story of an officer's abuse of power and the cruel treatment inflicted upon enlisted men in prewar Hawaii. Ultimately, the filmmakers agreed to tone down some of the brutality and have the offending officer resign rather than being promoted as in the novel; the army then allowed filming at Schofield Barracks, Hawaii, using real soldiers as extras.

Although Herman Wouk thought he had written a pro-navy story based on his own experiences aboard a destroyer in World War II, the navy was opposed to the title—*The Caine Mutiny*—arguing (incorrectly) that there had never been a mutiny aboard a U.S. Navy ship. Producer Stanley Kramer refused the suggested title, *The Caine Incident*. After eighteen months of negotiation, both sides compromised on a script that put the blame for the takeover of the USS *Caine* on the civilian-appointed turned wartime officers rather than on Captain Queeg, a regular navy officer.

Ironically, one of the films that the navy thought beneficial and assisted, *The Bridges of Toko-Ri* (1954), based on James Michener's novel, contained some of Hollywood's strongest antiwar statements. The navy provided an extraordinary amount of assistance in this portrayal of carrier operations during the *Korean War. Although the film contains a strong justification for the need to fight the Communists in Korea, the closing image of the downed pilot-protagonist, shot dead in a muddy ditch by North Korean soldiers, did little to create enthusiasm for naval aviation or for war itself.

Only on very rare occasions did the Pentagon flatly refuse to provide assistance to a film during the peak of the *Cold War in the 1950s. One example was *Attack!* (1956), in which an enlisted man shoots his incompetent officer. By the end of the 1960s, the interest in World War II had about run its course. Moreover, young, independent filmmakers, not beholden to Hollywood's comfortable relationship with the military establishment, had begun to take control of the industry. Things also changed within the Pentagon as a result of the controversies surrounding the making of *The Longest Day* (1962), the film that ended the golden age of World War II movies.

The army had, of course, few problems with providing assistance to a movie about the *D-Day landing in Normandy, its greatest moment in World War II. Producer Darryl Zanuck of 20th Century Fox received help in recreating the invasion of *Normandy not only from the U.S. military but from the forces of the other three major participants in the battle, Britain, France, and Germany. But, when the American media focused attention on the amount of cooperation Zanuck was receiving, the Pentagon began reevaluating its long-standing regulations on assistance. The producer did not help the inquiry when he shot a scene of American soldiers killing German soldiers who were trying to surrender, which he had agreed not to

include, and then refused to delete it despite army demands that he do so.

Although the free and easy relationship between Hollywood and the military came to an end in the 1960s, the film industry was not immediately ready to produce movies openly critical of the armed services; but filmmakers were willing to use the atomic bomb as a focus for anti-war statements. In particular, *Fail Safe* (1964), *Dr. Strangelove* (1964), and *The Bedford Incident* (1965) each argued that the Pentagon did not have the control it claimed over the use of nuclear weapons and that an accident could lead to nuclear holocaust. The air force and navy refused to cooperate on any of these productions. And the navy would have nothing to do with *The Americanization of Emily* (1964), in which for the first time a Hollywood studio portrayed a U.S. military officer as a professed coward.

To be sure, filmmakers continued to produce traditional military stories with Pentagon assistance during the 1960s and early 1970s. These included *PT-109* (1963), *In Harm's Way* (1965), *Bridge at Remagen* (1969), *Patton* (1970), and *Tora! Tora! Tora!* (1970). Yet, even these films often contained negative images. Hollywood made one more pro-air force, pro-atomic bomb movie, *Gathering of Eagles* (1962), at the request of Curtis E. LeMay.

John Wayne was involved in an effort to glorify the U.S. military in Vietnam, using army assistance. Unfortunately, *The Green Berets* (1968) reeked of its propaganda message about an unpopular war. It became Hollywood's sole movie on the Vietnam War until the conflict ended in 1975. Thereafter, Hollywood set about to complete the saving, begun by the media during the war, of the largely positive image of the U.S. military that American filmmakers had helped to create for more than seventy years.

When presented with the scripts of *Go Tell the Spartans* (1978), *Coming Home* (1978), *The Deer Hunter* (1978), and *Apocalypse Now* (1979), the Pentagon did not deny that many bad things had occurred in Vietnam. But public affairs officers in each of the services argued that the stories often lacked balance and portrayed events that simply had not occurred or had been aberrations.

In May 1975, the director Francis Ford Coppola visited the Pentagon to discuss his plans to make a film about the Vietnam War; Department of Defense officials wanted to avoid controversy with the Oscar-winning director and they sought ways to provide him at least some assistance on *Apocalypse Now*. However, they contended that the army would never send one officer to "terminate" another officer and so could not assist on a film that used this as the springboard of its story.

In *The Deer Hunter*, director Michael Cimino turned the My Lai Massacre into a Viet Cong atrocity. However, the film's re-creation of the American evacuation of Saigon bore no relation to historical events and the army pointed out that no American prisoners of war had ever been forced to play Russian roulette. The service declined to provide any assistance to Cimino's production.

Each service usually manifested far too much sensitivity in dealing with requests for even limited help on Vietnam War films. *Go Tell the Spartans* contained a relatively accurate portrayal of the activity of American advisers in the early 1960s. The filmmakers expressed a willingness to negotiate with the army to deal with service objections to the script, but they met with what they considered absolute in-

transigence from the public affairs office. Again, the Air Force refused to consider cooperation on *Rolling Thunder* (1977), claiming that there were no known cases of air force officers becoming schizophrenic "there is nothing beneficial for the Department of Defense in the dramatization of this situation."

The army flatly refused to consider assistance on *Hair* (1979), equating the Vietnam antiwar movement message in the stage play with an entirely different screenplay. The army even refused to discuss the request with the Defense Department's public affairs office. Only after that office suggested that script contained a moral tale of one friend giving his life for another did the filmmakers receive some limited assistance from the National Guard.

The army did provide full assistance to one movie about combat during the 1970s cycle of Vietnam War movies. *Hamburger Hill* (1979) gives a highly positive portrayal of American courage in combat. Despite the heroism, however, the film contains a strongly antiwar statement: soldiers conquer an enemy-held hill at high cost and then retreat, with no explanation of the reasons for either the battle or the withdrawal.

In 1979, the first wave of Vietnam movies came to an end. Ironically, despite the negative portrayals of the American fighting experience that these films had contained, Hollywood had concurrently been rehabilitating the image of the U.S. armed forces. Not so badly tarred by the war as the other services, the navy could serve as a viable subject for filmmakers who wished to create patriotic stories of men in uniform, particularly as the United States celebrated its bicentennial in 1976.

The navy had refused to provide even limited assistance to *The Last Detail* (1973) and *Cinderella Liberty* (1973), both set in the peacetime Navy, because its public affairs office believed the films reflected anti-Vietnam War sentiment. In contrast, the navy embraced *Midway* (1976), which focused on the Battle of Midway, the first great U.S. naval victory of World War II. The service readily ignored the insipid fictional story that overlaid the documentary-like portrayal of the famous battle, recognizing that aerial combat footage would create high drama and an appreciation of the courage of the participants.

The success of the film, perhaps due to the nation's longing for a military success following the debacle of Vietnam, encouraged Hollywood to return to the navy as a locale for other stories including *Gray Lady Down* (1978), *Raise the Titanic!* (1980), and *The Final Countdown* (1980). Each showed naval officers and men doing their jobs in a competent, highly professional manner.

Paradoxically, the navy refused to become involved with *An Officer and a Gentleman* (1982), a traditional rite-of-passage love story, not at all different from the thirties Hollywood romances for which the service regularly provided men and ships. In this case, the Navy's public affairs office objected to the language, graphic sex, and suicide of an officer who flunked out of the Naval Aviation Officer program. The service recognized its mistake after the film became a box office hit and people assumed the navy had provided the ambiance. As a result, the navy readily agreed to lend the producers of *Top Gun* (1986) an aircraft carrier and planes, and gave access to the Top Gun school of naval aviators. The top-grossing film of the year, it marked the final rehabilitation of the American military image.

Admittedly, such films as *The Great Santini* (1979) and

Private Benjamin (1980) also contributed to the more positive portrayals of the armed services. Consequently, even the second wave of Vietnam stories including Oliver Stone's *Platoon* (1986), Stanley Kubrick's *Full Metal Jacket* (1988), and Brian De Palma's *Casualties of War* (1989), despite containing some of the most vivid images, real and imagined, about the American experience in Vietnam, did not seriously affect the nation's renewed confidence in the military establishment.

At the same time, filmmakers have shown less inclination to hide the armed services' deficiencies in their contemporary stories. As a result, the military has more readily refused to provide assistance to such films as *Broken Arrow* (1996), in which an air force pilot helps steal a nuclear weapon. *The Hunt For Red October* (1990), however, which was the last film of the Cold War and the first of the "New World Order," received extensive assistance from the navy. The service did reject a request for assistance on *Crimson Tide* (1995), arguing that its portrayal of command and control of nuclear weapons aboard U.S. submarines had no basis in fact. Likewise, the army turned down a request for help on *Courage Under Fire* (1996) because this film about the "Persian Gulf War" showed some U.S. soldiers being cowardly under fire and lying about their actions.

In the post-Cold War world, of course, filmmakers face the problem of deciding who poses a threat to U.S. national security. So far, Hollywood has had the armed services fight terrorists of the Irish Republican Army in *Patriot Games* (1994), Colombian drug dealers in *Clear and Present Danger* (1995), nuclear terrorists in *True Lies* (1995), and ultranationalist Russians in *Air Force One* (1997). To be sure, these enemies do not compare with the threat that Germany or Japan posed in World War II. Nevertheless, Hollywood has portrayed the cinematic sailors, soldiers, aviators, and Marines doing their jobs competently, and the armed services have willingly provided assistance as the symbiotic relationship between the film industry and the armed services continues.

FIRE CONTROL SYSTEMS. See Detection, Observation, and Fire Control Systems.

FLAMETHROWERS. The primary effects of flame weapons are fear, blinding, choking, and asphyxiation. Germany first invented and used the modern flamethrower in World War I. Since then, all major military powers have developed and fielded both portable and vehicle-mounted versions. The United States used flamethrowers extensively in "World War II, the "Korean War, and the "Vietnam War.

The U.S. model M3 man-portable flamethrower

weighed about 65 pounds fully loaded, and projected a burning stream of semiliquid fuel about 40 yards with a duration of less than ten seconds. Its storage tanks for fuel and compressed air connected by hose to a gun and igniter held with both hands by the operator. Triggers released the jellylike fuel, propelled by air pressure and ignited as it streamed past the nozzle. The United States also fielded an armored flamethrower with greater range and duration mounted inside the Sherman tank chassis.

The U.S. Army and Marine Corps made wide use of flamethrowers in World War II, especially in the Pacific theater as part of a systematic tactical technique for attacking Japanese pillboxes, dugouts, and caves like those at Iwo Jima and Okinawa. Attackers suppressed the objective with small-arms fire, allowing flamethrower operators to get close enough to put fire into apertures and openings.

The U.S. military continued to use flamethrowers in Korea and Vietnam, but also fielded new flame weapons during the Vietnam War, including the M202 Flash, which was much lighter than the M3 and could hit point targets at over 100 yards and area targets out to 275 yards. The M202 is man-portable and weighs about 25 pounds fully loaded, with four rocket-propelled charges fired independently from the operator's shoulder.

FLEXIBLE RESPONSE. The doctrine of "flexible response" was a not entirely successful attempt to "square the circle" of "nuclear weapons strategy by suggesting ways in which nuclear weapons could be used, together with conventional weapons, in battle without invoking nuclear Armageddon. Though it remains a part of official U.S. policy in the 1990s, it has been eclipsed by increasing awareness that nuclear weapons have no utility except to deter others from using these weapons.

The phrase was widely publicized by Gen. Maxwell Taylor in his book *The Uncertain Trumpet* (1960) published immediately after his resignation as chief of staff of the U.S. Army in protest to army budget cuts. Taylor argued that the doctrine of "massive retaliation" had been overtaken by events because of the growing Soviet nuclear capability, and that nuclear weapons, or at least strategic as distinguished from tactical nuclear weapons, by themselves did not constitute an effective response to low-level aggression. Taylor proposed a significant expansion of conventional weapons budgets and troop strength, which had been cut back during his term as chief of staff, with consequent losses to the army in its battles with the other services over the division of the military budget.

Taylor's ideas were enthusiastically adopted by the Kennedy administration, and President John F. Kennedy appointed him a special adviser, and then chairman of the "Joint Chiefs of Staff (1962). Kennedy had already expressed the view, in a major speech on the Senate floor in 1960, that U.S. nuclear retaliatory power "cannot deter Communist aggression" and was "too limited to justify atomic war," although he did not refer to the doctrine of flexible response by name.

One of the first official acts of Secretary of Defense Robert S. McNamara was to instruct the Joint Chiefs to revise the Single Integrated Operating Plan (SIOP) to create several options for the use of the strategic nuclear force,

in place of the single option of ordering a devastating attack on Soviet society. At the same time, McNamara sought and obtained from the Congress substantial increases in funding for nonnuclear forces. These increases were designed to assure that the *NATO conventional response to a Soviet incursion across the Iron Curtain would be more than token resistance designed to trigger the employment of nuclear weapons, despite European nervousness that anything more than a conventional trigger might weaken the effectiveness of the nuclear deterrent. In a special presidential message of 28 March 1961 accompanying the major budget revisions, Kennedy asserted: "Our defense posture must be both flexible and determined ... our response ... selective, permitting deliberation and discrimination as to timing, scope and targets ..."

Reacting in part to Nikita Khrushchev's call for "wars of national liberation," the Kennedy administration made training for "sub-limited war" a key element in its flexible response policy, including special emphasis on counterinsurgency by *special operations forces such as the army's Green Beret teams.

Early theorists of nuclear strategy, like Bernard Brodie and William Kaufmann, rejecting massive retaliation except as an instrument of last resort, embraced policies that could be described as flexible response, although again they did not employ the term. Brodie for a time explored the potential of tactical nuclear weapons as offering more flexibility. Others, particularly Herman Kahn, argued that the United States could survive a major nuclear exchange, provided it undertook an extensive civil defense effort.

McNamara, applying the doctrine in practice, realized that it did not offer a ready answer to the fundamental question, How much is enough? At first he proposed, in a speech to *NATO allies later delivered in unclassified form at the University of Michigan, that strategic nuclear forces should be configured like conventional forces, "to destroy the enemy's military forces, not his civilian population." This proposal was motivated in part by the desire to constrain allied, and particularly French, nuclear forces to coordinate their war plans, in order to reduce the likelihood that uncoordinated strikes would lead rapidly to nuclear Armageddon.

McNamara later shifted his emphasis away from a counterforce strategy to base his nuclear force requirements on the capacity to inflict unacceptable damage on the enemy (i.e., Soviet) society and economy, after absorbing the most powerful first strike that could be directed against the United States. This doctrine of Mutual Assured Destruction (derisively labeled MAD by its critics) did not exclude the possibility of flexible response, including limited nuclear response to a Soviet conventional attack across the North German plain, relying on nuclear weapons to overcome an assumed Soviet conventional superiority. But MAD supporters put more faith in an assured second-strike capability than in the threat of limited nuclear weapons involvement, which could too easily escalate into an all-out nuclear exchange. President Richard M. *Nixon's substitution of "sufficiency" for "supremacy" in the vocabulary of nuclear strength made Mutual Assured Destruction more palatable.

A flexible response analysis (not under that name) had a brief revival in the 1980s when the Soviets initiated the deployment of a new nuclear-tipped missile specifically

aimed at European targets, and NATO responded by beginning the deployment of two Europe-based missiles targeted on the Soviet Union, generating a major controversy in Europe and the United States over the appropriateness of the response. But Premier Mikhail Gorbachev resolved the controversy by accepting an earlier proposal by President Ronald *Reagan to terminate both deployments.

It can be argued that the shift from massive retaliation to flexible response created a more favorable climate for arms control negotiations. It seems more logical, however, to attribute both developments to the realization that eventual rough nuclear parity with the Soviets was inevitable—and rough parity was good enough to produce mutual assured destruction.

On the debit side, critics of U.S. involvement in the *Vietnam War (e.g., Brodie) argue that the idea of flexible response may have helped to lead the United States into the Vietnamese quagmire, and, as Colin Grey has observed, "Strategic concepts of flexible response and controlled escalation have ... tended to blind decision makers to the possible employment of non-military options."

FOR. See Fellowship of Reconciliation.

FORD, GERALD (1913—), thirty-eighth president of the United States. Born in 1913, a decorated veteran of the Pacific theater in World War II (serving in the U.S. Navy as an ensign aboard USS *Monterey*), Ford served twelve consecutive terms in the House of Representatives before he was chosen by Richard M. *Nixon (1973) to be his vice president.

When Ford became president after Nixon's resignation in 1974, he found himself caught between two ideological camps on national security issues. Many Americans, tired of war, wanted Ford to reject any further obligations abroad. However, conservatives in both parties demanded that Ford demonstrate that the *Vietnam War had not weakened American military resolve. Himself a conservative in military affairs, who had supported the American commitment in Korea and Vietnam, Ford nevertheless wanted to win his own term as president. As a result, he followed a policy path he hoped would satisfy both camps.

In the spring of 1975, Ford did little to help either Cambodia or South Vietnam as they faced the final Communist offensives against their regimes. The fall of Saigon, which led in April to the evacuation of the U.S. Embassy there, allowed Ford to announce that "[the] war is finished as far as America is concerned," but it left him open to criticism by conservatives for abandoning an ally. They were more supportive of Ford's actions in the *Mayaguez* crisis that May, when he reacted to the seizure of an American merchant vessel by bombing the Cambodian mainland and launching a successful, though costly, rescue mission by the U.S.

Marines. Nevertheless, conservatives broke with the administration over the *SALT Treaties that they felt favored the Soviet Union, and with Ford's support of the 1975 Helsinki Accord, which acquiesced in Soviet hegemony in Eastern Europe.

While the conservatives, led by Ronald *Reagan, were unable to wrest the Republican nomination from Ford in 1976, Democratic presidential nominee Jimmy *Carter was more successful in painting Ford as showing ambiguity of purpose in the realm of military affairs.

FORD, HENRY (1863-1947), industrialist and isolationist. Born on a Michigan farm, Ford used his skill as a machinist to develop an automobile, founding the Ford Motor Company in Detroit in 1903. Cutting production costs through an assembly line, Ford produced an inexpensive, standardized car, selling over 15 million autos between 1908 and 1928, and becoming a multimillionaire.

In 1914-15, Ford spoke out against World War I and arms races, blaming them on financiers and the military men. He personally financed an effort by pacifists to end the war through mediation by neutral nations. The "Ford Peace Ship" took a contingent of American pacifists to neutral Sweden in December 1915, and the dramatic gesture broke the previous suppression of peace news in the warring nations. Nevertheless, many newspapers derided the effort as naive, especially when Ford proclaimed that he hoped to end the war by Christmas. The Ford Neutral Conference, composed of unofficial delegations of men and women from six neutral nations, met in Stockholm in February 1916. Although Sweden and Denmark were interested in calling a conference of neutral governments, they were blocked by the belligerents.

When the United States entered World War I in 1917, Ford became a leading producer for the military, supplying airplane engines, ambulances, munitions, tanks, trucks, and submarine chasers. In the 1930s, he was a staunch supporter of *isolationism, but Ford again converted his factories to production of war material after 1941. He retired in 1945.

FOREIGN POLICY. In the context of U.S. military history, foreign policy can be defined as "the goals the nation's officials seek to attain abroad, the values that give rise to those objectives, and the means or instruments used to pursue them." This definition has three essential elements with linkages among them. Moreover, it draws attention to the facts that U.S. foreign policy has historically exhibited change over time in each of these elements, and that their relationships with one another have also varied across different periods.

If diplomatic and military historians could reach agreement on the nature of changes in U.S. foreign policy so defined, the task of tracing this history would be relatively simple. But the challenge is difficult, because controversies over U.S. foreign policy goals, values, and instruments abound. Rather than attempting to resolve these contro-

versies, it is more useful to clarify the three major categories within which debate has been conducted.

Goals. In the first instance, in modifying the goals of foreign policy, the major issue confronting U.S. leaders has been reconciling the advantages and disadvantages of

* *isolationism* and * *internationalism*. At certain times, American leaders and public opinion have sought U.S. withdrawal from international affairs, practicing disengagement and nontanglement in order to isolate the country from the perils of international dependence and foreign wars. At other times, American foreign policy has swung in the opposite direction, toward active engagement with other nations on the issues at the moment. In fact, U.S. foreign policy exhibits over time an ambivalent "approach-avoidance" syndrome. What is more, a cycle in these periodic oscillations between isolationism and internationalism is observable, alternating rather rhythmically every twenty to twenty-five years. As Frank Klingberg documents, an "introvert" foreign policy (isolationism) has been pronounced in the periods 1776-98, 1824-44, 1871-91, 1919-40, and 1967-86, and an "extrovert" foreign policy (internationalism) in the periods 1798-1824, 1844-71, 1891-1919, and 1940-66 (with a resurgent globalist phase underway, predictably, once again since 1986).

At its core, internationalism expresses a desire for American leadership in world affairs. It springs from the motivation for the United States to head the world, to set America apart from others, and to forge a "new world order" compatible with U.S. ideals and interests. "Unilateralism"—a self-assertive effort to be self-reliant—represents one approach to internationalism, and speaks to the quest popular at times for the United States not to act in concert with others and to avoid dependence upon them. "Globalism"—the preference to become a hegemonic world leader—is another.

At the extreme, internationalism reflects the desire for the United States to act as an agent of international reform to bring justice and order to world affairs, perhaps through imperialism and interventionism abroad, and at others more passively by serving as a model for countries to emulate. This penchant has not been without its critics. For example, John Quincy Adams counseled (4 July 1821) that a crusading, excessive U.S. involvement in world affairs dedicated to reforming the world in America's image could lead to the prostitution of the very ideals Americans hold most dear—liberty abroad and at home. Unrestrained U.S. international leadership also has been pursued as a goal, however, as seen, for example, in John F. *Kennedy's 1961 pledge that the United States would "pay any price, bear any burden, meet any hardship, support any friend, oppose any foe to assure the survival and success of liberty." This goal is sometimes termed *liberal internationalism* because it refers to what political scientist Richard Gardner calls "the intellectual and political tradition that believes in the necessity of leadership by liberal democracies in the construction of a peaceful world order."

In contrast, isolationist goals speak to the U.S. foreign policy preference to sever the country from the corrupting influences of international engagement and despotic foreign governments. George *Washington enshrined the reasoning rationalizing withdrawal when he warned the nation in his farewell address to "steer clear of entangling alliances with any portion of the foreign world." The *Monroe Doctrine (1823) stemmed from the same logic

and preference, as later did the "Neutrality Acts in the 1930s. *Detachment* and *withdrawal* are also deeply instilled goals in the American diplomatic tradition, and they have periodically resurfaced as the defining characteristic of U.S. foreign policy.

Values. The push for two seemingly incompatible foreign policy goals springs from the political beliefs in which U.S. foreign policy is rooted. The values that give rise to fluctuations and alternating cycles in defining U.S. goals and postures include two quite different world views—*idealism* and *realism*—both of which at various times have dominated the thinking of U.S. leaders and shaped their foreign policies. The two value systems stem from very divergent beliefs about the ways to best reconcile the tension between ideals and interests, between principle and power, and between moral purpose and military primacy.

At the core of idealism is the belief that American foreign policy should be guided by its fundamental liberal values—what may be called the "ideology" of American foreign policy. But throughout U.S. history, Americans have often differed about the relative importance of particular liberal ideals. Still, underlying idealism has been the fundamental belief that the United States has a special mission to use power for moral purposes. Adlai Stevenson stated this "exceptionalist" version of America's international purpose, for example, when he argued that "America is much more than a geographical fact. It is a political and moral fact." Similarly, Woodrow Wilson proclaimed that "America was established not to create wealth but to realize a vision, to realize an ideal—to discover and maintain liberty among men."

At the risk of sounding simplistic and selective, the idealist-liberal tradition may be said to stress the Enlightenment's faith in reason, progress, the essential goodness of human nature, popular sovereignty, and the benefits of equal access to opportunity. Idealism counsels the search for international cooperation through U.S. support for international law, international institutions and organizations (such as the "League of Nations and the "United Nations), a liberal trade regime, "arms control and disarmament, and the promotion of democratic governance, collective security, and multilateral approaches to international peace.

This liberal-idealist conception of a transcendent national purpose differs from the *realist* conception with which it is often juxtaposed. To this alternate frame of mind—whose roots are equally deep—*raison d'état* and national interest are, necessarily, primary goals, and in a contest between principle and power, power must be paramount. To the realist tradition, it is prudent for the United States to acquire military capabilities and use them not only for defense but also to exercise influence abroad and to compete with other states in the international struggle for power. To advocates of *realpolitik*, the U.S. goal should be to put the military means to American prosperity, privilege, power, and position ahead of a drive to exalt liberty or any other grand ideal.

Like internationalism and isolationism, the history of American diplomacy also can be largely written in terms of cyclical swings between idealism and realism. In general, idealist moods have been particularly dominant in the immediate aftermath of America's major war experiences and in times of optimism and prosperity, when hopes for successful American reform of international practices have

risen—for example, during and after World War I when Woodrow Wilson championed an idealist American foreign policy dedicated to building "a world safe for democracy" under a rule of law, managed by an international organization (the League of Nations). But, instructively, the idealist program was promptly repudiated, and values based on realist assumptions again prevailed in the thinking of U.S. policymakers. This reversal illustrates the general tendency for a realist mood to capture the thinking of policymakers prudently concerned more with core national interests such as defense than with ideals when war scares have been perceived to threaten U.S. security (as, for example, during the "Cold War).

Instruments. Identifying the most effective means to the ends of foreign policy (consistent with the values that inspire choices about goals) has always been a challenge. The most difficult decisions facing leaders are often not about definitions of national interests and foreign policy priorities, but about the instruments to serve them.

Whereas there are observable patterns and periodicities in the goals and values underlying U.S. foreign policy, the record with respect to choices about instruments is more erratic and episodic, depending on different leaders' perceived needs and their estimates about the probable efficacy of different tactical tools.

Salient in the U.S. experience are *military* instruments. Here a basic choice involves the desired level of military preparedness to deter an attack on the United States or to project power abroad and, potentially, to deploy U.S. military might overseas. Both military expenditures (as a percentage of the national budget) and force levels have exhibited short-term perturbations and long-term trends, as seen in the framers' rejection of a large standing army and in just that kind of massive military commitment after World War II to enforce America's contest with the Soviet Union during the Cold War. The actual U.S. use of armed force abroad has displayed more repetition and regularity. Military engagement has ranged from large-scale protracted involvements like those in World Wars I and II to frequent practice low-scale *intervention* overseas. Nearly every U.S. administration has used coercive diplomacy on numerous occasions, but especially when internationalist goals shaped by *realpolitik* have been pursued.

The "strategies" guiding military methods of foreign policy, for both deterrence and compellence, comprise a related dimension. These have been defined by the various doctrines specifying the purposes for which military might should be put. Also related to overt military instruments of foreign policy are a cluster of other, less blatant tools such as "covert operations, clandestine intelligence activities, so-called public diplomacy designed to disseminate information abroad to bolster the United States and influence public opinion, and so-called gunboat diplomacy relying on shows of force abroad to signal U.S. resolve and commitments.

A second subcategory of instruments may loosely be defined as political, inasmuch as they refer to tools on which U.S. decision makers sometimes rely to exercise influence over other nations to get them to do things they might not otherwise do. Alliances are key here, as the recruitment of allies (and prevention of states' alignment with adversaries) comprises the primary method by which leaders seek to maintain a favorable international balance of power. Foreign assistance and foreign military sales add

to the arsenal of policy tools by which political influence can be exercised; for the United States, these were particularly popular during the Cold War. So, too, was the creation of international organizations, such as the *United Nations, constructed less for idealistic reasons than as mechanisms through which the United States could shape international events in directions compatible with its national interests.

A third basic subcategory of foreign policy instruments is *economic*. To serve the goal of increasing U.S. prosperity, leaders have depended on a range of divergent strategies. At one end of the philosophical spectrum are mercantilist approaches, which seek American power through trade protectionism, tariff walls, export and import controls, and, at the extreme, colonialism and imperialist *expansionism. Alexander *Hamilton's national industrialization policies to develop "infant industries" and the "open door" policies with respect to China in the 1890s reflected this approach, which sought to expand American power and territory at the expense of others; this drive is colored in *re.ippolitik*. At the other extreme, shaped heavily by liberal-idealism, are policies designed to lower barriers to free trade of the sort advocated in Woodrow Wilson's *Fourteen Points address. This approach was successfully pursued by the United States after World War II, when the United States led in the promulgation of the liberal international economic order that, through the General Agreement on Tariffs and Trade (GATT) culminated in creation of the World Trade Organization. Between these positions lie a variety of less controversial economic practices, such as embargoes and sanctions, that have been used as policy instruments to influence relations with foreign targets.

Rethinking the Concept of Foreign Policy. Scholars have disagreed about the emphasis that should be placed on pronouncement and doctrine (words) and observable behavior (deeds) as indicators of foreign policy by which changes might be measured. Beyond conceptualization, substantial disagreements exist about the best ways to characterize the goals, values, and instruments of American foreign policy. It is unlikely that consensus will crystallize, because the subject is complex and amenable to differing but equally plausible interpretations. The term *foreign policy* is elastic. Goals, values, and instruments have habitually taken new directions as global circumstances changed and American leaders sought to cope with them.

It is worth speculating that global conditions have changed so rapidly recently that traditional conceptions of foreign policy may be becoming anachronistic. With the radical expansion of international trade, travel, and communications, the international system has become perhaps unprecedentedly interdependent, and there is little prospect that this "globalization" trend will reverse direction. Borders that traditionally have divided sovereign territorial states no longer separate and buffer them from external influences as in the past. As a result, the classic distinction between "domestic" and "foreign" policy is collapsing. If this trend continues, if "domestic" policy truly becomes "foreign" policy, and vice versa, then the very meaning of foreign policy—its goals and implementations—will require reconceptualization.

FORREST, NATHAN BEDFORD (1821-1877), Civil War general, slave trader, planter. Born in Bedford County, Tennessee, Forrest received little formal education but learned to hold his own—and then some—in a violent frontier society. By ruthless drive and intelligence he made himself a planter and slave trader.

At the outset of the Civil War, Forrest raised a cavalry battalion in the Confederate army. He led his men out of Fort Donelson just before its 16 February 1862 surrender, and at the 6-7 April Battle of *Shiloh was conspicuously aggressive, being severely wounded covering the Confederate retreat. That summer he led a cavalry brigade in a spectacular raid through middle Tennessee. Promoted to brigadier general 21 July, he again raided behind Federal lines in December, helping to defeat Ulysses S. *Grant's first drive on Vicksburg.

In Alabama, in April 1863, he captured Col. Abel D. Straight's superior Union raiding force by bluff. At the Battle of *Chickamauga, 19-20 September, Forrest's troops opened the fighting. Afterward, he fell out with his army commander, Braxton *Bragg, was transferred to Mississippi, and promoted to major general on 4 December 1863.

In April 1864 his troops at the Battle of *Fort Pillow, Tennessee, stormed the fort, killing black Union soldiers as they attempted to surrender. In June, he routed a superior force under Samuel D. Sturgis at Brice's Cross Roads, Mississippi, but suffered defeat at Tupelo the following month. In November and December, Forrest commanded all the cavalry accompanying Gen. John Bell *Hood's ill-fated offensive into Tennessee, and skillfully covered the Confederate retreat.

On 28 February 1865, Forrest was promoted to lieutenant general, but he and his command were worn out, and they faced a powerful Federal mounted force under James H. Wilson driving into Alabama. Wilson defeated Forrest at Selma in April. After the war, Forrest returned to planting and served as the first grand wizard of the Ku Klux Klan.

His military usefulness in the Civil War was marred by his hot temper; he virtually required autonomy. Nevertheless, as the leader of a semi-independent mobile striking force, he has had few equals. He is also remembered for his alleged advice to commanders to "get there 'firstest' with the 'mostest.'"

FORRESTAL, JAMES V. (1892-1949), investment banker, undersecretary of the navy (1940-44), secretary of the

navy (1944-47), and the nation's first secretary of defense (1947-49). Forrestal was the youngest of three sons born to Irish immigrant parents in Beacon, New York. He attended Princeton University in the class of 1915, served as editor of the *Daily Princetonian*, and was voted "Most Likely to Succeed" and "The Man Nobody Knows."

After a short stint as a naval aviator in World War I, he joined the Wall Street firm of William Read & Co. (later Dillon, Read) as a bond salesman. He was elected to the partnership in 1923, became one of the "golden boys" of investment banking during the Roaring Twenties, and was made president of the firm in 1940. He married Josephine Ogden, an editor of *Vogue* magazine, in 1926.

Called to Washington by President Franklin "Roosevelt to help convert the U.S. economy to war production, Forrestal was named undersecretary of the navy (August 1940) with full authority in the area of procurement—for the design, construction, and delivery of ships to the fighting forces. Over the next three years he was the principal architect of the navy's vast World War II expansion from 1,099 to 50,759 vessels, and from 160,997 to 3,383,196 officers and men. The creation of that largest, most powerful fleet in the world was a precondition of victory.

Forrestal became secretary of the navy (in April 1944). He organized a comprehensive information effort to make the magnitude and complexity of the Pacific War—including the significance of particular naval battles and acts of heroism—more understandable to the American people. He toured the battlefronts in both the European and Pacific theaters, and went ashore at Iwo Jima on D-Day+2, "exposing himself to the dangers of warfare as no other United States official of his rank did in World War II." In August 1945, when the Japanese government expressed a readiness to surrender provided it did not "prejudice the prerogatives" of the emperor "Hirohito, President Harry S. Truman's advisers were divided on the question whether this met the U.S. requirement for "unconditional surrender." Forrestal convinced Truman to accept the Japanese condition, but to call it "unconditional surrender" and arrange to subordinate the emperor to the U.S. Supreme Allied Commander.

Forrestal was one of the first high officials to see in the Soviet Union an ideological, political, and military threat to U.S. security and to democratic societies everywhere. He played a large, influential role in government efforts to restore a shattered postwar world, confront the new Soviet challenge, and create or restructure those agencies ("National Security Council, "Central Intelligence Agency, Department of "Defense, "Joint Chiefs of Staff, cabinet secretariat) required to handle the new, unprecedented responsibilities of the "Cold War in Europe, Asia, and the Middle East. He commissioned a Soviet expert, George F. Kennan, to write the paper that became the famous "Mr. X" article, setting forth the "containment" doctrine that formed the definitive guideline for U.S. foreign policy throughout the Cold War.

As navy secretary, Forrestal strongly resisted President Truman's postwar plan to integrate the army, navy, and air force under a single secretary of defense. Truman's plan became law, but Forrestal succeeded in obtaining amendments that severely limited the power and authority of the new secretary: he would be essentially a presiding chairman of the board, with only "general authority" to as-

sign military roles and missions and develop a single budget for the armed forces. The secretaries of army, navy, and air force would continue to administer their own separate departments.

When Truman's first choice for the new post declined it (Robert Patterson, the outgoing Secretary of War), the president turned to Forrestal, who fatefully accepted. Almost immediately he found that the secretary of defense lacked adequate authority and staff to control an organization riven by bitter rivalries that were aggravated by a combination of expanding military technologies and sharply limited postwar military budgets. At the same time, the armed forces were charged with protecting the nation in a disordered postwar world, marked by widespread physical destruction and a dangerous new challenge from Stalinist Russia. Belatedly aware that his earlier concept had been deeply flawed, Forrestal nevertheless struggled to manage an almost unworkable organization. In the process he drove himself to exhaustion, and began a tragic descent into paranoia and self-destruction. Truman asked for his resignation in March 1949. Forrestal was hospitalized for "reactive depression"—essentially the condition of combat fatigue seen frequently during World War II. On 22 May, he committed suicide by jumping from a sixteenth-floor window of the Bethesda Naval Hospital.

—Townsend Hoopes

FORTIFICATIONS, both permanent and temporary, formed an important element of American military activity as early as the colonial period and remained a highly visible aspect of national defense well into the twentieth century.

A major threat facing isolated coastal communities in colonial times was seaborne attack by European forces. The defensive works built by the colonists were mainly small, primitive attempts to replicate the European bastion-trace fortification with its prominent corner gun platforms. Most were constructed at the water's edge of port cities, using whatever local materials were available. The American Revolution triggered a revival of local construction, but with little change in either materials or design. Most fortifications built during the "Revolutionary War itself were field fortifications rather than permanent works. Classed as either *complex entrenchments* (with small, reinforced earthen and timber works often connected by ditches to serve as trenches) or *hasty entrenchments* (the normal ground configuration supplemented by minimal construction), fieldworks also followed European models. Having no indigenous military engineers, the Continental army relied mainly on French-trained officers, such as Louis La Bèque Duportail and Thaddeus "Kosciuszko, for the expertise needed to construct larger works in the field—a tradition that would continue into the nineteenth century.

The emergence of a plausible threat in the 1790s during the French Revolution led to the first of two "systems" of coastal fortifications prior to the "War of 1812. The "First System" of 1794 was the initial effort undertaken by the federal government, and it represented a continuation of past practices both in terms of design and materials and in reliance on European engineers (one of whom was Pierre

L'Enfant, the future designer of Washington, D.C.). The "Second System" emerged in 1807, also in response to a foreign threat, this time from Britain in the Napoleonic Wars. This system included works built to a novel design advocated by Jonathan Williams, first U.S.-born chief of the U.S. *Army Corps of Engineers. He endorsed the construction of works with high stone or brick walls, the guns arranged in multilevel tiers of internal chambers called *casemates*, and firing done through iron-shuttered embrasures piercing the facade. This theory, based on the ideas of a French engineer, the marquis de Montalembert, meant two or three tiers, and thus more guns and greater defensive firepower within the same ground occupied by an older-style, single-level fortification.

A handful of American fortifications designed to Williams's ideas, including Castle Williams in New York Harbor, arose before 1812; but the impact of these ideas was far greater in following decades. During the War of 1812, British coastal raids—and the burning of the national capital—persuaded national leaders to establish a board of engineers in 1816 to examine the entire coast and recommend defenses. The Bernard Board Report of 1821, named after French engineer Simon Bernard, was the first comprehensive plan for American coastal defense. It led to construction of the "Third System" of some fifty American coastal forts, almost all of them casemated works built to designs of increasing sophistication.

The leading figure of this program was Joseph G. Totten, an 1805 graduate of West Point and later chief engineer of the U.S. Army 1838-64, the longest tenure of any chief engineer. As important was Dennis Hart Mahan, a professor of engineering at West Point in 1832-71. Basing his ideas on French models, Mahan taught two generations of soldiers Americanized theories of fortification and emphasized the role of field fortifications in actual operations to steady America's partially trained troops and militia. Totten's 1851 report recommended increasing the number of projected coastal fortifications from 50 (in 1821) to 186 (with 28 for the Texas Gulf Coast and the Pacific states). Estimated cost of this increased program was \$25 million, with over \$20 million already expended.

Coastal fortification planning inevitably touched on naval operations, and in every report the engineers remarked, usually in passing, that the navy was the first line of defense. Since actual invasion was unlikely, the engineers stressed that the proposed fortifications were to protect cities, potential anchorages, and intracoastal navigation routes, as well as to keep blockading vessels at a distance. Confronted by choice of attacking powerful defenses head-on or landing far from their target, enemy forces might be discouraged from attacking at all. Many critics countered by asserting that fortifications alone were insufficient to protect coastal areas, suggesting various additional floating defenses or technological innovations, such as electrically detonated underwater mines demonstrated by Samuel *Colt in the 1840s.

Totten's arguments for the Third System fortifications, though, overlooked the ways the Industrial Revolution was already spawning dramatic changes in artillery and ship design. Fortifications themselves were an evolved technology. In the years shortly before the *Civil War, developments in metallurgy and ordnance design led to the production of heavy rifled and shell-firing guns of enormous power. Previous heavy naval and siege guns fired shot

weighing 32 to 48 pounds, the larger guns now possible fired shot weighing up to 100 pounds, with rifled *artillery capable of accuracy at three or four times the previous ranges. During the Civil War, such guns, sited by engineer officers like Quincy Gillmore, smashed the thick brick and stone walls of Confederate-occupied forts like Sumter and Pickens into rubble in hours or days. These developments were paralleled overseas, as was the development of the armored, steam-powered, oceangoing warship.

By the end of the Civil War, it was clear that the Third System of coastal defenses was obsolete. At the same time, the rival armies learned to construct field fortifications at every opportunity. In some cases—notably the defensive works arrayed around Washington, D.C., ordered by George B. *McClellan, or the trench systems created by both sides during the Siege of *Petersburg, Virginia—these fieldworks became enormously complex. Built of earth reinforced by heavy timbers, they proved less susceptible to artillery damage than the seacoast fortifications. For more permanent defensive works, however, there was no consensus on a proper design other than returning to lower structures protected by earth. The Indian wars of the late nineteenth century did not provide an answer. The few western forts with walls of any kind generally had palisades of wood that could not resist artillery.

Toward the end of the nineteenth century, gun manufacturers, following William Armstrong in Great Britain, had successfully developed methods of compound manufacture to create increasingly powerful, long-range cannon. Steel became the predominant material, and most of these new guns were breech-loading instead of muzzle-loading, giving them higher rates of fire. Studies suggested new, slower-burning and more powerful propellants instead of traditional gunpowder. Warships increased in size, armor, and speed. Consequently, many army and navy officers urged improvements in U.S. armaments and urged a program of new coastal fortification. A persistent argument was that coastal defenses were a form of insurance against the destruction resulting from raids to major coastal cities.

In 1885, President Grover Cleveland appointed a board headed by Secretary of War William Endicott to study the issue. The report of January 1886 endorsed much the same kind of system demanded by the engineers, dismissed the idea of a full-scale invasion, and linked coastal defense to the protection of the commercial metropolises of the seacoasts. It stressed in particular the use of relatively new, and still unproved, technologies such as searchlights, steel breech-loading cannon on disappearing gun carriages, armor plate, underwater naval *mines, and auxiliary vessels, many of which did not yet exist in usable form. At the time, engineers estimated the total cost of the system at around \$126 million.

The enormous cost of this effort meant that it was never entirely completed. Moreover, the original proposal underestimated the increasing power and range of artillery, and thus overestimated the number of guns needed. Eventually, some 700 heavy artillery pieces, mostly 8-, 10-, and 12-inch long-range guns, were emplaced, among them several hundred 12-inch arching-fire mortars, along with other hundreds of smaller-caliber, rapid-firing guns. The largest guns were capable of firing a 1,000-pound shell to a range of 7 or 8 miles. These were installed in fortifications that encompassed a series of connected strongpoints and bat-

teries rather than a single, massive structure, dispersed to lessen their vulnerability to naval guns. They were low-lying, protected by thick berms of earth to absorb heavy, high-explosive shells, and built to take advantage of ground contours to make them less visible from the ocean. In some cases, older fortifications were rebuilt to accommodate the newer guns; elsewhere the newer works went up in the same general vicinity.
