During the *Spanish-American War, despite unfounded fears of coastal raids by Spanish warships that triggered the emplacement of several hundred artillery pieces, no raiders attacked any U.S. cities or harbors. Still, the acquisition of overseas territories during the war, along with the realization of advancing military technology, persuaded President Theodore *Roosevelt to create another board, this one headed by Secretary of War William H. Taft, to review the coastal fortification program. Aside from suggesting the need for defenses to guard newly acquired overseas locations such as the Panama Canal, Hawaii, and Manila Bay in the Philippines, the Taft Board limited itself to modifying minor details, reestimating costs, and changing priorities slightly. It concurred with Adm. Alfred T. *Mahan (son of Dennis Mahan) that the role of a navy was offensively to seek for command of the sea, not restrict itself to direct coastal defense.

By the outbreak of World War I, moreover, battleship ordnance could once more outrange most of the guns of the shore defenses, with the plunging trajectory of naval shells making open-topped defensive works untenable. Engineers began siting defenses farther out toward the sea from the locales they defended and pushing development of more powerful 14- and 16-inch guns. Fortifications became ever simpler in design and dispersed over wider areas; 1,000 feet might separate the guns of a single battery. During the 1920s and 1930s, engineers experimented with mobile railroad- and tractor-drawn guns, utilizing wartime stocks of 8- and 14-inch guns. Employed as armament in two dozen permanent sites were newly developed 16-inch guns, which fired a 2,000-pound shell to a range of 30 miles. The new threat posed by aircraft forced planners to include antiaircraft guns, and led to a design that placed the entire battery structure under up to 30 feet of concrete and earth. The first such structure was erected outside San Francisco between 1937 and 1940, and it became the prototype for the defensive works constructed during World War II. The urgent demand for defenses early in that war could only be met by almost complete standardization into two-gun batteries, emplaced within concrete bunkers and protected by steel shields. By 1944, however, with no direct threat to American shores, construction ceased.

Field fortifications also changed during World War II, with the complex, continuous trench lines of World War I giving way to small "foxhole" emplacements for individual soldiers and weapons crews, providing greater dispersal and thus survivability from modern ordnance. In both the *Korean War and the *Vietnam War, in the absence of aerial and armor threat, fixed defenses in the field (around bases and other strongpoints) reappeared to some degree, with works protected by earth or sandbags. Structurally, these were similar to the semipermanent, complex entrenchments of the nineteenth century, albeit with electronic listening devices and mines taking the place of cruder systems of detection and forward protection.

During the *Cold War, the greater threat to American

cities came from the sky, not the sea. Reliance on coastal fortifications gave way to dependence on antiaircraft guns and *missiles and early warning *radar networks against bombers and then missiles. The Reagan administration accelerated research on a satellite-based laser defense system in an attempt to protect the United States against missile attack (the *Strategic Defense Initiative). Between 1948 and 1949, nearly all the larger guns of the fortifications were scrapped, marking the end of relying on such fixed defenses for the protection of the American seaboard. In the 1960s, many of the old coastal forts were turned over to the National Park Service.

FORT PILLOW, BATTLE OF (1864). By 1864, the captured Confederate earthwork Fort Pillow, located 40 miles above Memphis, Tennessee, on the Mississippi River, was garrisoned by 557 Union soldiers under Maj. Lionel F. Booth. Of these men, 262 belonged to the 11th U.S. *Colored Troops and Battery F, 4th U.S. Colored Light Artillery. On 12 April, Confederate Maj. Gen. Nathan Bedford *Forrest ordered Brig. Gen. James R. Chalmers's 1,500 men to attack the fort.

Beginning at 5:30 A.M., Confederate sharpshooters located on hills above the fort opened a devastating fire, killing many soldiers, including Booth. Forrest arrived on the field at midmorning and directed the assault that gained part of the fort for the Confederates. By 3:30 P.M., Forrest sent a surrender demand to Maj. William F. Bradford, now in command of the Union force. When Bradford delayed, Forrest attacked, quickly driving the defenders out of the fort and down the bank into a crossfire.

What happened next has served to place Fort Pillow second only in infamy in *atrocities of that war to Andersonville, the most notorious of the *Civil War *prisoner-of-war camps. At Fort Pillow, many Union soldiers tried to surrender while others continued fighting or tried to run. Forrest either ordered his men to accept no surrender or his Confederates lost control but in either case, they began to slaughter black soldiers. The casualty list confirms a massacre. Confederates suffered 14 killed and 86 wounded, while the Union force lost 231 killed and 100 wounded; only 58 of the 226 surviving Union prisoners were black soldiers.

The U.S. Congress's Committee on the Conduct of the War investigated, and after much testimony from survivors—including horrifying accounts of black soldiers being buried alive—it denounced the Confederate actions as murder and atrocity. Forrest objected, and many historians have sided with his account but Forrest's best biographer, Brian Steel Wills, concluded that the committee's findings were valid and that Forrest was responsible for the slaughter.

FORT SUMTER, CAPTURE OF (1861). After the Republican Abraham "Lincoln won the election of 1860, seven states seceded from the Union and formed the Confederate States of America. The new president vowed in his inaugural address to "hold, occupy, and possess" federal property in the South, but by then the United States controlled only two major posts within the Confederacy: Fort Pickens, on Pensacola Bay, Florida; and Fort Sumter, in the harbor of Charleston, South Carolina. Brig. Gen. Braxton "Bragg appeared unenthusiastic about his chances of capturing Fort Pickens, and so attention centered on Fort Sumter.

On 10 April 1861, Confederate secretary of war Leroy Pope Walker ordered Gen. P. G. T. "Beauregard to demand the evacuation of the Charleston post and, if refused, to reduce it. Maj. Robert Anderson held Fort Sumter with a modest garrison and forty-eight guns, few of which could be manned. The Confederates encircled the harbor installation with thirty heavy pieces and eighteen mortars, and bombarded it from 4:30 A.M. on 12 April until early the next afternoon. Raging fires threatened the defenders and Major Anderson surrendered Fort Sumter with the honors of war. He began evacuating the post on the 14th.

FORT WAGNER, SIEGE OF (1963). Constructed on the northern end but extending completely across Morris Island, Fort (or Battery) Wagner was integral to the Confederate defensive system protecting Charleston Harbor. Along with the batteries directly across the channel at Fort Moultrie, and with Fort Sumter only a mile and a half away, Fort Wagner had to be taken before Union forces could capture Charleston. Wagner was literally built of sand, with thick sloping walls 20 feet tall lined in front with abatis (sharpened tree branches) and benefiting from high tides, when seawater narrowed the approach to the fort and filled the ditch Confederates dug just behind the abatis.

On 10 July 1863, the Federal army took control of the southern end of Morris Island. The next day Maj. Gen. Quincy A. Gillmore ordered a dawn attack against Wagner. Brig. Gen. George C. Strong with two and a half brigades dashed against the fort's 1,200 defenders under the command of William Taliaferro. Strong's force was repulsed with a loss of 339 men against 12 Confederate casualties. From Charleston, Gen. P. G. T. "Beauregard sent another 600 men to reinforce the fort.

Gillmore, who had become the Union's most renowned artilleryman after he had forced the capitulation of Fort Pulaski at Savannah in April 1862, brought in heavy weaponry. On 18 July, he began a daylight bombardment with twenty six rifled guns, ten heavy mortars, and the additional firepower provided by Adm. John "Dahlgren's naval force of monitors and warships. Meanwhile, Gillmore's infantry organized for the rush everyone knew would follow.

The 54th Massachusetts Infantry Regiment of the U.S. "Colored Troops commanded by Col. Robert Gould Shaw, spearheaded General Strong's infantry assault of 5,624 men. It became quickly apparent that Gillmore's fierce bombardment had done no damage to Wagner's 1,785-man garrison. The attackers made it up past the obstacles

and temporarily held a position on the fort's parapet before being repulsed. The Union suffered 246 dead, 880 wounded, and 389 missing for 1,515 total "casualties. Of these, the losses of Shaw and 272 of his 650 men were the most conspicuous. Confederates lost 36 killed, 133 wounded, and 5 missing.

With two failed infantry assaults, Gillmore began formal siege operations. He continued to hammer away with artillery; an estimated 10,000 shells struck at Wagner. On 6 September, the fifty-seventh day of the siege, Union soldiers had completed digging a series of ditches that zigzagged forward and had reached the abatis. Gillmore ordered an infantry assault for the next day, but the Confederates had slipped away during the night after Beauregard recognized the impossibility of a further defense of Wagner.

For months afterward, when reports of this encounter could get past the news about the Battle of "Gettysburg and the siege of "Vicksburg, the Northern press praised the heroic conduct of the black soldiers as proof that black men would fight and die for the Union. Confederates inadvertently contributed to the praise when in the aftermath of the 18 July battle, they threw Shaw's body into a common grave with twenty of his men. With news reported by the South that the young hero had been "buried ... with his niggers," the North had its most important martyr to the brotherhood of man since abolitionist John Brown was hanged in 1859.

The 1989 film *Glory* graphically depicts the battle at Fort Wagner.

FOURTEEN POINTS (1918). President Woodrow "Wilson's statement of January 1918 was the most important on war aims advanced during World War I. Based on his anti-imperialist "Peace without Victory" formula of the previous year, Wilson made his address owing primarily to the revolutionary upheaval that had seized Russia. By the end of 1917, Lenin and Trotsky had pulled their ravaged homeland out of the war, thus permitting Germany to transfer huge numbers of troops to the western front. They also published the Allies' secret treaties (signed by the czarist regime) for parceling out territory after victory. The Bolsheviks then summoned the soldiers of both the Allied and Central Powers to lay down their arms and repudiate plans for conquest. Because many liberal and socialist groups among the Allies had already begun to question the continuation of the carnage, it fell to Wilson to remove the suspicions hanging over their cause and explain why the conflict was any longer worth fighting.

The president argued that German militarism must be crushed, first, in order to create a new and better world. He then outlined the American peace program. Seven of the points dealt with territorial readjustments, including the "unembarrassed opportunity" for Russia to shape its own destiny. The others were characteristically Wilsonian—open covenants openly arrived at; free trade; self-determination; disarmament; impartial adjustment of colonial claims; freedom of the seas; and a league of nations.

Wilson's progressive response to the Bolshevik challenge provided the ideological cement that held the Allied coalition together for the remainder of the war. The Fourteen Points also set the public agenda for the Paris Peace Conference, but became a source of controversy when they were only partially fulfilled in the Treaty of *Versailles.

FRAGGING is a term first encountered during the latter years of the *Vietnam War. It refers to the killing of officers and noncommissioned officers using fragmentation hand grenades, often thrown into a sleeping area at night. A broader definition encompasses murder by a variety of other means, including mines, shooting, and hit and run with a vehicle.

Instances of leaders being killed by subordinates have occurred in American forces since the * Revolutionary War. Often the cause appeared to be concern for survival in a combat environment made more hazardous by a leader perceived to be incompetent or unconcerned with soldier welfare. Although records are incomplete, the rate of such incidents was relatively low until the Vietnam War, when fragging increased dramatically. The highest incidence in Vietnam occurred between 1968 and 1972. Most episodes were in the army and Marine Corps, especially among support and rear area units. There were approximately 830 actual and suspected fraggings in Vietnam, with the annual number peaking at 333 in 1971. Fragging declined significantly in 1972 as American troops were withdrawn.

The explanation for the fragging epidemic can be found in the interaction of two broad factors, one societal and the other organizational. Widespread and severe change and conflict emerged in American society during the period. This combined with unfortunate organizational policies and a demoralizing military strategy to produce an unprecedented internal crisis within U.S. forces, characterized by poor leadership and unit performance. An individual replacement system that rotated soldiers back to the U.S. after twelve months along with frequent reassignments within Vietnam had a strongly corrosive effect on unit-leader bonding. In Vietnam, erosion of effective leadership, and the unraveling of unit cohesion exposed the forces in Southeast Asia to the full impact of drug abuse, racial conflict, and antiwar activism then rampant in the United States. Fragging was an unfortunate symptom of the internal crisis experienced by the U.S. military in Vietnam during this period.

FRANCE, LIBERATION OF (1944-45). Following the invasion of *Normandy, the breakout by Omar N. *Bradley's U.S. First Army created conditions for mobile warfare that permitted the World War II Allied armies to liberate France by the late summer of 1944. In the aftermath of the

American breakthrough of German lines, George S. * Patton's newly activated U.S. Third Army swept west through the Brittany peninsula. Meanwhile, British and Canadian armies under Bernard Law * Montgomery pushed further into Northern France. On 6 August, the Germans launched a large counterattack at Mortain to defeat the Americans and push them back into the English Channel. But the fighting ability of U.S. ground and air forces, advised of Berlin's plans by *ULTRA intelligence, resulted in the German's defeat after two days of fighting.

On 8 August, in bold disregard of the recent threat at Mortain, Bradley devised a plan to cut off the German Army before it could withdraw to the Seine River. He ordered Patton to swing around the German left and cut off the enemy escape route by capturing Argentan. Meanwhile, the Canadian First Army under Henry Crerar was to close the trap from the north by seizing Falaise. Patton's troops moved aggressively, capturing Argentan on 13 August, while the Canadians pressed toward Falaise against stiff German resistance. However, concerns that an unexpected encounter between U.S. and Canadian troops might result in numerous friendly * casualties caused a halt in Allied operations and left the pincers' jaws open. The Germans now had an escape route through the Falaise-Argentan gap. Allied airpower savaged the German ranks, but a considerable portion of the enemy escaped. Still, German losses in the Falaise-Argentan pocket included 10,000 killed and 50,000 captured. The failure of Allied generals to close the Falaise-Argentan gap remains one of the great controversies of the war in Western Europe.

On 19 August, Supreme Allied Commander Dwight D. *Eisenhower modified his pre-invasion plans. He had originally planned to halt his armies along the Seine River to reorganize and resupply, but the deteriorating enemy situation prompted him to order exploitation to the Seine and beyond. Montgomery now urged the encirclement of the remnants of the German Army. The Allies attempted another large pincer movement south of the Seine, but most of the German infantry escaped and made it over the river. The Allied approach toward Paris caused Free French uprisings on 19 August that soon needed assistance. The U.S. V Corps took Paris on 25 August with the honor of the triumphal entry going to the French 2nd Armored Division. French Gen. Charles de Gaulle entered Paris the same day and installed his government in the French capital.

As the Allies advanced toward the Seine River, a second Allied coalition force landed in southern France. On 15 August, U.S. Gen. Jacob Dever's Sixth Army Group, consisting of the U.S. Seventh and French First Armies, landed in southern France in Operation Dragoon, captured the key port at Marseilles, and began an offensive up the Rhone River valley. The Germans successfully withdrew more than half of their forces from southern France before the Allied armies effected a juncture on 11 September. Dever's army group was then ordered to protect the Allied southern flank during the drive into Germany. Meanwhile, U.S. efforts in clearing the Brittany peninsula to the west came to naught. After a stubborn fight, the Germans finally surrendered Brest on 25 August, but not before destroying nearly all of the port facilities. With the opening of Marseilles in the South, of Cherbourg, and with the imminent capture of other Channel ports, logisticians saw little need for capturing additional harbor facilities in Brittany.

Flushed by the past month's tremendous successes, Montgomery and Bradley argued for a single, bold thrust into Germany launched from their respective sectors. But Eisenhower, concerned that a single drive might be too vulnerable to counterattack, ordered his armies to advance simultaneously on a broad front. To implement the "broad front" strategy, Eisenhower directed that Montgomery's continued attacks in the north be supported by Courtney Hodges's U.S. First Army. Patton's Third Army was to advance only as supplies permitted.

As the Allied armies moved beyond the Seine, logistics began to govern operations. The beach unloading facilities in Normandy were unable to accommodate the large amounts of gasoline, munitions, and other supplies the armies required, and in some cases, advance units were more than 300 miles from the beaches. Despite expedients such as airdrops and the implementation of a truck convoy system called the "Red Ball Express," supply levels remained inadequate.

To ease the logistics crisis, Eisenhower gave priority of supplies to Montgomery and ordered him to capture the port facilities at Antwerp in Belgium. The British moved rapidly, capturing Brussels on 3 September. Antwerp fell the next day, though continued German resistance did not permit the port's use until late November. Meanwhile, American progress slowed considerably due to lack of gasoline. Patton's Third Army crossed the Meuse River on 30 August but had to halt for lack of fuel. Hodge's First Army captured a large number of Germans near Mons on 3 September, but the advance then ground to a halt. Finally, on 14 September, troops from Hodges's army became the first Allied soldiers to set foot on German soil. Days later, Patton's supply situation improved, and Third Army moved westward to complete the liberation of France.

Adolf "Hitler brought in Field Marshal Gerd von Rundstedt on 5 September to take charge of the German Army in the West. In the face of the Allied advance, Rundstedt consolidated his forces and stabilized a defensive line. A key element of the defense was the West Wall, a dense line of small, mutually supporting pillboxes that stretched the length of the German border. In an abortive effort to outflank the West Wall by capturing a bridgehead across the lower Rhine River at the Dutch town of Arnhem near the German border, Field Marshal Montgomery planned operation "Market-Garden." On 17 September 1944, the 82nd and 101st U.S. Airborne Divisions and 1st British Airborne Division (16,500 paratroopers and 3,500 troopers in gliders), dropped near the Rhine bridges. However, many were blocked by two SS Panzer divisions, whose recent move into the area had been ignored. The British armored column coming by land was delayed by stiff German resistance and bad weather, and eventually prevented from reaching Arnhem, thus losing 6,000 British paratroopers as prisoners of war. The two U.S. airborne divisions held their ground and suffered 3,500 casualties. "Market-Garden" failed to gain a major bridgehead across the lower Rhine and by diverting sizable forces produced major delays in defeating Germans in the estuaries to open the vital port of Antwerp.

Between 6 June and 14 September, the Allies put 2.1 million soldiers on French soil, severely punished the German Army in the west, liberated the French people, and advanced to the German frontier. Despite the huge, sweeping success, Allied losses were heavy: 40,000 killed, 165,000

wounded, and 20,000 missing. In all, German forces suffered nearly 700,000 casualties. Still, the German Army remained intact, and larger battles loomed on the horizon as Allied forces began the Battle for "Germany."

FRANCE, UNDECLARED NAVAL WAR WITH (1798-1800). In the 1778 treaty that created the "Franco-American Alliance, the two countries agreed to mutual defense and accepted the doctrine that neutral ships carried neutral cargoes. But under President George "Washington, the United States retained its neutrality when England and Revolutionary France went to war in 1793; and in 1794, John Jay negotiated a treaty conceding both favored status in trade and a broad definition of contraband to England—in effect, agreeing to limit trade with France. French privateers responded by seizing nearly \$200,000 worth of American shipping during 1796-97.

President John "Adams wanted to send either Vice President Thomas "Jefferson or Congressman James "Madison to France. Both were Republicans, more favorably disposed to France than Federalists like Washington and Adams, but neither man would go, and Adams's Federalist cabinet refused to grant the opposition so prominent a role. When Adams learned in May that France had authorized seaborne "privateering to seize neutral American ships carrying British goods, he called Congress into special session. To start negotiations, he dispatched two Federalists, Charles Cotesworth Pinckney and John Marshall, and a moderate Republican, Elbridge Gerry, to France, but he also started military preparations. Three frigates begun in 1793—the *United States*, the *Constellation*, and the *Constitution*—were to be completed as quickly as possible; 80,000 militiamen were to be armed and trained; harbor defenses built; and \$800,000 borrowed to pay for an undeclared "Quasi-War" with France.

France's foreign minister, the comte de Talleyrand, declined to receive the U.S. commissioners formally, but made subsequent contact through agents who insisted that the United States loan France \$6 million and provide \$250,000 in presents. Pinckney's famous response—"[N]o; no; not a sixpence"—came just as Napoleon Bonaparte's army defeated the Austrians in Italy. Contemplating France's control of Western Europe, John Marshall commented that "the Atlantic only can save us."

In March 1798, President Adams reported to Congress, substituting "W, X, Y, and Z" for the names of the French agents (hence the "XYZ Affair"). He vowed never to send another minister to France unless he would be "received, respected, and honored" as representing "a great, free, powerful, and independent nation." Congress commissioned 1,000 privateers to capture or repel French vessels, established the Department of the Navy (30 April), levied \$2 million in taxes, and passed the "Alien and Sedition Acts to restrict domestic dissent. Pinckney and Marshall returned as heroes (Gerry, less obnoxious to the French, stayed in Paris), and "Millions for defense, but not one cent for tribute" became a Federalist slogan.

By May 1798, the U.S. war sloop *Ganges* was guarding

the coast between Long Island and the Chesapeake, joined in June by the *Constellation* and the *United States*. In July 1798, Stephen *Decatur, on the sloop *Delaware*, captured the French schooner *Croyable* off New Jersey. After the British navy defeated French forces in the Battle of the Nile (1 August 1798), the U.S. Navy drove the French away from the U.S. coast to the Caribbean. Ten important naval engagements ensued, six of them in February and March 1799. The Americans lost only once: the *Retaliation* (formerly the *Croyable*) was captured in November 1798. In February 1799, the *Constellation* captured the frigate *L'Insurgente*. The French captain blamed U.S. Capt. Thomas Truxtun for provoking war between the United States and France.

Despite ship-to-ship actions and U.S. support for former slave Toussaint Louverture's independence movement on Haiti, neither side declared war. Adams resisted Federalist pressure for war; while congressional Federalists created a provisional army with Washington as commander in chief and Alexander *Hamilton as second in command, Adams favored a strong navy to make the United States independent of both England and France. The French Army, he told Hamilton, was more likely to invade heaven than the United States.

Napoleon's *coup d'état* on 9 November 1799 changed French politics and policy. Needing the support of neutral Denmark and Sweden, he returned in December 1799 to the principle that neutral ships make neutral goods. American diplomats at the Hague (William Vans Murray) and Berlin (John Quincy Adams) sent word that France wanted to negotiate. In November 1799, Adams dispatched official envoys to France.

On 7 March 1800, the American diplomats—William Vans Murray, Chief Justice Oliver Ellsworth, and Governor William Davie of North Carolina—met with Napoleon. In September, the Americans and French completed a convention that restored amity and deferred to future consideration the vexing issues of indemnities for seized property and the status of the 1778 treaty. The peace mission cost Adams much Federalist support. In 1800, Hamilton backed Pinckney instead of Adams for president, a split that resulted in Jefferson's election.

FRANCO-AMERICAN ALLIANCE (1778-1800). In 1778, Benjamin Franklin and France's foreign minister, the comte de Vergennes, signed two documents—a Treaty of Amity and Commerce, and a Treaty of Alliance—midway through the American *Revolutionary War. They expressed realpolitik for both parties. Vergennes hoped to weaken the British, make France the Americans' primary trade partner, and contain U.S. expansion. American leaders had hoped to achieve independence without a binding military alliance, but after the battlefield setbacks in 1776, they saw the treaty as the only way to overcome the British forces. Britain's willingness to negotiate after the American victory at the Battles of *Saratoga in October 1777 convinced Vergennes that only a "permanent" alliance could prevent American-British rapprochement. Hence, he proposed preferential Franco-American commercial ties, French recognition of U.S. independence, renunciation of any French claims to Canada, military cooperation against

Britain, and a U.S. guarantee of France's Caribbean holdings. French recognition helped legitimize the American Declaration of Independence, and French military and financial aid contributed decisively to U.S. military victory, particularly in the decisive Battle of *Yorktown (1781).

As peace approached, American leaders lost interest in the alliance. In 1782, Franklin, John *Adams, and John Jay began peace negotiations with Britain, without consulting the French. After independence in 1783, many Americans increasingly viewed the French alliance as a dangerous foreign entanglement, particularly after the French Revolution led to a new Anglo-French war in 1793. President George *Washington declared America's *neutrality despite the alliance and even allowed Jay to sign a favorable commercial treaty with Britain in 1794. French efforts to bring a more friendly American government to power led Washington to warn against "entangling Alliances" in his farewell address (1796)—words that became the cornerstone of U.S. foreign policy until the twentieth century. The alliance proved an embarrassment in the Undeclared Naval War with *France (1798-1800) and was ended with the 1800 Convention of Morfontaine, when Napoleon Bonaparte's government signed it away in return for economic concessions. The United States would not sign another peacetime military alliance until the *NATO pact of 1949.

• Ronald Hoffman and Peter J. Albert, eds., *Diplomacy and Revolution: The Franco-American Alliance of 1778*, 1981. Lawrence S. Kaplan, *Entangling Alliances with None: American Foreign Policy in the Age of Jefferson*, 1987. —Jeffrey G. Giauque

FRANKLIN, BATTLE OF (1864). After Union General William Tecumseh *Sherman had captured the capital of Georgia in the Battle of *Atlanta, he cut loose from his supply lines and set out with 62,000 of his troops in mid-November 1864 on *Sherman's march to the sea to cripple southern resources and demonstrate the hopelessness of the Confederate cause. But, while Sherman headed east, Confederate Gen. John B. *Hood headed into Tennessee behind Sherman.

To guard against this move, Sherman had left George H. *Thomas in Tennessee. Once Thomas could gather the numerous garrison troops there, he would have an army of ample size to deal with Hood. Meanwhile, Thomas assigned Gen. John M. Schofield with 34,000 men to watch Hood. Hood advanced rapidly from northern Alabama, outmaneuvered Schofield, and nearly captured his force at Spring Hill, Tennessee, 29 November 1864. Something went wrong—just what did remains controversial—in the Confederate army's command structure, and Schofield's army was able to escape from the trap.

The next morning, an enraged Hood put his army in pursuit. He caught Schofield at Franklin, Tennessee. The *Fédérés'* backs were to the unbridged Harpeth River, but in front of them were powerful entrenchments and an open plain two miles wide. Though two of his divisions and nearly all his artillery had not yet arrived, Hood hurled his 30,000 available men against the Union fortifications in a series of bloody and futile charges. Six of Hood's generals were killed, and 6,245 other Confederates became casualties. Union casualties numbered only 2,326.

After the battle, Schofield withdrew at his leisure, joining Thomas in Nashville. Hood followed. The slaughter at

Franklin substantially weakened Hood's army and made easier and more complete Thomas's devastating victory at the Battle of *Nashville a fortnight later.

FREDERICKSBURG, BATTLE OF (1862). After repelling the Confederates at the battles of *Antietam, *Perryville, and Corinth, the Union forces in the fall of 1862 renewed their offensives against Richmond, Chattanooga, and Vicksburg. President Abraham *Lincoln replaced Gen. George B. *McClellan with Gen. Ambrose *Burnside in November 1862 in command of the Army of the Potomac. Burnside proposed to move toward Fredericksburg, Virginia, as a preliminary to an offensive against Richmond. Moving quickly, his army covered 40 miles in two days, leaving Confederate Gen. Robert E. *Lee guessing as to its destination, but confused orders and bureaucratic bungling delayed the arrival of pontoons for bridging the Rappahannock River for a week. These delays and Burnside's own indecisiveness allowed Lee to concentrate his forces and establish strong defensive positions on the hills behind Fredericksburg.

In the early morning of 11 December, Burnside's engineers began laying pontoon bridges. A heavy *artillery bombardment and a crossing on the upper bridges by a Union brigade drove out the Confederate defenders. On the evening of 11 December and throughout 12 December, Federal troops moved into position in Fredericksburg. For the next several days, the soldiers thoroughly sacked the city.

On 13 December, Burnside ordered William B. Franklin to attack the Confederate right. However, carelessly drafted orders and Franklin's own lack of initiative led to delay and a weak assault with only one division. Despite these problems, however, George Gordon *Meade's men poured through a gap in Gen. Thomas *Jackson's line. A vigorous Confederate counterattack drove Meade's unsupported division back, and twilight ended the fighting on this part of the field.

While waiting impatiently for news of Franklin's attack, Burnside ordered Edwin Sumner to take Marye's Heights in the rear of Fredericksburg. Around noon, William French's division moved through the streets toward a sunken road and stone wall at the base of Marye's Heights. French's brigades were thrown back by well-placed Confederate artillery fire and what many participants described as a "sheet of flame" from Georgia and North Carolina infantry stationed behind a stone wall. Assaults by parts of five more Union divisions proved equally disastrous. Several generals talked Burnside out of leading the Ninth Corps in a desperate attack the following day, and by 16 December the Army of the Potomac had been withdrawn from Fredericksburg.

Although the battle had cost the Confederates over 5,000 *casualties, the *Fédéraux* had lost nearly 13,000. Historians have long criticized Burnside for both rashness and indecisiveness, yet the Union general was badly served by several subordinates. Some believe his battle plan stood a reasonable chance of success if properly executed. Whatever the merits of this argument, the results of the battle in

the North were demoralization and political recrimination. For the Confederates, a relatively easy victory added to public confidence while producing fresh rumors of foreign mediation and peace negotiations.

FRÉMONT, JOHN C. (1813-1890), explorer, Civil War general, U.S. senator, and first Republican candidate for president. Born in Georgia, Frémont briefly attended the College of Charleston. He began his military career in 1833, teaching mathematics to shipborne cadets aboard the sloop-of-war *Natchez*. Five years later, he was appointed a second lieutenant in the army's Topographical Engineers.

In 1846, on the eve of the *Mexican War, Frémont, sometimes called "the Pathfinder," was leading his third exploring expedition in the Far West. Although he led only part of the U.S. conquest of California, Frémont denied that his scientific expedition there was a mere pretext—one in fact encouraged by his powerful father-in-law, Senator Thomas Hart Benton, and by President James K. *Polk.

Before the Mexican War began, Frémont encouraged a band of disgruntled U.S. settlers near Sonoma, California, to oppose Mexican soldiers and form an independent "Bear Flag Republic." After war broke out, he reorganized his Topographical Engineers into the "California Battalion." Appointed by Commodore Robert F. Stockton as naval commander of U.S. forces in California, Frémont was later court-martialed for insubordination. Although President Polk commuted the sentence, Frémont resigned his commission and returned to civilian life.

Failing in his Republican presidential bid in 1856, Frémont reentered the army upon the outbreak of the Civil War as a major general. Commander of the Department of the West, he made the mistake of issuing an emancipation proclamation without presidential authorization. Consequently, he was transferred to the Shenandoah Valley, where he encountered the Confederate forces of Thomas "Stonewall" *Jackson. Frémont's controversial military career came to an ignominious end when his defeat at Cross Keys caused Lincoln to relieve him from command. On 12 August 1863, Frémont once again resigned his commission, his military career over.

FRENCH AND INDIAN WAR (1754-63). Three long-standing contests came together again in the Seven Years' War, which British colonial Americans called the French and Indian War. The ancient Anglo-French rivalry, which predated their colonization of America, became truly global, including unprecedented martial commitments to North America. Secondly, the war continued an equally epic battle between Indians and Europeans, a struggle that Indians could sustain best as allies of one European supplier and enemies of another. The third enduring contest pitted the North American colonists of Britain against

those of France in a frequently brutal 150-year-old struggle for trade and land.

An intercolonial boundary dispute between British and French colonies sparked a war that became imperial as well as Indian. The Upper Ohio Valley had been an underpopulated borderland that, by 1748, had become home to Delaware, Shawnee, and Mingo migrants from east of the Appalachians. Although long since denuded of valuable furs and peripheral to Canadian trade routes, this area gained strategic value with the arrival of Pennsylvania traders and Virginia land speculators. The government of New France responded with diplomacy; raids against British American traders and their protectors; and the building (1753) of three forts between Lake Erie and the forks of the Ohio River. Virginia's governor sent Col. George Washington on a futile mission to order the French out, and obtained formal British permission to use force to expel the French Canadians.

Fighting began when, on 28 May 1754, Washington's Virginia troops ambushed a Canadian reconnaissance party, killing ten and taking twenty-one prisoners. Retaliation led to Washington's surrender of hastily fortified and aptly named Fort Necessity on 3 July. The French marked their victory by turning another unfinished Virginian fort into Fort Duquesne.

British government response to Washington's defeat proved uncharacteristically strong. While claiming to preserve the peace, the ministry sent two regular regiments to America under Gen. Edward "Braddock with instructions to remove French "encroachments" from British-claimed territory. What was to have been a series of attacks by a single army became, because of enthusiastic New England preparations, four simultaneous British and colonial expeditions against Forts Duquesne, Niagara, Ste. Frédéric, and Beauséjour in 1755. The British attack on Fort Duquesne ended in "Braddock's defeat at the Monongahela River, nine miles from his destination, when Indians and Canadian irregulars exploited flanking woods and poor British scouting to surprise and slaughter much of his column. Another army under Governor William Shirley of Massachusetts failed to reach Fort Niagara. William Johnson led the British colonial army that failed to reach Fort Ste. Frédéric, but won a defensive victory at the Battle of Lake George. The only clear British success was by New Englanders, led by British colonel Robert Monckton, who easily took Forts Beauséjour and Gaspereau in Canada, and then expelled 6,000 French Acadian neutrals. The British sent more regulars to avenge Braddock and gave Commanders in Chief Shirley (1756) and John Campbell, earl of Loudoun (1756-58), powers that centralized the war effort and antagonized the colonies.

New France, United under Governor Pierre-François de Rigaud, marquis de Vaudreuil (1755-60), seized the military initiative. Indian raids launched from Fort Duquesne terrorized the Pennsylvania and Virginia frontiers, while other raiders destroyed New York outposts. General Louis-Joseph, marquis de Montcalm, led well-coordinated forces of French regulars, Canadians, and Indians to conquer Fort Oswego in August 1756 and Fort William Henry a year later.

The British recovered the offensive in 1758, as the eloquent and efficient secretary of state, William Pitt, took control of the war effort. Pitt reassured British voters and creditors while spending massively on war in both Europe

and America. He cut the power of his new commander in chief and negotiated a "subsidy plan" with colonial governments that was generous enough to promote unprecedented levels of imperial cooperation in supply, transport, and recruitment. British regulars, recruited in Europe and America, now constituted a majority of the much larger forces available. Britain's North American initiatives for 1758, against fortress Louisbourg and Forts Carillon, Frontenac, and Duquesne, paralleled the strategy of 1755, but met with more success. In July, 13,000 British regulars under Maj. Gen. Jeffrey "Amherst besieged and captured Louisbourg. Gen. James Abercromby's hurried assault against Montcalm's entrenched defenders at Ticonderoga (Carillon) failed disastrously, increasing Montcalm's influence over military strategy for New France. Abercromby then authorized an expedition by 3,600 colonial volunteers that took Fort Frontenac. Seven thousand men under Brig. Gen. John Forbes constructed a military road across Pennsylvania to Fort Duquesne, which the French destroyed and evacuated on 25 November 1758.

British intent to capture the core of New France in 1759 met such determined French and Canadian resistance that Amherst countered cautiously, and met shifts in Indian diplomacy that proved diversionary. By early 1759, the Delaware and Shawnee had made peace overtures, and the Six Nations of the Iroquois Confederation were reconsidering their uneasy neutrality. The siege of increasingly isolated Fort Niagara in July 1759 reflected Amherst's caution, impressed the Six Nations by clearing the French from their territory, and afforded some Ohio Indians an opportunity to change sides decisively. While these Indians strengthened the British side, the Cherokee in the South moved from their traditional alliance to open war with the British colonies between 1759 and 1761. Annual punitive expeditions, the first by South Carolina volunteers and the other two by British regulars, burned abandoned Cherokee towns, provoked retaliation, and may have helped bring a negotiated peace by the end of 1761.

Conquest of New France was not completed in 1759, but the capture of Fort Niagara and the French evacuation of Fort Ste. Frédéric and reoccupied Fort Frontenac represented British success on two of the three prongs of that attack. The third prong, a nearly three-month amphibious campaign led by Brig. Gen. James Wolfe against the walled city of Québec, stalled until a well-exploited gamble in the Battle of "Québec gave the British victory on 13 September 1759, and control of the city four days later. Control of these areas remained precarious during a successful French counteroffensive that ended only with the arrival of British warships in May 1760. On 8 September, with 17,000 British and American soldiers surrounding Montréal, which was defended by some 3,000 French, Governor Vaudreuil surrendered New France. British and American colonial troops reported the conquest to the interior posts without meeting resistance and mounted major campaigns in the French West Indies that captured Guadeloupe (1759) and Martinique (1762). The Peace of Paris ended the war 10 February 1763, confirmed the conquest of New France, and ceded to the British all lands east of the Mississippi.

The war decided only one of the three long-standing contests. The Anglo-French duel would resume regularly for another half century, and the equally long-lived military struggle between Indians and Europeans reopened

immediately with *Pontiac's Rebellion. However, the struggle between the British and French North American colonies had been decided. Some Americans opposed the way Britain integrated both New France and "Indian country" into its empire; many more resisted imperial taxation imposed to help pay for the war and for the regular army garrisons of the peace. The war that had unified the British Atlantic empire to an unprecedented degree thus, not surprisingly, helped produce the American *Revolutionary War for Independence a decade later.

FRIENDLY FIRE. So-called friendly fire, sometimes termed *fratricide* or *amicicide*, is officially defined by the U.S. Army as "the employment of friendly weapons ... which results in unforeseen and unintentional death or injury to friendly personnel." Intentional firing on friendly troops and true accidents are properly excluded from the definition.

The difficulties posed by terrain, poor visibility, and the type and size of operations all contribute to friendly fire. The immediate causes include mechanical defects, simple carelessness, poor spatial orientation, misidentification of the target, and miscalculation of firing data. Poor coordination of the movement of forces on the battlefield, lack of training, and poor discipline also play a role; but the fear, uncertainty, and excitement of the combat environment are perhaps the most important factors.

The statistical dimensions of the friendly fire problem have yet to be defined; reliable data are simply not available in most cases. Operational and medical reports suggest, however, that the relationship of friendly fire casualties to overall friendly casualties is between 2 percent and 25 percent. In the *Persian Gulf War of 1991, there were 615 American casualties; 23 percent of the personnel (35 killed and 72 wounded) and 77 percent of the combat vehicle losses were attributable to friendly fire.

Whatever the statistical reality, friendly fire is known to have occurred in all of America's wars, and the victims have ranged from the rawest recruits to very senior officers. The Confederate general "Stonewall" *Jackson died after being mistakenly shot by one of his own soldiers at Chancellorsville in 1863. In World War II, Lieut. Gen. Lesley J. McNair and 813 other Americans were killed or wounded near St. Lô in Normandy in one of the most costly incidents of friendly fire ever to occur. The use of American medium and heavy bombers to provide close support for ground troops in Operation Cobra, the breakout of Allied forces from Normandy, resulted in mistaken

bombing of American positions on two successive days, 24-25 July 1944. The planned ground attack was delayed but ultimately succeeded despite the frightful toll.

Earlier, in July 1943, nervous American naval and ground troops Gela, Sicily, fired on aircraft carrying paratroopers of the 82nd Airborne Division and caused 319 casualties (88 dead, 162 wounded, and 69 missing) plus 80 aircraft destroyed or badly damaged. In the Pacific, a month later, 15-16 August, 28 Americans and Canadians were killed and 55 wounded during the invasion of Kiska in the Aleutian Islands. There were no enemy troops on the island; all of the casualties were from friendly fire.

As weapons have become more complicated and more deadly, the ability of human beings to control them has been stretched to its limits, and both the number and the severity of friendly fire incidents have increased. Modern armies search earnestly for ways to reduce or eliminate friendly fire. Improved training and sophisticated electronic devices are sure to have a positive effect, yet it is equally certain that the problem cannot be eradicated altogether. As long as men make war, friendly fire will continue to occur.

FULTON, ROBERT (1765-1815), inventor. Best known for his development of the first commercially successful steamboat in 1807, Fulton also made important contributions in portrait painting, canal engineering, and naval warfare. Born in Pennsylvania, he lived most of his adult life in Europe. His first naval project was the *submarine *Nautilus*, manually driven underwater and tested successfully in French waters in 1800. Shifting to mine warfare, Fulton successfully blew up two brigs with floating mines in tests off Dover, England, in 1805 and New York in 1807. His grand vision was to promote freedom of the seas and free trade, using naval weapons to prevent war. He offered these weapons alternately to Napoleon and the British with little success. Returning to America, Fulton continued developing steamboats and naval weapons until his death. His American-developed weapons concepts stressed harbor defense, and included the moored mine, the submarine gun, use of the steamboat for troop transport in the *War of 1812, and the construction of the first steam warship in history, USS *Fulton* the *First*. His *Nautilus* was the first cigar-shaped submarine, and he was the first to conceive of the moored mine. Fulton's emphasis on the submarine, on mines, and on the deterrent effect have particular relevance for the modern era.

GAGE, THOMAS (1721-1787), British general and royal governor of Massachusetts. In the * French and Indian War, Gage demonstrated personal courage on the battlefield, but little talent for command. His real skill was as an administrator, and he fully proved it as the military governor of Montréal from 1761 to 1763. For more than a decade after succeeding Jeffrey * Amherst as commander in chief of British North America in 1763, Gage confronted the legacies of the French and Indian War. After suppressing * Pontiac's Rebellion, he struggled to keep land-hungry colonists from new conflicts with the Indians. Following the Stamp Act upheavals, he tried to keep smugglers and other scofflaws from flouting Parliament's authority. Gage's mission soon shifted from protecting American colonists to controlling them. In 1774, Gage, newly appointed governor in chief of Massachusetts, enforced the Coercive Acts by closing the port of Boston and suspending representative government in the colony. In the ensuing crisis, he sent British troops to seize patriot supplies in the battles of Lexington and Concord (19 April 1775), triggering the *Revolutionary War. Following the Battle of *Bunker Hill (17 June 1775), he was recalled to England and blamed for allowing the American colonies to rebel.

GAME THEORY. Within national security analysis, *Game theory* deals with parties making choices that influence each other's interests, where they all know that they are making such choices. Using mathematics, it analyzes the think/doublethink logic of how each adversary sees the other, sees the other's view of it, and so on. Unlike *war gaming*, where real players assume roles, it involves only mathematical calculations.

John von *Neumann and Oskar Morgenstern laid the foundation of game theory in the 1940s. Its application to military problems has been limited but interesting. One World War II example involved *submarine warfare. A submarine is passing through a corridor patrolled by submarine-hunting planes. The submarine must spend some time traveling on the surface to recharge its batteries. The corridor widens and narrows, and the submarine is easier to detect in the narrower parts, with less sea for the hunters to scan. Where should the submarine surface? Where should the hunters focus their effort? The premise that the wide part is the one logical place is self-refuting. If it were true, the hunters would deduce that, would head there and leave the narrower part alone, making the narrower part better. Choosing the narrow part likewise leads to a contra-

diction. Game theory advises a "mixed" strategy—do one or the other unpredictably, using exact probabilities calculated from the ease of detection in each section.

Other applications have addressed the problems of when an interceptor aircraft closing on a bomber should open fire, how to allocate antimissile defenses to targets of varying value, and when to fire intercontinental *missiles to avoid Soviet nuclear explosions in the stratosphere.

These problems involved specific wartime encounters. Another area is broad strategy. A prevalent misconception is that game theory set the principles of nuclear strategy. In the 1940s, planners hoped that the new mathematics would do this, but strategic problems proved too complex. It was hard even to specify each side's goals. Game theory has not given exact strategic advice, but it has clarified general principles. In a model of crisis confrontation, for example, one side wants to show the adversary that it values winning very highly, to induce the other side to back down. It uses the tactic of sacrifice-to-show-resolve—make some costly military deployment so the adversary will conclude that only a determined government would pay such a cost to prove its determination. The model precisely illustrates the skeletal structure of strategic concepts such as showing resolve or enhancing credibility. By the 1990s, a sophisticated body of academic work had addressed *deterrence, escalation, war alliances, and the verification of arms treaties.

GARRISON, WILLIAM LLOYD (1805-1879), abolitionist, nonresistant, and feminist. With the publication of the first issue of the *Liberator* on 1 January 1831, William Lloyd Garrison became the undisputed leader of the U.S. abolitionist movement. Garrison called for the "immediate" and "complete" emancipation of slaves. Yet he was also a confirmed advocate of nonviolence. In 1838, he and other abolitionists formed the New England Non-Resistance Society. In its "Declaration of Sentiments," Garrison pledged its members to oppose all preparation and exercise of war and all cooperation with institutions of war.

Although nonviolence was his key stance, Garrison and his abolitionist wife, Helen Eliza Benson, openly supported the *Civil War once it had begun since it brought about the end of slavery. Their eldest son, George Thompson, fought

with the 55th Massachusetts (Colored) Regiment. Their other sons (William Lloyd Junior, Wendell Phillips, and teenager Francis Jackson) took philosophically "conscientious objection stances, as did their daughter, Helen Frances (Fanny). Garrison's legacy is most visible in the pacifist-feminist-antiracist lives of succeeding generations of the family who participated in post-Civil War freedmen's associations, the 1898 anti-imperialist impetus, the "peace and antiwar movements from 1915 to today, the founding of the National Association for the Advancement of Colored People, and the antinuclear and environmental movements.

GATES, HORATIO (1727/8-1806), Revolutionary War general. Born in Old Malden, Surrey, to an unlettered English customs official and the housekeeper of the duke of Bolton's mistress, Gates was commissioned a British army lieutenant in 1745, through Bolton's influence. In the "French and Indian War, after being wounded at Monongahela in 1755, he rose to the rank of major, but eventually barred from further advancement, he retired in 1769. Living in Virginia at the outbreak of the "Revolutionary War, Gates was appointed adjutant general by the Continental Congress, and he helped George "Washington organize the Continental army. Popular with New Englanders, he replaced Philip Schuyler as commander of the northern army after the loss of Fort Ticonderoga. At the two battles of "Saratoga, he employed his numerical superiority to force the surrender of British Gen. John "Burgoyne's entire army on 17 October 1777.

Gates planned to follow up by invading Canada, but Washington blocked the expedition. A hero after Saratoga, Gates became Washington's rival, but in 1778 was discredited on the spurious charge that he had plotted with the "Conway cabal" to elevate himself over Washington. Assigned to command the Continentals in South Carolina in 1780, he undertook a rash offensive with ill-prepared troops and was disastrously defeated at the Battle of Camden by Gen. Charles "Cornwallis. In 1783, he was associated with, but took no active part in, the officers' aborted "Newburgh "conspiracy" to coerce Congress into giving them backpay. A novel combination of professional and populist, Gates managed short-term militia unusually well, and was a generally competent, if ultimately flawed, commander.

—Max M. Mintz

GATES, THOMAS (1906-1983), secretary of defense (1959-61). Gates was born in Philadelphia and became an investment banker, serving in the navy in World War II. In the Eisenhower administration, he was successively undersecretary (1953-57) and secretary of the navy (1957-59) and deputy secretary of defense before succeeding Neil "McElroy as secretary on 2 December 1959.

Gates moved quickly to establish close relations with the "Joint Chiefs of Staff, meeting with them regularly to force decisions on disputed issues. Gates's principal contribution to defense planning was his institution of the Single Integrated Operating Plan (SIOP), which unified the targeting of all strategic "nuclear weapons in general war. In doing so, he overrode strong opposition from the navy, with its traditional hostility to centralized defense organization.

While supporting President Dwight D. "Eisenhower's effort to hold down defense spending, Gates recognized the need for a modest increase to meet growing Soviet power. He firmly and accurately denied the existence of a "missile gap"—an advantage in "missiles favoring the Soviet Union. In 1969, President Richard M. "Nixon appointed Gates to head a commission that successfully recommended replacing the "conscription with an "All-Volunteer Force.

GATLING GUN. The precursor of the modern machine gun was invented in 1862 by Richard J. Gatling. Born in North Carolina, Gatling had moved to St. Louis, Missouri, where he invented and manufactured agricultural machines. Previous attempts at designing an automatically reloading multishot gun were stymied by the loading and ignition techniques of the mid-nineteenth century: bullet and gunpowder had to be loaded separately, and the powder ignited via an external percussion cap. The introduction of metal-jacketed cartridges containing a percussive, explosive charge and a bullet in a single unit enabled Gatling to invent a self-loading primitive machine gun.

The Gatling gun featured a circle of ten barrels attached to a rotating shaft turned by a hand-operated crank, which drove the entire device. As the barrels revolved, they passed by a firing hammer that discharged the cartridge, which was automatically ejected and replaced by a new breech-loaded cartridge from a gravity-fed hopper. The gun could be fired continuously as long as the crank was turned; externally powered Gatling guns could fire up to 3,000 rounds a minute.

Despite their obvious potential against infantry attacks, Gatling guns were infrequently used during the "Civil War. Gen. James W. Ripley, the "Union army's chief of ordnance, opposed their development, due to suspicion of Gatling's Southern birth and concern about the weapon's reliability and the enormous supply of munitions such guns would require. The U.S. Army eventually adopted the Gatling gun, assigning the large wheeled, horse-drawn weapons and their munitions limbers, to artillery units that used them in the "Plains Indians Wars and in the "Spanish-American War. The U.S. Army replaced these with smaller, lighter, and recoil-powered modern "machine guns in the twentieth century.

GAY MEN AND LESBIANS IN THE MILITARY. Homosexuality is one of many categories that people use to think

about, define, and organize their sexual identities and behaviors. Although the term *homosexuality* refers to loving or desiring or having sex with someone of the same sex, there is no straightforward, agreed-upon definition of homosexuality, and no clear relationship between the types of sexual acts that people perform and whether they define themselves as gay or lesbian. Eve Sedgwick, a prominent cultural theorist, refers to homosexuality as a space of overlapping, contradictory, and conflictual meanings. In addition, Sedgwick argues that notwithstanding evidence of same-sex love and desire throughout history, modern understandings of homosexuality may be different from previous arrangements of same-sex relations.

The history of same-sex desire in the military dates back to the earliest days of the military. In the United States, Gen. Friedrich Wilhelm von "Steuben, who trained the "Continental army at Valley Forge, is believed by some to have had male lovers, and Lt. Gotthold Frederick Enslin became the first soldier drummed out of the Continental army for sodomy on 11 March 1778. The military's first known lesbian soldiers apparently disguised themselves as men and fought in the 15th Missouri Regiment during the "Civil War. Indeed, gay men and lesbians have served in every sector of the military, including the Navy SEALs, Green Berets, and the cockpit of Air Force One. According to the journalist Randy Shilts, they have included army and marine four-star generals, a lesbian admiral, and a member of the "Joint Chiefs of Staff.

Military understandings of homosexuality have reflected larger societal understandings even as actions taken by the military have in turn influenced society. As the United States mobilized for World War II, military officials who believed that homosexuals were not fit for combat used new screening procedures to attempt to identify homosexual men. For the first time, regulations focused on whether recruits and soldiers had gay identities, not just whether they committed sodomy. Of 18 million men examined during the war, the military rejected 4,000-5,000 for homosexuality. After the war, 9,000 gays and lesbians who did serve were disqualified from obtaining G.I. benefits when they received section eight or "blue" discharges for undesirable habits or character traits. Many returned to port cities where they formed the nuclei of emerging gay communities. Historian Alan Bérubé argues that by identifying and managing people as homosexual persons rather than focusing narrowly on the act of sodomy, the military encouraged gays and lesbians to assume a stronger identity.

In 1950, Congress enacted the Uniform Code of Military Justice, which subjected any persons who engaged in oral or anal sex to court-martial and five years' incarceration. To enforce regulations, military investigators sought to identify gays and lesbians by detaining suspects and forcing them to specify their peers' sexual orientation. During witch-hunts, it was not uncommon for investigators to extract confessions by threatening incarceration. Between 1941 and 1996, the military discharged about 100,000 gays and lesbians, an average of roughly 2,000 per year; the 1996 discharge figure was 850. The navy tends to account for the highest percentage of discharges and women are discharged at a proportionally higher rate than men.

Discharges tend to decrease during wartime when the need for personnel increases. The navy discharged only 483 gays and lesbians (about half its annual average) in 1950 during the "Korean War and 461 in 1970 during the

"Vietnam War. In 1942, during World War II, the commander at Moffett Field, California, canceled the dishonorable discharges of seven gay men so they could be reassigned after their prison sentences. Many gay men and lesbians have been separated under less than honorable conditions. Of 1,648 enlisted personnel ousted in 1985 for homosexuality, for example, over 600 were denied honorable discharges. In addition, prison sentences for same-sex sodomy were common until the late 1980s. Although prohibited by military law, sodomy between men and women rarely has invited court-martial or incarceration.

Despite the threat of punishment, enforcement of antigay regulations has varied considerably among units and service branches and has depended on the discretion of individual commanders. As a result, while some gay and lesbian service members do not reveal their sexual orientation, others have served openly. Gay military networks that emerged in World War II developed into vast subcultures by the 1970s, and by the late 1980s, much of the military's gay subculture was barely hidden.

In 1973, gays and lesbians began to use courts to challenge the substantive constitutionality of antigay regulations and to question the rationale for retaining some soldiers while discharging others. The Department of "Defense responded in 1981 by promulgating Directive 1332.14, which made the discharge of gay and lesbian soldiers more clearly mandatory. President Bill "Clinton attempted to overturn this policy in 1993 by proposing to allow gay and lesbian soldiers to serve openly. In response, advocates of antigay regulations who invoked mental illness, unfitness for duty, and vulnerability to blackmail to justify discriminations during the "Cold War contended that unit cohesion would suffer if the military allowed gays and lesbians to be open about their sexuality.

Some scholars responded that gays and lesbians do serve openly in the United States and foreign militaries and in American police and fire departments without jeopardizing cohesion. In addition, they noted that racial integration did not undermine cohesion, although 1948 polls indicated that 63 percent of the public favored segregation in the military. Finally, they pointed to organizational theory that indicates that performance depends on task cohesion (shared commitment to group objectives) but not social cohesion (emotional bonds).

The subsequent compromise between pro- and antigay advocates is known as "Don't Ask, Don't Tell, Don't Pursue." The policy prohibits asking recruits about their sexual orientation, although the military has breached regulations 1,632 times since 1994 according to the Servicemembers Legal Defense Network. Under this new policy, homosexual but not heterosexual status passes as evidence that a service member has violated antisodomy laws. Federal courts ruled both ways on the "Don't Ask, Don't Tell" policy, but the Supreme Court has declined to rule on the policy's constitutionality.

Antigay regulations have important negative consequences. Regulations can compromise unit cohesion when soldiers are encouraged to turn against each other. They can lead to suicides and also deter rape victims from reporting assaults when rapists threaten to accuse victims of homosexuality. Regulations enable commanders to question the sexual orientation of service members who report antigay death threats. Because investigators require only rumors to discharge service members for homosexuality,

threatening to label a woman as a lesbian probably is the most prevalent form of *sexual harassment in the military. Antigay regulations also have economic consequences. According to the Servicemembers Legal Defense Network, between 1980 and 1995 the government spent more than \$600 million on training those subsequently discharged as homosexuals. In January 1999, the Pentagon reported that the four services had discharged 1,145 gay men and lesbians in fiscal year 1998, a 13 percent increase from 1997 and nearly double the number in 1993, the year before the "Don't Ask, Don't Tell" policy went into effect.

GENDER. *This entry consists of two articles, each of which deals with the issue of gender and the military from a different perspective. The first, Male Identity and the Military, examines the concept of men as warriors and protectors. The second, Female Identity and the Military, emphasizes the relationship that women have had to war and the military. For more detailed related discussions, see Combat Effectiveness, Gays and Lesbians in the Military, Gender and War, Military Ideals, Sex and the Military, Sexual Harassment, Women in the Military.*

Male Identity and the Military

Female Identity and the Military

GENDER: MALE IDENTITY AND THE MILITARY

Male identity in the United States, except in certain pacifist groups, has generally been closely tied to the socially defined role of warrior and protector. Throughout American military history, the manipulation and exploitation of this gender identity has been among the most important means of persuading men to join the service or informally coercing them to participate. This process has served three major purposes: first, it draws huge numbers of men into uniform without having to resort to widespread physical coercion by the state; second, it serves a military useful role by defining behavioral standards that make for effective combatants and contribute to post-service reintegration; and third, the gender roles fostered by the military bolster and legitimize gender roles in society as a whole. The agents of this manipulation have been as diverse and pervasive as their message, including politicians, military leaders, commercial interests, and religious and educational institutions.

The creation of male gender identity has been tied explicitly to a warrior role and military service for the local

community and the *state. That this was a product of the natural order went virtually unchallenged throughout the colonial and early national periods, and military service for men was explicitly tied to rights and obligations of citizenship. By the end of the nineteenth century, however, with the rise of industrialization and urbanization, the closing of the frontier, slowly expanding roles for women, and the influence of social Darwinism, this assumption came into question. To reaffirm it, some Americans like Theodore *Roosevelt openly embraced war with Spain in 1898 in part to restore the individual and collective masculine virtues apparently eroded by modern, materialistic, urban society.

The twentieth century has witnessed a dynamic of ever stronger attacks on traditional, polarized gender identities, and increasingly extreme retrenchments of the male warrior identity. As women's roles in the workplace and the military expanded with national "mobilization in two world wars, they directly challenged the underlying assumptions of male-warrior exclusivity. If women were allowed to step into uniform, as temporary auxiliaries in 1917, in segregated branches of the armed forces in 1943, and integrated into the force beginning in 1978, their specialties and geographic assignments were still carefully circumscribed away from combat in efforts to protect the male-warrior status.

As the reserved male domains shrank, definitions and defense of those domains became more polarized. When the military as a whole was an exclusively male sphere, there was no need to draw gendered distinctions within it, but as women entered the military, gendered distinctions sharpened between the warriors and supporting personnel. This also marked the rise of concern over sexual orientation, which threatened further to subvert the traditional male identity. In "training and indoctrination of male recruits, gendered behavior emphasized boundaries and fostered extreme behavioral standards. The hypermasculine ideals espoused and often embodied by drill instructors and unit leaders fostered effective battlefield performance, especially among various airborne, amphibious, and aviation elite forces. But while such indoctrination served short-term institutional needs and provided individual affirmation of male gender values, it also promoted behavior increasingly incompatible with gender relations in society as a whole. This has been seen in dramatic fashion in the last twenty years with the integration of the services and the incremental lifting of many restrictions on women serving in combat.

The integration of women in the military has exposed the false premise of the traditional male gender identity, which insists that the role of warrior and protector must be an exclusive province of men. The myths that have long underpinned this identity are deeply interwoven into the fabric of American society, and efforts to redefine gender roles have encountered widespread resistance from many sources. If men are no longer to hold exclusive control of sanctioned organized "aggression and violence, then the basis for individual and collective roles and behavioral standards will require fundamental change, such change is unlikely to come about without intense and protracted conflict.

GENDER: FEMALE IDENTITY AND THE MILITARY

Gender—male and female identity—has both “always” and “never” been relevant to the American military. All societies make distinctions between women and men. Across societies, though, there is enormous variation between what men do and what women do except with regard to two activities. Everywhere, weapons belong mainly to men and care of the very young mainly to women. Warfare and child care have traditionally been reserved roles. However, there is an asymmetry in this specialization. Women’s special role has a biological underpinning. Men cannot give birth to or physically nurse children. Women therefore do not have to defend or protect their special reserved activity. In contrast, women can fight, can wage war, and in fact their help in doing this is periodically sought. They then do have the capacity to do men’s special work. This has meant that in this area men have a continuing need to defend, to separate, or to distinguish what they do from what women do. They have to prohibit—to bar—women, since “nature” does not.

The special task of the military is to fight. Fighters require a lot of support, which in the early years of the American military was provided by civilians, civilians who often included women who did laundry, sewing, cooking, and other tasks for the soldiers. Thus, some women have always been involved with the military. Some have unofficially fought in the military (in the early years disguised as men), others have officially helped support the military. Indeed, when the military did not have enough men to perform the required support tasks, it either employed civilians or recruited women who accepted these tasks, such as the temporary auxiliaries who served in uniform as military telephone operators or clerks in World War I.

Even before World War I, nurses were the military women’s vanguard, the first group to crack the military’s gender barrier. At the same time, they unequivocally maintained their female identity. It was only in the Civil War, in the North, that women began to work as nurses regularly in military hospitals. First brought into the military because of need, they served as auxiliaries with different rules, benefits, and compensation from men. For their performance, they were later rewarded with more “regular” status. But they were also kept in sex-segregated units until long after World War II. This was a pattern replicated for other women as they entered the U.S. military.

In the second half of the twentieth century, “guerrilla warfare and the threat of nuclear war made it clear that women could not be protected simply by keeping them out of uniform. Furthermore, once the draft ended in 1972, the military again needed women to help fill its ranks. This need coincided with a push by feminists for an end to all discrimination, all prohibitions, based on sex. Although men’s reserved role shrank and its boundaries became somewhat ambiguous, in principle, the warrior role remained men’s.

Equity arguments against exclusion continued in court and in public, but although many continued to argue against allowing women in combat roles, their argument

was diminished by the fact that modern war claims as many or more civilian casualties as military “casualties. Women could not be kept safe. The physical strength argument was diminished by the achievements of women athletes and by the reduced role of physical strength in technological combat such as is common in the air force and the navy. Indeed, the combat restriction was removed under President Bill “Clinton for aviation and naval ships, a result in part of the navy’s embarrassment over the “sexual harassment of women at its aviators’ Tailhook Convention. The change was also supported by the public acclaim for the professional behavior of Maj. Rhonda Cornum as a prisoner of war during the “Persian Gulf War, and the public’s acceptance of American women casualties in that war.

Still, women at the end of the twentieth century remained excluded from ground combat. Much of the argument for maintaining this area of combat exclusion ultimately focused on “combat effectiveness arguments related to group cohesion and individual performance—contentions that emphasized the need for male bonding and men’s alleged inability to perform professionally in women’s presence (arguments that were once applied to African Americans and that continue to be applied to homosexuals).

Some have argued that citizenship is linked to military service, and for men this has been true. But the United States was also founded in part on the argument that citizenship is linked to paying taxes (that taxation requires representation). Thus, it could be argued that women’s early limited citizenship was associated not with their failure to perform military service but with their sparse property rights and consequent lack of status as taxpayers. Since the U.S. military is so clearly accountable to elected civilians, the resistance to women’s full participation in the military probably lies not with the desire to restrict women’s citizenship, but with the desire to maintain the role of the warrior as one still reserved for men.

GENDER AND WAR. War is a gendered phenomenon, one with meaning for the relative status of men and women within American society. Times of national emergency create enormous possibilities for change, and often threaten foundational social hierarchies, such as gender, race, and class relations. Yet many of the new opportunities for traditionally marginalized groups have historically been circumscribed by powerful ideological constructions of the meanings of “war. These social myths define war itself as a masculine undertaking and delineate the differential duties prescribed for men and women during wartime. White men (and by the late twentieth century, all men) were expected to *protect* “their” figurative women, homes, and families, especially through military service. Women’s ostensibly passive role as *protectees* during war highlights

their efforts to maintain these same homes and families, thereby supporting their men, and waiting for them to return. The actual experience of men and women during American wars belies this easy dichotomy; many men did not serve in the military and many military men never saw combat. Similarly, many women, particularly when wars were fought on American soil, achieved wartime access to political, economic, and social means of power to which they were barred in peacetime. Yet such activities were contained, often through deliberate propaganda, within a cultural framework that allowed for elasticity in gender behavior during wartime, but did not sanction such activities as appropriate in 'peace.

One of the most frequently employed models for analyzing the topic of gender and war has been the "watershed" approach. This assesses whether the impact of war on gender relations proves a "watershed" that results in long-term change, or whether traditional gender systems were successfully reinstituted after the war to minimize wartime gains by marginalized groups. The Revolutionary War, for instance, provided a vehicle through which some women challenged their exclusion from the definitions of republican citizenship as the province of free, white, propertied men. During the Revolutionary era, free white women were central to the success of boycotts of imported products, and subsequently to the production of household manufactures, that were so critical to the Revolution's success. Their activities politicized the domestic sphere itself: the daily female tasks of shopping and home production. However, these activities were consistent with white propertied women's prescribed identification with home and family. Caricatured as domineering and masculine by the British in an attempt to shame patriot men, many American white women nevertheless continued their increasingly public political actions. In the same period, moreover, some northern enslaved African women employed the rhetoric of the Revolution in successful attempts to free themselves and their families via the colonial and early state court systems.

The resulting gender system, a product of contestation and negotiation during the Revolution, provided a limited space within which some women might assert themselves as political actors. In particular, the question of how female citizenship would be defined in the new nation was answered by extending the politicization of domestic duties during the Revolution into the postwar republic—in other words, endowing domesticity itself with political meaning. Embodied in the role of the "Republican mother," such politicization included the presumption that white, propertied women would educate their children at home to be good republican citizens. The increased ideological importance assigned to women as educators—especially of male children—linked white, educated, propertied women to the newly created nation, and gave them some degree of power over its future. Since their duty to the state was to reproduce a virtuous citizenry, elite and educated women had to be able to write as well as to read. They had to be schooled in matters of government in order to develop in themselves the political virtue necessary to reproduce these values in their children. In the years following the Revolution, white, propertied northern women would expand upon this strategy as a means of enlarging their roles as political actors outside the domestic realm.

Like the Revolutionary War, the 'Civil War is distin-

guished by the fact that the entire conflict was a domestic one. The Civil War was further marked by the direct impact of military action on civilian populations as targets of military violence. Most of the campaigns that led to violence against civilian populations and their property took place within the American South. As distinctions between "home front" and "battle front" blurred, so too did the asymmetrical relationship between men as "protectors" and women as "protected" that undergirded the southern gender system. The 'Union army's wartime occupation of many southern towns and cities, for instance, undercut the ability of white southern men to come to the aid of their families, and forced elite and educated white southern women to devise strategies in their own defense. Moreover, Union Gen. William Tecumseh 'Sherman's March to the Sea through Georgia and the Carolinas late in the war not only demonstrated the vulnerability of "unprotected" southern women but attacked the manhood of southern men who failed as "protectors." In response, southern elite and middle-class white women directed their anger not just at Yankee soldiers and officers but also at Confederate men and the Confederate government. As many noted in their diaries, their encounter with the enemy ruined forever their trust in men as protectors. Thus, the southern framework of protection was undercut by a more powerful axiom of warfare illustrating the white southerners' defeat by demonstrating their inability to protect "their" women.

The two world wars of the twentieth century were distinguished from past conflicts by the massive mobilization of all parts of the civilian population to support war efforts, the 'conscription of huge armies to wage the war, and especially during World War II, the 'bombing of civilians. U.S. 'mobilization for both world wars catalyzed popular concerns that mobilizing large portions of the populace might undermine the established gender and sexual order. To offset this potential threat, during World War II federal government and media propaganda created the image of "Rosie the Riveter." This image depicted a first-time female worker who enters the labor force, not for the extra income such employment might bring into her home, but rather for solely patriotic reasons to "support the war effort." Rosie the Riveter was also characterized by wartime propaganda as a temporary worker, completely "feminine," and perfectly willing to "give up" her job and return to her role as wife and mother as soon as the war concluded. On the one hand, Rosie the Riveter was used by federal and private agencies as a recruiting device to encourage women to enter the paid labor force. On the other hand, by portraying Rosie's service as "for the duration only," the propaganda highlighted female workforce participation as motivated by wartime necessity, and made invisible the thousands of women who had worked outside their homes prior to the war. Thus, the symbol of Rosie the Riveter contained within it the ideological means to push women out of the labor force, or out of higher-paying jobs, once the war concluded.

During both world wars, moreover, the fact that the vast majority of the conflict was not fought on American soil maintained the distinctions between home front and battle front and thus between male "protectors" fighting and the women they "protected." The lack of tangible evidence of the need for immediate protection, however, necessitated propagandistic representations of the potential dangers an enemy victory would pose to American women

and the potential rewards protectors might expect to reap for their role as guardians of the American home front. Scholars have argued, for instance, that during World War II, "pinups" visible in soldiers/officers' footlockers, bunks, and barracks, as well as bombers and "tanks named after female movie stars, models, and sweethearts, functioned as symbols of the private obligations for which men were fighting and as surrogate objects of sexual desire—the potential "bounty" servicemen and officers might claim if they successfully defended the home front. A counterpoint to the "good woman as spoils" image was the threat throughout the war of American women being raped. During World War II, for instance, the U.S. government *Who Is the Enemy?* series of films presented the "enemy" as a soldier (Japanese or German) or male leader (often Hitler), who would rape and murder "our" women if the enemy were not defeated. Both "pinups" and representations of posited dangers for American women maintained and reinforced the gender system and the unequal distribution of power contained within it.

What these propagandistic attempts to contain any threats to the gender order concealed, however, were the many ways in which women's activities in support of both wars *did* represent new possibilities and roles for women and result in challenges to prevailing notions of the proper identities of women and men. While American women's participation in the World War I war effort was far less than that of their European counterparts, for instance, American feminists and suffrage leaders nonetheless argued that women's war work demanded that they be accepted fully as citizens. In fact, the Nineteenth Amendment, giving American women the right to vote, was finally supported by President Woodrow Wilson in 1918, before the end of the war, and was adopted as law in 1920. Moreover, the escalation of women's participation in the paid labor force during World War II resulted in what some historians have termed a "change in consciousness" that set the stage for the modern women's movement twenty years later. Although World War II was followed by the reinstitution of fairly rigid gender norms and a reemphasis on conformity, some scholars have contended that the abrupt withdrawal of wartime options for some women was one of the major catalysts to the feminist movement of the 1960s.

Another prominent gender legacy of World War II was what some scholars have characterized as a new politicization of nuclear families. As in the Revolution, women were deemed during the "Cold War to be essential to the "family's" and the nation's survival and stability. The significance of the nuclear family was particularly emphasized in the 1950s as women's prescriptive roles as wives and mothers were ideologically joined to the stability of the nation, national defense, and the superiority of the American over the Soviet model of government and society. Epitomized in the "kitchen debates" between Vice President Richard M. Nixon and Soviet premier Nikita Khrushchev in 1959 in Moscow, the American system was symbolized by the contrast between the U.S. housewife who was allegedly "free" not to work (at least outside her home) and the Soviet woman who was "forced" to work outside her home. Thus, Soviet women were depicted as unprotected within a coercive system that provided endless drudgery, while the protected American housewife was a consumer, with both "choices" and access to "labor-saving" household devices.

In the 1960s and 1970s, the civil rights, antiwar, student,

and feminist movements coinciding with U.S. involvement in the "Vietnam War made the period paradoxically one of the most violent and hopeful in American history. Questions of racial justice, class disparities, gender equity, and the meanings of "manhood" and "womanhood" were actively debated amid the backdrop of nightly news coverage of American military involvement in Vietnam. As for women during World War I, the franchise as a right of citizens was again raised—this time by young men, drafted or volunteering for military service in Vietnam, whose age (below twenty-one) made them eligible to fight and die for their country but not to vote. The voting age was reduced to 18. Many young men during the 1960s engaged in serious debate about definitions of "manhood" and constructions of the duties and rights of male citizens. Those involved in the "Vietnam antiwar movement protested what they believed was an illegitimate war, and in so doing disrupted the historic link between male citizenship, American manhood, and military service.

"Conscientious objection to "conscription, draft card burnings, draft evasion, and participation in massive antiwar demonstrations, which marked a new definition of "manhood" for some American men, were met by accusations of cowardice, characterized as Communist sympathy, and decried by many in both Congress and the broader civilian population. This contestation over the meaning of American "manhood" and the obligations of male citizens was heightened by male veterans' creation of Vietnam Veterans Against the War. Some veterans decorated for valor literally threw away their medals to symbolize their rejection of those symbols conflating courage, manhood, and obligatory military service. A popular antiwar slogan, "Women say Yes to Men who say No," however, reinforced the conventional system of gender relations by placing women once again in the position of "bounty"—this time not for those who served but for those who did not.

The legacy of the Vietnam War was also gendered, as the first U.S. military "loss," and the first war in which a significant minority of American sons resisted the rite of passage to manhood that military service during wartime had historically provided to their fathers and grandfathers. It was also the first American war in which some veterans' return was an occasion for shaming—by both civilians and male veterans of "successful" American wars. This legacy would not be erased until the 1980s, first through Hollywood films portraying the "remasculinization" of America, such as the *Rambo* films in which a hypermasculine John Rambo "returned" to Vietnam, this time to "win" and, at least symbolically, restore the masculinity of those who had fought and lost. The most significant erasure of the Vietnam legacy, however, came in the shape of new conflicts (Grenada and Panama) and finally a new war that the United States could and did convincingly win: the "Persian Gulf War of 1991. The Gulf War, in all its glory, put to rest the memory of resistant sons and the broader antiwar discourse highlighted during the Vietnam conflict. Yet the Gulf War also made explicit new questions about the gendered nature of warfare, including renewed scrutiny of the "proper" roles of men and women during times of war in the context of the gender-integrated military.

GENERAL STAFF ACT (1903). The General Staff Act of 1903 culminated the reforms initiated by Secretary of War Elihu Root and provided the U.S. Army with a central planning body. The immediate impetus for creating such an agency was the chaotic mobilization for the "Spanish-American War (1898). Since the Franco-Prussian War of 1870-71, 11 major powers had been creating some variant of the German General Staff. Root shepherded the legislation through Congress, but ran into opposition from congressional antimilitarists and Lieut. Gen. Nelson Miles, the commanding general of the army.

Miles helped to kill an ambitious general staff bill in 1902. A narrower law in 1903 provided for a small General Staff Corps, limited to forty-five officers and assigned to the War Department. It also sanctioned the Army War College, a planning entity that Root had created in 1900. The legislation replaced the commanding general with an army chief of staff, who supervised the staff corps and served as principal military adviser to the secretary of war. Congress required that the chief of staff serve for no more than four years and that the staff officers rotate out of Washington and into the field. The chiefs of existing bureaus such as the Quartermaster and Ordnance departments, and especially the Adjutant General's office, remained powerfully allied with Congress and worked to marginalize the general staff until U.S. entry into World War I.

GENEVA AGREEMENT ON INDOCHINA (1954). The "Agreement on the Cessation of Hostilities in Viet-Nam" ended the eight-year war over the decolonization of Indochina between France and the Communist forces under the command of the leader of the League for Vietnamese Independence, "Ho Chi Minh. It was the result of an international conference held in Geneva between 8 May and 20 July 1954, following the fall of the French-held fortress at Dien Bien Phu and the collapse of the French military effort to retain control over their colonial empire in Southeast Asia.

The agreement provided for a cease-fire, established a provisional military demarcation line at the 17th parallel, empowered the two Vietnamese "parties" (later to be called North and South Vietnam) to administer their zones of control, and called for "general elections which will bring

about the unification of Viet-Nam" in July 1956. The representatives of the United States and of the state of Vietnam (which was to become South Vietnam) refused to sign the agreement. Three other agreements were issued, providing for cease-fires in Laos and Cambodia and relating to international inspection arrangements. Conference participants also made seven declarations about intended compliance with the agreement.

The outcome at Geneva was a product largely of secret negotiations between China's foreign minister Zhou Enlai and Pierre Mendès-France, the new prime minister of France. Mendès-France had publicly denounced the war for some time; on taking office in June, he staked his prime ministership on achieving a "satisfactory solution" within four weeks.

The outcome, however, sowed the seeds of future war and ultimate intervention by U.S. military forces. The People's Republic of China used the threat of withholding future aid to the new Vietnamese Communist state to force the leaders in Hanoi to reach a settlement that ceded authority over much less than Ho Chi Minh's forces had actually won on the battlefield. Zhou thought he had written into the agreement a process leading to the eventual unification of the two Vietnams and the consolidation of Communist political control that would deny the United States any future pretext to intervene in Indochina, where its forces could then threaten China.

The final declaration of the conference, 21 July 1954, called for a prohibition on "the introduction into Viet-Nam of foreign troops and military personnel as well as of all kinds of arms and munitions." This provision was aimed at preventing U.S. aid from shoring up what was perceived to be a weak and also temporary government in the South. In fact, President Dwight D. "Eisenhower began to provide military aid in October 1954, and U.S. military advisers to train South Vietnamese forces began arriving in February 1955.

Eisenhower, who rejected French requests for U.S. air support when they were under siege at Dien Bien Phu, responded much more positively to the request from the new South Vietnamese government under Prime Minister Ngo Dinh Diem for help, and was persuaded by his secretary of state, John Foster "Dulles, that it was important for South Vietnam to serve as bulwark against communism in Asia. Dulles was also against holding the prescribed plebiscite called for in the agreement on grounds that the elections in the North would not be conducted fairly and that the communists would win an overwhelming political victory.

By 1957, the Soviet Union, in part to weaken China's influence in Southeast Asia, proposed that the "United Nations admit Vietnam as 'two separate states ... which differ from one another in political and economic structure.'" The United States rejected this proposal, refusing to recognize any Communist country.

The negotiations surrounding the Geneva Agreement also prompted the United States to take the lead in forming a regional collective security pact "to deter and if necessary combat Communist aggression." The Southeast Asia Treaty Organization (SEATO) was organized in Manila in September 1954, and placed South Vietnam under its protection. A month earlier, the "SEATO Treaty was debated in the U.S. National Security Council, where Secretary of State Dulles explained that a "line against aggression"

needed to be drawn "to include Laos, Cambodia, and South Vietnam on our side."

GENEVA AGREEMENT ON LAOS (1962). In Southeast Asia, Laos had descended by 1961 into a threeway civil war that was becoming internationalized as part of the *Cold War. Struggling to control the country were Pathet Lao Communists, backed by North Vietnam and the Soviet Union; Souvanna Phouma's neutralist Laotian government, which at times enjoyed the favor of the Soviet Union, the People's Republic of China (PRC), and the United States; and a revolutionary committee headed by Gen. Phoumi Nosavan, which received covert support from the U.S. *Central Intelligence Agency (CIA).

The administration of President John F. * Kennedy believed that geography made Laos a poor place to use military force to stop the spread of communism in Southeast Asia. Pathet Lao advances, however, suggested that covert U.S. support would be insufficient to save General Nosavan or prevent Souvanna Phouma from falling under the sway of the Communists. Several military actions were considered to stem a Pathet Lao victory; the most drastic proposal called for 60,000 American soldiers to occupy southern Laos.

On 11 May 1961, Soviet and British officials defused the impending crisis in Laos by orchestrating a truce and by reactivating the International Control Commission (associated with the 1954 *Geneva Agreement on Indochina that led to the division of Vietnam). Five days later, a second Geneva conference was convened by the PRC, Cambodia, France, Laos, the Soviet Union, Great Britain, the United States, South Vietnam, North Vietnam, India, Canada, Poland, Burma, and Thailand. The negotiations led to the 23 July 1962 Declaration and Protocol on the Neutrality of Laos. These second Geneva accords called for a peaceful, neutral, independent, and democratic Laos, and for the removal of foreign military units from Laotian soil.

Hope faded quickly that the accords would lead to real neutralization, although the agreement reflected a tacit understanding that conflict in Laos would remain limited. The North Vietnamese preferred to use the country to infiltrate soldiers and material into South Vietnam. The United States, which concentrated its efforts in Vietnam, used a CIA-led army of Laotian Hmong tribesmen to harass North Vietnamese infiltrators in Laos. The Geneva accords helped turn Laos into a sideshow to the Vietnam War, but they did not save the Laotian people from years of bloodshed.

GENEVA CONVENTIONS (1864). The Geneva Convention of 22 August 1864 was the world's first multilateral humanitarian treaty. Sixteen nations were present, responding to public concern about the sufferings of sick and wounded soldiers, well publicized by the labors of Flo-

rence Nightingale in the Crimean War, Clara *Barton and the U.S. *Sanitary Commission in the American *Civil War, and the dramatic book *The Memory of Solferino* (1862) by Henry Dunant, a Swiss, about the casualties at the Battle of Solferino in 1859. Dunant and four other Genevan philanthropists had already launched, in October 1863, what would become the international Red Cross movement. Now the twelve initial signatories bound their armies to respect and protect the lives and workplaces of each other's ambulance and medical personnel; to incorporate volunteer auxiliaries into their medical corps; and to signify their virtual neutrality by a protective emblem, "a red cross on a white ground." The United States acceded to the convention in 1882.

Its consequences were mixed. The popularity of national Red Cross societies actually facilitated social mobilization for war purposes. On the other hand, the convention set a valuable humanitarian precedent, of which the most obvious sequels were its successively extended versions of 1906, 1929, 1949, and 1977.

GENEVA PROTOCOL ON CHEMICAL WARFARE (1925). Widespread revulsion against the World War I use of poison gas led to the Geneva Protocol in 1925, restricting chemical warfare. The agreement, ratified by most powers, was rejected by Japan and by the U.S. Senate.

Senators blocked it despite popular belief that gas warfare was immoral and military skepticism of its value. Supporters of stockpiling chemical weapons, including the U.S. Army's Chemical Warfare Service, argued that any ban was ineffective and that possession of such weapons was the best deterrent. Still, U.S. presidents abided by the protocol, and the military did not obtain any toxins between 1922 and 1937.

At the outset of World War II, the allies announced adherence to the Geneva Protocol, but reserved the right to retaliate, a conditional pledge based on mutual restraint. In 1942, the British and Americans changed explicitly to deterrence, threatening massive retaliation if the Axis initiated chemical warfare. (The Nazis used gas to murder millions of Jews and other civilians during World War II, but Allied leaders did not consider that to be chemical warfare.)

The Geneva Protocol was subsequently weakened by its own ambiguous language, and by Soviet and American stockpiling of large quantities of chemical weapons during the Cold War. One of the main problems of enforcing a ban was how to prevent clandestine conversion of commercial pesticide plants to military use. In the 1990s, the Russians finally agreed to U.S. demands for short notice, on-site inspections, but by then chemical weapons were being stockpiled by fifteen to twenty other nations (Iraq, for example, used them against Iran).

A new Chemical Weapons Convention, prohibiting the production, storage, and use of poison gas, and providing for monitoring of the civilian chemical industry with systematic and also surprise inspections, was signed by President George *Bush in January 1993 after ten years of

negotiations. Pressed by President Bill *Clinton and Senator Major Leader Trent Lott (Rep.-Miss.), the U.S. Senate overrode concerns from the chemical industry and from conservatives worried about North Korea, Iran, Iraq, and Syria, and ratified the treaty 74-26 on 24 April 1997. With seventy-five nations ratifying the treaty, it went into effect on 29 April 1997.

GENOCIDE. The UN Genocide Convention, passed on 9 December 1948, defined genocide as “acts committed with intent to destroy in whole or in part, a national, ethnical, racial or religious group...” Although political groups were not included—due to objections by the Soviet Union and other nations—most students of genocide consider such acts against political groups as genocide. UN conventions and statements of principles have created a body of “international law,” but enforcement mechanisms have been nonexistent, highly limited, or ad hoc, like the tribunals created to try perpetrators in Bosnia and Rwanda, and usually ineffective.

Perpetrators of genocide tend to offer justifications, such as destructive actions or intentions by the victims. Usually, these justifications are unfounded or greatly exaggerated; moreover, since old and young, women and children are killed, genocidal violence, even if partially defensive, is never morally justifiable. To understand the origins of genocide, it is necessary to consider societal conditions, the political system (genocide is less likely in a pluralistic, democratic society), cultural characteristics, the psychology of perpetrators and of internal bystanders (members of the society in which genocide takes place who are not themselves perpetrators), and the role of external bystanders (especially other nations).

Difficult social conditions are frequently the starting point for genocide. These are created by intense economic problems; by intense political conflict within a society—which can take varied forms, one of which is conflict between a dominant group and a subordinate group that is poor and has limited rights; or by very great and rapid social changes; or a combination of all these factors.

Under such conditions, people often scapegoat a subgroup of society for their problems, or create an ideology that promises a better life but identifies an enemy that stands in the way of its fulfillment. As the group or its members begin to harm the scapegoat or ideological enemy, they begin to change. Individuals and groups “learn by doing,” changing as the result of their own actions. Perpetrators further devalue their victims, exclude them from the human and moral realm, and create institutions to harm and kill them. An evolution of increasing violence leads to genocide.

All this is more likely to happen in cultures with certain characteristics. One of these is a history of devaluation of the group that becomes the victim. Cultural devaluation is usually deeply set and becomes influential when condi-

tions are difficult, as was the case with anti-Semitism in Nazi Germany in the 1930s. At times instead of devaluation by one group of another there is a history of conflict and violence between two groups, and intense mutual antagonism, as was the case in both Rwanda and Bosnia, in the 1990s. Other characteristics of culture that make the genocidal process probable include a strong respect for authority, a monolithic rather than pluralistic society, certain ways members of a group see their group, and a history of violence in dealing with conflict.

The evolution toward genocide is usually made possible by the passivity of both internal and external bystanders. Their passivity affirms the perpetrators. Early strong reactions by bystanders, such as protests, boycotts, and sanctions, occurring before the perpetrators have developed strong commitment to their ideology and murderous course, could inhibit this evolution.

There is a history of passivity. While internal enemies and the Jews were increasingly persecuted in Nazi Germany, all nations went to Berlin to participate in the 1936 Olympics. At the same time, U.S. corporations did business in Germany. Jews were kept out of the United States—only about one-tenth of the legal quota of Jewish immigrants was filled. During World War II, the Allies refused to bomb Auschwitz or the railroad leading to it. At the time of the genocide of the Armenians by the Turks in World War I, the United States had limited influence over Turkey, but Germany, Turkey’s supporter and ally, did nothing. In Cambodia in the 1970s, U.S. actions destabilized the country. Once the Communist Khmer Rouge took over, the United States had little influence over Pol Pot’s genocidal regime. However, after Vietnam invaded Cambodia and stopped the genocide, the United States showed strong hostility toward Vietnam and joined with China to insist that the Khmer Rouge government was the legitimate representative of Cambodia in the *United Nations. In the 1980s, the United States supported Iraq against Iran, even though it was using chemical weapons against its Kurdish citizens. Washington turned against Iraq only after it invaded Kuwait.

Early nonviolent actions by the community of nations might have inhibited the evolution and continuation of violence in the former Yugoslavia. However, the bombing of Serb positions in Bosnia, and the subsequent peace-keeping role of *NATO and the United States, set a positive precedent.

The influences that give rise to genocide create other forms of violence between groups as well, including mass killings, and, at times, war. In the course of the evolution described above the targets of violence may expand, to other groups within a country, or to other countries. In Argentina, the murder of dissenters in the late 1970s was followed by the Falklands War. At times war provides a cover for genocide, or its violence makes genocide easier to commit, as it did in Nazi Germany, 1939-45, and in Turkey, 1915-16.

Cultural characteristics and political organization in the United States now make genocide unlikely, yet the history of exclusion of Native Americans and African Americans from the public domain rendered violence against them probable. The violence in the United States against Native Americans is perhaps best described not as genocide but as group violence, including mass killings. However, genocide and mass killing have fuzzy boundaries. Intense devaluation, self-interest in gaining territory, conflict and

mutual antagonism, and learning-by-doing probably all shared roles in the violence against Native Americans.

GEORGE III (1738-1820), king of Great Britain. George III ascended the throne in 1760 upon the sudden death of his grandfather, George II, with whom he was politically at odds. He was a member of the House of Hanover, an ethnic German family that succeeded to the British throne in 1714. The new king tended to defer to his ministers' advice, especially in colonial matters. He was not averse to conciliation, provided that it did not diminish the authority of king and Parliament. In 1766, he backed the repeal of the Stamp Act. After the Boston Tea Party in 1774, however, his willingness to compromise vanished. The king supported the Coercive Acts of that year and adamantly rejected the colonists' argument that they could disobey Parliament while remaining loyal to the king.

George III became a fervent advocate of the war against the Americans. He participated minimally in the war's actual planning and management, but he used his influence to commit his government and his people to enforcing the colonies' obedience. During the Revolutionary War, the king never wavered in his support of Lord North, his chief minister (1770-1782), and his backing delayed the emergence of an opposition party strong enough to bring down North's ministry and foster a compromise.

Perhaps George III's most significant contribution to the American Revolution was his presence as a symbol of British sovereignty—and, ultimately, tyranny. The patriot leaders always insisted, down to 1776, on their loyalty to the crown, as the only legitimate link between America and Great Britain. Hence the Declaration of Independence indicted the king, rather than Parliament, for Britain's misdeeds. George III's rhetorical transformation from symbol of monarchical benevolence to tyrant provided the ultimate justification for revolution. After 1784, George III largely retired from an active role in government. He suffered a nervous breakdown in 1788-89; when he was declared insane in 1810, his son was appointed regent.

GERMANY, BATTLE FOR (1945). During the 1945 battle for Germany, the Americans effectively led the World War II Allied effort in the West; but in accommodating the Soviets, whose Red Army was invading from the East, they won military victory at a great geopolitical cost.

As their armies recovered from the temporary reverses suffered in late 1944 during the liberation of "France and the Battle of the "Bulge, the American, British, Canadian, and other generals agreed upon certain key objectives of the forthcoming campaign for Germany. By late January 1945, the Anglo-American armies had 4 million men, two-thirds of them American; the Soviet armies numbered nearly 7 million. The Western Allies were preparing to

seize the Ruhr, home of much of the German armaments industry. The North German plain with its Baltic ports was also a major target. The Allies further desired to strike at other points along the Rhenish front so as to envelop the Wehrmacht. After achieving their initial aims, they would then race through the heart of Germany, perhaps effecting a junction with the Soviet forces but certainly bringing about an end to the European War.

And yet considerable discord existed. British Field Marshal Bernard Law "Montgomery expressed contempt for Supreme Allied Commander Dwight D. "Eisenhower's deliberate, "broad front" tactics. Montgomery insisted that he should command not only the British and Canadian troops but two U.S. armies and make what he predicted would be a rapid, concentrated thrust through the Rhine Valley north of the Ruhr and eventually on to Berlin itself. He and fellow British generals—joined by some postwar British historians—believed "Ike" to have been vacillating and unreliable. But the American generals as well as their troops disliked Montgomery and did not want to serve under him. To them, "too-tidy Monty" wasted too much time in campaign preparation and sometimes failed to carry through. And they resented his attitude toward Eisenhower.

As most historians have concluded, Eisenhower tactfully but decisively exercised a firm command. He resolved disputes among contentious generals while maintaining tight discipline. Throughout the battle for Germany, Ike listened to advice but made his own choices.

Although both American and British units had entered Germany as early as 12 September 1944, the first massive crossings of the Rhine occurred in March 1945. After capturing 250,000 prisoners and inflicting 60,000 German casualties while on the west bank, the Allies searched for bridgeheads over the river. On 7 March elements of the U.S. Ninth Army found a lightly defended span at Remagen, and within a day 8,000 Americans stood on the eastern shore of the Rhine. Within several more days, not only the Remagen bridgehead but also many others made possible the crossing of all 7 Allied armies, primarily because 62 bridges were constructed by 75,000 men of the U.S. "Army Corps of Engineers. By 25 March the greatest aggregation of armor ever assembled in Western Europe was bearing down upon the Reich.

The double envelope of the Ruhr then proceeded with brilliant success. Courtney Hodges's First U.S. Army and William Simpson's Ninth caught the Reichswehr forces inside a circle of 80 miles diameter. With tremendous air, artillery, and naval support, the fast-moving Allied armored columns forced 400,000 German troops to surrender. By early April 1945 German resistance was futile, and Adolf "Hitler had neither the materiel nor the personnel to block the Allied armies from the West or the Soviets from the East.

While British and Canadian troops advanced through North Germany after sealing off Holland and Denmark, and French soldiers moved through the south, the Ninth U.S. Army stormed to within 63 miles of Berlin by 21 April. Further south, George S. "Patton's Third Army achieved even more spectacular results, sometimes covering 100 miles a day, as it took Frankfurt on 27 March and raged through Czechoslovakia, Bavaria, and Austria during April. The U.S. Seventh Army headed south, and in early May, at the Brenner Pass, linked with American

troops from the former Italian theater of war. On 25 April, the historic meeting of Soviet patrols with advance units of the American Ninth Army occurred at Torgau on the Elbe River, the prearranged meeting place.

Overwhelming power and logistic skill were primarily responsible for the American success. The U.S. Army had enormous numerical advantages in manpower, tanks, and artillery, and the supportive air forces commanding the skies could disrupt German industry, troop movements, and supplies. The Army Corps of Engineers used their bridging equipment effectively, and the Army Air Force—with more than 1,600 “flying boxcars” and other aircraft—transported 60,000 tons of supplies, including 10 million gallons of gasoline, to the rapidly advancing front during April 1945.

Unwilling to risk American and other Allied lives in an attack upon Berlin since the Soviets had been promised a postwar occupation zone, Eisenhower, under orders from Washington, restrained the Allied armies at the Elbe River, thus allowing the Red Army to seize Berlin, East Germany, and additional territory in Central Europe.

The invasion of Germany also led to the liberation of the German concentration and death camps. Generals Eisenhower and Omar N. Bradley personally visited Ohrdruf on 12 April, and soon Buchenwald, Dachau, and several others were liberated. To the world, the Americans exposed these ghastly horrors of Nazi cruelty, causing shock and revulsion.

For Germany, there was only complete and humiliating defeat. As the Red Army battled into Berlin, Hitler committed suicide there on 30 April 1945. At the command of his successor, Grand Admiral Karl Doenitz, Field Marshal Alfred Jodi went to Eisenhower's forward headquarters in Reims, France, and signed an unconditional surrender of 7 May. Josef Stalin demanded a second signing in Berlin on 8 May, which was hailed as V-E Day—Victory in Europe Day—marking the formal end of the war in Europe. On 5 June 1945, Germany was placed under an Allied Control Council and divided into four occupation zones.

GERMANY, U.S. MILITARY INVOLVEMENT IN. American military involvement in or with Germany has followed a mixed course over the past two centuries. Initial American sympathy for German unification in 1871 in appreciation of German support for the Union in the Civil War was transformed as Germany evolved into an autocratic and militaristic state, dominated by a blustering kaiser,

* Wilhelm II. Imperial Germany soon became a rival of the United States as both nations embarked on rapid industrialization and expansion of their world trade, built large navies, and began to engage in overseas expansion. Although the Americans were concerned with competitive German ambitions in Latin America, Asia, and the Pacific,

the primary threat was seen as potential German hegemony that would upset the balance of power in Europe.

When World War I broke out in 1914, Americans were divided, and President Woodrow Wilson declared neutrality. Though the United States remained legally neutral until 1917, its trade and financial support with the Allies grew dramatically. Eventually, Berlin's decision for unrestricted submarine warfare brought the United States into the war in April 1917 to prevent German hegemony and to establish a stable world order. The arrival of masses of fresh American troops in 1918 helped halt the German's spring offensive and fuel the Allies' counteroffensive, which led German military commanders to ask Berlin to obtain an armistice. Wilson refused to deal with the monarchy and a republic was established before the armistice was concluded 11 November 1918. U.S. troops participated in the temporary occupation of the Rhineland, 1918-23.

Although Wilson wanted some leniency for Germany because he supported the new Weimar Republic and because he feared Communist expansion from Eastern to Central Europe, the Allies imposed harsh terms in the Treaty of Versailles in 1919. Weimar had to accept them, but it then sought American help in the 1920s to ameliorate them. The U.S. Senate rejected the treaty because of provisions for the League of Nations, but made a separate peace with Germany. Politically isolationist in the 1920s, the United States aided Weimar economically by giving it most-favored-nation status and reducing its reparations payments, especially through the Dawes Plan of 1924; and American investments helped to stimulate the German economy, but this ended with the stock market crash of 1929 and the Great Depression.

The end of the Weimar Republic and the establishment of Adolf Hitler's Nazi dictatorship in 1933 rekindled American concern about the geostrategic and moral threat posed by an aggressively expansionist, antidemocratic Germany, Hitler's Third Reich (Third Empire). Nevertheless, antiwar sentiment led an isolationist Congress to adopt legislation emphasizing U.S. neutrality in 1935, 1936, and 1937.

After the outbreak of World War II in 1939, President Franklin D. Roosevelt followed an anti-German course. The United States became the “great arsenal of democracy,” supplying the Allies, occupying Greenland and Iceland, and patrolling the North Atlantic, even engaging in actions with German submarines. On 11 December 1941, four days after the attack on Pearl Harbor, Hitler declared war on the United States. Unlike World War I, the United States fully joined the Allies against Germany and gradually took the lead in directing Western military operations. To avoid a resurgent militarized Germany and to reassure the Soviet Union, which bore the brunt of the land war, the Allies insisted on unconditional surrender. Roosevelt considered postwar dismemberment and deindustrialization of Germany (the Morgenthau Plan of 1944), but abandoned the idea as creating a power vacuum in Central Europe.

After the Battle for Germany and Berlin's surrender in May 1945, Allied policies included occupation, denazification, and demilitarization in order to eliminate the threat of a resurgent aggressive Germany. Gen. Lucius Clay was the U.S. military occupation commander. Cold War conflict with the Soviet Union led the United States to seek German economic revival and press the Western Allies to merge their occupation zones. Soviet resistance through a

blockade of divided Berlin in the Russian zone in 1948 was overcome by the *Berlin Airlift (1948-1949).

In May 1949, the Federal Republic of Germany (West Germany) was established as much as possible in the political image of the American republic. Initially, West Germany had limited domestic and foreign authority, and the Allies retained supervision and military bases. Under Konrad Adenauer (chancellor, 1949-63), West Germany received massive *Marshall Plan aid, was rearmed, and was made a member of the North Atlantic Treaty Organization (*NATO) in 1955; U.S. policy was to integrate Germany into Europe as a bastion against the expansion of Soviet influence and control. The Soviets converted their zone into the German Democratic Republic (GDR) in 1949 and made it part of the *Warsaw Pact in 1955.

Beginning in the 1950s, as part of the U.S. commitment to NATO, large numbers of American troops and weapons were stationed in Germany. These included *nuclear weapons by the mid-1950s. In the *Berlin Crises (1958, 1962) President John F. *Kennedy protested but acquiesced when the Russians built a wall around Berlin in 1961. With the growth of U.S. and Soviet nuclear ICBM arsenals in the 1960s, the American troops in West Germany took on the added role of guarantor of the U.S. commitment to Central European defense, with the partnership between the United States and West Germany becoming the military core of NATO after France withdrew in 1966. That partnership became strained in the early 1980s when the USSR and the United States deployed a new generation of intermediate-range nuclear *missiles in the two Germanies.

The fall of the Berlin Wall in November 1989, and the reunification of Germany with the consent of the four former occupying powers, accompanied the collapse of the Soviet empire and the end of the Cold War. As the United States reduced its military presence in Germany, NATO expanded its original political purpose of linking the United States to Europe and Germany to the West by expanding that linkage beyond Germany into newly democratizing states in Eastern Europe.

GERONIMO (1823?-1909), Apache Indian leader. To North Americans and Mexicans of the 1870s and 1880s, Geronimo personalized the horrors of Apache warfare. Never a chief, and despised by many of his people, he nonetheless attained leadership through mastery of the partisan fighting style that baffled U.S. and Mexican troops. In cunning, stealth, endurance, perseverance, ruthlessness, fortitude, fighting skill, and command of the harsh conditions of his homeland, he excelled. With small followings, he alternated between reservation life in Arizona and raids from Mexico's Sierra Madre. In 1882, Brig. Gen. George Crook, relying heavily on Apache scouts and pack mules, penetrated the Sierra Madre and obtained

Geronimo's surrender. In 1885, however, Geronimo again took refuge in Mexico. Again Crook and his scouts pursued, and again Geronimo surrendered. But he had second thoughts, and fled to the mountains.

Crook, his methods under fire from Washington, asked to be relieved. Brig. Gen. Nelson A. Miles took his place, but eventually had to adopt Crook's unorthodox approach. Geronimo surrendered to Miles at Skeleton Canyon, Arizona, on 4 September 1886. Confined in Florida, Alabama, and finally near Fort Sill in present-day Oklahoma, he became a celebrity in parades and expositions. Pneumonia took his life in his eighty-sixth year.

GETTYSBURG, BATTLE OF (1863). One of the most decisive battles of the *Civil War raged from July 1-3 1863 at Gettysburg, Pennsylvania. General Robert E. *Lee decided to invade Pennsylvania and threaten Harrisburg, Baltimore, and Washington, not only to carry the war to the enemy but also to relieve the pressure on the siege of "Vicksburg. The *Confederate Army of Northern Virginia, 75,000 strong, crossed the Potomac in June and the *Union Army of the Potomac, 88,000 strong, moved to stay between the Rebels and Washington. Command of the Union army had been given to Gen. George Gordon *Meade on June 28 and he determined to find and fight Lee.

Union and Confederate troops met each other near Gettysburg. Rebels were looking for shoes and other supplies; Yanks were looking for Rebs. Fighting erupted near Gettysburg early on 1 July as outnumbered Union cavalry under John Buford skirmished with Rebel infantry. Reinforcements came to both sides, but by afternoon, Union Maj. Gen. John Reynolds had been killed and Federal troops retired southeastward from the town to Cemetery Hill and Cemetery Ridge. Lee arrived and vainly urged Lt. Gen. Richard S. *Ewell to attack Cemetery Hill. This wasted chance gave Meade time to get his army set in a fish-hook line, with his right anchored on Culp's Hill, the center on Cemetery Ridge and the left on a hill later called Little Round Top. Lee's men deployed during the night along the lower Seminary Ridge to the west. The first day went to the Rebels, but at high human cost.

Daylight on 2 July showed the two armies formed, with open country yawning between the lines. The initiative was with Lee, who ordered Lieutenant General James *Longstreet's Corps to attack the Union left while Ewell's corps struck the Union right at Culp's Hill and Cemetery Ridge.

Lee's orders were delayed and compliance lagged (the source of much controversy later); Longstreet, Lee's "Warhorse," opposed the plan (he thought the Confederate army should move south, get between Meade and Washington, pick a good defensive spot and receive attack); troops were shifted, time passed.

While the Confederates were shuffling their plans, Union III Corps commander Maj. Gen. Dan *Sickles, worried about being flanked, initiated an advance into the Peace Orchard, Devil's Den, almost to the Emmitsburg Road between the two forces—and, hence, offered a weak salient to the enemy.

The whole Union line depended on the left flank position at Little Round Top—a fact noticed by Meade's chief engi-

neer, Maj. Gen. G. K. Warren, who was horrified to see that hill unoccupied. Warren saved the day by pulling in brigades and batteries just as Longstreet's men charged Little and Big Round Top and nearly took the high ground. The Twentieth Maine, under Col. Joshua Chamberlain, held out against furious Confederate attacks and saved the flank. Longstreet's efforts against the Peach Orchard, the Wheatfield, Devil's Den, the lower slopes of the Round Tops and on to the Emmitsburg road were successful and Sickles finally retreated to Cemetery Ridge.

About dusk, too late to help Longstreet, Maj. Gen. Jubal A. Early, of Ewell's corps, fiercely attacked the Union right at East Cemetery Hill and nearly took the crest. No help came to Early and he abandoned the hill at about 10 P.M. A similar fate, at roughly the same time, met Maj. Gen. Edward Johnson's energetic divisional drive against Yankee positions on Culp's Hill.

Fighting on 2 July went to neither side but casualties were high and controversies were brewing: Longstreet's efforts were slow, Lee's attacks uncoordinated; Sickles had blundered and the Union high command had nearly missed the importance of Little Round Top.

Meade, steady in crisis, suffered uncertainty as night fell on 2 July. His left and right had held. Would Lee try them again or switch to the center? Or would the wily Rebel leader simply slip away and appear somewhere closer to Harrisburg or Washington? Calling his corps commanders together after midnight, Meade discussed possibilities. Unlike his predecessors, Meade did not urge retreat; instead he decided to wait for Lee's next move. He expected a strong Rebel attack on his center and ordered men and artillery there from the flanks. Union morale remained high.

Lee was not well. Stomach trouble plagued him and he had chest problems. Illness, and Gen. J.E.B. ("Jeb") Stuart's absence on a wagon hunting raid with most of the cavalry, edged Lee's temper and subordinates noted him unusually touchy that night. By morning his temper was shorter. He had decided to test the Union center, since the flanks were strong. This decision irked Longstreet, who felt the center would be tougher than the rest of the line. Why hit the one untouched Union position on the field? Why a frontal attack against so many visible enemy guns? Unmoved, Lee ordered Maj. Gen. George Pickett's division of Longstreet's corps, with some of Gen. A. P. "Hill's" units, to attack on 3 July.

On the third day, Confederates who participated in "Pickett's Charge" and lived to tell about it, recalled that 143 Southern guns bristled in the lines and that the sun etched things sharply. It was a strange kind of day, one fragmented by small memories. Men noted the flights of birds, some listened to a band, many lay on soft ground and waited as Federal shells probed the trees on Seminary Ridge, and many of them died. One, a sergeant in Company A, 14th Tennessee, could hear, years later, the things he said to himself. June Kimble was his name, his was a center regiment, and he was curious. In a lull after a morning shelling he walked to the fringe of the woods and looked at the place his men would go. Guns crowning the Federal hills, the little clump of trees that fixed so many an eye that day, the low stone wall thronging with bluecoats—the whole position lay shimmering far away across almost a mile of open, rolling land. There, up there, into that line of black guns behind the low stone wall, there his men would go. Kimble was scared, almost sick at the sight, and

began mumbling to himself: "June Kimble, are you going to do your duty today?" And he answered, "I'll do it, so help me God."

Confederate artillery started a thunderous and wasteful artillery duel in the early afternoon that lasted almost two hours. Union fire slackened off—both to conserve shells and to fool the Rebels into thinking that the Southern guns commanded the field. During a lull in the bombardment a grandly mounted General Pickett scratched a brief note to his fiancée, talked briefly to Longstreet, then rode to one of gallantry's last great gestures.

Confederates came out of the woods at about 3:15 P.M. Yankees counted many battle flags; and noted the formation was trim as the enemy march began slowly, to allow for distance and rising ground. Some direction changes were accomplished by the 12,000 to 15,000 Southerners marching. Silence. Union gunners waited. Steadily the "Johnny Rebs" marched, lines dressed and closing. Across a small stream they went, through a fence, then straight up the hill toward the trees, the guns, the infantry. Men remembered how it was on the way; to some the silence crowned the world, then broke in a clap so awful it was more than sound, in a roar so angry it was tangible, in an endless crack of doom. Union shells raked lines, cut gaps in ranks; the gaps closed, the lines moved on, faster; men leaned forward against some great wind that winnowed them, bunching as Yankee batteries ate away the flanks. Then they ran, crouched, flags waving as they began their "Rebel yell." Some stopped to fire near the wall at the little clump of trees, took a withering volley right in the face, recoiled, went on and carried the wall. Then the charge faded in carnage. "Men fire into each other's faces," a witness wrote. "There are bayonet-thrusts, sabre-strokes, pistol shots;... men ... spinning around like tops, throwing out their arms, gulping up blood, falling, legless, armless, headless ... ghastly heaps of dead men...." A handful, maybe 300, rode the Southern tide to its height; most of them died in an angle by the clump of trees, including Confederate Gen. Lewis A. Armistead.

Back down the slope scarcely 5,000 survivors fled, razed and raked and maimed again. Many heard Lee greet them. "All this is my fault. Too bad! Too bad! Oh, TOO BAD!"

Meade wasted a chance to counterattack, and two days later on a rainy night, Lee began a woeful journey back to Virginia with a wounded column seven miles long.

An incredulous President Abraham Lincoln fumed that Lee's army had escaped. "We had them within our grasp," he lamented. "We had only to stretch forth our hands and they were ours." He blamed Meade's excessive caution. Although Meade had a fresh corps available for pursuit, his caution came from his own casualties as well as appreciation of local conditions. More than 3,155 bluecoats were dead, 14,529 wounded and 5,365 missing—a total of 23,049, about a quarter of Meade's force. More than 2,500 Rebels were dead, nearly 13,000 wounded and almost 5,500 missing—some 21,000, or nearly a third of Lee's army, along with 25,000 weapons. Lee's men reached Virginia on 13 July.

Lincoln's anguish was understandable. Vicksburg, the main Rebel bastion on the Mississippi, fell on 4 July, and had Meade destroyed Lee's army, the twin victories might have ended the war.

Gettysburg nonetheless stands as America's greatest battle; it stopped further Confederate invasions, and the

South could never make up the losses in men and equipment. The tide of the war had changed.

GETTYSBURG NATIONAL MILITARY PARK. The nucleus for the park began shortly after the Battle of *Gettysburg, when the state-sponsored Gettysburg Battlefield Memorial Association sought to raise private funds for a permanent Soldier's National Cemetery there. In October 1863, the association began exhuming 3,354 bodies of Union soldiers for permanent burial on a site at the edge of the battlefield. In November 1864, at the dedication ceremonies for the cemetery, President Abraham *Lincoln delivered what later became known as the "Gettysburg Address," a brief address in which he defined American democracy and sanctified the war for the Union.

In 1895, in order to forestall railroad lines being built through the battlefield, Congress established the Gettysburg National Military Park. The National Park Service succeeded the War Department in administering the site in 1933. In 1972, a controversial privately owned observation tower was constructed. Many preservationists and Civil War organizations continue to express alarm over the commercialization of parts of the battlefield not under federal control.

Despite its national symbolism, the battlefield retained strong regional and local ties. State governments and veterans' groups, on both sides, erected commemorative statues, markers, and other memorials. For decades, * Civil War *veterans gathered at Gettysburg for reunions, which by the 1890s often included ex-Confederates. In recent years, reenactments have taken place outside the park boundaries, except for the motion picture *Gettysburg* (1993), which was filmed inside the park.

GIAP, VO NGUYEN (1910-), North Vietnamese general and government minister. Born into a family of small landowners in Quang Binh, Central Vietnam, Giap had an early education in Chinese, followed by one in French. Involved in student political disturbances of 1926, he was expelled from school. Thereafter, he joined the New Vietnam Revolutionary party advocating independence from French rule. In the 1930s, he was a political prisoner for two years and became a member of the Indochinese Communist Party. He also became a history teacher and a jour-

nalist who campaigned for press freedom and the diffusion of the national language. In 1939, he wrote a book on the military situation in China and co-authored another about Vietnamese peasants. Two years later, he joined *Ho Chi Minh in China and learned more about *guerrilla warfare.

Back in Vietnam by 1944, Giap helped to organize the Viet Minh forces, the nucleus of the Vietnam People's Army (VPA), in order to oust the Japanese and, after World War II, the French. After the August 1945 revolution, he held a number of posts in the Democratic Republic of Vietnam, including minister for defense and commander in chief of the VPA. In 1954, he overrode Chinese tactical advice and decisively defeated the French in the battle for Dien Bien Phu. From 1958, Giap as vice premier (1955) envisaged development of the Ho Chi Minh Trail to supply South Vietnamese insurgents. An authority on guerrilla warfare, General Giap had a major influence on strategy in the war against American and/south Vietnamese forces. His many books include *People's War People's Army* (1961), and *The Military Art of People's War* (1970).

He began to shed his military posts in 1976, and became minister for science and technology. During an interview he gave Greg Lockhart in Hanoi in 1989, he stated that he had become "a general of peace."

The G.I. BILL (1944) was a series of benefits for World War II *veterans granted by the U.S. Congress under the Servicemen's Readjustment Act of 1944 and extended by later legislation. Administered by the *Veterans Administration, these benefits included educational grants for higher education or vocational training, mortgage loan guarantees for home buyers, and cash payments for those unemployed after discharge.

Initially, President Franklin D. *Roosevelt favored a comprehensive approach to dealing with postwar *demobilization, especially in the areas of job retraining and vocational rehabilitation. However, faced with significant opposition in Congress and among veterans' organizations to such broad-based plans, he bowed to political realities and supported narrower legislation aimed at veterans. Substantial public pressure developed in 1943 and 1944, led by the *Veterans of Foreign Wars and the Hearst newspaper syndicate, to provide a bonus and other benefits to discharged service men and women. The * American Legion, eager to attract World War II veterans to its organization, played a pivotal role in drafting and lobbying for the so-called G.I. Bill.

The bill's emphasis on aiding able-bodied veterans established important precedents that stemmed in part from fears of massive unemployment caused by demobilization and the return of millions of ex-service men and women.

Between 1944 and 1949, nearly 9 million veterans received a total of \$4 billion from the G.I. Bill's compensation program. Although unemployment increased after V-J Day, the provisions of the bill, the unemployment insurance popularly known as the "52-20 club," played an instrumental role in ensuring that the United States avoided a postwar depression similar to that after World War I. In addition, over 3.5 million mortgages would be partially guaranteed under the homeowners' loan

provisions of the bill, and this was instrumental in encouraging rapid growth of suburbia after 1945. At the peak, in 1947, slightly over 40 percent of all housing starts in the nation would be funded by the guarantee.

The G.I. Bill's education and training programs reached slightly over half of the nearly 16 million eligible veterans in 1945-56. College enrollments increased by 70 percent over prewar levels. Ex-service men dominated student bodies at American colleges in the late 1940s; in 1947, close to half the college students had served in the military. G.I. Bill recipients as a group tended to outperform traditional nonveteran students.

Benefits similar to the G.I. Bill would be extended to veterans of the *Korean War. Subsequently, the Veterans' Readjustment Benefits Act of 1966 extended such provisions to all who serve in the armed forces, even in peacetime. The precedents established by the G.I. Bill for federal aid to higher education would expand over the course of the *Cold War. Totalling over \$14 billion, the bill was crucial to the expansion of the middle class.

GOETHALS, GEORGE W. (1858-1928), U.S. *Army engineer and builder of the Panama Canal. Born in Brooklyn on 29 June 1858, Goethals graduated second in his West Point class in 1880, and went on to achieve what William Tecumseh *Sherman predicted would be a "brilliant future." Early in his career with the U.S. *Army Corps of Engineers, he worked on lock and dam projects that later served him well in Panama. More engineer than soldier, Goethals viewed the military simply as a vehicle through which he could express his talent.

On President Theodore *Roosevelt's order, Goethals was appointed chief engineer of the Panama Canal in 1907 when John E Stevens resigned because of the difficulties in the first three years of construction. Goethals supervised nearly all major excavation and all construction. He vastly expanded the proposed canal's size, taking into account U.S. *Navy preferences for access, passage, and defense. To oversee the building of immense locks and dams, Goethals brought in army and civilian engineers who had distinguished themselves in similar work. He then set the two groups to work on opposite sides of the canal, expecting that professional rivalry would encourage speed and excellence.

Goethals's responsibilities at Panama extended well beyond construction. He organized a strictly regimented social order, with engineers and designers at the top and workers at the bottom. Each lived in separate communities with separate amenities, with a court system adjudicated by Goethals himself. Goethals had the ability to manage an incredibly diverse number of workers. He completed the canal in 1914, having done the job under budget and ahead of schedule, and still operating with most of the original construction equipment. General Goethals served as governor of the Canal Zone (1914-16) and then with the War Department's supply agencies in World War I.

GOLDWATER-NICHOLS ACT (1986). The Goldwater-Nichols Department of Defense (DoD) Reorganization Act of 1986, sponsored by Senator Barry Goldwater and Representative Bill Nichols, was enacted primarily to improve the ability of U.S. armed forces to conduct joint (interservice) and combined (interallied) operations in the field, and secondarily to improve the DoD budget process. The act contained three major changes: it greatly strengthened the influence and staff of the *Joint Chiefs of Staff (JCS) chairman, compared to those of the service chiefs and military departments; it increased the authority and influence of the unified combatant commands that control U.S. forces in the United States and around the world; and it created a "joint officer specialization" within each service to improve the quality of officers assigned to the Joint Staff.

The act's supporters felt that U.S. military operations since World War II had suffered from conflict and inadequate coordination among the services. They believed that individual service programs and priorities, rather than the needs of actual joint military operations—the ultimate purpose for which the armed forces were maintained—dominated DoD. Enough retired senior officers, former civilian DoD officials, and private analysts and commentators, as well as members of Congress, agreed with these views to make it possible for the act to be enacted over the objections of the uniformed military leadership.

The intensity of objection was much greater in the navy and Marine Corps, as had been the case for all disagreements about service unification since the end of World War II. In general, those who objected to the act felt that DoD operational and budgetary problems in the post-World War II era resulted from lack of political will, inadequate defense budgets, excessive civilian "micro-management" of military operations and defense budgets, and the inevitable chaos and friction attendant on war or the operations of any large organization. They were also skeptical of "jointness," believing that service-unique assets and views needed to be nurtured, not submerged; and that increased requirements for joint and central organizations created unnecessary bureaucracy, subsuming service assets and doctrine into less than optimal joint doctrines or systems.

The act has been accepted by most officers and civilian analysts, but certain issues remain: Is the increased authority of the JCS chairman compatible with an appropriate degree of civilian control of the military, or does it threaten that control, as some—for example, military historians Richard Kohn and Russell E Weigley—have charged? Has pressure for more joint operations added unnecessary layers of command and awkward "marriages of convenience" among the services, or has it been material in various military victories since 1989? (Many analysts regard the act as instrumental in ensuring the success of U.S. combat operations in Panama in 1989-90, and in the *Persian Gulf War of 1991, although it proved no substitute for clear political guidance during the U.S. military operations in Somalia in 1992-94.) Is increased Joint Staff involvement in weapons system procurement a long-overdue step toward effective management of DoD acquisition, or does it remove service-unique perspectives where needed?

GORGAS, WILLIAM C. (1854-1920), military physician, sanitarian expert, and surgeon general. Born in Alabama, the son of a West Pointer who had been the Confederacy's chief ordnance officer, Gorgas received a medical degree from New York's Bellevue Hospital Medical College in 1876 and joined the U.S. Army Medical Corps in 1880. When army surgeon Walter Reed proved mosquitoes were the transmitters of the yellow fever virus, Gorgas, as the army's chief health officer in Havana, Cuba, during the U. S. occupation (1889-1902), initiated sanitation countermeasures that eradicated the disease in Cuba by eliminating the mosquito-breeding areas and segregating stricken patients. During 1904-13, he served in Panama, duplicating his successes and greatly contributing to the completion of the canal by reducing malaria outbreaks among laborers. He later applied his sanitary measures in other parts of the world, including Ecuador and South Africa. In 1914, he was promoted to major general and appointed surgeon general of the U. S. Army. Gorgas served from 1914 to 1919, skillfully administering the Medical Corps during World War I. He died in London of a stroke. After a military funeral, his body was returned for burial in Arlington National Cemetery.

GRAND ARMY OF THE REPUBLIC. The Grand Army of the Republic (GAR) was the largest and most powerful organization of "Union army and navy veterans. Founded on 6 April 1866 at Decatur, Illinois, by former army surgeon Benjamin Franklin Stephenson, its proclaimed objects were "Fraternity, Charity, and Loyalty." Its basic unit was the local post, with membership open to any honorably discharged Union veteran. The social composition of GAR membership was cross-class, and to some extent cross-racial, though black veterans usually were relegated to segregated posts.

Between 1866 and 1872, the GAR operated as a virtual wing of the Republican Party, boosting the careers of soldier-politicians such as Sen. John "Logan of Illinois. After 1872, it entered a steep decline, reaching a low of 26,899 members in 1876. In the 1880s, the GAR revived as a fraternal order, emphasizing its secret initiation ritual and the provision of charity to needy veterans. It soon became an active and powerful national pension lobby, and the custodian of a conservative version of American "nationalism, stressing the ideals of the independent producer and the volunteer "citizen-soldier. At its peak membership of 409,489 in 1890, the Grand Army enrolled about 40 percent of eligible Union veterans. The GAR declined in influence after 1900, acting largely as the keeper of Memorial

Day, which Commander in Chief Logan had first proclaimed as gravesite Decoration Day in 1868. It held its last national encampment at Indianapolis in 1949. The GAR never became a hereditary order or admitted veterans of later wars; thus it disappeared with the death of its last member in 1956.

GRANT, ULYSSES S. (1822-1885), Civil War general and eighteenth president of the United States. Born at Point Pleasant, Ohio, on 27 April 1822, and named Hiram Ulysses, young Ulysses (as his father called him) grew up in nearby Georgetown, across the street from his father's tannery, and acquired an intense aversion to the stench of death. He attended local schools, did farm chores, and demonstrated unusual skill with horses. Appointed to the U.S. Military Academy at West Point, he was mistakenly registered as Ulysses S., which he eventually accepted, though insisting that his middle initial stood for nothing.

Graduating in 1843, he was assigned to Jefferson Barracks in St. Louis County. In the "Mexican War, 1846-48, Grant displayed commendable gallantry under Zachary "Taylor, but chafed at assignments as quartermaster and commissary in the army of Winfield "Scott until the final approach to Mexico City provided opportunity to earn brevet (temporary) promotion to captain. Grant encountered different styles of command and management, maintaining an aversion to military protocol, and believed that the war represented aggression against Mexico.

In 1848, Grant married Julia Dent, daughter of a Missouri slaveholder, and in 1850 they had a son. Grant was soon separated from his family when the army assigned him to the Pacific Coast. Paid too little to reunite the family in California, he was miserably unhappy; nonetheless, tales of his heavy drinking then and later are unsupported. He resigned in 1854 to begin farming on his father-in-law's estate in St. Louis County. When his farm failed in the Panic of 1857, he could not find employment in St. Louis. By 1860, necessity forced him to his father's leather goods store in Galena, Illinois.

When the "Civil War began, Grant, impelled by a sense of patriotic obligation, reluctantly left his wife and four children. He served Governor Richard Yates of Illinois temporarily as aide and mustering officer but failed to find an appropriate command in the frenzied pursuit of officer-ships for units of U.S. "Volunteers. Yates eventually gave him a regiment, and Grant quickly established discipline and marched the 21st Illinois to Missouri. Before he engaged the enemy, he acquired promotion to brigadier general chiefly because an Illinois congressman had no superior candidate in his home district. Chance placed Grant in command at Cairo, Illinois, just as the Confederates occupied Columbus and Hickman on the Mississippi River in previously neutral Kentucky. Grant then boldly occupied Paducah and Smithland at the mouths of the Tennessee and Cumberland Rivers. On 7 November 1861, he led 3,000 troops from Cairo to Belmont, Missouri. Initially successful in overrunning a Confederate camp, Grant was unprepared for the counterattack that drove his men back to their transports in disarray. Because Grant had dis-

played aggressiveness and suffered no greater casualties than he had inflicted, this indecisive encounter provided experience without damaging his prospects.

In January 1862, Grant wrung permission from his conservative superior, Maj. Gen. Henry W. Halleck, to attack Fort Henry on the Tennessee River. Union gunboats compelled the fort's surrender (6 February) before the arrival of all Grant's forces, and much of the garrison fled to Fort Donelson on the Cumberland River. Grant followed, sending gunboats to the Cumberland and troops overland. Rather than await expected reinforcements, Grant then besieged the 21,000 Confederates with his own army of 15,000. On 14 February, the gunboats attacked unsuccessfully. The next day, while Grant visited the wounded naval commander on shipboard, a surprise Confederate attack rolled up the Union right and opened the road for escape. As the Confederate commander dawdled, Grant returned and launched a counterattack that removed all options save "unconditional surrender"—Grant's phrase that matched his initials and provided a popular nickname. Grant captured about 15,000 men and compelled the Confederates to fall back from Kentucky and much of middle Tennessee. The first major Union victory of the war won Grant promotion to major general.

Advancing up the Tennessee River to attack Corinth, Mississippi, Grant assembled troops at Pittsburgh Landing, Tennessee, where Confederates unexpectedly attacked at Shiloh Church (6 April) in the Battle of *Shiloh. Pushed to the edge of destruction on the riverbank after a frightful encounter, Grant used reinforcements for a second day of fighting that recaptured the field. Grant's resilience and indomitability won acclaim, but heavy casualties and rumors raised questions that temporarily cost him his command. Not until Halleck left for Washington as general in chief did Grant resume leadership.

His campaign in the siege of *Vicksburg, Mississippi, began in late 1862 with setbacks. Confederate cavalry captured Grant's supply base at Holly Springs and William Tecumseh *Sherman's premature assault on Vicksburg failed. After a winter of frustration, Grant's supporting fleet ran past the batteries and landed troops south of Vicksburg. Grant then unexpectedly struck at Jackson, Mississippi, before turning toward Vicksburg. His lightning moves prevented the cooperation of two Confederate armies in Mississippi and led to eventual surrender of the besieged citadel of Vicksburg in July 1863. Grant's military masterpiece virtually opened the river and bisected the Confederacy. A smashing victory against Gen. Braxton Bragg at Chattanooga in November 1863 firmly established his reputation as the Union's finest commander.

Promoted to lieutenant general and given command of all Union forces in March 1864, Grant left Halleck in Washington as chief of staff while he accompanied the Army of the Potomac in Virginia. He planned a coordinated campaign with two western armies converging on Atlanta and three eastern armies aimed at Richmond. In spring 1864, Grant faced Robert E. *Lee in a bloody series of encounters, including at the Battle of the *Wilderness (5-6 May), fighting at Spotsylvania (7-19 May), North Anna (23-26 May), and Cold Harbor (1-3 June) in the *Wilderness to Petersburg Campaign. Shocking Union casualties accompanied Grant's approach to Richmond, but a brilliant crossing of the James River then brought his armies to thinly defended Petersburg, Virginia, where

subordinates immediately bungled a dazzling opportunity to end the war. Grant settled uncomfortably into siege. Four of five armies had failed to achieve their missions; only Sherman's victory in the Battle of *Atlanta (2 September) redeemed his strategy.

Grant maintained pressure on Lee as *Sherman's march to the sea again divided the Confederacy. In late March 1865, Grant launched another lightning campaign that drove Lee from Richmond and to surrender at Appomattox Courthouse (9 April). President Andrew *Johnson tried to harness Grant's popularity in an effort to restore Southern statehood at the expense of the freed slaves. Grant's refusal to abandon his soldiers or his black veterans frustrated Johnson's attempt to replace Secretary of War Edwin M. *Stanton with Grant and drove him to support the Republican Party. Grant's reputation as a wartime commander carried him on to two terms as president (1869-77). Contrast between expectation and fulfillment in the political arena dimmed Grant's fame, which revived shortly after his death with posthumous publication of his *Memoirs*—a splendid military autobiography written with fairness, candor, and surprising humor.

Grant's popular reputation as an impassive "butcher" whose victories depended on luck and larger armies arose amid strivings for sectional reconciliation. Military analysis by the English soldier-scholar J. F. C. Fuller and later by American military historians T. Harry Williams and Bruce Catton promoted reappraisal. Lincoln's understanding that Grant deplored politics but valued freedom in military matters formed the cornerstone of their effective partnership. Sherman, who also deferred to Grant's military mastery, became his ideal lieutenant. Grant's resilience, unpredictability, and strategic grasp continue to challenge scholars, as does Grant's meteoric rise from provincial clerk to military eminence. "The laws of successful war in one generation would insure defeat in another," he wrote, but arguments that his innovations foreshadowed modern total warfare lack historical perspective.

GREAT BRITAIN. See United Kingdom, U.S. Military Involvement in.

GREEN BERETS. See Special Operations Forces: Army Special Forces.

GREENE, NATHANAEAL (1742-1786), Continental army general. Nathanael Greene was born into a Warwick, Rhode Island, family of anchorsmiths and millowners. Raised a *Quaker, Greene nevertheless developed a youthful fascination for military history. In 1775 Private Greene joined patriots besieging Boston. His intelligence, knowl-

edge of military affairs, and managerial skills, led Congress to appoint him a brigadier general and placed him in charge of Boston when the British left.

Greene was one of George *Washington's favorite lieutenants. An amateur, Greene initially made by-the-book mistakes; learning war through war, however, he grew as a leader. Promoted to major-general, Greene fought the Battles of Trenton and Princeton (1776-77), Brandywine (1777), Germantown (1777), Monmouth (1778), and Newport (1778), and often commanded in Washington's absence. Appointed quartermaster general (1778), his business experience aided him immeasurably. Resuming field duty, Greene fought at Springfield (1780) before accepting command of the Southern Department in December 1780.

In the South, Greene's position appeared hopeless. Georgia and South Carolina had fallen, North Carolina and Virginia lay exposed to British invasion, and his small detachment of the *Continental army was ill-clothed, starving, and demoralized. Greene quickly restored discipline and morale. Next, he boldly divided his force, detaching Daniel *Morgan into South Carolina's backcountry and Henry *Lee's cavalry to join Francis *Marion's coastal guerrillas. It was a stroke of genius. With one order, Greene recaptured the strategic initiative. After Morgan's victory at the Battle of *Cowpens (1781), Greene concentrated his forces and led British Gen. Charles *Cornwallis deep into North Carolina. At the Battle of *Guilford Courthouse (1781) they fought a bitter engagement, with Cornwallis winning a Pyrrhic victory. Lord Cornwallis retired to Virginia to meet ultimate defeat by Washington at the Battle of *Yorktown.

Greene returned south. Combining guerrillas, militia, and regulars as integral parts of his operational strategy, he fought several battles (Ninety-Six, Hobkirk's Hill, Eutaw Springs). The British won all of them, but at high cost. By October 1781, except for Charleston and Savannah, the South was under American control. A brilliant, innovative leader practicing in *guerrilla warfare, Greene left the army in 1783. Soon after (1786), he died of sunstroke in Georgia.

GRENADA, U.S. INTERVENTION IN (1983). Grenada first attracted the military interest of the United States in 1979. A Marxist-Leninist coup that year, led by Maurice Bishop and the New Jewel movement, overthrew the government; the Communists also began construction of a 9,800-foot airstrip. A second and more violent coup in 1983 left Bishop and more than 100 other Grenadians dead and Deputy Prime Minister Bernard Coard and Gen. Hudson Austin in charge. In response to this violence and disorder, Grenada's governor general, Sir Paul Scoon, secretly asked the Organization of Eastern Caribbean States (OECS) for assistance in restoring order. The OECS, in turn, requested help from the United States.

To the strongly anti-Communist U.S. president, Ronald *Reagan, the possibility of a Soviet client-state in such a

strategic location was unacceptable. The airstrip was seen as a threat to vital Caribbean sealanes and the Panama Canal, and it could have been used for staging Cuban and Soviet military flights to Africa and Nicaragua. U.S. officials also expressed their concern for the safety of approximately 1,000 Americans, mostly medical students, living in Grenada. The day after Bishop was murdered, a U.S. Navy task force, with Marines, was ordered to Grenada.

U.S. military intervention in Grenada in 1983, code-named "Urgent Fury," was hastily planned but overwhelming. The invasion force included the *Independence* Carrier Battle Group; the helicopter carrier *Guam* and Amphibious Squadron Four; 1,700 Marines of the 22nd Marine Amphibious Unit; two army ranger battalions; a ready brigade of the 82nd Airborne Division; various special operations units; and token forces from the OECS. It turned out that the island was defended by only about 500 to 600 Grenadian troops; 2,000 to 2,500 militiamen; and 750 to 800 Cubans, mostly military construction workers.

U.S. forces began landing on Grenada on 25 October. Their objectives were to seize the airports, destroy Radio Free Grenada, and ensure the safety of resident U.S. citizens. By 28 October, Grenada was firmly under the control of U.S. and OECS forces. Although ultimately successful, there were a number of serious problems with Urgent Fury, among them inadequate and poorly disseminated intelligence information and failures of communications and coordination failure among army, navy, and Marine units. The brief battle for Grenada cost the lives of 18 U.S. servicemen, including eleven soldiers, 3 Marines, and 4 Navy SEALs; another 116 U.S. servicemen were wounded. Cuban casualties were 25 dead and 59 wounded; Grenadian casualties 45 dead and 350 wounded.

GRENADES AND GRENADE LAUNCHERS. Essentially small bombs, grenades contain two basic parts: a body and a fuse. A hollow container holds the explosive charge and provides the piercing shards of metal. Screwed into the grenade's body is a fuse that burns at a controlled rate, allowing the weapon time to reach its target before exploding. Besides such fragmentation grenades, smoke, chemical, and incendiary types are also produced. To increase range, the World War II service rifle was fitted with an adapter to fire grenades, but it proved unpopular because of recoil and the special blank cartridge required. After 1945, hand grenades were improved by making the body from sheet metal, but wrapping the explosive charge with pre-notched wire, increasing the amount of fragmentation. During the * Vietnam War, special grenade launchers resembled large, single-barrel shotguns that propelled a grenade almost 1,500 feet. Additionally, modifications were made to the service rifle's muzzle to accept a rifle-projected grenade propelled by ball ammunition caught in a "bullet trap."

GROUND ATTACK AIRCRAFT. World War I established the requirements for ground attack airplanes: armored aircraft, capable of high speed but also maneuverable and agile at low speeds and altitudes, equipped with multiple "machine guns and bomb delivery capability. In World War II, the German Ju-87 "Stuka" dive-bomber spearheaded the early success of blitzkrieg operations and triggered increased interest in ground attack aircraft. Improved air defense capabilities and changes in battlefield doctrine created a less permissive operating environment, making the advantages of designated ground attack aircraft less obvious as World War II progressed. The "Korean War revived the controversy over fast versus slow air speeds, high- versus low-altitude strikes, air-ground communication, and air control links.

In recent years, the U.S. Air Force has preferred to build air-ground capabilities into its general purpose fighter and medium bomber aircraft, like the F-111 and the F-16. Still, its fixed-wing gunships (the AC-47 and the AC-130) played an important role in the "Vietnam War, and the A-10 Thunderbolt attack aircraft did yeoman's duty in the "Persian Gulf War. The army has developed the AH-64 "Apache" attack helicopter and other rotary-wing aircraft; the Marine Corps has acquired both fixed-wing ground attack aircraft, including the AV-8B "Harrier," and attack "helicopters such as the AH-1 "Cobra."

Airmen and soldiers agree on the potentially decisive nature of air-ground attack, but have reached no consensus on the best platform for delivering such firepower. The increasing lethality of the modern battlefield for all aircraft in the era of "heat-seeking technology and laser-guided "missiles keeps the debate over air-ground aviation alive.

GUADALCANAL, BATTLE OF (1942-43). The Guadalcanal campaign, unexcelled for sustained violence on land, sea, and in the air in World War II, lasted for six months: August 1942 to February 1943. The struggle arose because Adm. Ernest J. King countered a planned Japanese thrust down through the South Pacific to isolate Australia by initiating an offensive following the U.S. naval victory at the Battle of "Midway. King targeted Guadalcanal, a jungle-entangled island ninety miles long and twenty-five miles wide in the Solomon Islands in the southern Pacific. Radio intelligence showed the Japanese planned to prepare an airfield there to intercept U.S. convoys to Australia. The landing by the 1st Marine Division achieved tactical and strategic surprise and seized the nearly completed airfield. Immediately thereafter, in the first of a series of dramatic reversals, a Japanese task force defeated Allied warships off Savo Island and forced the withdrawal of the transports. The Marines were left isolated.

The airfield, renamed Henderson Field and located in the northwest corner of Guadalcanal, proved a key to the campaign. From its runway, a conglomerate of Marine, navy, and army squadrons defended the local air space, eventually permitting resupply and reinforcement. Air attacks denied the Japanese daylight access to the island, and compelled them to resort to night runs by destroyers—

dubbed the "Tokyo Express"—to reinforce and maintain their forces. Over the next three months, the Japanese sought to recapture Henderson Field with successive counterattacks. Each time, they were repulsed. Four U.S. divisions, two Marine and two army, successfully defeated the Japanese in bloody fighting.

The ultimate decision in the campaign came at sea. The Americans won a carrier clash at Eastern Solomons in August, and a night encounter in October at Cape Esperance. When the South Pacific theater commander, Vice Adm. Robert L. Ghormley, faltered, Pacific naval commander Adm. Chester "Nimitz replaced him with the dynamic Vice Adm. William F. "Halsey. But "Bull" Halsey's positive impact on morale was initially balanced by a defeat in carrier battle at Santa Cruz. In a wild series of air and sea battles between 12 and 15 November, Halsey threw in everything he had. American arms prevailed—barely—at a fearful cost.

The Japanese would win another night sea action at Tasafaronga, but they decided to evacuate their surviving troops. This they did successfully in the last week of the campaign in the face of local Allied air and sea superiority, and under pressure of an American ground offensive. The campaign cost the Japanese over 680 aircraft and 24 warships; American losses were 615 planes and 25 ships. The United States lost an estimated 5,000 sailors and about 2,500 soldiers, Marines, and airmen killed in action; the Japanese lost about 30,000 men.

The lasting importance of the U.S. victory at Guadalcanal rested in its vindication of American will and morale; in the severe attrition it inflicted on the Japanese, especially on experienced pilots; and in the American destruction of the myth of Japanese invincibility.

GUADALUPE-HIDALGO, TREATY OF (1848). The treaty that ended the "Mexican War with the United States was signed in Guadalupe-Hidalgo, a suburb of Mexico City, on 2 February 1848. President James K. Polk had already discharged negotiator Nicholas P. Trist, but the U.S. envoy used his imminent departure to persuade a fragile Mexican provisional government to consent to a substantial loss of territory rather than continuing a disastrous war or risking a more draconian peace. U.S. forces already controlled the capital, the major ports, and the northern half of Mexico. Polk, facing a fractious Congress and fearing the costs of an open-ended occupation, reluctantly accepted Trist's handiwork.

The U.S. agreed to pay Mexico \$15 million and assume adjusted claims of U.S. citizens of \$3 million. The territorial settlement—a Rio Grande boundary for Texas, and the annexation by the United States of Mexico's northern provinces—New Mexico and Alta California—was the most important and durable legacy of the treaty. The pact's most controversial provisions were those that assured political and religious liberty and the security of property to Mexicans who remained in the transferred territories. During the ratification process, the U.S. Senate modified Article IX, which had originally promised U.S. citizenship

to these people "as soon as possible," and struck out entirely Article X, which had guaranteed Mexican land grants in all of its former territories, including Texas. The U.S. Senate ratified the treaty (38 to 14) on 10 March 1848.

Although U.S. emissaries sought to reassure Mexico through the "Protocol of Querétaro"—signed in that city when the two countries exchanged ratifications of the treaty in May 1848—that civil and property rights were not threatened by the Senate's modifications, these presumed privileges were in fact sharply circumscribed in the decades following the war.

The term GUERRE DE COURSE describes a form of maritime warfare aimed at disrupting seaborne commerce. Derived from the French word for "privateer" (*cOURSE*), it is usually rendered as "commerce raiding" in English. Operationally, *guerre de course* resembles *blockades in that it is primarily a form of economic warfare, in which combat with enemy warships is at best a secondary consideration. Tactically, however, its methods differ from those of a blockade. Blockades seek to apply continuous pressure, either along the entire coastline of the enemy or at key chokepoints through which ships must pass on their way to the open sea. Blockades succeed less by sinking or seizing enemy vessels than by discouraging them from embarking in the first place. If a blockade is to endure for any length of time, it always requires the deployment of forces markedly superior to those of one's adversary.

Guerre de course, in contrast, is usually adopted by countries too weak to attempt such continuous, large-scale operations; or unwilling to risk the kind of fleet action that may be necessary to impose or break a blockade. It is conducted by individual ships (naval warships or privately owned ships armed with guns and authorized by government letters of marque to engage in legal privateering) or small squadrons. These operate in hit-and-run fashion along oceanic shipping lanes, or in coastal or archipelagic waters, where geography affords some means of escape should superior naval forces appear. Strategically, *guerre de course* represents an alternative to operations directed against the main naval forces of the enemy. *Guerre de course* in the form of privateering was widely employed by Americans in the *Revolutionary War and the *War of 1812.

Fundamentally attritional in nature, *guerre de course* aims to erode the enemy's warmaking capacity by depriving it of materiel, financial assistance, or military support from overseas; to undermine public morale by inflicting economic losses and depriving the population of necessary or familiar goods; and to divert a disproportionate share of the enemy's naval strength, which might otherwise be employed in more aggressive operations. It normally requires several warships, and sometimes a great many, to find and sink a single commerce raider—an imbalance that arises regardless of whether one seeks to hunt down the raiders or simply to fend them off by means of convoys. In theory, defense against a vigorously conducted *guerre de course* might stretch the resources of a superior navy to the point where it could not conduct offensive operations of its own.

In practice, it at least affords a cost-effective means of harassment, one whose psychological impact usually exceeds whatever material results are achieved.

Guerre de course is most frequently attempted as a counter to an enemy-imposed blockade. During the *Civil War, Confederate privateers conducted long-range sweeps against Union shipping around the world, in order to disrupt northern trade and draw off Union warships that might otherwise have contributed to the blockade of southern ports. The exploits of the Confederate raiders became legendary. The most famous was the British-built *Alabama*, an eight-gun Barkentine-rigged, sail and steamship that roamed the high seas for 22 months, seizing or sinking nearly 70 Union merchantmen along the way until it was sunk by the USS *Kearsarge* in June 1864. By the end of the war, more than a third of all northern seaborne trade had been shifted to neutral-flag vessels, a tribute to the predatory brilliance of men like Raphael Semmes, the *Alabama's* captain. (After the war, in the *Alabama* claims, an arbitration panel awarded the United States \$15 million for merchant ships sunk by Confederate raiders built in British shipyards.)

Like Sir Francis Drake, Semmes was a private individual sailing what amounted to an armed merchantman (albeit under the Confederate flag) rather than a commissioned officer commanding a naval warship. To that extent, he was a figure of the past. The peace settlement that ended the Crimean War in 1856 included a declaration outlawing commerce raiding by irregular forces or privateers—a declaration the United States had refused to ratify because it believed efforts to codify the *guerre de course* favored the large professional navies of Europe over the American privateering tradition.

From the outset of the Industrial Revolution, however, it had been clear that the rising value of world maritime trade would make it an increasingly important target for regular navies; and also that such attacks would come in for an increasing share of legal scrutiny. The Declaration of 1856 was but the first in a series of attempts (including at the *Hague Peace Conferences of 1899 and 1907, and the London Naval Conference in 1908) to make explicit the rights and obligations of all those caught up in a form of warfare that was, by definition, directed against unarmed ships crewed by civilians.

These matters were rendered vastly more weighty in the twentieth century by the advent of torpedo-armed *submarines, which brought to the *guerre de course* a ferocity and decisiveness it had not previously possessed. A surface cruiser operating under the rules of engagement accepted by nineteenth-century navies was expected to board a prospective target, determine if its nationality and cargo made it a legal prize, and see to the safety of the crew before taking further action. However, the early months of World War I revealed that similar conduct by German submarines exposed them to enormous risks, and reduced their tactical effectiveness far below what was possible if such scruples were set aside. *Guerre de course* accordingly lost its traditional character as a relatively bloodless and vaguely romantic sort of peripheral operation, and became a desperate and murderous struggle capable of deciding a major war.

This trend culminated in the devastating campaign against Japanese commerce conducted by American submarines (and to a lesser extent by carrier-based aircraft)

during World War II—a rare example of *guerre de course* waged by the stronger side, but also suggestive of the degree to which the tactic was now losing its distinctiveness, and its historic rationale. By 1945, *guerre de course* had become little more than one of the modalities of total war, and scarcely the most efficient, given the capabilities of modern airpower. No first-class navy today regards the maritime trade of its adversary as an important target, and no second-class navy, facing a strong opponent, would consider it a feasible or fruitful one. If the spirit of Drake and Semmes survives, it does so in the small diesel submarines and fast, well-armed patrol boats that increasingly populate the littoral regions of the world—vessels whose targets, in all probability, will be not the commerce but the capital ships of their foe.

GUERRILLA WARFARE. Guerrilla warfare (the word guerrilla comes from the Spanish meaning "little war") is often the means used by weaker nations or military organizations against a larger, stronger foe. Fought largely by independent, irregular bands, sometimes linked to regular forces, it is a warfare of harassment through surprise. It features the use of ambushes, hit-and-run raids, sabotage, and, on occasion, terrorism to wear down the enemy. Typically, a small guerrilla force seeks to concentrate its strength against the weaker portions of the enemy's forces, such as outposts or lines of communication and logistics, to strike suddenly, and then to disappear into the surrounding countryside. In the American experience, this type of warfare has been used since the *French and Indian War (1754-63), when colonists adopted American Indian tactics to strike back against French forces and their Indian allies. Maj. Robert Rogers of Connecticut, considered a founder of the guerrilla tradition in America, organized Rogers's Royal American Rangers in 1756 and trained them to carry the war deep into enemy territory. His doctrine, published as *Rogers' Rules for Ranging* (1757), is considered a classic and is still issued to all soldiers attending the school for U.S. Army *Rangers (Fort Benning, Georgia).

During the *Revolutionary War, the guerrilla legacy was reflected in Col. Ethan *Allen's capture of Ticonderoga (1775); Col. Francis *Marion's operations against Col. Bonastre Tarleton's cavalry (1780); and Brig. Gen. Daniel *Morgan's victory at the Battle of *Cowpens (1781). Gen. Nathanael *Greene even developed principles of guerrilla warfare in his successful campaign against the British in the South (1780-81). During the *Civil War, the outnumbered Confederate forces featured several guerrilla leaders, including Col. John Singleton Mosby and Gen. Nathan Bedford *Forrest. A particularly fierce guerrilla war was waged in the border states of Kansas and Missouri, where Southern sympathizers organized into partisan bands that attacked Federal supply trains and harassed Union sympathizers. The more prominent partisan leaders were William Quantrill and William "Bloody Bill" Anderson. The former is best known for his daylight raid and de-

struction of the city of Lawrence, Kansas (1863), and the fact that his followers included Frank and Jesse James and the Younger brothers, destined to become prominent outlaws in the postwar years.

After the Civil War, the much-reduced regular army was fully engaged in supporting the westward expansion of the United States, a mission that entailed years of fighting against American Indian tribes that opposed encroachment. Considered one of the premier practitioners of guerrilla warfare, the American Indian proved a formidable and elusive foe. Before being ultimately defeated, the Indians occasionally inflicted stunning reverses on units of the regular army—in the Fetterman fight (1866) for example, and the defeat of Custer's 7th Cavalry at the Battle of the *Little Bighorn (1876). Those army officers who were most successful at countering the Indians did so primarily through their adoption of unconventional tactics. Among these innovators were Gen. George Crook, who pioneered the use of pack mules to enhance the mobility of his columns and employed Apache Indian scouts against hostile Apache clans led by Geronimo; and Gen. Nelson Miles, who struck at hostile tribes during the winter months when the warriors' mobility was restricted by deep snows and lack of forage for their ponies. Significantly, although the *Plains Indians Wars lasted well over thirty years, the army regarded this sort of warfare as a temporary condition and never developed a coherent doctrine for countering a guerrilla foe. Even protracted operations against Philippine *insurrectos* in the *Philippine War (1899-1902) and Mexican general Francisco "Pancho" Villa's irregular forces (1915-16) failed to engage the interest of army theorists.

It was the U.S. Marine Corps, engaged in a number of expeditionary missions in Asia and Latin America during the late nineteenth and early twentieth centuries, that began to codify the techniques, tactics, and procedures necessary for conducting counter guerrilla operations. The Marine's efforts culminated in the publication of the *Small Wars Manual* (1940), a work that is still issued to Marine officers.

In World War II, some U.S. servicemen in the Philippines retreated into the hills after the Japanese conquest, set up guerrilla organizations, and continued to harass the enemy throughout the occupation. At the same time, the army and Marine Corps began to form and train units for irregular or guerrilla war operations, most notably Brig. Gen. Frank Merrill's "Marauders" and Col. William "Wild Bill" Donovan's Office of Strategic Services. The latter fielded a number of three-man "Jedburgh Teams" (contrary to more romantic theories, "Jedburgh" was selected from a series of randomly generated code names), who were inserted behind Axis lines in Asia and Europe to perform *covert operations, organize and advise resistance groups, conduct acts of sabotage, and collect military and political intelligence.

After World War II, the American military gave little thought to guerrilla war theory, despite the examples of the French in Indochina and Algeria, the British in Malaya, and the defeat of the Huks in the Philippines. Even the brief involvement of U.S. military advisers from the fledgling *Special Operations Forces (formed by direction of President Eisenhower in June 1952) in the Greek civil war made little impression on American military thought. It was not until the United States had become engaged in

Southeast Asia that military planners began grappling seriously with the problem of guerrilla warfare and counterinsurgency. The immediate result was President John F. Kennedy's decision to expand the U.S. Special Forces (1961). Called "Green Berets" because of their distinctive headgear, these are carefully selected and highly trained troops organized into ten-man operational "A-Teams" (logistics and other support activities being handled by larger "B-Teams"). Each soldier was required to be an accomplished parachutist and capable of speaking at least one foreign language. Additionally, each team member was cross-trained in two military occupational specialties (e.g., a radio operator might also be certified as a demolitions expert). Special Forces operational teams were organized and trained to act as advisers and planners for indigenous guerrilla units and achieved some measure of success, especially among the Hmong and Montagnard tribesmen of the Vietnamese highlands. These minor successes were not enough to turn the tide of battle, and with the end of the "Vietnam War" (1975), the Special Forces were relegated to a secondary status in the armed forces.

In the 1980s, in response to increased guerrilla activity in Central and South America, the U.S. military experienced a resurgence of interest in the problem of guerrilla warfare, now under the rubric of "*Low-Intensity Conflict* (LIC)—in turn superseded by *Operations Other Than War* (OOTW), and then by *Military Operations Other Than War* (MOOTW), encompassing "peacekeeping, peace enforcement and humanitarian assistance, or stability and support operations—which resulted in the formation of a separate Special Operations Command (SOCOM), and the establishment of a separate source of funding to support special operations missions, training, and equipment.

GUILFORD COURTHOUSE, BATTLE OF (1781). A pivotal "Revolutionary War battle, the engagement at Guilford Courthouse, North Carolina, strategically altered the war's course and ultimately led to victory in the South and at the Battle of "Yorktown.

Stymied in the North, England in 1780 initiated a "Southern strategy," the state-by-state reinstallation of loyalist governments. Georgia and South Carolina fell, and North Carolina and Virginia awaited invasion by Gen. Charles "Cornwallis. In December 1780, Maj. Gen. Nathanael "Greene assumed command of a tiny, demoralized segment of the Continental Army in the South. Brilliant and innovative, Greene restored discipline and morale, then divided his small force and took the strategic initiative. Following the U.S. victory at the Battle of "Cowpens (January 1781), Cornwallis cut communications and launched a pursuit. Greene concentrated his detachments and in a punishing, epic march led the enemy deep into North Carolina.

At Guilford Courthouse on 15 March, Greene sought battle. He copied Daniel "Morgan's successful Cowpens tactics—militia backed by Continentals with cavalry in reserve—but without Morgan, who was ill. Cornwallis launched a frontal assault. The militia bolted, but Greene's staunch Maryland and Delaware Continentals held. Desperate, Cornwallis's artillery fired into the melee, killing friend and foe alike. Greene withdrew, leaving Cornwallis a hollow victory (American casualties numbered 261; British 532). Cornwallis left for Virginia, and Greene returned south. In six months, he had liberated the entire region, confining the British to two seacoast strongholds, Savannah and Charleston.

GULF OF TONKIN INCIDENTS (1964). In 1964, under OPLAN (Operations Plan) 34A, the United States was sending small vessels with Vietnamese crews into the Gulf of Tonkin on covert raids against the North Vietnamese coast. On the afternoon of 2 August, the U.S. Navy destroyer *Maddox*, on what was called a DeSoto patrol, was gathering various information, including electronics intelligence (elint) about the coastal radar defenses, and signals intelligence (sigint) from intercepted radio messages. North Vietnamese "torpedo boats attacked the *Maddox*, unsuccessfully, near an island that had been shelled in an OPLAN 34A raid three nights before. U.S. aircraft briefly pursued the retreating torpedo boats attempting to sink them, but otherwise there was no retaliation.

A second incident was reported on the night of 4 August. The men on the destroyers *Maddox* and *Turner Joy* who described torpedo boats attacking them certainly believed this at the time. Many later decided they had been shooting at ghost images on their radar. Many others who were there, and some later historians like Marolda and Fitzgerald, believe there was a genuine attack. The preponderance of the available evidence indicates there was no attack.

In retaliation for the supposed second attack, U.S. aircraft attacked North Vietnamese naval vessels at several locations along the coast 5 August, plus a fuel storage facility at Vinh. On 7 August, the House of Representatives passed 416-0, and the Senate 98-2, the so-called Tonkin Gulf Resolution, giving the President Lyndon B. "Johnson a blank check for further military action in Vietnam.

HABEAS CORPUS ACT (1863). In the early months of the *Civil War, President Abraham *Lincoln suspended the privilege of the writ of habeas corpus in the border states and subsequently throughout the North. A writ of habeas corpus orders a person detaining another, the petitioner, to bring that person before a judge, who can determine the lawfulness of the detention. The suspension of this privilege allowed the government to take into custody persons suspected of disloyal activities and hold them until they no longer posed a threat to the Union. In response to complaints about arbitrary arrests and doubts about the president's authority to suspend the writ, Congress enacted the Habeas Corpus Act in March 1863. The act legitimized Lincoln's suspensions of habeas corpus and approved future suspensions for the duration of the war. It also sharply limited the time a prisoner could be held without trial by requiring that civilians arrested and detained by the military be released if grand juries failed to indict them. Finally, the act afforded protection to federal officials who were sued in state court for arresting and detaining civilians and for acts performed while enforcing federal * conscription and emancipation policies. It authorized removal of these suits to federal courts (where defendants were less likely to face hostile judges and juries) and stipulated that any order made under authority of the president was a defense against such suits.

HAGUE PEACE CONFERENCES (1899, 1907) were the largest diplomatic conferences between the Congress of Vienna and the outbreak of World War I. Czar Nicholas II of Russia, calling for limitation of armaments, proposed the first conference (1899) at the Dutch seat of government. Representatives of twenty-six governments attended. President Theodore *Roosevelt, responding to wishes of peace movement leaders, in 1904 proposed a second conference, and the czar officially called the 1907 conference. Forty-four governments attended.

The Russians originally proposed discussion only of limitation of armaments at the 1899 conference, but expanded the agenda to include the laws of war on land; extension of the 1864 *Geneva Conventions to the sea; and international arbitration. These topics made the conference acceptable to governments determined to oppose arms limitation. At the same time, peace movement leaders and some journalists, who labeled the proposed meet-

ing a "Peace Conference," welcomed addition of arbitration to the agenda. The 1899 conference accomplished little in regards to armaments. The German delegates opposed limits on armies; the British on navies. U.S. naval delegate Capt. Alfred T. *Mahan, famed historian of seapower, made clear his opposition to limiting armaments. The Russians proposed bans on new firearms, *submarines, and ships with rams, and prohibitions against throwing projectiles or explosives from balloons or "similar means." The conference did nothing about new firearms or submarines but negotiated declarations against expanding ("dumdum") bullets, poison gas, and the aerial use of explosives from balloons. Renewal of the balloon declaration was the only arms limitation of the 1907 conference. German opposition convinced the Russians that limitation should not appear on the 1907 program; an Anglo-American resolution recognizing the seriousness of the *arms race was only a gesture.

The Hague conferences made important advances in codification of the laws of *land warfare. General Orders No. 100, The Union army code announced in 1863 strongly influenced the unratified Declaration of Brussels (1874). The 1899 conference concluded a comprehensive convention based on that declaration, which proved its worth during the Boer and Russo-Japanese Wars. The 1907 conference revised that convention and concluded two related conventions: one concerned neutral rights and duties on land; the other required formal declarations before beginning hostilities. Angry over the surprise Japanese attack on Port Arthur, Manchuria, in 1904, the Russians urged agreement on this convention. Generally respected during World War I, this convention was often disregarded thereafter, notably by the Japanese when they attacked on * Pearl Harbor in 1941. The 1899 conference achieved little for the laws of war at sea. The Russian program called for extension of the 1864 Geneva convention which protected victims of war on land to the sea, and this was done; but there was little discussion of larger matters. An American proposal that the conference consider immunity of private property at sea from capture—a traditional U.S. principle—was blocked by the British.

The 1907 conference, however, dealt seriously with war at sea, for the Russo-Japanese War had presented neutrals with numerous maritime problems. The conference concluded a new convention about the Geneva rules at sea and conventions about the status of merchant ships at the beginning of hostilities, conversion of such vessels into warships, submarine mines, and the maritime rights and duties of neutrals. British, German, and American delegates obtained Convention XII, which provided for an international prize court, but there was general recognition that

the restrictions on capture in Convention XI were inadequate for decisions by the proposed court. The British called a special conference to consider *blockades and contraband. The result was the Declaration of London (1909), a careful statement of prize law; but when the British House of Lords blocked ratification, other governments also delayed action. During the first months of World War I, American efforts to secure the adherence of the belligerents failed, largely because of British objections. The project for an international prize court was soon forgotten.

International arbitration agreements were major achievements of the Hague conferences. The 1899 conference framed a convention setting forth principles and procedures. British and American proposals resulted in the Permanent Court of Arbitration—a list of judges named by signatory powers from which parties to an arbitration could select a panel of judges. U.S. delegates at the 1907 conference called for a worldwide agreement to make arbitration obligatory in a very limited sense and a Court of Arbitral Justice that would have had a few judges sitting continuously. The Germans defeated agreement on obligatory arbitration; several small nations, particularly in Latin America, defeated the court proposal by insisting upon equal representation for all member governments. The United States, however, secured a convention requiring that no nation use force to collect debts unless arbitration had been offered and refused.

The 1907 conference called for a third conference in 1915, but the outbreak of war in 1914 prevented that meeting. Much of the work of the Hague conferences survived. The *League of Nations in 1920 adopted a world court statute based on the 1907 court project. The United States never adhered to that statute but in 1945 accepted the *United Nations version. The Hague conventions on warfare were of large importance during the two world wars and other wars. Since World War I, the Hague idea of limiting armaments through multinational negotiations has often inspired the calling of large international conferences.

HAIG, ALEXANDER MEIGS (1924-), U.S. Army officer, secretary of state, business executive. Born near Philadelphia, Haig attended Notre Dame University and then graduated from West Point in 1947. He soon joined the staff of Gen. Douglas *MacArthur in Japan and served under him in the *Korean War. Subsequently, Haig taught at West Point, held a succession of line, staff, and school assignments in the United States and Europe, and earned an M.A. in international relations from Georgetown University. In 1966-67, he served as a battalion and then brigade commander during the *Vietnam War, returning to West Point as deputy commandant.

Between 1969 and 1974, already known as an able officer knowledgeable about the political-diplomatic aspects of

military affairs, Haig served in the Nixon White House as an assistant to national security adviser Henry *Kissinger. He had an important role in the 1972-73 negotiations culminating in the *Paris Peace Agreements. Appointed a four-star general, Haig served as Richard M. *Nixon's chief of staff, 1973-74. After Nixon's resignation, Haig was appointed commander of *NATO forces. Retiring from the army in 1979, he became president and CEO (1979-81) of United Technologies, a major defense contractor.

Under President Ronald *Reagan, Haig served as secretary of state, 1981-82, taking a hard line toward the Soviet Union and insurgencies in Central America. In 1982, he supported Britain during the Falklands/Malvinas War and Israel in its invasion of Lebanon. Disputes with Defense Secretary Caspar *Weinberger and national security adviser William Clark led to Haig's resignation. Afterward, he served on a number of corporate boards and was briefly a Republican candidate for president in 1988.

HAITI, U.S. MILITARY INVOLVEMENT IN. Given Haiti's location and the growing U.S. role in the Caribbean, Washington at the end of the nineteenth century paid increased attention to the island republic. By 1890, Americans provided half its imports and dominated its banks and railroads. When dictator Guillaume Sam was hacked to death in an uprising in 1915, President Woodrow *Wilson, concerned about U.S. investments as well as possible German seizure of the island, directed Rear Adm. William B. Caperton to land Marines and sailors from the USS *Washington* to protect lives and property. They were followed by a brigade of Marines.

Real authority in Haiti then rested with the Americans, although they permitted the election of President Philippe S. Dartiguenave. Normally, the *cacos* (rebel bandits) would have faded back into the hills; but angered by white American occupation, they lashed out, particularly in northern Haiti. The Marines quelled sporadic violence for over a year. In 1916-18, U.S. occupation forces attempted to win over the peasantry and implement construction programs, but they remained unpopular. The resident U.S. naval commander dissolved the Haitian Congress and dictated a new constitution. By 1918, opposition leader Charlemagne Peralte mounted a rebellion in the north, while his lieutenant, Benoit Batraville, led a revolt in central Haiti. The Gendarmerie (local constabulary trained and officered by Marines), supported by the Marine brigade, tracked down and killed Peralte (1919) and Batraville (1920).

During the depression, President Herbert *Hoover appointed the Forbes Commission, which concluded that the occupation, failing to respond to Haiti's problems, should be abolished. U.S. troops began to transfer responsibilities to Haitian nationals. The last Marines left Haiti under President Franklin D. *Roosevelt's order in 1934, although U.S. fiscal control remained until 1947.

The United States took a renewed interest in Haiti during the *Cold War. Washington reluctantly backed a series of military strongmen, including François ("Papa Doc") Duvalier, a disarmingly simple country doctor without apparent military connections who was elected president in

1957. In 1958, Duvalier asked that Marines retrain and reorganize the Haitian Army, and again the Marines handled public works as well as police functions while trying to develop an army that would resist communism. Duvalier became increasingly dictatorial, using a paramilitary secret police to impose terror. Although the United States government was reluctant to cut off aid to Haiti after Cuba became Communist in 1959, it withdrew its military mission and virtually shut down its embassy. "Papa Doc" died in 1971; he was succeeded by his son, Jean Claude ("Baby Doc") Duvalier.

Unprecedented famine and terrorism in the 1970s and 1980s drove desperate peasants to flee to the United States. Duvalier responded to the Carter administrations outrage with inconsequential reforms. In 1983, Pope John Paul II visited Haiti. His attention to human rights emboldened Haiti's Catholic clergy to call for improvements in social conditions and a grassroots movement responded.

The Reagan administration distanced itself from Duvalier, now clearly weakened by internal unrest, and the United States orchestrated his departure in 1986. A National Council of Government took over, but showed little interest in reform. The growing liberation theology began to coalesce around Father Jean-Bertrand Aristide, who was elected president in December 1990, in Haiti's first free election. Overthrown in September 1991 by a military coup, Aristide fled to the United States.

In 1994, the Clinton administration, confronted with a continuing exodus of seaborne Haitians seeking refuge in the United States, obtained economic sanctions and then authorization from the "United Nations for military force to remove the junta. With a U.S. military and naval force offshore, and paratroopers en route to the island, a last-minute mission headed by former president Jimmy "Carter achieved an agreement with the junta on 18 September for its resignation. U.S. troops came ashore without opposition. Aristide returned 15 October. A U.S. intervention force of 20,000 remained in Haiti from September 1994 to March 1995, when it was replaced by a UN "peacekeeping force of 6,000, including 2,400 U.S. troops. The poorest nation in the hemisphere, Haiti remained impoverished and plagued by periodic strikes and violence, but it had a democratically elected government at last.

HALSEY, WILLIAM F. (1882-1959) fleet admiral, U.S. Navy, World War II. Born in Elizabeth, New Jersey, Halsey graduated from the Naval Academy in 1904. In the 1930s, he learned to fly and became a leading advocate of "carrier warfare. During the Japanese attack on "Pearl Harbor, he was at sea, commanding the carrier *Enterprise*. In the spring of 1942, he helped orchestrate a series of carrier raids in the Pacific against enemy strongholds, including the famous James "Doolittle bomber attack on Tokyo. Later, as commander of the South Pacific theater in 1942-44, he directed

forces that captured Guadalcanal, Bougainville, and several other key islands in the Solomons.

During and after the Battle of "Leyte Gulf (October 1944), Halsey was criticized for sailing his fleet northward in pursuit of enemy decoy carriers and leaving the San Bernardino Straits open to defended attack by a main enemy force. Later that year, he was again questioned for heading into a typhoon and losing three ships. By war's end, however, the aggressive commander, known as "Bull" Halsey, was hailed as a popular hero, awarded a fifth star, and promoted to the rank of fleet admiral.

In retirement, Halsey often defended his Leyte Gulf decision, claiming that under the circumstances it was the best of all options. Above all, he was an energetic and demanding leader, who had the ability to invigorate the U.S. Navy's fighting spirit when most required.

HAMBURGER HILL, BATTLE OF (1969). For ten days in May 1969 during the Vietnam War, units of the 101st U.S. Airborne Division and the Army of the Republic of Vietnam (ARV) attacked North Vietnamese Army units dug in on a mountain called Dong Ap Bia, in A Shau Valley, Thua Thien Province—part of I Corps Tactical Zone in northernmost South Vietnam. Heavy losses among all combatants gave the mountain a new name: Hamburger Hill.

Long the scene of fierce battles between U.S. and their South Vietnamese allies and North Vietnamese forces, the A Shau closely parallels the Vietnam-Laos border. This made it easy for North Vietnamese units to cross from their Laotian sanctuary, lure allied units into battle, inflict heavy casualties, then vanish into sanctuary. On Hamburger Hill, the North Vietnamese strategy was again effective: 56 Americans died, and 420 were wounded; South Vietnamese losses were also high. An estimated 600 North Vietnamese soldiers died and many more were wounded. Over 270 close air support sorties and 22,000 rounds of "artillery were delivered to support a poorly coordinated piecemeal ground assault by about ten battalions—four of them U.S. Both sides abandoned the fight—and the hill.

The newly installed Nixon administration was severely criticized for announcing the beginning of "Vietnamization"—a policy of turning the war over to the South Vietnamese, then wasting U.S. lives attacking an entrenched enemy on what appeared useless terrain. The controversy seemed to stiffen President Richard M. "Nixon's determination to remove U.S. forces from Vietnam quickly.

HAMILTON, ALEXANDER (1755-1804), Revolutionary soldier and statesman. Born in Nevis, Hamilton migrated to New York in 1772, where he studied at King's College until lured into the Revolutionary War. Hamilton caught Gen. George "Washington's eye, and in 1777 became his aide-de-camp. In 1781, Hamilton led an infantry regiment to victory against a British redoubt at the Battle of "Yorktown.

Hamilton's wartime experiences convinced him that only a strong central government led by a natural aristocracy could preserve American liberty. In 1782, he entered the Confederation Congress, a body he worked to invigorate; Hamilton's Annapolis Convention report (1786) summoned the 1787 Constitutional Convention. At the Philadelphia meeting, he pushed a powerful national government; thereafter he wrote fifty-one of the celebrated *Federalist Papers*.

As the first Treasury secretary (1789-95), Hamilton issued three brilliant, controversial reports to Congress, aimed at strengthening the national government. The first, favoring funding of the federal deficit at par and assuming state debts, helped establish national credit; the second proposed a national bank; the third (never enacted) advocated bounties and subsidies to boost manufacturing. Taken as a whole, Hamilton designed his program to win the public creditors to the government's support and to help the nation develop economically. His financial and diplomatic policies inspired the formation of the Republican opposition.

Hamilton's vision for national grandeur included a military establishment. Through a series of crises—including the *Whiskey Rebellion, which Hamilton personally helped quell—the Federalists built a professional force despite the public's fear of standing armies. Appointed Inspector General in 1798 under Washington, Hamilton broke with John *Adams when the president negotiated America's differences with France instead of waging war. In 1804, fearing a secessionist conspiracy, Hamilton opposed Aaron Burr's bid to become New York's governor. After his defeat, Burr challenged Hamilton to a duel, wounding him mortally at Weehawken, New Jersey.

HAMPTON ROADS, BATTLE OF (1862). Confederate Secretary of the Navy Stephen R. Mallory believed ironclads could break the Civil War blockade by the Union navy. On 11 July 1861, he ordered the conversion of the captured USS *Merrimack* into the ironclad CSS *Virginia*. His Federal counterpart, Gideon *Welles, on 4 October 1861 directed John *Ericsson to build the ironclad USS *Monitor*. Although the Europeans had started to build iron ships, the battle between these two vessels on 9 March 1862 in Hampton Roads, Virginia, near Norfolk, was the world's first combat between armored warships.

The two vessels incorporated the latest naval advances: steam-powered, screw-propelled, and ironclad-hull. The *Virginia* (*Merrimack*) carried ten major guns (four in each broadside, one bow and one stern gun) and an iron ram. The low-silhouetted *Monitor* resembled a "cheesebox on a raft" with its rotating centerline gun-turret, housing two 11-inch guns.

On 8 March 1862, the *Virginia* sortied against the Union navy's blockade. It sank the USS *Cumberland* with its ram, burned the *Congress* with incendiary shells, but it disengaged when it could not approach the grounded *Minnesota*. The next day, Lt. Catesby ap Rogers Jones succeeded the wounded captain in command of the *Virginia* and found the waiting *Monitor*, which had just arrived

with Lt. John L. Worden in command.

For four hours the two ironclads pounded each other at close range (at times only 15 yards apart). The larger *Virginia* tried without success to ram the *Monitor* and to board. Neither ship could sink the other, nor pierce the armor plate, but the *Virginia*, taking on water from hull damage, withdrew. Although the engagement between the two ships was inconclusive, the withdrawal of the *Virginia* for substantial repairs left the blockade in place and was proclaimed a victory by the Union. The "battles of the ironclads" presaged an eventual revolution in naval warfare. When the Confederates abandoned Norfolk in May, they destroyed the *Virginia*; the *Monitor* foundered off the Carolina capes later in 1862.

HEAT-SEEKING TECHNOLOGY is most commonly associated with the detection of infrared radiation. All objects with a temperature greater than absolute zero emit infrared energy, the most common characteristic of which is heat. Detection of this heat can be utilized for many purposes.

Military adaptations of infrared technology began during World War II. A device called the Sniperscope was developed by the Allies, enabling the soldiers to see and shoot at night by distinguishing the heat differentials of the terrain. In addition to the Sniperscope and other night-vision devices, the potential of this technology for guidance purposes began to be realized. An infrared detector could be added to a missile, allowing the missile to seek out and follow the heat given off by the target. The U.S. military has since developed a number of such *missiles, beginning with the Sidewinder, an anti-aircraft missile successfully tested in 1953 and deployed in 1956. This new missile was quickly adapted for use by the other service branches, especially the air force. Since that time, missiles equipped with infrared seekers, including the Sidewinder and the Maverick, have been responsible for the destruction of aviation, maritime, and ground targets. Heat-seeking missiles have been used in every major U.S. military conflict since the *Vietnam War.

*Satellites equipped with infrared sensors use heat-seeking technology for reconnaissance. The infrared sensors can aid in standard intelligence-gathering purposes or to provide early warning of the launch of an attacking missile. This real-time technology was utilized during the *Persian Gulf War (1991), when satellites equipped with forward-looking infrared sensors detected the launch of Iraqi Scud missiles.

Infrared seekers offer a number of advantages over other guidance systems (such as *radar). First, infrared sensors cost less per unit; second, heat-seeking sensors operate well by day or night, in good weather and bad. In addition, they are effective despite electronic countermeasures. Finally, infrared seekers improve the safety of the pilots whose planes bear the missiles through the use of "fire-and-forget" capabilities. After releasing the missile, the pilot can leave the area while the missile guides itself to the target.

These sensors do not provide a perfect system. One disadvantage is that objects that emit little heat are difficult to detect: the Tomahawk cruise missile, for example, is therefore difficult to detect with an infrared sensor. Second problem is that heat sensors are sensitive to shock and can be thrown off course during flight by a nearby explosion or disturbance. Nevertheless, heat-seeking technology continues to play an important role in the observation and guidance systems of the U.S. military.

HELICOPTERS. With its ability to hover, take off and land rapidly, and fly close to the world's land and seas, the helicopter has extended the efficacy of air power by bringing it down to earth. In contrast to many other aviation developments which seemed focused on creating an independent role for airpower, for most of its existence helicopter aviation has concentrated on intimate involvement with land and sea forces.

The first complete helicopter ("gyroplane") performance was accomplished by Louis-Charles Breguet in 1935. Four years later, Igor Sikorsky captured the imagination of the military with several demonstrations of his VS-300, XR-4, and XR-6 helicopters before high-ranking officials of various U.S. and British defense units. After developing Sikorsky's ideas, the U.S. military put helicopters into service at the end of World War II, primarily for air rescue. In the Korean War, the United States expanded on tactics developed by the French during their involvement in Algeria, and began experimentally to arm its helicopters. These innovations, along with the deployment of troops by U.S. Marine Corps helicopters, and medical evacuations (medevacs) were key developments in helicopter applications. Helicopters were also used for resupply and observation; and the potential for command and control from above became clearer. The introduction of the helicopter into the battlefield gave the United States a valuable new offensive weapon.

The experiences with helicopters in the Korean War provided impetus for postwar experimentation. Several attempts were made to integrate offensive armaments with other helicopter systems. The U.S. Army, in particular, led by Brig. Gen. Carl I. Hutton, Commandant of the Army Aviation School at Fort Rucker, Alabama, aided by Col. J. D. Vanderpool, sought to construct and employ helicopters which could perform in the traditional cavalry roles, including reconnaissance, flank security, and shock as well as transportation of ground troops.

There was great resistance in political and military circles towards the development of a large, sophisticated, or autonomous army aviation element. One of the main sources of this antipathy was the feeling that all air operations belonged to the air force. Many in the army feared the consequences of a bitter schism similar to that which occurred when the air force itself became autonomous from the army in the previous decade. Proponents, however, argued that army aviation was necessary to fulfill the close air support mission; there was a pervasive feeling, felt most strongly in the army, that the air force was simply not interested in supporting small ground units in close combat.

The development of the UH-1 "Huey" helicopter gave

proponents of an airmobile division the craft, which ultimately persuaded policymakers that such an organization, within the Army, could flourish. Originally planned as an air ambulance, the Huey was later rigged as a gun ship and a troop carrier. The presence of the Huey in all of its multiple roles allowed the army to ask for a division-sized airmobile unit and to press for the infusion of helicopters into already existing ground units.

Within the army hierarchy individuals such as former paratroop commander Gen. James Gavin were advocates of an increasing role for army aviation. One of Gavin's proteges, Gen. Hamilton Howze, was a Director of Army Aviation and the chief of the Army Tactical Mobility Requirements Board, which during the Kennedy administration advocated an Airmobile Division. Tests for a new 11th Air Assault Division, which largely used UH-1 Hueys, under Gen. Harry Kinnard began in earnest with a key evaluator being an ardent army aviation supporter, Gen. Robert R. Williams.

In 1965, the army and the air force reached an understanding in which responsibility for helicopter operations were assigned to the army. At approximately the same time the 11th Air Assault Division was redesignated the 1st Cavalry Division (Airmobile), and with its 16,000 troops and more than 400 helicopters was assigned to Vietnam. A second Army division (101st Airborne) became airmobile and aviation assets were assigned to other army and Marine units in large numbers. In many respects the Vietnam War was a "helicopter war" and by 1970 the U.S. Army operated about 12,000 aircraft, the overwhelming majority of which were helicopters.

Helicopters provided American commanders in Vietnam a great deal of flexibility in their operations. They enabled the quick evacuation of wounded troops from the battlefield and saved thousands of lives, thereby holding the politically important death statistics down. Paradoxically, helicopters enabled U.S. troops to engage in combat in areas that otherwise would be inaccessible. The ability to land helicopters in any area with a small cleared space enabled the United States to establish bases known as LZs (landing zones), which produced a battlefield which distinctly lacked a clear demarcation between the friendly and enemy lines. The airmobile capability of helicopters created a more effective fighting force for Vietnam, but it also limited the imagination of tacticians who used this asset in cases where helicopters may not have been the wisest choice to employ. Nevertheless, the sound of helicopters became associated with the Vietnam War in the nightly news and motion pictures.

In 1983, army aviation became a separate branch within the United States army. This was a step along the way toward demand for greater autonomy for army aviators. The Marine Corps organizational structure also promotes considerable autonomy for their aviation forces. Following Vietnam, the army acquired an advanced attack helicopter, the AH-64 Apache, a modern multi-purpose craft, the UH-60 Black Hawk, and an armed reconnaissance craft, the OH-58D Kiowa Warrior. Other services use, among other helicopters, variants of these craft.

Operation Desert Storm, the American-led assault to evict Iraqi forces from Kuwait, was initiated in early 1991 by Apache attacks on Iraqi long range radar. The Persian Gulf War presented army aviation with the opportunity to use airmobile tactics to the fullest. The strategic scheme of

maneuver for the final assault on Iraqi troops in both Kuwait and Iraq was a flanking attack from the west, known as the "left hook." The execution of the "left hook," deep into Iraq, confirmed the faith of military planners who believed in the centrality of helicopters for cavalry and logistical missions.

Over the years the primary criticism of helicopters has been their vulnerability to ground fire. This vulnerability was made clear, once again, when two Black Hawks were shot down in Mogadishu, Somalia almost three years after the Persian Gulf War. Though helicopters may be somewhat vulnerable to ground fire, they are still feared by opposition forces because their ability to fly along the nap of the earth makes them difficult to track via electronic methods. The enemy's frequent inability precisely to locate a helicopter via electronic means contributes to the helicopter's effectiveness and the ground troops' terror. For example, the fear of U.S. helicopters by opposition forces has been noted by implementation force (IFOR) peace-keeping soldiers who served during the "Bosnian Crisis in the late 1990s.

HELSINKI AGREEMENTS. See Conference on Security and Cooperation in Europe.

HELSINKI WATCH (1978), a division of the U.S.-based nongovernmental organization Human Rights Watch, was founded to monitor and promote the human rights provisions of the 1975 Helsinki Accords. Those accords focused primarily on the security and economic dimensions of East-West Cold War relations, confirming, among other things, the Soviet Union's post-World War II borders. But the agreements also made economic and security cooperation dependent on the human rights practices of signatory countries. Activists throughout the Eastern bloc seized on these provisions to demand greater political freedoms, and established local committees to fight for government compliance. The groups were harshly repressed by incumbent Communist regimes. The first arrests of human rights monitors were carried out by Soviet authorities in early 1977. Helsinki Watch was organized to campaign internationally on behalf of the imprisoned monitors in the Soviet Union and Eastern Europe, spearheading efforts to free such leading figures as Yuri Orlov in the Soviet Union, Václav Havel in Czechoslovakia, and Adam Michnik in Poland. The group lobbied Western and neutral governments meeting at periodic Helsinki review conferences to pressure Eastern bloc signatories to live up to their human rights commitments under the accords.

During heightened Cold War tensions in the 1980s, Helsinki Watch worked closely with U.S. government officials, whose strategic agenda included the promotion of civil and political freedoms in the Soviet Union and East-

ern Europe. Relations with official Washington became more distant after the end of the Cold War, as the United States stressed economic development and political stability over human rights concerns, or was simply unwilling to become involved in outbreaks of ethnic or communal violence in former Communist states. Since the eruption of wars in Bosnia and Chechnya, Helsinki Watch has focused its efforts on promoting respect for the "laws of war, including the treatment of civilian noncombatants in conflict areas, conditions in prison camps, and the use of rape as a weapon of political terror.

HILL, A. P. (1825-1865), Confederate general. Born in Culpeper County, Virginia, Hill graduated from West Point in 1847, fifteenth in a class of thirty-eight. While still a cadet he contracted gonorrhea, which caused recurrent prostatitis that afflicted him physically and psychosomatically for life. Hill served in the "Mexican War and the Seminole Wars; his 1859 marriage to Kitty Morgan was a happy one that produced four daughters. After Virginia seceded in 1861, Hill resigned; he was appointed Confederate colonel of the 13th Virginia Infantry and fought at First Manassas. Promoted to brigadier general in February 1862, and major general in May 1862, Hill's Light Division became deservedly renowned during the Civil War for its fighting abilities; his energetic leadership distinguished him at the "Seven Days' Battle, as well as the Battle of "Fredericksburg, and the Battle of "Antietam, where his timely arrival saved Robert E. "Lee's right flank. In May 1863, he was promoted lieutenant general after "Stonewall" "Jackson's death at Chancellorsville, assigned command of the Army of Northern Virginia's new III Corps, and led it from Gettysburg to the Wilderness. After 1863, repeated illnesses and quarrels with superiors marred Hill's temperamental leadership, especially during the 1864-65 "Wilderness to Petersburg Campaign. Shortly after returning from sick leave, he was killed on 2 April 1865 at Petersburg by a Union infantryman while attempting to reconnoiter lines and rally his troops.

HINDENBURG, PAUL VON (1847-1934), German field marshal and president. Member of an aristocratic Prussian family, Hindenburg saw action as a junior officer in 1866 and 1870-71 and retired in 1922 as a corps commander. After the victory at Tannenberg in August 1914, Hindenburg became a national symbol. The mystique of the "wooden titan" increased during 1915 and 1916, less for his own achievements than through the continued discrediting of rival symbols: Chief of Staff Erich von Falkenhayn, Chancellor Theobald von Bethmann Hollweg, and not least Kaiser Wilhelm himself.

Appointed chief of the General Staff in August 1916, Hindenburg was over his head as the supreme commander of a total war effort in a state already stumbling from exhaustion. He lent his name and prestige to a series of fumbling, even disastrous, policies. He supported the

increasingly unrealistic war aims of the militarists and nationalists. Yet, at the end, he did facilitate acceptance of the kaiser's abdication, the establishment of the Weimar Republic, and the armistice, and he remained a hero. Elected president of the Weimar Republic in 1925 by a coalition of conservatives and nationalists, Hindenburg initially performed his limited duties loyally and with the same success. The Great Depression, the rise of National Socialism, and his own advancing age, however, reduced his effectiveness. Reelected in 1932 and fearing civil war, the nearly senile president appointed Adolf * Hitler as chancellor in January 1933, and thereafter remained a figurehead until his death in 1934.

HIROHITO (1901-1989), emperor of Japan from December 1926 until his death in January 1989. A timid man, preferring marine biology to affairs of state, Hirohito reigned over but did not directly rule Japan; from early in his reign, the military increasingly held sway and committed Japan to war in his name. Hirohito unwittingly contributed to this outcome: as a constitutional monarch he always felt obliged formally to sanction the government's aggressive policies, however much he disagreed with them.

Hirohito privately but unsuccessfully opposed Japan's undeclared war with China, beginning in July 1937, and Japan's entry into the Tripartite Pact with Germany and Italy in September 1940, fearing that this would lead Japan into an unwanted war with the United States and Great Britain. However, he was a nationalist, not the pacifist some accounts imply, and when the United States ended oil exports to Japan on 1 August 1941 in retaliation for Japan's military occupation of French Indochina, Hirohito eventually accepted that war was inevitable. That Japan formally declared war on the United States only after it attacked the U.S. naval base at Pearl Harbor on 7 December 1941 had not been his intention.

During the Pacific War, even as he publicly exhorted his countrymen to sacrifice their lives for victory, Hirohito instructed Prime Minister *Tôjô Hideki to work for peace. Ironically, Hirohito may have prolonged the war, first by protecting the die-hard Tôjô, upon whom he relied politically, from critics until Tôjô finally resigned in July 1944 following the fall of Saipan; and second, by advocating the last "decisive" Battle of *Okinawa, which he hoped would strengthen Japan's position in any forthcoming peace negotiations.

Ultimately, when the war was clearly lost, but with the government deadlocked over whether to accept the Allies' Potsdam Proclamation (26 July 1945) calling for Japan's "unconditional surrender," Hirohito personally intervened and Japan capitulated 15 August 1945. In September, when he first met Gen. Douglas *MacArthur, Supreme Allied Commander in Japan, Hirohito offered to take responsibility for the war. However, he was exempted from standing trial as a war criminal and retained on the throne so that the occupation could use his authority in the demilitarization and democratization of Japan. The new 1947 Constitution stripped him of all prerogatives, leaving a purely ceremonial role.

Despite Hirohito's formal apology for the war, made years later (1975) during a state visit to the United States, many Americans regard him as a controversial figure. However, there is no evidence that Hirohito knew in advance of, or sanctioned, the great many *atrocities committed by Japanese forces during the Pacific War.

HIROSHIMA AND NAGASAKI, BOMBINGS OF

(1945). The U.S. Army Air Forces' (USAAF) mission to use atomic bombs began in mid-1944 when Gen. "Hap"

* Arnold, USAAF commander, initiated a special force to deliver a new "heavy and bulky" superweapon. He appointed Col. Paul W. Tibbets, a veteran of the first B-17 mission over Europe, to command the 509th Composite Group, built around the 393rd Bombardment Squadron, commanded by Maj. Charles W. Sweeney. To accommodate the bomb, Tibbets had his B-29s stripped of most defensive armaments. Most crew training took place at Wendover Field, Utah. The lead aircraft, flown by Tibbets, was a new B-29, which he named the *Enola Gay* after his mother.

By mid-1945, *Manhattan Project scientists produced two kinds of atomic bombs: a *gun type*, detonated by firing one mass of uranium down a cylinder into another mass to create a self-sustaining chain reaction; and an *implosion bomb*, which detonated when a volatile outer shell drove a layer of plutonium inward to collapse into a plutonium core and form a critical mass.

On 16 July 1945, as President Harry S. *Truman began meeting with Soviet leader Josef *Stalin and British prime minister Winston S. *Churchill at the *Potsdam Conference, Manhattan Project officials oversaw the first successful test of a nuclear weapon at Trinity Site, Alamogordo, New Mexico. Debate had already begun as to the wisdom and morality of using the bomb. It came to a choice between demonstrating the bomb (e.g., by destroying an island in Tokyo Bay), or obliterating an actual city. A panel of scientists concluded that saving American lives outweighed all other considerations and that no effective demonstration was feasible.

During the Potsdam Conference, Arnold argued that USAAF raids over Japan could end the war. Army Chief of Staff Gen. George C. *Marshall worried that conventional bombing could not defeat such a determined enemy and would require an invasion of Japan. Marshall's view reinforced Secretary of War Henry L. *Stimson's view and Truman's own belief that the bomb should be dropped before the U.S. invasion, scheduled for November 1945.

After informing Churchill and providing a vague reference about the weapon to Stalin, Truman issued a warning to Japan to surrender. Tokyo did not respond to the offer because the Japanese leaders were deeply divided. Some saw no alternative to surrender, while others wanted peace but feared for Emperor *Hirohito's safety. A small faction advocated fighting to the death. There were deluded hopes that the Soviet Union might mediate for Japan. These no-

tions created official paralysis. On 30 July, Truman approved the use of the atomic bomb.

On 3 August 1945, orders were issued to drop the first bomb when weather permitted. Operations began at 2:45 A.M., 6 August, as the *Enola Gay* and two observation B-29s launched from Tinian. The primary target was Hiroshima, an industrial city that had seldom been attacked. Of little military significance, the city of 250,000 provided a good test of the bomb's destructiveness.

At 8:15 A.M. local time, the *Enola Gay* dropped the gun-type uranium device, nicknamed "Little Boy," from 31,600 feet. It detonated in the center of the city fifty seconds later. A 20,000-foot mushroom cloud of smoke and debris whirled upward. At its base, a combination of blast, fire, and lethal radiation killed at least 60,000 civilians and several thousand military personnel; subsequently another 60,000 fatalities resulted from injuries or radiation poisoning. It also destroyed 81 percent of the city's structures.

When the Japanese government remained deadlocked, U.S. officials authorized the use of a second bomb. The primary target for the plutonium, implosion bomb, nicknamed "Fat Man," was Kokura, a steel manufacturing center. Major Sweeney, who had flown his observation B-29, *The Great Artiste*, during the Hiroshima raid, led the second mission. Without time to restore his plane to a bombing configuration, Sweeney switched planes with Capt. Frederick C. Bock, taking off in *Bock's Car* around 3:30 A.M. on 9 August. Sweeney found Kokura obscured by clouds and turned to a secondary target, Nagasaki, a seaport. At 10:58 A.M. local time, the bomb was dropped from 28,900 feet. It exploded two miles wide of the target because of the bombardier's reliance on "radar until, when the clouds broke at the last minute, he returned to visual aiming. Because Nagasaki lay among hills surrounding the bay, whereas Hiroshima sat on a plain, parts of the city of 200,000 were sheltered from the blast. Still, at least 35,000 persons were killed. Afterwards, 40,000 more died from radiation and other injuries. Nearly half of the city's buildings were destroyed.

On 8 August, Soviet forces had overrun Japanese defenses in Manchuria, and with this and the atomic bombing, Emperor Hirohito concluded that the situation was hopeless. While still uncertain of his future, he chose to seek peace, thus invoking the moral authority of his office and defying the tradition that made the emperor a spokesman for his ministers rather than a ruler. After resistance by a few obsessed by the humiliation of surrender, he prevailed. This debate took time, and U.S. officials believed progress toward peace had failed. Truman ordered the resumption of conventional bombing on 14 August, with more than 1,000 B-29s attacking Japan. As the B-29s returned, Truman announced that the war was over. That same evening, Japan surrendered unconditionally, with official ceremonies held aboard the USS *Missouri* on 2 September, in Tokyo Bay.

The controversy over the use of the atomic bombs emerged during the "Cold War as the world agonized over the possibility of a nuclear holocaust. In 1994-95, the debate focused on the nature of a planned exhibit of the *Enola Gay* at the Smithsonian Institution's Air and Space Museum in connection with the fiftieth anniversary of the bombing.

The atomic bomb has had a profound effect, ushering in the Cold War and the proliferation of "nuclear weapons.

Thus far, the era has also shown ostensibly that there is a point beyond which mankind will not go. Today, civilization's greatest challenge is to make sure that the atomic bombings of Hiroshima and Nagasaki remain singular events.

HISTORY, MILITARY USE OF. The armed forces have periodically emphasized or de-emphasized the study of history. Their approach, generally, has been one of "lessons learned," to study the past so as to avoid mistakes in the future. To accomplish this goal, the analysis of history has ranged from individual study requirements to inclusion in professional military "education and training courses, the establishment of history offices at service headquarters levels, and other centers to analyze experience.

For decades, all the services have included the study of "war and battle in officer cadet and professional schooling. After the "Korean War, for example, Army Reserve Officer Training Corps ("ROTC) cadets studied every major battle and campaign of the U.S. "Army, from before the "Revolutionary War to the "Korean War, the text: an army-produced manual, ROTCM 145-20, *American Military History, 1607-1958* (1959). Newly commissioned officers in their initial training also have received service, and now joint-oriented, history. A renewed emphasis and more in-depth study of history has occurred in the late twentieth century in all the professional military education schools. But this is not new; the Naval War College in the years between the world wars analyzed the 1916 Naval Battle of Jutland, while in the 1930s the Marine Corps Schools at Quantico, Virginia, studied the failed Gallipoli campaign of 1915—and the analysis contributed to the development of "amphibious warfare doctrine.

Historical examples of campaigns and battles have always been used in officer education, with the "Civil War a constant, and others studied from the experience of American and foreign armies. Such study ranges from detailed analysis of campaigns and battles to lead-in examples for contemporary exercises. An extension of this are the "staff rides," which date from 1906. In these, military personnel visit the sites of battles or campaigns; in the ensuing "staff ride" (originally on horseback), extensive analysis is

conducted through discussion and interaction. The U.S. Army pioneered this approach, and the Marine Corps and air force have included such “rides” in their professional educational programs.

All four armed services, plus the *Joint Chiefs of Staff (JCS) and the Department of *Defense, have established history offices. These have multiple missions, from recording the history of the services and events in which they have participated to responding to inquiries from the heads of services and their supporting staffs to answering public inquiries and assisting in official and unofficial research. The U.S. Army’s Center of Military History is a prime example: it has published works spanning the spectrum from unit lineages to its monumental 78-volume history of the U.S. Army in World War II. The sister services have similar agencies, and all also have historical museum programs for preservation of artifacts and display for specific service and public education.

The armed forces also established programs for individual education. For example, during the commandancy of Gen. Alfred Gray (1987-1991), the U.S. Marine Corps set up a reading program for all Marines, from privates to generals. Most of this is rooted in history. The list is revised periodically, most recently in 1996. The other services, in various forms, have their own programs; for example, in 1995, students attending the U.S. Air Force’s Air Command and Staff College received a reading list, history-based, of 95 books.

However, a word of caution. Many professionals study history to “learn lessons.” Thucydides, still studied by the military, pioneered this approach in his history of the Peloponnesian War. But there is an inherent temptation here to use the past to prove a point or theory. This dilemma was addressed decades ago, when the Prussian general Paul Bronsart von Schellendorf commented: “It is well known that military history, when superficially studied, will furnish arguments in support of any theory or opinion.”

Another aspect of the study of military history has been the attempt to determine “principles.” A listing of *principles of war first appeared in 1921 in a U.S. Army training regulation, and in the ensuing decades has appeared in various forms in *FM100-5, Military Operations*. These still appear in all contemporary doctrinal publications, as well as those promulgating joint doctrine (for example, *Joint Pub 1: Joint Warfare of the Armed Forces of the United States*, 1995, and *Joint Pub 3-0: Doctrine for Joint Operations*, 1995). Too much focus on or adherence to the “principles” of war, however, can be a liability. Gen. Ulysses S. *Grant cautioned that “If men make war in slavish obedience to rules, they will fail.”

How can the misuses of history be avoided? Today, within armed forces professional military education institutions, academically educated historians—both civilian and uniformed—are faculty members. Integrated into both course development and teaching, they bring their education, standards, and approaches to the evaluative process. Whether in separate organizations (the Combat Studies Institute at the U.S. Army’s Command and General Staff College), or within academic departments (the Air University and Naval War College), or paired with uniformed colleagues into faculty advisory teams (the Marine Corps Command and Staff College), they help ensure perspective and contribute to the broader training and experience of their students.

The armed forces believe in the value of history. There are three main reasons for this. Conceptually, most problems personnel will face as commanders or staff officers have been confronted by their predecessors in the profession of arms. History provides an opportunity to learn from the experience of others. And a study of history can reveal what succeeded and failed in the past, as well as the reasons why. This military faith in the study of history is expressed in the Marine Corps publication on *Warfighting* (1997): “The military is a thinking profession. Every Marine is expected to be a student of the art and science of war. Officers especially are expected to have a solid foundation in military theory and a knowledge of military history and the timeless lessons to be gained from it.”

The armed forces have faith in the lessons of history. The key is asking the right questions of the past—with the ensuing analysis, interpretation, and conclusions. As Professor Jay Luvaas, formerly of the U.S. Army Way College, has so often counseled professional military officers: “No source can answer an unasked question”; and then the important follow-on: “Ask not just what, but why.”

HITLER, ADOLF (1889-1945), German leader, Führer (leader) of the Nazi empire. Born in Austria, Hitler fought in the German Army as a corporal in World War I. Self-styled Führer (leader) of the Nazi Party (NSDAP, or National Socialist German Workers’ Party) after 1921, he was briefly imprisoned by the Weimar Republic following a failed coup d’état in Munich in 1923, during which time he wrote *Mein Kampf* (My Struggle, 1924). The book sketched out Hitler’s belief that the noble “Aryan” or Germanic race was engaged in a life-and-death battle with other inferior races, of which the Jews were the most insidious and dangerous. It called for the creation of a racially pure Reich (empire), ruled by a dictatorship, which would impose the German “master race” over the rest of “subhumanity.” In the wake of the Great Depression, the NSDAP became the largest party in Germany in 1932. Appointed Reich chancellor in 1933, Hitler soon assumed dictatorial powers, dismantled all other political parties, introduced conscription, and promulgated the racial “Nuremberg Laws” of 1935. Meeting little international or domestic opposition, Hitler reoccupied the demilitarized Rhineland, annexed Austria and the Czech Sudetenland, purged the leadership

of the German Army, and set loose a widespread anti-Jewish pogrom in 1938.

Having signed a nonaggression treaty with the Soviet Union, Hitler invaded Poland on 1 September 1939, conquered Western Europe in spring 1940, occupied southeastern Europe, and attacked Russia in the summer of 1941. The fighting was accompanied by untold atrocities against enemy soldiers and civilians, and the Nazi regime simultaneously implemented the "Final Solution," the genocide of European Jewry. Yet the reverses of the so-called Third Reich multiplied with the Soviet counteroffensive and the entry of the United States into the war in December 1941, the German debacles at Stalingrad and El Alamein the following winter, the Allied invasion of Italy in summer 1943, and the invasion of Normandy, France, in June 1944. A failed assassination attempt on Hitler's life in July 1944 led to a widespread purge of the plotters; but as American and Soviet troops met on the Elbe River on 25 April 1945 and the Red Army entered Berlin, he committed suicide on 30 April, only days before Germany capitulated on 7-9 May 1945.

Historians debate the extent to which Hitler forged Germany's fate during his twelve-year dictatorship. Some, like Eberhard Jackel, argue that his totalitarian regime held Germany under complete control, and that Hitler personally had set his goals and decided as early as the 1920s on the means to achieve those goals. Others, such as Martin Broszat, assert that Hitler had far less control over events, that his regime was based on a chaotic struggle of power between competing agencies, and that his policies were largely the function of circumstances rather than careful, farsighted planning. Nevertheless, most historians agree that Hitler strove to achieve two major goals: the winning of additional "living space" for the German people, mainly in the East; and the destruction of the Jews. There is little doubt that he was obsessed with questions of race and social Darwinian "struggle for existence." What is still unclear is how much of the population shared his ideas, and whether the main engine for the implementation of the war of expansion and extermination that Germany unleashed in 1939 was only his personal obsession or the outcome of much more widespread prejudices, phobias, and aspirations at least among the German political, economic, and military elites.

There is also some debate on Hitler's role in the conduct of military operations. Though German generals subsequently claimed they were only following Hitler's orders and that he had a detrimental effect on operations, evidence shows that they shared his urge for conquest and subjugation, and utilized his popularity among the soldiers to boost the troops' morale and motivate them in fighting. This applies also to the popular view that Hitler was a raving madman who somehow seized control of a civilized nation that could liberate itself from his hold only with the assistance of others. As historians such as Ian Kershaw have shown, the "Hitler myth" was a potent political force during much of the regime. Whether or not Hitler was insane, for a long time he seems to have been supported by much of the population of Germany.

HOBBY, OVETA CULP (1905-1995), public official and newspaper publisher. Born and raised in Killeen, Texas, Oveta Culp accompanied her father, a lawyer-politician, to Austin when he was elected to the state House of Representatives. She served as parliamentarian of the house (1925-31, 1939-41). In 1931, she married William P. Hobby, former governor of Texas and publisher of the *Houston Post*, on which she later held several positions. In World War II, when Congress created the Women's Auxiliary Army Corps (WAACs), she was appointed first director of the WAACs in 1942, and first director of its successor, the Women's Army Corps (*WACs), established in 1943 as a branch of the U.S. *Army.

Despite the important roles of the WAACs and WACs, many military commanders resented the idea of women undertaking military jobs, and many male soldiers shared this misogyny, which resulted in vicious rumor campaigns against the female soldiers. Hobby and her supporters withstood extremists' accusations of undermining American womanhood and undermining the sanctity of home and the family. Despite the valuable service of the women in uniform, Hobby's rank was limited to colonel, even though the WACs eventually numbered more than 100,000 female soldiers. She remained director of the WACs until 1945 and was awarded the Distinguished Service Medal.

In 1953, President Dwight D. Eisenhower appointed her first secretary of the newly created Department of Health, Education and Welfare. She thus became the second woman (after former Secretary of Labor Frances Perkins) to hold a cabinet post. In 1955, she resigned to succeed her ailing husband as editor of the *Houston Post*; she became chair of the newspaper's board of directors in 1965.

HO CHI MINH (1890?—1969), international Communist and president of the Democratic Republic of Vietnam (DRV). The son of a scholar-official, Ho was born in Nghe An, central Vietnam, and went to a Franco-Vietnamese school. He moved to France in 1911 and thereafter used over 100 aliases.

A sailor for two years, Ho worked between Le Havre, London, and New York. During World War I, he lived in London, working as a domestic. Back in France, he became a founding member of the French Communist Party in 1920, and, in Moscow from 1923, a Comintern (Communist International) expert on colonial and Asian questions. During long periods in China Ho was instrumental in forming the proto-Communist Vietnamese Youth League in Canton (1925) and the Indochinese Communist Party in Hong Kong (1930).

Ho returned to Vietnam in 1941 and emerged at the head of the Vietnamese Independence League (Viet Minh). Using the code name "Lucius," he supplied anti-Japanese intelligence to American authorities in Kunming, China, in 1944-45. As he led the Viet Minh to power in Vietnam in the August 1945 revolution, Ho's attempts to gain American support against a resumption of French

rule continued, but failed. During the thirty-year war for independence against French rule and American intervention, he remained president of the DRV until his death. Although he wanted to be cremated, the myth of the "Uncle-President" became so central to Vietnamese political culture that Ho's body was embalmed and placed in a mausoleum.

HOLLAND, JOHN (1841-1914). America's preeminent submarine pioneer was born at Liscannor, County Clare, Ireland, and educated by the Christian Brothers, who recognized his drafting skill and mechanical aptitude. As a parochial schoolteacher, Holland studied earlier efforts by William Bourne, David Bushnell, and Robert "Fulton to construct underwater boats. Emigrating from famine-ravaged Ireland in 1873, he secured teaching employment in Paterson, New Jersey, and won support from the Irish Revolutionary Brotherhood to construct his first submersible, tested on the Passaic River in 1878. Similarly funded, he successfully demonstrated his *Fenian Ram* at New York in 1881. Gaining only limited official attention, not until 1895 did he win a contract to construct the navy's steam-powered submersible *Plunger*.

Holland's advanced ideas on armament, hull form, and electric underwater propulsion were embodied in his *Holland VI*, the first modern submarine, constructed at Elizabethport, New Jersey, in 1897 and commissioned by the U.S. Navy as *SS-1* in 1900. Holland's Electric Boat Company secured navy contracts for five additional submersibles, followed by orders from Great Britain, Russia, and Japan. Simon Lake, Holland's principal design rival, entered mounting international competition with contracts for Russia, Austria, Germany, and in 1911 with the United States. Shuffled aside by Electric Boat management, Holland, father of the American and the British submarine, devoted his final years to aeronautical research.

HOLOCAUST, U.S. WAR EFFORT AND THE. The Holocaust, Nazi Germany's systematic destruction of the European Jews, began in June 1941 and ended with the defeat of Germany in May 1945. The U.S. government was aware of Germany's program of extermination by November 1942, but for fourteen months thereafter the State Department, with the knowledge and acquiescence of President Franklin D. "Roosevelt, made virtually no attempt to rescue Jews. Only in January 1944 did Roosevelt act, and then only when confronted with pressure from many members of Congress, as well as documentation presented by the Treasury Department proving that the State Department had for the most part been following a policy of active obstruction of rescue. Faced with incipient scandal, the president established a government rescue agency called the War Refugee Board. It ultimately helped to save the lives of

about 200,000 European Jews. The British government, whose policy on the Holocaust had paralleled that of the State Department, declined to form a rescue agency and never altered its program of inaction.

Throughout World War II, the U.S. military considered proposals to rescue Jews as outside the scope of its mission. As early as April 1943, responding to inquiries from the Anglo-American Bermuda Conference on Refugees, the War Department made clear its unwillingness to support even minor rescue efforts. The "Joint Chiefs of Staff (JCS) urged rejection of a proposal to move 3,000 Jewish refugees from danger in Spain to safety in North Africa, pointing to the shortage of shipping, the added administrative burden the refugees would put on the military government in North Africa, and the possibility that Arab resentment might require military action to keep order.

In December 1943, the JCS refused a State Department request for military help in moving 4,000 Jews to southern Italy from the Adriatic island of Rab before the Germans seized the island. The chiefs explained that Allied forces in Italy were already overloaded with refugees (mostly non-Jewish Yugoslavs) and action to help those on Rab "might create a precedent which would lead to other demands and an influx of additional refugees." Edward R. Stettinius, Jr., recently appointed undersecretary of state and one of the very few State Department officials interested in rescuing Jews, declared that if this response accurately reflected military policy, the United States might as well "shut up shop" on its efforts to rescue any more refugees from Axis Europe. Stettinius recommended that President Roosevelt inform the military that rescue was "extremely important... in fact sufficiently important to require unusual effort on their part and to be set aside only for important military operational reasons." Nothing came of his suggestion.

The military's noninvolvement in rescue might have changed in early 1944 when Roosevelt formed the War Refugee Board. The president's executive order specified that the State, Treasury, and War Departments each had a special responsibility to help the new agency in its rescue endeavors. War Department officials, concerned that this could mean military forces might be diverted to rescue missions, decided, secretly, in February 1944 not to participate in rescue operations despite the executive order.

By late spring 1944, the massive killing operations at Auschwitz, in Poland, were known to the Allied governments, and Allied air forces had the range to strike the gas chambers as well as the railroads leading to them. Yet no effort was made to bomb those locations, despite several requests for action. Such proposals began to reach the United States from occupied Europe in June 1944, as the deportation of the 760,000 Jews in Hungary went forward.

The first request was turned down by the War Department in late June on the ground that "it could be executed only by diversion of considerable air support essential to the success of our forces now engaged in decisive operations." In reality, the decision was not based on any analysis of air force operations. The War Department did not consult the commanders of the Italy-based U.S. 15th Air Force, which was in the best position to conduct the proposed strikes. Instead, when the War Refugee Board forwarded the initial bombing request to them, War Department officials measured it against their February 1944 policy of noninvolvement. On that basis they decided against the proposal, without investigating its feasibility.

Obviously, they could not inform the board of the real reason for rejection. Instead, they used the best argument available: that the operation would divert considerable military power from essential war plans. With this, the pattern was set. All succeeding requests were rejected on the same grounds as the first.

In fact, bombing the gas chambers at Auschwitz could have been accomplished with little diversion of airpower. Because the complex included a major industrial area adjacent to the camp, Auschwitz itself was a military target—the primary objective a synthetic oil refinery. The Germans has seven other synthetic oil plants in the region, all based on the coal resources of Upper Silesia and all within forty-five miles of Auschwitz. From July through November 1944, more than 2,800 American heavy bombers pounded the eight oil installations. En route to their targets, all of these aircraft flew along or over key deportation railways. On two occasions (20 August and 13 September) large fleets of American heavy bombers struck the industrial area at Auschwitz itself, less than five miles from the four large gas chambers. Yet the War Department stated in a letter of 14 August 1944 that the bombing was not possible because such actions “could be executed only by the diversion of considerable air support essential to the success of our forces now engaged in decisive operations elsewhere.”

The last of the attempts to persuade the War Department to bomb Auschwitz came in November 1944. War Refugee Board director John Pehle wrote a strong letter urging destruction of the gas chambers and pointing out the military advantages in simultaneously bombing industrial sites at Auschwitz (the board was not aware of the earlier raids on Auschwitz industries). Once again Pehle’s appeal was rejected on grounds that airpower should not be diverted from vital “industrial target systems.”

In late November 1944, SS chief Heinrich Himmler ordered the killing machinery at Auschwitz destroyed. On 18 and 26 December 1944, American bombers again pounded the Auschwitz industries. The Soviet army captured the camp 27 January 1945.

As Red Army forces advanced across Eastern Europe in 1944 and 1945, they overran several Nazi concentration camps, including those at Lublin and Auschwitz. In April and May 1945, American and British soldiers came upon the concentration camps in Western Europe—Dachau, Bergen-Belsen, Buchenwald, and others. The liberation of these camps has been cited as proof of the Allied governments’ and the armies’ concern for the helpless Jews and other victims trapped there.

It is important to keep in mind that these liberations were completely unintentional—an unexpected byproduct of military advances, not the result of military planning. The camps were not assigned as objectives; in reality, the Allied troops came upon them entirely by chance. These facts are clearly reflected in two aspects of the responses to the camps by the American and British armies. First, the officers and men were totally surprised at what they found. There was also shock at the extent of the Nazi depravity. To make certain the Germans could never claim doubt about what had been found, the troops forced local civilians to view the camps and help bury the dead. Second, the armies came without provisions or emergency equipment appropriate to the acute needs of concentration camp survivors. The troops’ efforts to help were indeed compassionate, but their attempts to keep the surviving inmates alive had to be

improvised. About one-third of those found in the camps died within a month.

The U.S. military’s final connection with the Holocaust came about after the defeat of Germany. One result of World War II was that more than 8 million displaced persons (DPs) were stranded in Germany and Austria when the war ended, including former slave laborers and concentration camp inmates, prisoners of war, Eastern Europeans fleeing the Russians, and others. The Allied military forces, in a highly successful operation, managed to repatriate about 7 million DPs by September 1945. Of the more than 1 million who remained, about 100,000 were Jewish survivors of the Holocaust.

Nonrepatriable DPs were to have been cared for jointly by the *United Nations Relief and Rehabilitation Administration (UNRRA) and the Allied military forces. As it turned out, UNRRA was unable to meet its responsibilities, so the military had to fill the vacuum in an assignment for which it had not been trained. The consequence was a continuing disaster for the Jewish survivors. The U.S. Army had very little sympathy for or understanding of the difficult problems of these people, who had been most damaged by the Nazis. Most were kept in inadequate camps (some were former concentration camps) and provided with rations similar to those they had received from the Nazis.

In July 1945, responding to pressure from American Jewish leaders, President Harry S. *Truman agreed to send Earl G. Harrison, former U.S. commissioner of immigration and dean of the University of Pennsylvania Law School, to investigate the situation in the DP camps. Harrison found the plight of the Jews to be “far worse than that of other groups.” He denounced “the continuance of barbed-wire fences, armed guards, and prohibition against leaving the camp except by passes,” and declared that “as matters now stand, we appear to be treating the Jews as the Nazis treated them except that we do not exterminate them.” In early August 1945, the War Department instructed General Dwight D. *Eisenhower, Supreme Allied Commander in Europe, to do everything possible to improve the situation. Eisenhower issued several directives, and by late 1945 conditions for Jewish DPs were generally better, although many military officials in the field continued to show little inclination to implement the new policy adequately.

HONORS, MILITARY. See Awards, Decorations, and Honors.

HOOD, JOHN BELL (1831-1879), Civil War general. Hood graduated from West Point in 1853 and served on the frontier before resigning to join the Confederacy.

Rising rapidly in rank, he won glory at the head of "Hood's Texas Brigade" in the *Seven Days' Battle, Second Bull Run, Antietam, and Fredericksburg, being promoted to major general in October 1862.

At the Battle of *Gettysburg he was severely wounded, permanently crippling his left arm. Returning to duty, he accompanied his division to Georgia, where at Chickamauga troops under his command made a key breakthrough. Again wounded, Hood lost his right leg.

Promoted to lieutenant general and assigned to command one of Joseph E. *Johnston's corps in Georgia the following spring, Hood undermined his commander with a stream of critical letters to President Jefferson *Davis. On 17 July 1864, Davis replaced Johnston with Hood. Backed into the outskirts of Atlanta by Johnston's retreat, Hood had no choice but to fight. In eight days, he fought three battles. The Confederates lost because they were outnumbered, because Hood's physical impairment prevented his supervising operations personally, and because William J. Hardee, upon whom he depended, was resentful and uncooperative after being passed over in Hood's favor.

Union general William Tecumseh *Sherman cut the Confederate supply line at Jonesboro, forcing Hood to evacuate Atlanta 1 September. Hood then tried threatening Sherman's supply lines in northern Georgia, with moderate success, but in November, when Sherman set out on his march to the sea, Hood invaded Tennessee. He outmaneuvered a Federal force under John M. Schofield near Spring Hill and might have destroyed it except that inexplicably the army's command system again failed. Schofield's force escaped, and at the Battle of *Franklin on 30 November, Hood, beside himself with rage, hurled his army at Schofield's entrenched soldiers with devastating *casualties for the Confederates. Incredibly, after this slaughter, Hood followed Schofield to Nashville, where the *Fédérés* became part of a huge Union army under George H. *Thomas. In two days of fighting, 15-16 December 1864, Thomas virtually eliminated Hood's army as an effective fighting force. Relieved at his own request, Hood held no other important command.

HOOKER, JOSEPH (1814-1879), Civil War general. Graduating twenty-ninth of a class of fifty at the U.S. Military Academy, Hooker won three brevets in the *Mexican War, but angered Winfield *Scott by testifying against him in a court of inquiry. While a civilian colonel in the California militia in the 1850s, he had a major disagreement with Henry W. Halleck. During the Civil War, he advanced his way up the promotion ladder as a Union leader, often denigrating other officers, until he found himself commanding the Army of the Potomac to its disastrous defeat at the Battle of *Chancellorsville. He served under William Tecumseh *Sherman as a corps commander but demanded reassignment when he failed to receive command of the Army of the Tennessee. From 1 October 1864 to his retirement in 1868, he held inconspicuous assignments.

Hooker had the reputation for being a drinker and a womanizer and is often erroneously cited as the inspira-

tion for prostitutes being called "hookers." He gained the nickname "Fighting Joe" when the newspaper headline "Fighting—Joe Hooker" was in error printed as "Fighting Joe Hooker." His is the tale of a military man of limited ability, reaching command beyond his talents and paying the awful price of *casualties to his men and ruin to his reputation.

HOOVER, HERBERT C. (1874-1964), U.S. president. Born in West Branch, Iowa, son of a Quaker blacksmith, Hoover was orphaned, then raised by relatives in Oregon. Graduating from Stanford University in 1895, he soon became a millionaire as a global metallurgical engineer.

His humanitarian reputation stemmed from his direction of food relief for occupied Belgium, 1914-17. As head of the U.S. Food Administration (1917-18) under Democratic president Woodrow *Wilson, and as secretary of commerce under Republican presidents Harding and Coolidge (1921-28), Hoover also established a reputation for efficient administration. Defeating Al Smith, he became president, 1929-33.

Although a progressive Republican, Hoover's popularity was undermined by the onset of the depression. In his foreign policy, he struck a balance between *internationalism and traditional U.S. unilateralism, supporting open trade, but accepting a congressional high tariff. Thinking in terms of economic self-sufficiency for the western hemisphere, he repudiated Theodore *Roosevelt's interventionism and withdrew the Marines from Nicaragua.

Hoover emphasized arms reduction and nonmilitary strategies. He obtained some success in the London Naval Disarmament Treaty (1930), extending the 1922 battleship limitation to *cruisers and *submarines. His *pacifism appeared most clearly after Japan's conquest of Manchuria in 1931. When the *League of Nations failed to act, Hoover eschewed economic sanctions, which he thought might lead to war in an area not vital to the United States. Instead, he had Secretary of State Henry L. *Stimson respond with the doctrine of nonrecognition of the illegal conquest.

Hoover's fear of an expansionist Soviet Union led him to oppose U.S. intervention in Europe on the Pacific before 7 December 1941, because although he abhorred the German and Japanese regimes, he feared Josef *Stalin more. In 1942, he co-authored *The Problems of Lasting Peace*, emphasizing that military success alone would not ensure peace, and urging a new postwar international organization to settle disputes peacefully; gradual disarmament; and a ban on military alliances. Hoover coordinated European food relief again in 1945-47. During the *Cold War, he advocated U.S. naval and air defense of the western hemisphere and island bastions from Britain to Japan, Taiwan, and the Philippines. Against commitment of U.S. ground troops overseas, he opposed *NATO and the *Korean War, and supported President Eisenhower's increased reliance upon airpower.

HOPKINS, HARRY (1890-1946), social reformer, statesman. Beginning in 1940, this Iowa-born social worker and New Deal relief administrator became President Franklin D. "Roosevelt's surrogate in matters of international security. Residing in the White House and heading a staff that oversaw interagency preparation for American participation in World War II, Hopkins visited England to accelerate assistance against Nazi Germany and became Lend-Lease coordinator in March 1941. Following Germany's attack on the Soviet Union in June, Hopkins flew to Moscow and recommended immediate Lend-Lease to the Russians. In London, he accompanied Prime Minister Winston S. "Churchill to his Atlantic Charter meeting with FDR in August 1941. Hopkins then expedited military aid to Allies ahead of America's own rearmament in the remaining months before the attack on "Pearl Harbor.

At wartime conferences, Hopkins supported Roosevelt's "grand design" for a liberal postwar international order shaped and supervised by the Big Three. With a naval-oriented president, Hopkins, who emphasized the goal of defeating Nazi Germany in Europe, proved a "Godsend" to Gen. George C. "Marshall and Secretary of War Henry L. "Stimson; at the Teheran conference in 1943, he vigorously opposed Churchill's proposed Balkan invasion. At Yalta, early 1945, he optimistically viewed the compromise agreements as "the first great victory of the peace." Hopkins served as President Harry S. "Truman's special envoy to Josef "Stalin in June 1945; he died of stomach cancer six months later.

HOUSING, MILITARY. The U.S. Constitution specifically prohibited the European practice of quartering soldiers in private homes. The Quartermaster Corps, founded June 1775, was responsible for the construction of training cantonments and more permanent structured camps. During the "Revolutionary War, tents were issued to soldiers in the campaign season, providing shelter for up to six men. Lack of textiles caused tent shortages—a trend that would continue through American history. For winter quarters, lumber, brick, or stone and related supplies were issued for more substantial structures.

In the "War of 1812, the Quartermaster Corps again struggled to provide sufficient quantities of tentage. Afterwards, the War Department decreed that the "Army Corps of Engineers would be responsible for constructing barracks; the Quartermaster Corps would focus primarily on field military housing. The role of the Engineers Corps eventually evolved into the construction of more permanent military housing for soldiers and their families.

During the years that preceded the "Mexican War of 1846-48, the Quartermaster Corps had difficulty obtaining proper materials for tents. Cotton canvas was procured in lieu of imported hemp canvas, which was more suitable

for the hardships of extended military campaigning. Soldiers in the field were dissatisfied with the cotton tents issued to them—when they could get them. Common complaints ranged from tents tearing too easily to inadequate protection against rain.

In the American "Civil War, textile shortages again hampered the Quartermaster Department's efforts to procure tentage. The supply of tents was exhausted at the Philadelphia depot as early as 1861. With the exception of field hospitals, large tents were practically nonexistent. To protect troops in the field, the Quartermaster Department obtained tents manufactured on the pattern of the French *d'abri* tent; thus the shelter-half, so familiar to soldiers in the Civil War, was introduced. Field soldiers of this period affectionately referred to their new shelter as a "pup" tent. The term remains a part of military jargon to this day, along with the standard issue shelter-half tent.

During the Indian campaigns, scattered frontier posts were erected mostly with troop labor, using lumber from nearby forests or transporting it to the Great Plains. The "Spanish-American War of 1898, and burgeoning overseas territories, put further strain on the Quartermaster Department's resources to erect increasing numbers of barracks, hospitals, and post accommodations.

In World War I, larger canvas tents were used to house American Expeditionary Force members in field hospitals. American "Red Cross recreation tents in rear areas provided a respite from the harsh "trench warfare. The Corps of Engineers built wooden structured training facilities, then called *cantonments*, throughout the United States.

The interwar period featured a retrenchment in housing construction as the military was reduced in size. During the Great Depression, the army's housing program was supplemented by the Works Progress Administration. With the defense mobilization beginning in 1940, responsibility for military housing was formally transferred to the Corps of Engineers which constructed bases in the United States and abroad. The Quartermaster Corps continued to retain responsibility for tentage. Troops in the field during World War II, again suffered from tent shortages as the textile industry was hardpressed to keep up with demand.

During the "Korean War and the "Vietnam War, a half-moon-shaped structure, constructed with a thin layer of corrugated steel or aluminum—known as the *Quonset hut*—dotted the landscape. These semipermanent structures offered adequate protection from the elements, and were relatively easy to build and tear down quickly. Soldiers "in the bush" still shared the shelter-half, as their predecessors had done since the Civil War. The Corps of Engineers built military housing in base camps.

Base family housing construction during the Cold War era increased in the United States and in Western Europe—where large numbers of uniformed service members were stationed. The Army Corps of Engineers built housing (as well as airfields) for the air force after 1947. The U.S. Navy began to provide increased amounts of shore-based housing for sailors and Marines in the 1950s and thereafter.

When the "All-Volunteer Force was instigated in the 1970s, apartment-style quarters began to replace the traditional "open bay"-type barracks, which had wide-open rooms that typically housed up to 100 men on one level, along with a common-use latrine. Many of the newer

barracks featured two-person rooms equipped with a private bathroom.

In Operation Desert Shield/Desert Storm during the "Persian Gulf War (1991), elaborate portable shelters provided some fortunate service members with a self-enclosed home that not only housed them but also met their messing, laundry, and bath needs—all under a central air-conditioned/heated canvas unit. However, as in the past, not enough of these facilities were available to match mission needs. Soldiers in the front lines in the 1990s still shared the warmth of the familiar "pup" tent as soldiers had done long before them.

HOWARD, O. O. (1830-1909), Union army general and educator. A native of Maine and a graduate of West Point in 1854, Howard entered the U.S. Volunteers during the Civil War as a colonel in June 1861. Promoted brigadier general after the First Battle of Bull Run, he lost an arm at Seven Pines, but recovered quickly and attained division command at the battles of Antietam and Fredericksburg. After promotion to major general, he took over XI Corps in April 1863, overseeing a disastrous defeat at Chancellorsville the following month. As ranking officer on the afternoon of 1 July 1863 at the Battle of Gettysburg, he briefly commanded all Federal forces on the field.

Transferring to the western theater, Howard commanded the reorganized IV Corps during the Atlanta campaign of 1864, where he again suffered defeat at Pickett's Mill. Given the Army of Tennessee, Howard commanded without particular distinction during William Tecumseh

• Sherman's march to the sea and the Carolinas campaign. An extremely pious and moralistic officer, he led the Freedmen's Bureau during Reconstruction. On the Indian frontier, he accepted the surrender of Chief Joseph's Nez Percé band in 1877. A lifelong advocate of minority rights, Howard was instrumental in founding Howard University and Lincoln Memorial University before his death in 1909.

HOWE, SIR WILLIAM (1729-1814), British general. The youngest of the second Viscount Howe's three sons, all of whom served in America, William Howe joined the British army in 1746. During the "French and Indian War he served at the "Louisbourg Siege and the Battle of "Québec. Howe returned to America in 1775 to reinforce Gen. Thomas "Gage in the Revolutionary War, arriving in time to command British forces at the Battle of "Bunker Hill. Howe won that battle (losing nearly 40% of his attack force) and succeeded Gage as commander in chief October 1775. During the campaign of 1776, Howe defeated the "Continental army at Long Island, New York City, and White Plains. In 1777, hoping to capture the Congress,

he invaded Pennsylvania, but had to settle for occupying Philadelphia, while the northern Continentals and militia defeated Gen. John "Burgoyne's invading army in New York at the Battles of "Saratoga. Upon Burgoyne's surrender, Howe resigned his command, leaving for England in 1778.

During his three years as commander in chief, Howe consistently stopped short of destroying his enemy when the opportunity arose—perhaps from a sensible estimate of the dangers of pursuit, or from Howe's contradictory roles. As peace commissioner, he was required to negotiate a peace that would bring the colonies voluntarily back into the empire. Howe squandered the British army's numerical superiority by refusing to unleash its full force on the Americans.

HUSSEIN, SADDAM (1937-), Iraqi dictator. From the provincial town of Tikrit, Saddam rose in the national-socialist Ba'ath Party, becoming Iraq's vice president in July 1968 when Ba'athists seized power. After a decade of ruthless elimination of civilian officials and military officers, he forced out his predecessor and benefactor, Gen. Ahmad Hasan al-Bakr, became president in July 1979, and killed most of his opponents, establishing himself as dictator. Using Iraq's growing oil wealth to support development, grandiose public works, and massive arms purchases, Saddam invaded Iran, whose militant Islamic regime he considered a threat. After the death of 1 million Iranians and Iraqis, the war ended in a stalemate in August 1988. Hussein's forces then killed tens of thousands of Iraq's Kurdish minority, which had rebelled or supported Iran during the war.

With Iraq nearly bankrupt, despite loans of \$80 billion (nearly half from Saudi Arabia and Kuwait), Hussein sought to bully Kuwait into bailing him out. Then, on 2 August 1990, he invaded and conquered the emirate. Hussein was accustomed to taking calculated risks, but he had overreached and found himself confronted by almost unified opposition from the West and the rest of the Arab world. In January-February 1991, a U.S.-led Coalition army liberated Kuwait in the "Persian Gulf War.

Since the international coalition did not attempt to topple Saddam and even refrained from supporting Iraqi uprisings, his regime continued, brutally suppressing Kurds and Shiites. Although Saddam survived attempted coups in 1992 and 1993, and a major defection in 1995, UN sanctions hurt Iraq and prevented its resurgence as a major military threat in the Gulf.

HYDROGEN BOMB. See Nuclear Weapons.

IA DRANG VALLEY, BATTLE OF THE (1965). One of the most significant battles of the Vietnam War, the 14-16 November 1965 battle in the Ia Drang Valley in South Vietnam's central highlands between the U.S. Army's 1st Cavalry Division (Airmobile) and the 33rd and 66th Regiments of the North Vietnamese Army (NVA) marked a watershed change in the military strategies of both sides. For the NVA, it was a shift from reliance solely on Viet Cong guerrilla forces to the use of conventional military forces in order to achieve victory. For the United States, it marked the beginning of direct massive involvement in ground combat operations, as well as a test of the heliborne air mobility tactics that were to become the hallmark of the war.

Thwarting an NVA plan to cut South Vietnam in two by attacking eastward across the central highlands to the South China Sea, the 1st Cavalry Division's 1st Battalion, 7th Cavalry Regiment, made a heliborne combat assault directly into the enemy assembly area. Supported by massive air and *artillery fires, including strikes by B-52 bombers, the NVA were routed and forced to retreat back into their Cambodian sanctuaries. The victory was marred, however, by the ambush of the 2nd Battalion, 7th Cavalry, by remnants of the NVA force as it withdrew from the battle area. *Casualties totaled 234 killed in action during the landing zone X-Ray and Albany actions.

IDEALS, MILITARY. No single authoritative document sets forth America's military ideals. However, we may note three groupings that appear to be valid subsets of military ideals, recognizing that discussion cannot always accommodate compartmentalization along such analytic lines: ethical ideals, establishing standards of professional conduct; ideals in operational matters, that is, in the conduct of war itself; and ideals of military leadership.

Ethical Ideals. The early provenance of American military ideals lies in the history of war itself, predating by centuries the emergence of military professionalism among American officers in the nineteenth century. The British code of military honor as it existed in the later eighteenth century, distinctly aristocratic in tone, served as a model for George * Washington's Revolutionary forces, though it was substantially revised to fit social and political conditions in America. Itself an evolved adaptation of the code of chivalry from feudal times, the British "code" was in fact an

amorphous array of principles, values, and traditions that collectively served to encompass the British officer's concept of honor. Morris Janowitz has abstracted the four basic elements of the code: (1) officers fought for traditional military glory; (2) officers were gentlemen; (3) officers owed personal loyalty to their commander; and (4) officers were members of a cohesive, self-regulating brotherhood.

So far as military glory is concerned, modern vestiges of chivalric forms—medals and ribbons for heroism, unit patches on uniforms, unit mottoes and histories, and the celebration of individual and unit heroics in service lore—bespeak a continuing preoccupation with courage under fire and the justified pride and reputation that attends such courage. As to the tradition of officer-as-gentleman, Washington's embrace of that view, in combination with the fact that he became and remains the ideal of the American officer-gentleman to this day, has been a major factor in the persistence of the notion that officers are, first of all, gentlemen. This formulation survives today in Article 133 of the Uniform Code of Military Justice: "Any officer, cadet, or midshipman who is convicted of conduct unbecoming an officer and a gentleman shall be punished as a court-martial may direct." Edwin Cady isolated three persisting traits of the American gentleman that pertain to the realm of ideals: character, courtesy, and cultivation. Character in turn includes the entire range of patrician virtues, a central one being the habit of truthfulness. Out of such a mix emerged the principle that comes close to defining the ethical nucleus of the officer's code of honor: "A gentleman's word is his bond."

The British concept of personalized loyalty to one's commander underwent radical transformation in the American military, owing to constitutional strictures. Loyalty to one's immediate superiors in the military chain of command remains a strongly felt ideal—indeed, loyalty and obedience are the supreme military virtues—but it is always understood, both legally and professionally, that the loyalty owed is to the office, not to particular incumbent individuals. Under the American constitutional system, the loyalty, allegiance, and obedience owed by officers to the military chain of command, including the commander in chief, are subordinated to their allegiance to the Constitution and to the laws that flow therefrom. The primacy of the Constitution in establishing the officer's loyalties derives from the officer's oath of office, the current version having been set down by Congress in 1884. For orders issued by officers in the chain of command to be legally enforceable, including those issued by the commander in chief, they must be lawful. This requirement is spelled out in the officer's commission and is given legal force by Articles 90 and 92 of the Uniform Code of Military Justice.

The fact that within the chain of command, even at the topmost rung, loyalty extended to the office instead of the occupant was a prominent factor in the gradual emergence before the turn of the century of the ideal that officers were "above politics." The ideal of remaining above politics grew finally to embrace the notion that regulars should refrain from affiliating with particular political parties and even refrain from voting. The rationale was that the professional military must loyally serve the nation, regardless of whom political vicissitudes bring to the presidency or Congress, and that political involvement could be seen as compromising the impartiality of professional military advice. Since the 1960s, the strength of this ideal has waned, with the services now actively promoting voting by members through absentee ballots. However, the ideal of the apolitical officer who serves loyally and impartially, regardless of the party in power, remains. A corollary to the officer's allegiance to the Constitution, and closely related to his aim to remain aloof from politics, is the ideal of civilian control of the military. The professional military accepts the ideal of civilian control absolutely without question.

With respect to officers as members of an exclusive brotherhood, the connection between brotherhood and honor becomes clearer when we consider that soldiers, sailors, Marines, and airmen—enlisted members as well as officers—successfully confront the rigors of war only as members of teams, not as individuals. It is to the team that one looks for survival. It is only through the team that the mission is accomplished. To show cowardice and let down one's comrades is thus the ultimate martial sin, the worst form of dishonor.

The American officer's "code of honor," as abstracted and construed by Janowitz but never codified, is not to be confused with the widely noted cadet honor codes of the U.S. service "academies, for example, the honor code of the U.S. Air Force Academy: "We will not lie, steal or cheat, nor tolerate among us anyone who does." Such cadet codes neither pretend nor intend to be a complete description of honorable behavior on the part of military professionals. For cadets who graduate and are commissioned in the corps of officers, their academy honor codes, while remaining a strong force in their professional lives, must accommodate to the professional military ethic itself (i.e., the grand corpus of ethical prescriptions having claim to compliance by service members), which subsumes the codes and extends them so as to confront the ever-growing ethical complexities of today's professional "careers in the military.

None of the individual armed services has thus far elected to codify and officially promulgate a professional ethic in the sense of a comprehensive prescription for ethical behavior along the lines of the American Bar Association's *Model Rules of Professional Conduct* or the American Medical Association's *Principles of Medical Ethics*. A major task of winnowing confronts any officer who would seriously attempt to distill that core of ethical principles having the strongest claim upon his or her professional conscience. We can record here only the most salient elements: the West Point motto, adjuring all service members to accept as their highest values Duty, Honor, Country; the tradition implicit in that motto of always accomplishing the assigned mission, regardless of obstacles; the preeminence of the Constitution in the officer's hierarchy of allegiances; loyalty and obedience as the supreme military virtues, with

the precondition that orders be lawful; the imperative that officers be and act as gentlemen, the essential trait of which is strong character; the precept that an officer's word is his or her bond; "patriotism, valor, fidelity, and professional competence, as enjoined by the officer's commission; the injunction to remain above politics in all professional activity; the principle of civilian control of the military; the principle* that one's acts in war itself are subject to constraints laid down in law and that one remains no less an ethical agent in the most desperate straits of battle; the principle that law and ethical obligation follow the service member even after capture by the enemy; and the principle that officers must avoid conflicts between their private interests and official duties, and that this obligation remains after retirement or separation.

Operational Ideals. Such ideals are not to be confused with actual tactical, theater, or strategic principles, or with the principles of war themselves, all of which are subsumed under that universal body of disciplinary knowledge and theory associated with the art and science of war. Rather, there are overarching operational ideals that are peculiarly American, a product of the United States's unique economic, political, social, and geostrategic identity at the dawn of the twenty-first century. These include the following:

(1) U.S. forces are imbued with the spirit of the offensive, characterized by an indomitable will to win and an aggressive determination to carry the battle to the enemy. Their aim is to inflict on the enemy an early and decisive defeat.

(2) Concern for minimizing "casualties to U.S. forces has come to be a principal if not overriding factor in a commander's war-fighting deliberations, though there is no consensus on the best means to minimize friendly casualties (casualties among one's *own* forces) and still accomplish the mission.

(3) Doctrinally, U.S. forces cling to the ideal of maneuver warfare, which entails the rapid, decentralized movement of forces relative to the enemy, with the aim of outpacing the reactive capabilities of his command and control structures and achieving a prohibitive positional advantage. In theory, maneuver warfare is less costly in terms of lives, equipment, and munitions expended because it is indirect, targeting the enemy's will rather than his force. In modern practice, the maneuver ideal has been qualified by a tendency to append industrial-style variations—the habitual use of massive preparatory and concurrent supporting fires as adjuncts to, and in some cases substitutes for, purposeful and rapid movement.

(4) U.S. forces preferably wage war as part of a multinational force, one having the widest possible national representation. The object is not simply to gain additional power but to enhance legitimacy.

(5) War is waged with forces jointly organized and directed. The joint (i.e., multiservice) ideal has been imposed by Congress and the Department of "Defense, and is not yet fully assimilated by the services, though it is embodied in their doctrine. The army, lacking organic means to move its forces to the theater of war and lacking heavy air support, is perforce the most joint-minded of the services; the navy, with its own organic air arm and having the Marines as a land force, finds itself least prompted toward the joint ideal.

(6) U.S. forces seek always to capitalize upon modern

technology. A technological edge offers the advantages both of replacing humans with machines on the battlefield in many cases, thus reducing casualties, and of increasing the capabilities of logistics, transport, communications, intelligence, and fires beyond any level the enemy can match. Advanced computer technology is particularly exploited.

(7) War is waged in ways that minimize collateral damage to areas and structures that are not military targets and that minimize casualties among the enemy civilian population, even though such humanitarian concerns may reduce mission effectiveness.

(8) U.S. forces undertake a spectrum of ancillary missions, such as *peacekeeping and disaster relief, unparalleled in modern arms.

(9) Troops in the battle area are maintained and provisioned in the most unsparing manner possible consistent with the rigors of war. Such comparative plentitude of creature comforts is made possible by the vaunted responsiveness of the American military's logistical system.

Ideals of Military Leadership. The peculiar genius of the American people, among whom liberty and equality remain touchstone values, has predisposed those in uniform to respond better to certain broad leadership approaches than to others. Though such values as liberty and equality obviously cannot receive full or even substantial expression in military service, they do instill expectations in the minds of service members that military leaders ignore at their peril. These expectations have generated two transcendent leadership ideals within the American military tradition. First, regardless of the particular leadership style selected, leaders must always respect the innate human dignity of each of those being led. Second, leaders must recognize the status of American service members as thinking individuals rather than mindless automatons, giving them opportunity wherever feasible to exercise initiative, shoulder responsibility, and employ their native ingenuity in accomplishing assigned tasks.

These ideals, at least in rudimentary form, have always been present in the army, going back to the days of the *Revolutionary War. For the navy, faced with the unique disciplinary demands of harsh duty on the high seas, such ideals did not begin to emerge until after the abolition of flogging in 1850. In the services today, an enlightened philosophy of leadership based upon scientifically derived principles of human motivation has come to take hold. Among the five services, the air force, which did not gain full independence until 1947, is least afflicted by vestiges of rigidly authoritarian leadership, a fact largely attributable to the high educational standards of the enlisted component and the [intimate working relationship officer air crews and enlisted aircraft maintenance personnel], which tend to dilute the formalities of rank and station.

The entire spectrum of American military ideals—from the U.S. *Coast Guard motto *Semper paratus* (Always prepared) to the Marine Corps motto *Semper fidelis* (Always faithful), reflects the earnest idealism that continues to animate the professional conduct of the men and women who don military uniform to defend America. Such idealism in the military is both fitting and necessary. For, of all professionals, it is the soldier, sailor, Marine, and airman alone who must be prepared to face the ultimate trial and rigor of killing—and being killed—in service to their country.

ILLUSTRATION, WAR AND THE MILITARY IN. What distinguishes art from illustration has long been a vexing problem, but it is less a judgment of relative quality than ultimate purpose. As the famous American illustrator Norman Rockwell pointed out, "The illustrator has, unlike the painter, a primary interest in telling a story." Illustration in addition is almost always commissioned, and its ultimate purpose is reproduction and dissemination.

War and the military have long been subjects for both artists and illustrators. In the Revolutionary era, Paul Revere's widely disseminated engraving of the *Boston Massacre of 1770 helped inflame public opinion. In 1775, Amos Doolittle (1754-1832) issued contemporary engravings on the battles of *Lexington and Concord; Bernard Romans did the same for the Battle of *Bunker Hill. During the Revolution, the *Continental army used illustrations on recruiting posters (usually showing sharply dressed professional soldiers going through the manual of arms).

By the *War of 1812, hand-colored engravings publicized U.S. naval victories in the Atlantic and on Lakes Erie and Champlain, the burning of the nation's capital, the successful resistance of Fort McHenry in Baltimore Harbor, and Andrew *Jackson's victory in New Orleans.

In the early nineteenth century, wood-block engraving was increasingly displaced for producing inexpensive "news" and "history" prints for the general public by lithography, a process in which the illustration was drawn in reverse with crayon on a porous stone plate, which produced much finer gradations and values than sharp-line wood-block engraving. The most noted firm, Currier & Ives (initiated by Nathaniel Currier in 1834 and joined by James Ives in 1852), issued "news" prints of American military conflicts from the *Mexican War to the *Spanish-American War. They issued thousands of copies of some 100 different prints of *Civil War battles. Since the firm never sent any artists into the field, but relied upon newspaper accounts for their research, the prints have little value as firsthand visual accounts of particular battles. However, they did have considerable impact upon large numbers of Northerners as Union propaganda; the legends described every battle as a Union victory, regardless of the true outcome.

By the mid-nineteenth century, photography began to emerge as a competitor in disseminating to the public scenes of war and the military (for example, the Civil War photographs of the teams headed by Mathew Brady and Alexander Gardner). But the slow exposure time for pho-

tographic plates of the period made it impossible for cameras to capture action except as a blur.

It was artist-illustrators as well as photographers who made the Civil War the most visually documented war up to that time. Developments in printing had led to new weekly and monthly illustrated magazines such as *Harper's*, *Frank Leslie's*, and *Century*, which sent teams of "visual reporters" to accompany the *Union army on its campaigns. Among those sending back on-the-spot drawings of camp life and combat to the Northern magazines and weekly newspapers were Winslow Homer (1836-1910), Edwin Forbes (1839-1895), James E. Taylor (1839-1901), and Alfred R. Waud (1828-1891). Conrad Wise Chapman (1842-1910) was one of the well-regarded illustrators on the Confederate side. In the 1880s, as nostalgia set in, there was another outpouring of Civil War battle illustrations, such as the famous Kurz and Allison thirty-six-print set *Battles of the Civil War* and in the heavily illustrated four-volume series *Battles and Leaders of the Civil War*.

Beginning in the late 1890s, the new photomechanical process of halftone printing contributed to an astounding growth of illustrated mass-market newspapers and magazines. Sensationalist New York newspapers such as William Randolph Hearst's *Journal* and Joseph Pulitzer's *World* sent artist-illustrators to Cuba to cover the Spanish-American War, among them Frederic Remington (1861-1909), William Glackens (1870-1938), and the noted marine artist and naval officer, Henry Reuterdaahl (1871-1925).

It was World War I, however, that expanded the wartime role of American illustrators, particularly via the medium of the poster. Emerging in France in the 1890s as a major commercial force through the combination of art and lithography, the large-scale poster became widely used as a means for informing and persuading the urban masses. During World War I, all the belligerents employed posters for mobilization, not simply to recruit for the armed forces but also to encourage the public to buy war bonds, increase munitions production, conserve food, hate the enemy, and support the war effort. To mobilize public opinion when the United States entered the war in 1917, the Wilson administration created a Committee on Public Information, which in turn formed a Division of Pictorial Publicity headed by noted artist Charles Dana Gibson (1867-1944), president of the Society of Illustrators. Gibson obtained the services of some of the most famous illustrators, who worked almost exclusively in hand-prepared, full-color commercial lithography. Among them were Howard Chandler Christy (1873-1952), Joseph Christian Leyendecker (1874-1951), Joseph Pennell (1860-1926), Edward Penfield (1866-1925), and James Montgomery Flagg (1877-1960), whose self-image as "Uncle Sam" pointedly declaring: "I Want You for U.S. Army" is perhaps the best-known poster in American history. The armed services also commissioned combat artists to record the war.

By World War II, motion picture and still photographers had taken over production of most of the visual record of war and the military for newspapers, magazines, and movie theaters. Nevertheless, well-known artist-illustrators continued to work in the field, including Flagg, Reuterdaahl, and Leyendecker, who had produced such notable posters in World War I. Others like Norman Rockwell (1894-1978) produced both posters, such as his famous *Four Freedoms* series, and magazine illustrations, such as his well-known *Saturday Evening Post* cover of "Rosie the

Riveter." Mead Schaeffer (1898-1980) did a series of action covers for that magazine to characterize personnel from the particular branches of the armed services; Noel Nickles (1911-1982) did a similar series for *Life* magazine. Walt Disney (1901-1966) contributed his artists' efforts in many ways, including the design of some 1,200 unit insignias. The armed forces also had combat artists, but the most widely reproduced battlefield illustrations were undoubtedly those of the bedraggled foxhole denizens "Willie" and "Joe," in Bill *Mauldin's cartoons for the army's overseas newspaper, *Stars and Stripes*.

With the extension of photographic and television coverage of war, illustrators participated to a much lesser extent in American conflicts after World War II. Political cartoonists drew caricatures in the *Cold War and the "hot" wars of the period. The armed forces commissioned illustrators to record the *Korean War, among them John Pike (1911-1979), Steve Kidd (b. 1911), Clayton Knight (1891-1969), William A. Smith (b. 1918), and Ward Brackett (b. 1914). The antinuclear organizations' *peace and antiwar movements of the *Vietnam War also used cartoons and posters. Robert T. McCall (b. 1919) and Robert Benney (b. 1904) recorded everyday military life in Vietnam, and Charles Waterhouse provided more than 500 combat drawings of the navy and Marines in Southeast Asia. By the end of the twentieth century, illustrators had been largely replaced by still and motion picture photographers in the on-the-scene portrayal of war and the military.

IMPERIAL WARS. Although North America was peripheral to Western European rivalries in trade, revenue, and power, imperial wars strongly shaped modern North American history. Conflicts between Europeans and Indian communities were also imperial, but conflicts between European settlements and between European forces in America extended European military competition more directly. Generally, these wars reflected rather than affected European power. Their phases correspond to the dominance of Spain, the Netherlands, France, and Britain.

Spain's initial adventures in America roused little rivalry beyond the English-sponsored explorations of John Cabot and the Portuguese voyages of the Corte-Réal brothers. Although Portugal had fought Spain for the Canary Islands, the Portuguese crown quickly gained so much in the Far East that it seemed sensible to respect the 1494 Treaty of Tordesillas with Spain, a hemispheric apportionment of all the worlds that Iberians might discover. Other European courts made no forceful objections to Spain's modest ini-

tial colonies on Haiti and Cuba. The conquest of Mexico in 1521, however, soon changed everything.

The silver and gold of Central and South America were by far the greatest prizes any European power derived from the Americas, translating immediately into pay for armies and fleets, funds for dissidents in neighboring European countries, and collateral for a scale of borrowing that transformed European warfare. The year Mexico was conquered, rivalry between Habsburg emperor Charles V (1500-1558), who was also king of Spain, and French king Francis I (1494-1547) launched nearly forty years of Habsburg-Valois wars in Europe (1521-1559). French privateers captured their first Mexican treasure in 1523, initiating one strategy against Spain's American-supported power. Efforts to find riches equivalent to those of the Aztecs, Mayans, and Incas inspired French voyages by Giovanni da Verrazzano (1524) and Jacques Cartier (1534, 1535-36, 1542-43). They failed to find either North American wealth or a passage to the Orient, but Spain's rivals retained the option of stealing what Spain was taking from the New World. As Spain invested more in convoys for its American bullion fleets, French privateers attacked Spanish Caribbean ports, in the hope of diverting Spanish men-of-war from their primary task. When these Franco-Spanish wars ended in 1559, the two courts informally agreed that depredations occurring west of the Canary Islands would not disturb the peace of Europe. There was to be "no peace beyond the Line."

For the next half century, North America served primarily as a "privateering base for Spain's Protestant rivals. As France collapsed in religiously inspired civil war (1559-89), French Huguenots established a refuge and privateering base at Fort Caroline (Jacksonville, Florida) in 1564. The Spanish responded decisively the following year, capturing the fort, executing most of the prisoners, and establishing St. Augustine, the first permanent European settlement in North America. English illegal traders in the Caribbean, led by John Hawkins, were succeeded by pirates, led by Francis Drake. Elizabethan colonizing ventures in North America failed, under Humphrey Gilbert in Newfoundland (1582) and Walter Raleigh at Roanoke Island (1584-87); both had been intended as bases for raiding Spanish American shipping. During the Anglo-Spanish War (1585-1604), English privateers built fleets and gained navigational knowledge of the Americas, but failed to capture the treasure fleets.

Peace between European maritime powers allowed the English, French, and Dutch to establish permanent North American colonies. Spain took no military action against them, but the English Virginia Company destroyed French settlements at Mount Desert Island, the St. Croix River, and Port Royal (Annapolis Royal, Nova Scotia) in 1613. During the Anglo-French War of 1627-29, English privateers captured French fishing and trading fleets in the Gulf of St. Lawrence, and seized settlements at Tadoussac and Québec.

The Dutch, emerging from their long war for independence from Spain (1572-1648), became Europe's next dominant maritime power. The only mariners ever to capture an entire Spanish treasure fleet (1628), the Dutch forced Spain to extend Europe's peace "beyond the Line" in self-defense. The Dutch built their imperial success on efficient shipping and a global network of trade in exotic commodities for expanding European consumption. For

example, Dutch traders provided capital, expertise, shipping, and markets for sugar production on English and French Caribbean Islands in the 1640s, stimulating the growth of trade in both African slaves and North American provisions, lumber, and horses. Unable to compete with the Dutch, French and English competitors sought government support for exclusionary mercantilist trade laws, and for the maritime wars to enforce them.

Three Anglo-Dutch Wars (1652-54, 1665-67, 1672-74) reduced Dutch trading advantages by escalating their costs for battle fleets, convoys, forts, and marine insurance. Over 1,000 Dutch merchant vessels captured in the first war gave England enough ships to transport colonial commodities that the new Navigation Laws insisted must be carried in English or colonial-owned ships. Little fighting occurred in North America during this war, but the English capture of New York in 1664 helped provoke the Second Anglo-Dutch War. The Dutch readily recaptured New York in 1673 but, severely tested at home by the massive military power of Louis XIV's France, returned the colony to England a year later.

By the 1680s, France had become the paramount power in Western Europe, whether measured by population, tax revenues, or standing armies. Although Jean-Baptiste Colbert (1619-1683) developed impressive naval power and mercantilist colonial policies, America was less necessary to France than it had been to Spain or the Netherlands; maritime war could never cripple a French economy based primarily upon internal markets.

The Anglo-French struggle for North America involved four wars over a period of seventy-five years (1689-1763). Although the British colonists persistently outnumbered their French counterparts by at least twenty to one, the manpower advantage was offset by decentralized and disunited British colonial governments. Many Indians, using intercolonial wars to gain supplies for their resistance against encroaching European settlement, helped prolong the contest by supporting the Canadians. European navies helped insulate the American contests. European courts declared each war and proclaimed each peace, but were slow to undertake serious fighting in North America.

The shared pattern of the first three Anglo-French wars helps explain their inconclusiveness. British Americans rather optimistically named them after their monarchs: King William's War (1689-97), Queen Anne's War (1702-14), and King George's War (1744-48). Monarchs declared war, then hurried the news to the West Indies to snatch a rival's unsuspecting sugar colony. In North America, it was the Canadian governors who invariably initiated serious belligerence, putting stronger enemies on the defensive and consolidating Indian alliances. The first devastating blows in 1690 fell on Schenectady, New York; Salmon Falls, New Hampshire; and Forts Casco and Loyal in Maine. These were paralleled in 1703-04 by attacks on Wells, York, Saco, Winter Harbor, Casco, and Deerfield, and in 1744, by the capture of Canso.

The northern British colonies responded, in each case, with a major siege in Acadia as preliminary to a two-pronged attack on Québec. This type of offensive suited provincial armies recruited on eight-month contracts, trained for only a few weeks, and reliant on shipborne cannon. Such campaigns could promise to "extirpate" an otherwise elusive enemy at predictable costs. William Phips led New England volunteers who profitably captured Port

Royal in 1690, then formed a larger expedition that failed to take Québec. Meanwhile, New York and Connecticut volunteers joined Mohawk and Mohegan warriors in the overland force, stalling at Lake Champlain and sending a small raiding party that attacked La Prairie too early to divert Canadian forces from Québec. In the next war, New Englanders twice failed to take Port Royal in 1707. They awaited British assistance before capturing that base again in 1710, then became junior partners in the British Walker expedition that failed to reach Québec the following year. In King George's War, the New England provinces responded to the capture of Canso by conquering Louisbourg. Plans for an attack on Québec in 1746 collapsed when Britain diverted the intended battle fleet to Portugal, but the British government showed growing commitment when it reimbursed colonial expenses.

In all three wars, the failure of a massive British-American endeavor against Québec heralded reduced colonial effort on both sides, as though a balance of usable force had been confirmed. Profitable raiding, of Hudson Bay fur posts and Newfoundland fishing stations, continued, and colonists claimed to be pursuing the imperial war while "settling with" their Indian enemies as the wars ended. In 1697, the New Englanders fought the Abenaki while New France fought the Iroquois. After 1711 the Carolinas were embroiled in war, first with the Tuscarora, then with the Yamasee. British and French colonials struggled to control the Indians of the Upper Ohio Valley from 1747 in a contest that would defy the peace of 1748 and start a new imperial war six years later.

Whenever European governments contemplated peace negotiations, they became more willing to divert martial resources to America. Captured forts and colonies were useful bargaining items at the peace talks. Thus the French captured English St. John's, Newfoundland, in 1696, but it was retaken the following year while the French captured Spanish Cartagena. Peace negotiations had begun in the second war before the Walker expedition sailed to Québec. As the War of the Austrian Succession seemed decided in Europe, a massive French fleet set off on its disastrous attempt to retake Louisbourg in 1746.

This pattern of intercolonial warfare was broken in 1754, when Virginia troops clashed with Canadians and Indians near the forks of the Ohio River, launching the *French and Indian War two years before the European courts declared what would be known as the Seven Years' War (1756-63). Both Britain and France committed regular ground troops to North America from 1755, and this increased regular army and navy commitment reinforced unprecedented colonial military and financial efforts. French, Canadian, and Indian successes marked the first five years of the war, from the defeat of Virginians under Col. George *Washington (1754) and British regulars under Gen. Edward *Braddock (1755) through the capture of Fort Oswego (1756) and Fort William Henry (1757), to the defense of Fort Carillon (Ticonderoga, 1758). A comparatively unified command gave France advantages not matched until William Pitt inaugurated a subsidy system to encourage colonial participation and end a crippling series of disputes between colonial assemblies and military commanders. British and American victories followed: the recapture of Louisbourg and the taking of Fort Duquesne (1759); successful sieges of Fort Niagara and Québec (1759); and the surrender of Montréal (1760).

Spain belatedly joined its French ally in 1761, marking the fourth time the British and Spanish had been at war since 1717. The wars of 1717-18 and 1727-28 had been brief maritime confrontations, though South Carolina forces and their Indian allies besieged St. Augustine unsuccessfully in 1728. The British and British colonials enthusiastically undertook the War of Jenkins' Ear (1739-44), only to fail at St. Augustine (1740) and more miserably at Cartagena (1741). Spanish entry into the Seven Years' War proved less fortunate, for British forces supplemented by American volunteers captured Havana, which would be exchanged for Florida at the Peace of Paris (1763).

The protracted Anglo-French struggle had fulfilled Indian and Canadian objectives by limiting the expansion of British American settlement and trade. These wars climaxed in a ruinously expensive contest after which the victorious British government felt compelled to reduce North American expenses drastically. Indians were soon at war with a government that eliminated traditional gifts. American colonists, expecting the benefits of peace, soon replaced their celebration of imperial victory with resistance to new imperial taxation, a resistance that could be more confident because French power had been eliminated from the continent.

INCHON LANDING (1950). During the Korean War, in the summer of 1950 *United Nations forces were pushed back to the Pusan perimeter. In spite of this calamitous situation, Gen. Douglas *MacArthur, as early as July, had conceived of a great amphibious operation that would land at Inchon, South Korea's principal west coast port, and drive inland to liberate Seoul, South Korea's capital. He envisaged a huge turning movement that would cut the enemy's major lines of communication and force the North Korean Army, already overextended, to face around and defend on a new front.

Naval commanders saw horrendous problems in assembling the necessary amphibious shipping and negotiating the treacherous sea approaches to Inchon. The tides, up to 30 feet, were among the highest in the world. Low tide left vast mudflats across which landing ships and *landing craft could not beach and amphibian tractors could not crawl. Hydrographers stipulated that the best date for the landing would be 15 September, when the morning high tide would be at 6:59 A.M. and the evening high tide at 7:19 P.M.

The landing force, which MacArthur designated X Corps, would have to be gathered from parts scattered around the world. In the assault would be the hastily assembled 1st Marine Division. In reserve would be the 7th U.S. Infantry Division, weakest of the four divisions that

had made up the occupation force in Japan and with untrained South Korean conscripts as half its rifle strength.

At daybreak on 15 September, a Marine battalion landed on Wolmi-do, an island forming the northern arm of the channel. That evening, two Marine regiments made the main landing against Inchon itself, going over sea walls that were themselves formidable barriers. The assault, with a five-to-one strength advantage, easily overcame the 2,200 second-rate North Korean troops defending the city.

The march to Seoul, against thickening defenses, began the next morning. After heavy fighting, Seoul was declared "secured" on 28 September. The next day, MacArthur escorted President Syngman Rhee in a triumphal reentry into his capital city.

INCIDENTS-AT-SEA TREATY, U.S.-SOVIET (1972). This treaty, signed in Moscow 25 May 1972, prescribed measures to prevent incidents at sea and in the air space over it between the ships and aircraft of the U.S. and Soviet navies. Agreed procedures were necessary for ships and aircraft operating in close proximity to diminish chances of dangerous accidents. It was also agreed that there should be no simulated attacks upon each other's ships, such as aiming guns, missile launchers, torpedo tubes, and other weapons, or illuminating each other with searchlights. At U.S. insistence, this treaty did not provide rules for submarine-versus-submarine operations.

The rapid expansion of the Soviet Navy in the mid-1960s brought their fleet from a coastal force to one with worldwide capability, sailing to troublespots where U.S. ships operated. After two serious collisions between Soviet warships and U.S. destroyers in April 1970 and October 1971, it was obvious something had to be done.

In 1968, the United States invited the Soviets for discussions to reduce incidents, and in 1970 the Soviets accepted this invitation. The first negotiating session was held in Moscow in late 1971 and the second just prior to signing in 1972. This treaty, still in effect, was negotiated in only two nine-day sessions because it was a practical discussion conducted by naval staffs and successfully kept out of the political limelight.

The formal signing was conducted by Admiral of the Fleet Sergei G. Gorshkov and Secretary of the Navy John Warner during a historic visit to the Soviet Union by President Richard M. *Nixon.

INDIANS. See Native Americans in the Military; Native Americans, U.S. Military Relations with; Native American Wars.

INDIAN TREATIES AND CONGRESSES. Treaties, although often broken and usually seen as expeditious and economical methods of relieving Native Americans of

their lands, nevertheless have historically served as the foundations of tribal relations with the federal government. Hundreds of treaties were signed, but scholars disagree on the exact number and, significantly, on what an Indian treaty really means. There were probably more than 200 treaties concluded during the colonial period alone. The U.S. Senate ratified at least 367 treaties and perhaps, according to some scholars, as many as 5 to 8 more. Treaties negotiated but never ratified numbered over 150. States and citizens worked out treatylike agreements with several tribes, and individual communities also reached contractual agreements with Native American groups. The Confederate government made twelve treaties with Indian nations during the * Civil War, and by the early 1870s federally appointed intermediaries negotiated well over 100 intertribal treaties. U.S. Army officers serving in the field may have worked out as many as 50 unratified agreements with tribal leaders in the years between 1790 and 1890. Even after Congress officially ended the policy of making treaties with Indian tribes, the federal government negotiated close to 75 additional "agreements," the last in 1911 or 1914, depending on the authority.

To the Western Europeans who came to the New World, treaties were documents that essentially codified agreements made between two or more sovereignties. They could be made to end wars and reestablish peaceful relationships, define commercial interactions, create political and military alliances, or transfer territory from one nation to another.

The European discovery of the Americas created serious moral, legal, and cultural doubts about how to deal with Native Americans. Advocates of out-and-out conquest argued that Indians were either subhumans or heathens and were therefore incapable of having dominion over themselves or over property. In the 1530s, Francisco de Vitoria, who held the *prima* chair of theology at Salamanca University, wrote a series of discourses known as the *Relectios* in answer to the Spanish emperor's inquiries regarding the status of Native Americans under human, church, and natural laws. Vitoria argued effectively that Indians were indeed human, had a religion, were politically organized, and held rights to property. He concluded that Indian land could not be taken by right of discovery, or by right of conquest in the absence of a just war. It had to be secured by purchase from the legitimate rulers of the tribes. The Spanish were thus legally obliged to treat with indigenous tribes as sovereign nations.

Every other European empire in the Americas more or less followed suit. In several cases, Indian groups were more powerful than the colonists militarily and the whites were forced to deal with them as equal, sovereign polities. Treaty negotiations with Native American nations became customary to establish boundaries, obtain land cessions, end wars, and gain trade concessions. Native Americans too had a long history of extratribal relations and numerous customs that helped manage affairs between nations.

By the time the American colonies gained independence, the treaty-making process was well established and had become a ritual of no small consequence. Of course the Americans, who emphasized due process and documentation, always focused on the final wording of the treaties themselves. Tribal leaders, coming from societies that relied on the power of ceremony and the spoken word, probably paid more attention to the rituals of, and the

speeches made during, the formal negotiations. Whatever the case, the councils and congresses called for the purposes of making treaties were often many-sided exhibitions of generosity, oratory, and military might. Following tribal customs, gifts were always exchanged. The federal government had special silver peace medals struck for presentation to tribal leaders. Federal negotiators, in turn, received wampum, pipes, and sometimes weapons. Few councils occurred without a military presence, the officers and troops always at their parade-ready best. The tribes, too, put on military displays of no mean quality. Witnesses have described hundreds of tribal horsemen appearing at treaty councils heavily armed and dressed in their finest apparel.

Since 1776, more than 1,000 treaty councils or meetings have been conducted to reach formal agreements between various tribes and the federal government. Many occurred at frontier "fortifications; numerous others took place on tribal grounds. In the obvious attempt to impress upon the tribes the power of the federal government and the size of the white population, Indian leaders were invited to attend treaty councils in major cities. No fewer than twenty-four ratified treaties were signed in St. Louis and at least sixty-nine were negotiated in Washington, D.C. On hundreds of occasions tribes were asked to send delegations to tribal congresses at the Capitol to discuss problems and to reaffirm the relationship between the tribes and the federal government. President Bill Clinton called one such congress in 1994. The ceremonial side of treaty making—the desire to influence and awe the tribes—attested to the apparent seriousness the federal government attached to dealing with Native Americans. The tribes, in turn, placed equal and, as the United States became more powerful, even more weight on the process of treaty making to secure their sovereign rights. Native Americans in general felt betrayed when the federal government decided that it could not only end the process entirely but unilaterally abrogate specific provisions of Indian treaties.

The flaw in American Indian treaties that led to the betrayal of the tribes was built into the U.S. Constitution itself. Article VI clearly states that treaties, along with the Constitution itself and the laws of the United States, "shall be the supreme Law of the Land." This stipulation followed customary practices in international relations, which construed treaties as commitments between two or more sovereigns that could not be abrogated without grave consequences. Once signed and ratified by the Senate, treaties were to carry the full weight of the Constitution and should not be violated even by federal statute. All lower levels of government and individual citizens were of course legally obligated to obey treaty provisions.

On the other hand, Article I, section 8, gave Congress the power "To regulate Commerce with foreign Nations, and among the several States, and with the Indian tribes." The word *Commerce* when used in regard to Indians was quickly assumed to have the same connotation as the term *affairs*. This clause also set Indian tribes apart from states and foreign nations, a distinction the Supreme Court would later use to decide that Indian treaties could be judged according to a very different set of rules.

In the Supreme Court cases *Marbury v. Madison* (1803) and *McCulloch v. Maryland* (1819), Chief Justice John Marshall established the precedent of judicial review, which empowered the federal judiciary to decide whether or not a statute was unconstitutional and thus null and void. Judi-

cial review allowed the federal court system to decide which article of the Constitution, III or VI, actually governed Indian relations. The first inkling that the Supreme Court was leaning toward the commerce clause interpretation of Indian affairs came in a 1831 case, *Cherokee Nation v. Georgia*. Chief Justice Marshall, still on the bench after thirty years, ruled that the tribes acknowledged in treaties that they were under the protection of the United States and that "The Indian territory is admitted to compose a part of the United States." Therefore, Marshall held, Indian tribes were not foreign but "domestic dependent" nations, and Article I, section 8, of the Constitution refers to Indian tribes by a "distinct appellation." Although he used this argument to throw the Cherokee case out of court, Marshall nevertheless set the precedent of utilizing the commerce clause to define Indians and interpret the status of Indian tribes and treaties, under constitutional law.

In December 1870, the Supreme Court under Chief Justice Salmon P. Chase delivered one of the more perplexing rulings yet made in regard to Indian treaties. Two years before, Congress had imposed a tax on tobacco products and two Cherokee tobacco manufacturers, Elias C. Boudinot and Stand Watie, had refused to pay it, maintaining that the Cherokee treaty of 1866 exempted the Cherokees from any such levy. Quoting the supremacy clause of the Constitution, the Court reasoned in the *Cherokee Tobacco* Case that the Constitution really did "of settle the problems that might arise when treaties conflicted with acts of Congress. The Court ruled that a "treaty may supersede a prior act of Congress, and an act of Congress may supersede a prior treaty," placing treaties on an equal basis with ordinary legislation and weakening the supremacy clause considerably. This subjected the Cherokee treaty, and by extension all other Indian treaties, to unilateral congressional action.

Within three months, on 3 March 1871, Congress abolished treaty making with the tribes altogether. The act was as much the result of murky congressional politics as of the widespread belief that Indian tribes were really not worthy of being treated as sovereign states. For several years, the federal government had been subsidizing the railroad industry with land grants taken from the territorial concessions made in Indian treaties. The executive branch negotiated the treaties and the Senate ratified them. The lands obtained from the tribes were never really placed in the public domain. Members of the House of Representatives felt that their collective authority, as protectors of the electorate's interest in the public domain, had been usurped. The House used the power of the purse to halt allocations to the Indian Office and finally attached the rider abolishing treaty making to the Indian Appropriations Act. A major policy decision had thus been made within the framework of a relatively minor piece of legislation.

The act did not abrogate prior treaties, nor did it end the process of treaty making entirely. Because the treaties were still in effect, the only way to change or alter them was to make another treaty. Since Congress had abolished treaty making, however, the federal government instituted negotiating "agreements" with the tribes in 1872.

The most severe judicial blow made against Indian treaties came in the 1903 case, *Lone Wolf v. Hitchcock*. In 1867, the Kiowas and Comanches signed the Treaty of Medicine Lodge. Among other things, the treaty stipulated that no part of the Kiowa-Comanche reservation in the Indian Territory could be ceded without the consent of a

three-fourths majority of the tribes' adult males. In the 1890s, Congress began the process of surveying and allotting tribal lands to individual Kiowas and Comanches in an effort to force them to become farmers and ranchers and enter mainstream American society. Surplus lands were to be sold to non-Indians. Arguing that the sale violated the three-fourths majority stipulation in the Medicine Lodge treaty, the lawyers for the Kiowa leader Lone Wolf took the case to the Supreme Court. The Court, however, found that Congress had the power to abrogate Indian treaties "from the beginning," and thus had plenary authority over the tribes. In effect, Indian treaties were relegated to a lower level of law.

Since 1903, Indian treaties have been viewed in a somewhat different light. Treaties serve as the basis for the trust and the direct "government-to-government" relationships between the United States and the tribes. As a result of a number of legal precedents, Indian tribes now enjoy certain reserved rights that have not been specifically stripped away by congressional action. In short, a number of tribes have retained at least some sovereign rights recognized by treaty.

INDOCTRINATION. See Training and Indoctrination.

INDUSTRY AND WAR. The impact of America's wars on industrial production has varied dramatically, depending on the particular war and the stage of industrial development.

The key economic fact about the American *Revolutionary War is how little it affected industrial production. Since the *Continental army never exceeded 20,000 men, its material demands were comparatively small. Because a majority of Americans had no strong preference as to the outcome, major sacrifices were not to be expected, and little time was spent in actual combat. The southern plantation economy was of course disrupted, but exports still remained substantial. Although the government built armories, nevertheless, about 60 percent of U.S. gunpowder was imported. The Revolutionary War did retard the development of the iron industry, and the gross domestic product (GDP)—which at this time can only be very crudely estimated—probably declined somewhat during and immediately following that war.

Of somewhat greater significance was the impact of the *War of 1812. British *blockades of U.S. ports almost dried up American exports. This also meant that foreigners could not trade with the United States—hence encouraging import substitutes, especially textiles. Some see this development as the first faint beginnings of industrialization in America.

The impact of the *Civil War on industrial growth has been much studied. Traditionally (that is, in major studies of the topic from the 1920s to the 1950s), the Civil War was seen as a spur to industrialization. Charles and Mary Beard as well as Louis Hacker took this position, arguing that by destroying the Southern slaveocracy, the Civil War shifted the balance of political power to the industrial North, and the Northern Republicans passed laws that stimulated industrialization. In a classic article in 1961, Thomas Cochran argued that the rate of real growth in value added in U.S. manufacturing actually slowed during the Civil War decade. Pig iron and bituminous coal production—key elements in the manufacturing process—also declined or showed little growth during the war years. Railroad track growth rates were retarded, immigration declined, bank loans dropped, construction slowed. Nor did freeing the slaves help industrialization because former slaves largely became sharecroppers.

Other writers have emphasized the continuity of industrial development prior to and after the Civil War. Factory building and mechanized *transportation were continuous and rapid, both before the war and after. Industrial "takeoff" was well underway before the war started, Walt Rostow has argued, and industrial profits during the war largely lagged behind price increases. Real wages fell about 20 percent during the war. Government borrowing certainly drove up interest rates, as public debt rose from \$65 million in 1860 to \$2,678 million in 1865. In short, Cochran's position that the Civil War actually retarded industrial growth has become the dominant one, but it needs to be modified by the less quantifiable view that changes wrought by the rise of the Republican Party probably did enhance the "capitalist spirit," and certainly a host of Supreme Court decisions over the next three decades favored industrialists over labor and farmers and legitimized a high protective tariff.

World War I marked the transfer of world economic leadership from Europe, and especially Great Britain, to the United States, and quickly proved a boon to U.S. industrial economy. Early on, America became the arsenal as well as the granary for the Allied powers. To achieve this end, the government quickly seized control of the economy and passed laws to fix prices, shifted plants to war needs, established minimum wages and maximum hours, and imposed controls on foreign commerce. By 1918, the government had absolute control over industrial raw materials, the railway system had been nationalized, and marginal mines had been brought into production. Estimates of the growth of GDP during wartime are controversial, ranging from 5 to 18 percent, but by 1920 the high levels of wartime employment in manufacturing had been reached again, thus preparing the nation for a period of prosperity. Finally, World War I changed America's role in the world economy from a debtor nation to a creditor nation, and clearly established the United States as the foremost industrial nation in the world.

World War II solved the problem of the Great Depression, the greatest economic calamity America has ever faced. Even before the attack on *Pearl Harbor, unemployment and industrial sluggishness had almost vanished in the wave of increased defense spending, and by 1945 the real GDP per capita had almost doubled from its prewar base. Expenditures of the War Department rose from \$2 billion in 1939 to \$80 billion in 1945. The impact of

industrial war spending was most dramatic in the Far West, and especially California, which became the fulcrum for the naval war against Japan. By the end of the war, California was the center of the aircraft industry and Los Angeles had risen from a film industry city to a center of shipyards and aircraft plants. In fact, World War II really set the stage for the West to become the fastest-growing region in America since 1945. Overall, by 1944 the United States had indeed become the "arsenal of democracy," out-producing both Germany and Japan almost twofold, boasting the world's largest navy and air force and one of the world's largest armies.

The War Production Board controlled all raw materials and finished goods, both military and civilian, and the Office of War Mobilization and Reconversion served as an umpire over conflicting claims of government agencies. Under their guidance unemployment fell to 1 percent by 1944; industrial employment for blacks and other minorities jumped dramatically; and about half of all new civilian jobs were filled by women. Almost half of all men over the age of sixty-five were in the workforce during that war, compared to 2 percent in the 1990s. The war also saw a tremendous increase in union membership, but union leaders had to accept modest wage increases and agree to a "no-strike" pledge. A government freeze on prices, wages, salaries, and rents made inflation less of a problem than in World War I, but these controls were widely resented and a black market of troubling proportions emerged.

Great advances in technology and scientific research were achieved through war expenditures—most notably jet engines, rocket propulsion, plastics and other synthetics, and television and radar. Many if not all of these products would have come about anyway, but World War II certainly speeded their development. Medical breakthroughs, including sulfa drugs, penicillin, and quinine, were also a consequence of the war. Most obviously, nuclear energy, with all its positive and negative consequences, was a direct result of the development of the atomic bomb.

World War II industrial mobilization was paid for by taxes and borrowing in about equal proportions. The national debt rose from \$41 billion in 1941 to \$271 billion in 1946, or 114 percent of GDP. It has never been paid off, although it has been paid down to 52 percent of GDP (which includes nonwar debt as well). Few have questioned the value of this investment. The war also altered fundamentally our attitude toward government, making Keynesian fiscal policy the preferred approach to industrial development. With the passage of the Employment Act (1946), the federal government became responsible for maximum industrial development, employment, and purchasing power. Consequently, the public has come to expect full employment and an ever-growing economy.

The cost and consequences of the *Cold War, including the Korean and Vietnam conflicts, for industrial development have been substantial. Defense purchases as a percent of GDP reached 14 percent at the peak of the * Korean War and 10 percent during the * Vietnam War. During the Reagan defense buildup of the 1980s, military purchases peaked at 7 percent, and by the mid-1990s they were still in the 4 percent range. In the 1950s and 1960s, defense spending represented about one-half of all federal government outlays; in the 1970s and 1980s, it fell to about 25 percent; and by the mid-1990s, the figure had fallen to about 15 percent, not because defense expenditures plummeted but

because social spending rose dramatically. This military spending created powerful vested interest groups, sometimes referred to as the "military-industrial complex. Aerospace, electronics, shipbuilding, and computer industries benefited substantially from defense spending during these years, as did the interstate highway system and higher education. The great majority of America's largest corporations, however, derived only a small portion of their revenues from defense spending in this period, and the so-called "military-industrial complex" was and is only one of numerous and powerful interest groups with conflicting goals in the American system. Nor has defense spending had much influence on the stock market, which in recent years has boomed as defense has declined relative to other outlays.

Defense infusions into the American industrial base since 1950 correlate closely with the prevalence of fear of an external threat to U.S. security, principally from the former Soviet Union. Looking back, the level of fear was not irrational, and careful studies of congressional voting patterns in heavily defense-oriented districts show that the representatives in these districts were not more hawkish than those with little defense spending. On the contrary, big spenders in both parties tended to be those who were in Congress the longest.

During the 1990s, defense spending has tended to be highly concentrated by industry, with major impacts in ordnance, aircraft, and shipbuilding. Less than 100 companies dominated the market, most of them middle-sized corporations, and there has been little turnover and few failures for these businesses. Nor has there been much spillover to the private economy. The geographic impact industrially has tended to concentrate in a handful of states, notably California, Texas, and Massachusetts. At its last peak, in 1967, defense spending represented about 10 percent of U.S. industrial output and employed about 7.5 million workers. At that time, about one in every five scientists and engineers in private industry were employed in defense industries. By 1995, defense outlays amounted to \$272 billion, which was 18 percent of federal expenditures and 3.9 percent of GDP. Of this, about \$110 billion was in military prime contracts to industry, employing 800,000 civilians, about half of whom lived in the South.

INFANTRY. See Army Combat Branches: Infantry.

INF TREATY (1987). Signed by U.S. president Ronald "Reagan and Soviet general secretary Mikhail Gorbachev on 7 December 1987, the treaty on the elimination of U.S. and Soviet intermediate- and shorter-range "missiles was the first arms control agreement to eliminate—not simply set limits on—nuclear missile systems. Informally known as the INF Treaty (or Intermediate-range Nuclear Forces Treaty), it required the destruction of all U.S. and Soviet ground-launched ballistic and cruise missiles with ranges between 500 and 5,500 kilometers and of the missiles' essential infrastructure. The treaty resulted in the elimination within three years of 846 U.S. longer- and shorter-range INF missile systems and 1,846 similar Soviet systems, and it banned such systems in the future.

In the mid-1970s, the Soviets deployed new, highly accurate, intermediate-range mobile Soviet SS-20 missile systems, targeted on Europe. A 1979 "NATO "dual-track" response to pursue arms control talks while proceeding with counterdeployments of new, modernized U.S. intermediate missile systems in Europe led to the INF negotiations, which began in Geneva on 30 November 1981. The talks were briefly terminated by the Soviet Union on 23 November 1983 as deployments of the new U.S. systems began, but resumed in Geneva in March 1985 as part of broader discussions on nuclear and space issues.

To ensure compliance, the INF Treaty contains the most extensive verification structure achieved to that time, including a comprehensive regimen of on-site inspections and a provision for continuous monitoring of the former INF missile production plants at Volkovsk, Russia, and Magna, Utah, in the United States to confirm the treaty's production ban. The treaty's pioneering verification process has served as the model for all subsequent arms control agreements. In addition, it led to the creation of the U.S. "On-Site Inspection Agency and other permanent arms control bodies since used to implement arms control treaties.

INSIGNIA. Special identification for soldiers and their instruments of war predates recorded history, going back to specially carved prehistoric clubs, and including such well-known examples as Egyptian chariots, Israelite tribal symbols, Roman standards, Zulu regalia, and American Indian warpaint. Anthropologists and psychologists have suggested a warrior's need to identify with a proud unit, or to personalize, trust, and feel affection for those implements that deliver the warrior from or to destruction.

During the Crusades, at the siege of Antioch in 1097, since suits of armor were somewhat anonymous, the Crusaders painted their shields to help them recognize each other in the heat of battle. These later evolved into official coats of arms, representing families and clans. The spirit of knighthood quickly transferred such symbols into elaborate robes, medals, and rings, which became the forerunners of modern metal military insignia.

As weaponry began to render "body armor obsolete,

coats of arms were scaled down and used on tunics and caps, still in the form of the escutcheon or shield. In 1484, Richard III of England founded the Herald's College or College of Arms to determine who would wear certain coats of arms and what the symbols would look like. From this arose the term *heraldry*; an art form that, in the modern military services, remains basically unchanged from Richard's original intent. To avoid duplication and confusion, unit members who wish to create or change their primary emblem must still submit a preliminary piece of artwork to their service heraldry organization and have it officially approved.

As regular standing armies emerged in America in the seventeenth and eighteenth centuries, unit insignia became standardized. Men of common ancestry could now wear the colors of famous units on their uniforms, enhancing both esprit de corps and fighting "troop morale. When George "Washington took command of the "Continental army in 1775, he ordered his officers to wear colored rosettes on their hats as symbols of rank, beginning a long tradition of American military insignia that followed the European style. From these emblems of rank evolved the current use of shoulder or sleeve stripes and metal pins or embroidery as rank insignia. The pride and sense of history generated by such insignia remains a significant part of the military mystique.

Some weapons systems were also identified with official and sometimes unofficial identification symbols. In the twentieth century, the airplane provided the ultimate evolution of the medieval steed carrying a knight's colors into battle. Aircraft nose art—the most popular form of aircraft insignia—was created almost as soon as there were military aircraft. Italy was the first country to use the aircraft in war, deploying several planes to Tripoli in 1912. By 1913, a number of squadrons were using unit and identification markings, since, as the knights of old had discovered, friend and foe were anonymous in battle without some form of decoration. A Nieuport-Macchi of the Italian Navy was painted like a sea monster, with a face, teeth, eyes, and large ears, and the number 20 in large black numerals. In addition, the Italians marked the aircraft with 1-inch by 5-inch white wound stripes for each bullet hole received in combat.

At the start of World War I, the first additions of color to warplanes centered on national and squadron markings; on the ground, French motor transport units were the first to use a form of stylized identification, painted on the sides of their vans. Later, a young, idealistic American ambulance driver and fledgling artist named Walt Disney painted his own vehicle's canvas sides. These insignia, particularly on ambulances, were so graphic in depicting nurses, Indian heads, cartoon characters, and animals that French aircraft squadrons quickly applied similar motifs.

Though the British Royal Flying Corps (RFC) was the first to introduce numbers and letters on their aircraft, it was the Belgians, French, Italians, and Russians who used unit symbols as a departure to embellish their planes with a colorful variety of emblems. At this point, individual pieces of art began to appear, unique to the pilot. The British were the first to name individual aircraft. No. 10 (Naval) Squadron's "Black Flight" of black-painted Sopwith Triplanes became famous when its core of five Canadians painted names on their machines.

In late 1916, Allied pilots started reporting brightly

colored, outlandish, even fantastic German fighters, using every color of the rainbow. The *Jagdstaffeln*, on an incredible victory streak that peaked during what the RFC remembered as "Bloody April" 1917, were allowing their pilots to paint their fighters in any combination of colors they wanted.

The trend was initiated by German ace Oswald Boelcke, who painted his Halberstadt blue; it was then imitated by Manfred von Richthofen, known as the "Red Baron" for his red Albatros D III. Before long, the Red Baron's *Jasta* 11 pilots were using some form of red on their aircraft, with the understanding that only the Red Baron's would remain entirely red. Other *Jagdstaffeln* followed with what became known as the "Flying Circus" rainbow of colors, as well as individual art painted on the aircraft at the pilot's request. Belgian, French, Russian, Polish, and finally American Nieuports, and then Spads, began to sport their pilots' heraldry, reviving a medieval tradition as "Knights of the Air."

With World War II came the golden age of aircraft insignia. Though other nations identified and to some extent decorated their aircraft, the Americans made individual nose insignia an art form, plastering them on almost anything that flew, and even on tanks and ships. Listening to some of the crews who fought that war in the air, one would not be hard-pressed to conclude that the American pinup, and the field art it inspired, helped win the war. Though there were almost as many examples of nose art without them, women, usually in pinups, served as the prime movers for this phenomenon of flying personalized aircraft into combat. Americans defined much of what has come to be accepted as aircraft insignia, influencing the history profoundly.

Since World War II, American military insignia—in the air, at sea, and on the ground—have for the most part been muted by the generals and admirals for camouflage reasons. Anything that glinted or was colorful was given earth, sea, or sky tones to match its surroundings. But invariably the colors break out, enhancing morale and spirit. Military insignia, particularly the variety created by Americans, will always represent pride and color in a very dangerous profession.

INTELLIGENCE, MILITARY AND POLITICAL. Intelligence is often referred to as the "second oldest profession," but for the United States, intelligence is still a relative newcomer as an accepted government function. The United States has been largely free of proximate security threats for much of its history. This fact, and the ongoing lessons from the founders about the dangers of large standing armies, meant that intelligence activities played little role in U.S. history until the mid-twentieth century.

The term *intelligence*, as used here, means two significant functions, one large and one small. The large function is the collection, analysis, and dissemination of relevant national security information. The smaller function is covert activities—a broad range of actions intended to influence events overseas with the role of the United States either unknown or at least plausibly denied. This is a very small part of intelligence in terms of manpower and bud-

get, although it proved extremely important politically during the Cold War.

Prehistory: The Eighteenth and Nineteenth Centuries. The founders were not unaware of the uses and practice of intelligence. The European state system of which they had been an imperial appendage had a long history of secret agents and spies by the time the American Revolution began. Many of these practices had been carried over to the New World. Indeed, George Washington's famous mission into the Ohio wilderness as a young officer in 1754 was both a diplomatic and a reconnaissance expedition.

The Revolutionary War benefited from a number of intelligence practices. Washington, as a commander, understood the utility of espionage and employed spies. As is always the case, their success and veracity varied widely. (The most famous and unfortunate American spy, Nathan Hale, was a poor collector of accurate intelligence.) The Continental Congress had a Committee of Secret Correspondence to maintain communications with those in Europe (including some in Britain) who might be friendly to the American cause. Finally, prior to official diplomatic recognition in 1778, France clandestinely supplied crucial arms via what would be called today a "front company."

As with much else, President Washington established important precedents for U.S. intelligence. At his request, Congress supported what became known as the Secret Service Fund, which at one point amounted to 12 percent of the federal budget. Presidents had to certify the amounts they spent, but did not have to state the purposes, which were widely acknowledged to be intelligence-related.

During the nineteenth century, what little U.S. intelligence activity occurred largely meant wartime tactical reconnaissance. Intelligence played little role beyond that during the War of 1812 or the Mexican War. During the Civil War, both sides employed spies, to little effect. The Union achieved one short-lived technological breakthrough: airborne reconnaissance via balloons. Although these had some success in increasing the range of the commander's vision, the experiment was abandoned mid-war. The Army of the Potomac created a Bureau of Military Intelligence in 1863, which the historian Christopher Andrews credits with having made some contribution to Union victory by its ability to give accurate information as to the Confederate forces' strength and movement.

The first U.S. military attaché—an officer accredited abroad to collect information overtly—was a naval officer posted overseas in 1872. The first standing U.S. intelligence components were created in the 1880s: the Office of Naval Intelligence (ONI) in 1882 and the army's Military Intelligence Division (MID) in 1885. Both were small and largely devoted to collecting data that might be relevant in time of war. These can also be seen as part of a larger military trend then prevalent in Europe, the growing appreciation of the value of a more coherent military staff that was highlighted by Prussia's recent victories.

The prehistory of U.S. intelligence ended with the successful covert action (a not overly indigenous revolution) that created an independent Panama in 1903: the province successfully broke away from Colombia under the auspices of President Theodore Roosevelt, so that the United States could obtain what became the Canal Zone.

The Early Twentieth Century: 1903-40. In the early part of World War I, the United States—the most influential neutral power—was essentially an intelligence target of

both Britain and Germany. A British intelligence success helped shift much U.S. opinion away from cherished "neutrality." British codebreakers intercepted and deciphered Germany's offer of support and territorial spoils to Mexico should Mexico go to war with the United States, the famous Zimmermann telegram.

Once the United States entered the war, its predominant intelligence concerns were related to supporting eventual combat operations in France. There were two notable precedents: the beginning of U.S.-British intelligence cooperation, the famous "special relationship" and the beginning of U.S. signals intelligence (SIGINT), with the creation of a code and cipher unit in 1917 under the legendary Herbert Yardley.

The postwar period also saw two important developments. First, despite the usual "demobilization, Yardley's interception and codebreaking efforts survived as the Cipher Bureau—more familiarly called the "Black Chamber"—funded jointly by the State and War Departments. Second, the infamous Red Scare led to the creation of a General Intelligence Division within the Justice Department's Bureau of Investigation, the forerunner of the Federal Bureau of Investigation (FBI), which was created in 1935.

The Black Chamber contributed to a major U.S. diplomatic, rather than military, success. Having broken Japanese diplomatic codes, Yardley gave the U.S. delegation at the Washington Naval Conference (1921-22) the details of Japan's naval limits negotiating position, a striking coup. However, as U.S. interest in international issues waned, so did support for the Black Chamber. In 1929, Secretary of State Henry L. "Stimson shut it down (with the probably apocryphal comment: "Gentlemen do not read each other's mail"). Army codebreaking efforts continued, and were enlarged and consolidated with the Signal Intelligence Service (SIS), created in 1930.

Codebreaking remained the mainstay of pre-World War II intelligence efforts. SIS cracked Japan's diplomatic PURPLE code in 1940; the resulting decoded messages were called "MAGIC. The army and navy also continued to use attachés abroad, but these officers were often chosen more for their social skills than for their acuity as intelligence collectors.

World War II. The outbreak of war in Europe in 1939 (preceded by undeclared war in Asia in 1937) revealed once again the paucity of U.S. intelligence. President Franklin D. "Roosevelt relied on his own network of well-traveled friends, including attorney William Donovan, for international information. Under British tutelage, Donovan became convinced of the need for a central intelligence organization to handle collection, analysis, and operations. Roosevelt was more cautious, designating Donovan Coordinator of Information (COI), with the vague charter to collect and analyze information bearing on national security. Donovan ambitiously made the most of this, but faced rival organizations, predominantly in the military.

Pearl Harbor has become synonymous with the often overused but in this case apt phrase "intelligence failure." U.S. intelligence efforts were too disparate and disunited across the government, making it impossible to derive a coherent picture; analysts falsely "mirror-imaged" Japanese behavior and underestimated their capabilities; intelligence dissemination was deeply flawed. Anticipating

blows in Southeast Asia, Washington was caught completely by surprise with the actual attack on "Pearl Harbor.

The sudden advent of war saw a new intelligence turf battle. The military rapidly built up all functions, including intelligence. This imperiled the COI, but Donovan was a bureaucratic survivor. In 1942, his office became the Office of Strategic Services (OSS), which retained the collection and analysis functions and gained the task of planning and conducting "special services"—i.e., "covert operations. The military remained opposed to a separate intelligence entity and had OSS placed under the jurisdiction of the newly formed "Joint Chiefs of Staff (JCS). The OSS-JCS relationship remained difficult throughout the war. Interestingly, OSS emerged from the war with a legendary reputation for operational prowess, although these operations had little effect on the war's outcome. OSS's analytical efforts were also modest contributors, competing with both military intelligence and the FBI. Still, the OSS served one important intelligence function as the training academy for many who shaped the postwar intelligence community.

SIGINT played a much greater role in the Allied victory.

MAGIC, once the Japanese naval codes were broken in 1942, was central to U.S. victories at the Battle of "Midway and elsewhere in the Pacific, just as Britain's "ULTRA, the deciphering of German military codes—shared with the United States—helped to defeat Germany in the Atlantic, North Africa, and in Europe.

The Modern Intelligence Community. President Harry S. "Truman disbanded OSS one month after Japan surrendered, dispersing analysis to the State Department and some operations to the army. The future of U.S. intelligence became part of the larger debate over the entire national security apparatus, largely prompted by wartime studies to unite the military departments.

Truman became increasingly unhappy with intelligence reporting, finding it difficult to make sense of conflicting reports and analyses. In 1946, he created a Central Intelligence Group under a Director of Central Intelligence (DCI) to improve coordination among the disparate reports. Devoid of any institutional base, however, the DCI found this hard to do.

In 1947, the "National Security Act became law. This established a "National Security Council (NSC), to coordinate civilian and military policy; placed the DCI under the NSC, and replaced the CIG with a "Central Intelligence Agency (CIA) under the DCI to coordinate intelligence. The military was adamant, however, that each service maintain its own individual intelligence office despite the creation of the new CLA. (The military services also held to this position in 1961, when Secretary of Defense Robert S. "McNamara created the "Defense Intelligence Agency, hoping to consolidate defense intelligence activities. The service's resistance limited the extent of this consolidation.)

Truman envisioned the CIA as a coordinator, not a new intelligence producer or operator. But the CIA's legislative charter was vague, including the mandate to perform "such other functions and duties related to intelligence" as required by the NSC. A combination of unwillingness by other agencies to undertake broader analyses (rather than that written for one department only) or operations of any sort, coupled with a more bureaucratically aggressive CIA leadership willing to fill these gaps, quickly broadened the CIA's role.

Policymaker demands for current intelligence reports

and longer-range estimates gave CIA entree into analysis. Operations—i.e., covert action—began as a means of resisting Soviet advances in Europe. Gen. Walter Bedell Smith, Gen. Dwight D. *Eisenhower's wartime chief of staff, became DCI in 1950, shortly after the surprise outbreak of war in Korea. Smith capitalized on these trends in analysis and operations, solidifying the CIA into the agency familiar throughout the Cold War.

In 1952, Truman created the "National Security Agency (NSA) via a secret directive. NSA was charged with the protection of U.S. encoded communications and the interception and breaking of foreign ones, the lineal descendant of Yardley's early SIGINT efforts.

It is likely that, given the United States's postwar global responsibilities, an intelligence community of some sort would have been created. It is less debatable, however, that the Cold War greatly gave shape and form to U.S. intelligence.

Having opposed creation of the CIA, the military now found it useful, despite lingering rivalries. Military services warning of growing Soviet strength could appear self-serving; a national estimate from the CIA raising a similar concern had the advantage of appearing bureaucratically neutral.

But bureaucratic neutrality did not translate into political neutrality. Politicians in both parties used intelligence (or their version of it) about alleged Soviet strength for partisan means. The late 1940s and early 1950s saw the "bomber gap" debate. More illustrative and strikingly similar were the next two "gap" debates. In the early 1960s, Democrats—then out of power—charged that the United States suffered from a "missile gap." In the late 1970s and early 1980s, Republicans—also out of power—warned about a strategic "window of vulnerability." These were seen as legitimate issues in the presidential elections of 1960 and 1980. In both elections, interestingly, those raising the alarms won, only to declare the problem solved once they took office.

These repeated debates led some critics to conclude that the intelligence community (read CIA) was an intellectual pawn of the military, creating false alarms to justify larger defense budgets. This view was unrealistic, at least bureaucratically, since the CIA was a competitor with the *Department of Defense for national security dollars. Still, the legend remained—even among some senior officials, such as Secretary of Defense McNamara.

The tremendous growth of intelligence-related technology was a boon for both intelligence and the military. SIGINT and photoimage intelligence (IMINT) first by *U-2 spy planes and then by "satellites, not only greatly improved strategic warning, but helped give a better—albeit always incomplete—view of Soviet capabilities. One goal of U.S. Cold War diplomacy—often successful—was placing intelligence technical collection sites in nations bordering the USSR, just as orbiting improved intelligence collection satellites was a major goal of the U.S. space program.

Increased use of covert action was another Cold War intelligence feature. Proponents of covert action customarily defend this option as a necessary choice between doing nothing and using armed force. But covert action has proved to be a difficult instrument to use. In general, the closer the covert action supported a very specific overt policy goal and the more tightly focused were the operation's goals, the more likely the operation would be successful.

U.S.-abetted coups in Guatemala and Iran were successful—at least in the near to medium term (as much as twenty-five years). But large-scale paramilitary operations such as the abortive Bay of Pigs or the contra effort in Nicaragua were not. These operations tended to be extremely difficult to keep covert, given their scope; extremely difficult for the United States to claim "plausible deniability," and difficult to sustain politically if they dragged on too long. Paramilitary operations also raised issues for the CIA. Was the CIA competent to undertake such efforts or would it be of greater propriety or legality for the Defense Department to do so? Could CIA analysts provide unbiased assessments of situations in which the CIA was also supporting one faction via paramilitary operations?

Vietnam became the Cold War crucible for the entire national security community. Frustration over the inability to bring the "Vietnam War to a successful conclusion led to fissures between intelligence providers and policy customers. The infamous "order of battle" dispute—in which Defense analysts took issue with CIA estimates showing higher numbers of enemy troops, as these undercut claims of operational success in the field—typified both the overquantification of the war and the inapplicability of U.S. military resources.

Vietnam undermined the Cold War national security political consensus. The end of the war in 1975 was quickly followed by a series of revelations about and investigations of the intelligence community, detailing how agencies (CIA, NSA, FBI) had violated the limits of their charters, engaged in questionable activities at home and abroad, and had had insufficient executive and congressional oversight. From then on, the intelligence community could never return to its cloak of relative obscurity. Indeed, new intelligence-related revelations or scandals became a recurrent feature.

The Cold War continued for another fifteen years. President Ronald *Reagan espoused a never fully defined Reagan Doctrine that sought to reverse the Cold War pattern, making the Soviets and their allies pay the price of overseas involvement against "guerrilla warfare supported by U.S. intelligence operations. This policy was successful in Afghanistan, important in Angola, but inconclusive and very costly politically in the case of the contras in Nicaragua.

The vagueness at the core of the Cold War—a dogged and deadly serious competition that never erupted into outright, direct hostilities—makes it difficult to assess the factors that contributed to the U.S. victory, including the role played by intelligence. The key issue for many is the degree to which the intelligence community predicted or failed to predict the collapse of the Soviet Union. Critics observe that the very ability to track Soviet military in detail ultimately gave a false picture of Soviet strength obscuring the underlying economic and social weakness. Others note, more favorably, that intelligence had increasing knowledge of the systemic Soviet failure and the restiveness of nominal allies. But these warnings were not the same as a bold prediction that a positive end to the Cold War was in sight—although this may not have been predictable, even to the Soviet leadership.

The end of the Cold War also gave rise to familiar demands for a decrease in national security spending. Cuts in military and intelligence spending began even as political leaders came to appreciate that the post-Cold War world

was less threatening but perhaps more complex than the old bipolar struggle had been.

The * Persian Gulf War created new strains for intelligence and for its relationship with the military. Critics charged that U.S. surprise at Iraq's invasion of Kuwait was another "intelligence failure." Successful prosecution of Operation Desert Storm in 1991 revealed a number of new intelligence-related contributions: precise targeting information allowed the use of "smart" weapons that increase the likelihood of a "kill" while minimizing collateral damage; and "information warfare," the ability to attack important technological nodes—finance, utilities, communications, security—via computers, thus disrupting enemy efforts silently at their centers. Military intelligence professionals describe this as a major shift: they have gone from combat support to combatant. There were also intelligence problems: the "battle damage assessment" debate between the field command and Washington-based analysts; difficulties (largely technical in nature) in disseminating the right intelligence information to the right user when needed; and, in a debate that continued for years after the war, whether the CIA was explicit enough in detailing the location of Iraqi chemical weapons sites to U.S. troops sent to destroy them, perhaps resulting in chemical exposure and "Gulf War syndrome."

On the verge of the twenty-first century, intelligence is being asked to contribute to a new—and still debated—military doctrine: "dominant battlefield awareness." Proponents argue that technology now allows commanders to have intelligence about the battlefield in such depth and detail as greatly to reduce the size of forces and likely *casualties. Critics wonder whether this degree of knowledge is realistically attainable, what effect it will have on competing demands for intelligence resources both within the military and with nonmilitary national security users, and whether it is necessary. At one level, the debate is part of an ongoing evolutionary relationship; at another, it reflects how intelligence technology is once again sparking potential changes in combat doctrine.

INTER-AMERICAN TREATY OF RECIPROCAL ASSISTANCE (1947). The United States signed the Inter-American Treaty of Reciprocal Assistance—popularly known as the Rio Treaty—with the twenty Latin American nations in 1947 in Brazil. This regional security pact, per-

mitted under Article 51 of the "United Nations Charter, incorporated the principle that an attack against one was to be considered an attack against all. Signatories would decide by a two-thirds majority what kind of collective action might be taken against aggression. No nation would be required, however, to use force without its consent. The treaty continued the military cooperation that had characterized inter-American relations during World War II. The Rio Treaty was also a "Cold War pact aimed at the Soviet Union.

In practice, the treaty has been largely invoked, in conjunction with the consultative organs of the Organization of the American States (1948), to resolve intrahemispheric controversies, such as the dispute between Costa Rica and Nicaragua in 1955 or the Dominican Republic's attack on Venezuelan president Rómulo Betancourt in 1960. President John F. "Kennedy did cite the Rio Treaty in justifying his quarantine order during the "Cuban Missile Crisis of 1962. But usually when the United States decided that the Soviet Union threatened its hemispheric interests, Washington bypassed the treaty and acted unilaterally, as in Guatemala (1954), Cuba (1961), the Dominican Republic (1965), Chile (1970-73), and Nicaragua (1980s). The United States also refused the request of Latin American nations to invoke the Rio Treaty against Great Britain during the 1982 Anglo-Argentine war over the Falkland Islands.

INTERNATIONALISM. Internationalism emerged early in the twentieth century to challenge isolationism as a proper American approach to international affairs. In the balance between them lay competing perceptions of the role of external conditions in the country's remarkable security and well-being.

For some Americans, the country's favored position rested on elements of international stability whose permanence required the nation's attention. At the turn of the twentieth century, writers such as Alfred T. "Mahan, supported by members of the eastern Anglo-Saxon elite, argued that the rise of potentially expansionist Germany and Japan demanded closer ties to Britain. Other internationalists discovered the surest guarantee of universal peace, and with it the perpetuation of a world that served U.S. interests admirably, not in superior force but in the international acceptance of non-power devices, such as arbitration and conciliation, for the settlement of international disputes. For such legalists as William Howard Taft and Elihu "Root, the final guarantee of world peace lay in a world court that would command the absolute confidence of the entire world. American internationalism scored its initial triumph in response to the horrors of the Great War of 1914. Pressed by President Woodrow "Wilson, the Versailles Conference in 1919 adopted the American program for institutionalized peace in the form of the "League of Nations and the World Court.

If the Senate's rejection of the Treaty of "Versailles marked a powerful resurgence of American isolationism, it did not quell the determination of the country's

internationalists to fulfill Wilson's admonition that the United States actively pursue the cause of peace. In the vanguard of the country's postwar internationalism were academics and students of international law, such as the University of Chicago's Quincy Wright and Columbia's James T. Shotwell. Members of the eastern establishment of international bankers and lawyers entered the internationalist ranks through membership in the recently founded New York Council on Foreign Relations. Internationalists comprised largely the country's pro-League forces, who predicted endless triumphs for peace from a League of Nations morally enhanced by American membership.

In practice, the internationalists, no less than the isolationists, ignored the persistent role of power in affairs among nations. For them the goal of universal peace, rendered essential by the recent experience of war, was sufficiently overwhelming to eliminate the problem of means. Internationalists denied that the United States need be concerned with any specific configuration of political or military power in Europe or Asia. Whereas isolationism insisted that the United States had no external interests that merited resorts to force, internationalism declared that American interests existed wherever governments challenged peace or human rights. It presumed, however, that the universal acceptance of the principle that change, to be legitimate, needed also to be peaceful would control undesirable international behavior. Every program fostered by American internationalists during the 1920s—membership in the League of Nations and the World Court, the employment of arbitration conventions, the resort to consultation in the event of crises, collective security, naval disarmament, or the outlawry of war as embodied in the Kellogg-Briand Peace Pact of 1928—denied the requirement of any precise definition of ends and means in external policy, and anchored the effectiveness of any moral condemnation of aggressors to the power of an aroused world opinion.

Consigned by adverse opinion to failure on the League issue, internationalists seized World Court membership as the alternative approach to effective international cooperation. Eventually the court battle comprised the most determined internationalist counterattack of the decade. When in May 1922 the court officially opened, a noted American authority on international law, John Bassett Moore, was among its eleven judges. Under internationalist pressure, President Warren G. Harding, in February 1923, submitted the question of court membership to the Senate. To satisfy congressional isolationists, Harding recommended four reservations that would absolve the United States of all commitments to the League but would retain for the country all powers on the court enjoyed by members of the League. Isolationists killed the measure as an overcommitment of American power and prestige.

Not until December 1925, when the issue of membership had won the support of peace groups, women's clubs, pro-League forces, countless mass meetings, and much of the press, did the Senate agree to act. It approved membership, 76-17, in early 1926. But Senator Claude A. Swanson of Virginia introduced a fifth reservation that denied the court the right to render an advisory opinion on any question touching the interests of the United States. That reservation the court rejected; by the end of 1926, U.S. membership in the court had become a dead issue. Yet such

membership would have entailed no commitment for the United States beyond paying its share of the court's expenses. Internationalists agreed that neither the League nor the World Court had confronted any major challenges, nor had either institution demonstrated any capacity to restrain a major power.

Despite its limited prospects, the internationalist faith in such institutions continued into the following decade. However, its central assumption that world opinion was the ultimate arbiter in world affairs denied its adherents any answer to the troubling aggressions of the 1930s. As late as 1939, internationalists looked to the League as the world's primary hope for peace. In their general unconcern for military preparedness, they had done little in previous years to provide the League with either the sanctions or the means required for effective collective security. But internationalism, as embodied in the ideals of the League of Nations, failed not only in its unwillingness to provide a defense against "aggression and violence but also in its refusal to seek some accommodation with change as the only long-term alternative to war. Any system of collective security would seek order rather than change.

For the British historian Edward Hallett Carr, in his noted book *The Twenty Years' Crisis* (1939), collective security, like American internationalism, expressed the concern of status quo powers to prevent unwanted change in the international system. Thus peace became the vested interest of the predominant powers. With no single country strong enough to exercise a *pax Romana* or a *pax Britannica*, slogans such as "collective security" and "resistance to aggression" proclaimed the identity of interest between the dominant, satisfied group of nations and the world as a whole in the maintenance of peace. Throughout the interwar years American internationalism, despite its persistent effort to engage the United States in world affairs, remained essentially an effort to sustain the status quo without accepting the price, either in military preparations or in concessions, that international peace demanded.

The attack on "Pearl Harbor destroyed the illusion that the United States could have the world of its choice without cost. That event not only diminished the power of isolationism in Congress and the nation but also reinvented American internationalism. The realization that war had come unexpectedly and over vast distances recommended, at least to the country's military leaders, that the United States never again entrust its peace to world opinion or the oceans. Rather, its continuing interest in international stability required a military structure of sufficient magnitude to discourage aggression everywhere. The wartime decisions designed to engage the nation heavily in the postwar world included commitments to the "United Nations, the International Monetary Fund, the "World Bank, and other postwar international institutions. These decisions to assure postwar peace and stability received the support of an overwhelming national consensus. Internationalism emerged from the war firmly in the saddle.

What ultimately converted internationalism into an unprecedented body of worldwide economic and security commitments was the assumption that Soviet "expansionism, rendered global and unlimited by the Kremlin's alleged control of international communism, endangered American and world security. Such fears led to a system of global military containment, including "NATO and eventually treaties of alliance with dozens of countries

throughout the world. More limited, yet more pervading, internationalists embraced the * Marshall Plan to rebuild the economies of Europe. Acting through international agencies of trade and monetary stabilization, the plan contributed heavily to the world's unprecedented prosperity. Through forty years of *Cold War, the USSR, as a perceived global danger, enabled the United States, with its abundance of economic and military power, to maintain a worldwide influence without precedent in modern history.

After 1990, the passing of the Cold War, in denying the United States its special role as the world's self-appointed defender against communism, again compelled the country to redefine the meaning of its internationalism. Internationalists quickly detected new foreign challenges in the form of resurgent nationalism, ethnic strife, border disputes, economic chaos, and civil war. Confronting them in their demands for national action, moderates cited the potentially heavy costs of involvement in the world's domestic turmoil, especially when contrasted to the minimal U.S. interests at risk. Internationalism, as the past had demonstrated, was never an absolute good in itself; its utility hinged on its success in advancing the interests of the nation and its citizens.

INTERNMENT OF ENEMY ALIENS. Inevitably in time of war, American expectations of due process and protection of civil liberties have been reshaped into a peculiar synthesis of principle and expediency. Too frequently, expediency has triumphed over principle, and while the lapses in American commitment to these liberties has always been characterized by its perpetrators as temporary, and resulting from emergency conditions, it may be appropriate to ask: if such vital legal protections are disregarded when they are most needed, how deeply do they reflect American devotion to them?

Although internment of enemy aliens during the *Civil War was of minimal importance, given the internal nature of the conflict, in both world wars the practice was much more common. It had deep roots in American history, beginning with the Alien Enemies Act of 1792. Part of the notorious series of statutes known as the * Alien and Sedition Acts, this act somehow had escaped repeal—and President Woodrow *Wilson invoked its provisions in April 1917 shortly after the United States entered World War I. By the time of the armistice, more than 6,300 German aliens had been detained, while others who had not been arrested were forced to register with federal authorities and barred from moving without official sanction. Moreover, authorities frequently found it convenient to label labor-organizing activities as conduct by enemy aliens. Indeed,

the infamous Red Scare took place well over a year after the armistice, and resulted in the internment of more than 4,000 individuals—arrested and imprisoned without either warrants or trials.

Americans fought in World War II with much less antiforeign hysteria than in 1917-19, yet one episode involving enemy aliens remains a terrible blot on the American tradition of civil liberties. The internment of Japanese Americans was in fact what the constitutional scholar Edward Corwin called "the most dramatic invasion of the rights [of U.S. citizens] by their own government that had thus far occurred in the history of our nation." Although no specific evidence of sabotage by Japanese Americans was produced, in the wake of the attack on * Pearl Harbor neither the Justice Department nor the U.S. Attorney General was willing to confront the military on what it claimed to be a matter of "military necessity." Nor, were the executive and judicial branches of federal government. President Franklin D. *Roosevelt signed the evacuation and internment order without any discussion with his cabinet, followed by the supine acceptance of this action by the U.S. Supreme Court.

Solely because of their racial heritage, rather than their conduct, Japanese Americans on the West Coast suffered severe personal stress and loss. They were forced, often overnight, to sell their property—including "land, stores, homes," and personal possessions—before being forcibly relocated to confinement camps. The fact that Congress apologized for the internment many years after the war, and awarded some financial restitution to its survivors, only indicates the sense of national guilt over this episode, guilt that was fully warranted. The internment of Japanese Americans as enemy aliens, classified as such for reasons of expediency rather than evidence, remains an unnecessary blemish on the American heritage of equal protection under the law.

INTERSERVICE AGREEMENT. See Key West Agreement (1948).

IRAN, U.S. MILITARY INVOLVEMENT IN. The American military first assumed a role in Iran in 1942. The shift of the lend-lease supply route to the Soviet Union from Murmansk to the Persian corridor brought American military personnel to Iran. They came for two reasons: to move supplies across Iran and to shore up the Iranian government headed by Mohammed Reza Shah Pahlevi. The Americans organized a series of advisory missions to stabilize Iran, including one to reform its army and another to reorganize the gendarmerie (state police). The first adviser, Gen. John Greely, set out to improve the army's fighting quality, but lacked authorization or resources. His successor, Gen. Clarence Ridley, followed War Department guidelines to evaluate a military assistance program and reorganize the Iranian military supply system. Col. H. Norman Schwarzkopf (father of the leader of Desert Storm) headed the gendarmerie mission. By 1943, some 30,000 troops of the Persian Gulf Service Command (PGC) under Gen. Donald Connolly had begun rebuilding roads and

the railroad to move Lend-Lease supplies from the gulf to the Soviet Union.

Immediately after the war ended, the United States dismantled the PGC. President Harry S. Truman, at State Department urging, exempted the advisory missions from his order to remove all American troops.

The American military played a significant role during the Soviet-American crisis over Iran between November 1945 and April 1946. The "Joint Chiefs of Staff did warn that in any armed conflict, logistical difficulties prevented an effective military response. They later supported a "National Security Council finding that Iran had become "a major strategic interest to the United States." The region's oil was vital to postwar energy policy. Iran also shared with the Soviet Union a 1,300-mile border and blocked the traditional Russian aspiration for a warm-water gulf port. Both factors created long-term American concern with Iran's stability and independence.

Over the next two decades the Department of "Defense (DoD) resisted the Shah's requests for help in building Iran's military forces. Military advisers remained until the 1979 revolution, organized after 1950 as ARMISH-MAAG and GENMISH. They supported the American policy to contain Soviet ambitions in Iran, but played no significant role in the "Central Intelligence Agency operation that overthrew Mohammed Mossadeq in 1953. The Eisenhower and Kennedy administrations both stressed economic development and social reform rather than military strength as the key to Iran's future security. In case of conflict, the "Pentagon planned to use American forces to stop the Russians. The primary threat in the late 1950s came from Soviet arms shipments to Iraq. In 1964, the United States extracted a Status of Forces Agreement that exempted American military advisers from Iranian law. As a reward, the Shah received \$200 million in loans and credits to buy arms. That agreement angered conservative Islamic opponents of the Shah, especially Ayatollah Rouhollah Khomeini.

By 1970, some 778 Defense personnel were in Iran. In May 1972, over Defense objections, President Richard M. Nixon and NSC adviser Henry "Kissinger granted the Shah unlimited access to the most advanced American weapons, including F-14 and F-15 aircraft. In 1972-77, American arms sales totaled \$16.2 billion as Iran's defense budget rose 680 percent. Nixon and Kissinger justified this policy under the "Nixon Doctrine, which shifted the burden of regional defense to key allies. The buildup brought 30,000 Americans to Iran and increased the nationalist resentment of the Shah, ultimately triggering the revolution of 1978. On 24 April 1980, the military launched Operation Eagle Claw, a disastrous mission to rescue fifty-two Americans held hostage by Iranian militants. Eight "helicopters from the carrier *Nimitz* flew 600 miles to a site called Desert One to rendezvous with C-130 transport planes. A combination of bad weather and mechanical failure aborted the mission, leaving eight American Marines dead.

In response to Iran's revolution, President Jimmy Carter on 23 January 1980 enunciated the "Carter Doctrine: the United States would use military force if necessary to defend its "vital interests" in the Persian Gulf region. A major buildup of American naval forces and the development of the Rapid Deployment force and CENTCOM, its command structure, continued under Ronald

"Reagan. After the outbreak of the Iran-Iraq War in September 1980, both sides attacked tankers and oil facilities critical to the West.

In 1986, Iran focused its attack on Kuwait and Kuwaiti-bound ships in the gulf. American policy by then had tilted toward an Iraqi victory. The "Iran-Contra Affair of 1986 confused the issue as the Reagan administration, which publicly condemned Iran, privately shipped arms to Teheran. To protect the flow of oil from Iranian attacks, the U.S. Navy began to escort American and "reflagged" Kuwaiti tankers. In May 1987, an Iraqi Mirage F-1 fighter in error fired two Exocet missiles that killed thirty-seven sailors aboard the American destroyer *USS Stark*.

By late 1987, the United States had some thirteen naval ships in the gulf, supported by another twelve to fifteen in the Gulf of Oman and a substantial allied force. American forces several times attacked small Iranian ships. Iranian-laid naval "mines posed the gravest threat to gulf shipping. On 18 April 1988, in retaliation for a mine attack on the frigate *Samuel B. Roberts*, the navy fought its largest surface action since World War II. Operation Praying Mantis destroyed two armed oil platforms, a frigate, a fast attack craft, and two armed speed boats. As a war-weary Iran moved toward peace, the cruiser *Vincennes* on 3 July 1988 mistakenly shot down a civilian Iranian airliner with the loss of 290 lives.

After the Iran-Iraq War ended in July 1988, overt hostility between the United States and Iran ceased. Iran remained neutral during the "Persian Gulf War in 1991 and figured prominently only when over 100 Iraqi fighter planes fled there to avoid destruction from Operation Desert Storm. Friction with the United States persisted through 1995, primarily from Iran's support for international "terrorism and its program to build "nuclear weapons. Friction with the United States persisted into 1999, but the rise of more moderate leaders and Iran's continuing role as a counter-weight to Saddam Hussein in Iraq gave hints that tensions might ease.

IRAN-CONTRA AFFAIR (1986) represented the confluence of two politically controversial and arguably illegal foreign policies conducted by the Reagan administration: the arming of Nicaraguan counterrevolutionaries (the Contras) after Congress had banned such aid, and the selling of weapons to the government of Iran in order to secure the release of U.S. citizens held hostage in Lebanon. Both policies became publicly linked following press reports on the Iranian operation in November 1986, when a Justice Department review turned up evidence that millions of dollars in profits from the sale of arms to Iran had been diverted to fund the Contra rebels.

The revelations mushroomed into the greatest U.S. political scandal since Watergate, raising constitutional, legal, and ethical issues concerning the congressional role in foreign policy and the conduct of administration officials. Investigations by a presidentially appointed panel and a joint

committee of Congress focused on whether or not President Ronald "Reagan knew about or had authorized the diversion—an act that could have constituted an impeachable offense—and whether Congress's constitutional foreign policy and budget prerogatives as well as U.S. laws had been violated. An independent counsel investigated the legality of third-country fund-raising for projects banned by Congress, as well as the obstruction of justice by administration officials. Congress ultimately found that the common ingredients of the Iran and Contra policies were "secrecy, deception, and disdain for the law." And while blaming President Reagan for allowing a "cabal of the zealots" to take charge of foreign policy, it backed away from accusing him directly of illegal acts. The parallel investigation by Independent Counsel Lawrence Walsh secured criminal convictions of nearly a dozen senior administration officials and private citizens for acts such as perjury, conspiracy, fraud, and the destruction of evidence. Walsh's efforts were compromised by congressional grants of immunity to key U.S. officials during several months of televised hearings. All convicted U.S. officials and those awaiting trial, including Secretary of Defense Caspar "Weinberger, were pardoned by President George "Bush on 24 December 1992 following his defeat for reelection.

The roots of the scandal involving the Contras lay in the Reagan administration's decision in 1981 to conduct covert political and paramilitary operations aimed at "the Cuban presence and Cuban-Sandinista support structure in Nicaragua and elsewhere in Central America." Following a series of controversies, including that over the participation of the "Central Intelligence Agency in the mining of Nicaragua's harbors in 1983 and 1984, Congress enacted 1984 legislation known as the Boland amendment, which banned any U.S. agency involved in intelligence activities from supporting military and paramilitary operations in Nicaragua.

Notwithstanding the law, President Reagan instructed subordinates to keep the Contras together "body and soul." Operational control of the Contra program shifted from the "Central Intelligence Agency (CIA) to the "National Security Council. Both prior to and after the passage of the Boland amendment, senior U.S. officials, including the president himself, solicited Contra military aid from private individuals and third countries, including South Africa, Saudi Arabia, Taiwan, and Brunei. National Security Council aide Marine Lt. Col. Oliver North coordinated the resupply operation, which had its own pilots, planes, secure communications, and secret Swiss bank accounts. With the support of his superiors, national security advisers Robert McFarlane and John Poindexter, and, apparently, CIA director William Casey, North directed a network of former military and intelligence officials and businesspeople, code-named "the Enterprise," in effect creating a private "covert operations capability outside normal channels of oversight and accountability. All the while, the administration insisted publicly that the Contras were in desperate straits due to the congressional cutoff; it also spent federal funds for prohibited "propaganda operations aimed at influencing future congressional votes.

U.S. policy toward Iran was developed independently of Nicaragua, but shared many of the same operatives as well as covert practice. After the seizure of the U.S. Embassy in Teheran by Islamic militants in November 1979, the Carter administration had embargoed trade and financial trans-

actions, including arms shipments, to the Iranian regime. The Reagan administration sought to tighten the embargo by enlisting the cooperation of European and other governments, designating Iran as a sponsor of international "terrorism.

Despite the public policy of isolation, when U.S. hostages were seized in Lebanon by militants with apparent ties to Iran, the administration undertook covert "arms-for-hostage" sales of weapons to the Iranian government in 1985-86. President Reagan did not issue the legally required intelligence "findings" before initiating the covert sales of antitank and antiaircraft "missiles, and Congress was not notified of them. The sales also appeared to have violated U.S. arms export laws. The secret arms sales occurred against a backdrop of public statements by President Reagan that the United States would make no deals with terrorists. Although three hostages were released as a result of U.S. efforts, three new ones were taken during the same period.

In the wake of the Iran-Contra Affair, Congress and President Bush skirmished over reforms to the Intelligence Oversight Act. Bush refused to sign the bill in 1990, although a compromise was enacted in 1991.

ISOLATIONISM as a historic attitude in the United States can best be defined as opposition to intervention in war outside the western hemisphere, particularly in Europe; to involvement in permanent military alliances; and to participation in organizations of collective security. Above all, isolationists seek to preserve the United States's freedom of action. Isolationists often differ from pacifists, those who refuse to sanction any conflict and absolutely renounce any war, for isolationists often favor unilateral military action, what some call the doctrine of the "free hand." Indeed, an isolationist can be stridently nationalistic, endorse military preparations, sanction certain forms of imperialism, and engage in outright war, particularly in Latin America or the Pacific. At no time did most isolationists seek literally to "isolate" the United States from either the world's culture or its commerce.

By the above definition, American policy has been isolationist until the twentieth century. Thomas Paine's *Common Sense* (1776) combined calls for an independent foreign policy with a plea for commercial supremacy. John "Adams's Model Treaty of 1776 envisioned a purely commercial treaty with the French, not a binding military alliance. George "Washington's farewell address of 1796 advised his countrymen "to steer clear of permanent Alliances," a reference to the Franco-American Alliance of 1778-1800. Thomas "Jefferson's first inaugural of 1801 sought "peace, commerce and honest friendship with all

nations, entangling alliances with none." When in 1823 President James *Monroe advanced what later became known as the *Monroe Doctrine, he said: "In the wars of the European powers in matters relating to themselves we have never taken part, nor does it comport with our policy to do so."

Of course, a nation may pursue an isolationist foreign policy while involving itself extensively in political and military matters outside its borders. In 1812, the United States fought Britain; in 1846, Mexico; and in 1898, Spain. All such engagements were unilateral decisions by the United States and hence did not violate the classic isolationism espoused in the eighteenth century. During the nineteenth century, the United States encouraged the revolts of Latin American nations against Spain, vied with the British to control the Oregon Territory, and sympathized with the European revolutions of 1830 and 1948. It entered into only one agreement involving joint action with another power, the Clayton-Bulwer Treaty of 1850 with Britain, which limited U.S. action in building a transisthmian canal. Toward the end of the century, the United States possessed its own colonies and played a decisive role in reshaping a new military balance in the world. Yet just three months before the outbreak of World War I, President Woodrow *Wilson insisted that "we need not and we should not form alliances with any nation in the world."

Once, however, Wilson sought U.S. entry into the *League of Nations—a full-fledged system of collective security—isolationism emerged as a distinctive political position. Such opponents of the League as Republican senators Henry Cabot Lodge (Mass.), William E. Borah (Idaho), and Hiram Johnson (Calif.) successfully fought U.S. membership, thereby reasserting the traditional policy of isolationism in the face of its first real challenge.

Only in the 1930s was the general isolationist consensus threatened, for President Franklin D. *Roosevelt sought discretionary power to aid victims of aggression. Opponents of such policies fought back so successfully that the years 1934-37 marked the high tide of isolationist legislation. In 1934, Congress adopted the Johnson Act, which prohibited private loans to nations in default of obligations. In 1935, it voted down U.S. membership in the World Court. From 1934 to 1936, the Senate sponsored an investigation, led by Republican Gerald P. *Nye, of the munitions industry. From 1935 to 1937, a battery of *neutrality legislation was passed, including a ban on loans and credits to belligerents; a mandatory embargo on direct or indirect shipments of arms or munitions; presidential discretion to require payment or transfer of title before exporting any goods to a belligerent; prohibiting American citizens from traveling on ships of belligerents; and enjoining the arming of American merchant ships. Much of this legislation was passed in the belief that lack of such safeguards had led the United States into full-scale belligerency in World War I. By the 1930s, however, there was enough * internationalism in the United States, rooted in the desire for collective action against the rising dictatorships, that isolationism became a distinctive political position and one that was increasingly contested. The word itself became increasingly pejorative, and isolationists preferred such terms as *anti-interventionist*, *noninterventionist*, and *nationalist*.

In 1938, the isolationists met with their first failure, for they lacked sufficient support in the House of Representa-

tives to pass the Ludlow amendment to the Constitution, a proposal that would have prohibited Congress from declaring war until confirmed by majority vote in a national referendum. Once war again broke out in Europe in 1939, the ranks of isolationists thinned and Roosevelt increasingly aided the Allies. His legislative triumphs included military aid to France and Britain on a cash-and-carry basis in November 1939; military * conscription in September 1940; Lend-Lease aid to all nations fighting the Axis in March 1941; extending the terms of army service for draftees in August 1941; and authorizing the arming of U.S. merchant vessels and permitting them to carry cargoes to belligerent ports in November 1941. Acting on his own authority, the president ordered the military occupation of Greenland (April 1941) and Iceland (July 1940); froze Japanese assets (July 1941), thereby bringing all U.S. trade with Japan to a halt; issued a set of postwar aims with Britain called the Atlantic Charter (August 1941); extended aid to the Soviet Union (October 1941); and entered into an undeclared naval war with Germany (fall 1941).

All these moves the isolationists fought bitterly. Isolationist sentiment was increasingly concentrated in the America First Committee (AFC), organized in September 1940 as the major anti-interventionist group fighting Roosevelt's policies. The AFC was founded by Yale law student R. Douglas Stuart, chaired by Sears, Roebuck executive Gen. Robert E. Wood, and included in its ranks such figures as journalist John T. Flynn, diplomat William R. Castle, former New Dealer Gen. Hugh Johnson, advertising executive Chester Bowles, and aviator Charles * Lindbergh. At its peak it had 450 chapters, a membership of 850,000, and an income of \$370,000 donated by 25,000 contributors. Huge AFC rallies often featured such speakers as Nye, Lindbergh, Flynn, Democratic senator Burton K. Wheeler (Mont.), and Representative Hamilton Fish. The AFC was unable to defeat any of Roosevelt's legislative proposals, though it undoubtedly caused the president to be more circumspect on such matters as extending terms for draftees and convoying British vessels. The president's specific legislative policies were always supported in the polls, while the AFC stressed that nearly 80 percent of the American people, expressing themselves in the same polls, opposed a declaration of war on the Axis powers.

Although several leading isolationists endorsed *conscription for hemispheric defense, many more saw little need for a mass army. In isolationist eyes, a new American Expeditionary Force would simply prolong the struggle overseas and cost over 1 million U.S. lives. Furthermore, it would work against needed negotiation between England and Germany and ensure Soviet domination of Europe. Isolationists claimed that Hitler's blitzkrieg tactics had shown that mass armies were obsolete, and they called for small, highly mobile volunteer forces.

Isolationists differed among themselves as to the efficacy of large naval fleets, while strongly stressing airpower. Airpower, they claimed, was the most cost effective way of defending the United States. They argued that while no foreign power was able to conduct continuous bombardment of the nation, the United States could easily pick off any attacking planes. Moreover, a strong air arm was not dependent upon untrained conscripts.

The Japanese attack on *Pearl Harbor put an end to classic isolationism. The AFC promptly disbanded. In

1945, the United States became a charter member of the "United Nations, occupying a seat on its powerful Security Council. In 1949, it entered its first binding military alliance, the North Atlantic Treaty Organization ("NATO). In 1950, it was fighting in Korea under UN auspices, and in 1965 U.S. ground troops were committed to overt fighting in Vietnam.

During the "Cold War, many former isolationists became "Asia Firsters," warning against involvements in Europe while supporting increased action against communism in Asia. The 1948 and 1952 presidential bids of the isolationist-leaning Senator Robert A. Taft failed. Anti-Roosevelt works by such isolationist historians as Charles A. Beard, Charles Callan Tansill, and Harry Elmer Barnes did not receive scholarly acceptance. In 1953 and 1954, Ohio Republican senator John Bricker proposed a constitutional amendment limiting presidential treaty-making power, but it was opposed by President Dwight D. Eisenhower and defeated in the Senate. A military alternative to NATO, victory over the Soviet Union through airpower alone, was espoused by former isolationist Gen. Bonner Fellers, but lacked widespread support.

In the wake of the "Vietnam War, some commentators—such as Democratic senator J. William Fulbright and political scientist Earl C. Ravenal—were dubbed "neo-isolationists" as they sought drastically reduced American commitments. Yet they differed significantly among themselves, and seldom in principle totally repudiated membership in international organizations, military aid overseas, economic sanctions, and even combat forces.

ITALY, INVASION AND CONQUEST OF (1943-45). After Italy surrendered to the Allies in July 1943 at the height of World War II, Josef "Stalin continued to demand that the Allies open a second front in the west. The inability of the two Western Allies to mount a cross-Channel invasion into Northwest France until the late spring of 1944 made the invasion of Italy an attractive alternative to the British, who insisted that military operations continue in the Mediterranean. Allied strategy was always vague but was generally to tie up large numbers of German troops in Italy who would otherwise be dispersed to France or the eastern front.

Opposing the Allies was a German army group commanded by Field Marshal Albert Kesselring, who persuaded Adolf "Hitler to defend Italy south of Rome instead of in the Apennine Mountains of northern Italy.

The invasion of Salerno by elements of Lt. Gen. Mark

"Clark's U.S. Fifth Army on 9 September 1943 was the first major battle in the longest and bloodiest European campaign fought by the Western Allies. The landings were bitterly resisted by the German Tenth Army and nearly failed. When the Germans exhausted their resources in unsuccessful counterattacks, Kesselring ordered a fighting withdrawal north to the new Gustav Line, and anchored on Cassino.

The Allied High Command erroneously believed Rome would fall by the end of October 1943. However, without a second amphibious landing north of Salerno, the Allies were compelled to advance through the great chain of mountains that bisects central Italy, where freezing winter weather and numerous rivers proved the worst imaginable place to fight a large-scale military campaign. By December 1943, the Allies had failed to break the Gustav Line and the Italian campaign was stalemated.

On 22 January 1944, the Allied ground commander in chief, Gen. Sir Harold Alexander, launched an amphibious end run behind the German lines at Anzio, thirty-five miles southwest of Rome. Alexander believed the Anzio landings would force Kesselring to abandon the Gustav Line and retreat to the Apennines. However, an assault of the Rapido River by the U.S. 36th Division two days earlier was one of the bloodiest failures of the war and enabled Kesselring to reinforce Anzio with troops from the Cassino front—and from outside Italy.

Kesselring quickly contained the Allied threat, and in mid-February 1944 he attempted to carry out Hitler's directive to "lance the abscess south of Rome" by launching a powerful counteroffensive to destroy the Anzio beachhead. Ferocious German infantry attacks cracked but ultimately failed to break the Allied defenses.

Nevertheless, this was a decisive moment in the war in Italy: Anzio became a colossal liability for the Allies, who were obliged to rush reinforcements from the south to meet the threat of the massive German buildup. Instead of a stalemate on one front, the Allies were now deadlocked on two widely dispersed fronts.

Earlier in February, the Allies had failed to capture either the town of Cassino or one of the holiest shrines of Roman Catholicism, the abbey of Monte Cassino. Its needless destruction by Allied bombers on February 15 remains one of the most hotly debated incidents of the war and the most visible example of the failure of Allied "strategy in Italy in 1944.

The stalemate dragged on into the spring of 1944, with neither belligerent posing a serious threat to the other until overwhelming Allied offensives at Cassino and Anzio in May finally resulted in the collapse of the Gustav Line and a full-scale German retreat into northern Italy.

Rome was occupied 4 June 1944, but during their fighting withdrawal to the north the Germans inflicted 34,000 "casualties upon the pursuing Allied forces. The Gothic Line north of Florence was a defensive barrier where Kesselring successfully obstructed the Allied advance in the autumn of 1944, thereby continuing the war in Italy into 1945. The final Allied offensive that spring resulted in the surrender of all German forces on 2 May 1945.

The Italian campaign lasted 602 days. Overall Allied casualties were 312,000, of which 189,000 (60%) were sustained by the Fifth U.S. Army. Of these, 31,886 men were killed in action. Most were American (19,475 killed of 109,642 total U.S. casualties). German losses have been

estimated at 434,646, including 48,067 killed in action, with another 214,048 reported missing.

Allied grand strategy was less to win than to prolong the campaign and thus prevent the dispersal of German formations to other fronts, particularly France, where it was correctly feared their presence might well have made a decisive difference between success and failure when the Allies invaded Northwest France in the "D-Day landing, 6 June 1944.

IWO JIMA, BATTLE OF (1945). When the "Joint Chiefs of Staff directed the Pacific Fleet commander, Adm. Chester "Nimitz, to occupy an island in the Bonin volcano group during the western Pacific campaign in World War II, the only island of significance was Iwo Jima. Early in 1945, Japanese fighter aircraft from there were harassing the B-29s, which had begun their raids from the Marianas against Japan. Also, an emergency recovery airfield was needed for B-29s returning damaged or short on fuel.

Mt. Suribachi, at 556 feet, is the most prominent landmark of the seven-mile long, pork chop-shaped island, where Lt. Gen. Tadamichi Kuribayashi had 21,000 men and 1,000 guns. Forsaking the Japan doctrine of defending at the water's edge, he decided instead to defend from an elaborate system of caves and tunnels.

On the American side, Vice Adm. Richmond K. Turner commanded the Joint Expeditionary Force with Lt. Gen. Holland M. Smith as commander of the Joint Expeditionary Troops, while Maj. Gen. Harry Schmidt com-

manded the Marine V Amphibious Corps, consisting of the 3rd (Maj. Gen. Graves B. Erskine), 4th (Maj. Gen. Clifton B. Cates), and 5th (Maj. Gen. Keller E. Rockey) Marine Divisions. At 0930 on 19 February 1945, the first wave of armored amphibian tractors touched down, 5th Division on the left and 4th Division on the right. On the left, the 28th Marines, an infantry regiment, turned south toward Suribachi, and after four days of fighting gained the top of the mountain. A patrol reached the crest and tied a small American flag to a piece of pipe. Three hours later, a larger flag was brought up—one that could be seen from all over the island. Joe Rosenthal, an Associated Press photographer, took a picture of its raising that was published around the world.

The main effort was a slow advance to the north, with the 5th Division on the left and the 4th Division on the right. The 3rd Division was fed into the center of the line and the attack shouldered forward. After days of heavy fighting, the island was secured on 26 March. Altogether, 71,245 Marines had been put ashore; of these, 5,931 were killed in action, and 17,372 wounded. Twenty-two Marines, four navy hospital corpsmen, and one navy "landing craft commander were awarded the Medal of Honor, half of them posthumous awards. The number of Japanese killed has never been determined exactly, but only 216 prisoners were taken, most of them Korean conscript laborers. The terrible cost to Americans was somewhat balanced by another statistic: by war's end, 2,251 heavy bombers, with crews totaling 24,761, had made emergency landings on Iwo.

JACKSON, ANDREW (1767-1845), *War of 1812 general and seventh president of the United States. Jackson first experienced war at thirteen, fighting in the Battle of Hanging Rock, South Carolina (6 August 1780). Subsequently captured, he remained uncooperative and was slashed by a British officer, creating an antipathy as permanent as the scar on his face. Jackson's entire family perished in the * Revolutionary War.

In 1788, Jackson moved to western North Carolina (now Tennessee), where he served as a field-grade officer in the Tennessee militia and was elected, 1802, as major general—a post considered second only to that of the governor. In 1813, he commanded the Tennessee troops sent to subdue the Creeks in present-day Alabama. After several minor victories that significantly weakened the Indians, Jackson delivered a devastating blow at the Battle of Horseshoe Bend, 27-28 March 1814.

Thereafter, Jackson was given a major generalship in the U.S. Army and put in charge of the Gulf Coast region. He seized Spanish Pensacola in the fall of 1814 and then marched to New Orleans to counter a British invasion. After a series of largely successful preliminary engagements, on 8 January 1815 he and his troops won the main Battle of *New Orleans, one of the severest defeats ever suffered by a British army. Jackson emerged a national hero.

Retaining his major generalship after the war, Jackson in 1818 pursued Indians into Spanish Florida and again occupied Pensacola. The Monroe administration reluctantly supported him, using the conquest to force Spain to sell the Floridas to the United States. Jackson resigned his commission in 1821. Except while acting as commander in chief during his presidency, he never held another command.

Jackson was a superb general. Although unschooled in theory, he was a competent tactician and strategist. He thoroughly prepared for battle and acted quickly and resourcefully to take the war to the enemy and to catch him by surprise. Among his greatest assets as a leader was an indomitable will, which earned him the nickname "Old Hickory" in 1813 when he continued to campaign despite a nearly crippling case of dysentery. He expected the same devotion to duty from others. During the War of 1812, he sanctioned the hanging of seven militiamen for disobedience or desertion, and jailed several New Orleans officials (including a federal judge) who challenged his decision to continue martial law after the British had left. Jackson often inspired fierce loyalty in officers and enlisted men alike; even his critics followed him into battle, if only because they feared him more than the enemy.

Jackson was the first westerner to become a national military hero. Like few of his contemporaries, he demon-

strated a talent for commanding militia and volunteers no less than regulars, and showed equal skill in conducting conventional operations against European regulars and unconventional warfare against Indians.

JACKSON, "SCOOP" [HENRY] (1912-1983), U.S. senator. Born in Everett, Washington, Jackson was the son of working-class Norwegian immigrants. As a young boy he sold newspapers, the source of his lifelong nickname, "Scoop." After becoming a lawyer and county prosecutor, Jackson won election to the House of Representatives in 1940 as a Democrat, serving six terms before winning a Senate seat in 1952.

Between 1952 and his death of a heart attack in 1983, Jackson became one of the Senate's major champions of a strong military defense. In the late 1950s, he criticized the Eisenhower administration for neglecting defense and supported controversial claims of a "missile gap" with the Soviet Union. Deeply suspicious of the Soviets, Jackson opposed arms limitations, arguing against President John F. Kennedy's creation of the Arms Control and Disarmament Agency and voting reluctantly for the *Limited Test Ban Treaty in 1963. Later, he opposed the Anti-Ballistic Missile Treaty, and he extracted major concessions from the Nixon administration on the SALT arms control agreement. He opposed SALT II.

Jackson vigorously supported U.S. military involvement in Southeast Asia, beginning with Laos in 1962, and more particularly in Vietnam. He only reluctantly voted against President Gerald *Ford's 1975 request for aid to South Vietnam, claiming the United States had been correct in entering the * Vietnam War.

A ranking member of the Senate Armed Services Committee when he died, Jackson was known as a centrist Democrat, a lifetime liberal in civil rights and organized labor, a strong backer of Israel and Jewish immigration from the USSR, and a major supporter of the Boeing Aircraft Corporation, one of the largest employers in his state.

JACKSON, "STONEWALL" [THOMAS] (1824-1863), Confederate army general. Born in what is now West

Virginia, Jackson was orphaned at an early age and raised by paternal relatives. Although he had little formal education, he was appointed to West Point and by diligent study graduated in 1846. He distinguished himself as an artilleryman in the "Mexican War, serving under Winfield "Scott and winning brevets to major. After the war, as a lieutenant, he served in Florida, where he quarreled with his commanding officer, Capt. (later Union Maj. Gen.) William French, whom he did his best to have court-martialed. In 1852, when opportunity offered, Jackson resigned his commission in the U.S. Army to accept a position as a professor at the Virginia Military Institute at Lexington. Although a poor teacher, he remained there until the beginning of the Civil War.

In 1861, when Virginia seceded from the Union, Jackson was commissioned a colonel in the Confederate army and put in charge of the defense of Harpers Ferry. Although superseded there by Gen. Joseph E. "Johnston, he was soon promoted to brigadier general. He earned the enmity of his men, even many of his most senior officers, by pushing them through a punishing, futile midwinter campaign; but he distinguished himself in the First Battle of "Bull Run, winning the sobriquet of "Stonewall" when Gen. Barnard E. Bee called out to his troops, "There is Jackson standing like a stone wall! Rally behind the Virginians!"—or words to that effect. The name stuck, though it seems inappropriate when applied to a man who proved one of the South's most aggressive generals.

In spring 1862, Jackson fought the brilliant Shenandoah Valley Campaign that brought him his greatest fame, for he performed best as an independent commander. Here he proved himself a brilliant strategist, and his attack upon Front Royal and Winchester drove the "Union army of Gen. Nathaniel Banks across the Potomac and out of Virginia. Although he pressed his men relentlessly, he earned their respect, for troops will endure much for generals who provide victories.

Serving directly under Gen. Robert E. "Lee in the Army of Northern Virginia, Jackson took part in the "Seven Days' Battle, where he was less than his best, his judgment and mettle blunted by fatigue and above all by an overpowering need for sleep, which even his iron will could not overcome.

In August 1862, he advanced against Union Gen. John Pope, capturing and destroying the Union army's principal supply depot in Virginia at Manassas and driving Pope's forces north. He played a notable part in the Second Battle of "Bull Run and defeated the Union forces at Chantilly. He commanded a corps in the invasion of Maryland, and it was he who captured some 12,000 Union troops at Harpers Ferry.

At the Battle of "Antietam, Jackson ably commanded a corps on the left of the Confederate line; at Fredericksburg, he held fast on the right of Lee's line. At the Battle of "Chancellorsville, he attacked with great élan the right of the line of Gen. Joseph "Hooker, resulting in one of the most remarkable victories of inferior over numerically superior forces in the history of warfare. But there, on the night of 2 May 1863, while making a personal reconnaissance in front of the lines with a few other officers, his returning knot of horsemen was mistaken for enemy cavalry and Jackson was shot by Confederate pickets. His shattered arm was amputated, but he died eight days later of complications of pneumonia.

Like Lee, Jackson was a bold, aggressive soldier. Unlike most Civil War generals, he did not try to aggrandize himself, and he was so secretive that he refused to reveal his plans even to key members of his staff—a policy that would have proved disastrous had he succeeded to a higher command. A stern disciplinarian, he held his officers to exacting standards, and no general North or South court-martialed or tried to cashier so many subordinates.

An austere man, deeply religious, Jackson did not drink, gamble, or smoke, and his years as an artilleryman had left him partially deaf, a severe handicap to a lively social life. He was by nature a reserved man but not a cold one. His few intimates found him a warm friend, and he was a loving, even playful husband to two successive wives, both daughters of Presbyterian ministers who were college presidents.

He died at an early age, not yet forty, at the pinnacle of his reputation, which has proved enduring.

JAPAN, PEACE TREATY WITH (1952). With the advent of the "Cold War, and more especially the Sino-Soviet alliance and the "Korean War, the U.S. and Japanese governments moved toward an agreement concerning the role of Japan in the struggle against communism in Asia. Earlier, Tokyo had sought to exclude U.S. bases from Japan (although not Okinawa) when the occupation of Japan ended. But by 1950, Prime Minister Yoshida Shigeru was driven to accept U.S. bases even on the home islands by increasing Communist threat not only in the USSR, China, and Korea, but within Japan in the form of a larger, more militant Communist Party.

Negotiating in 1951 with President Harry S. "Truman's envoy, John Foster "Dulles, Yoshida agreed to the U.S. bases in return for American protection, but refused U.S. pressure for Japan itself to rearm. The result was two treaties. A multinational peace treaty, signed in San Francisco 8 September 1951 (with the Communist nations abstaining), was extraordinarily generous, providing for an end to the occupation, recognizing Japan's "full sovereignty," and mandating no Japanese reparations to its wartime victims. The same day, the United States and Japan signed a bilateral agreement for U.S. troops to remain indefinitely, even allowing their use against domestic disturbances. On 8 February 1952, both parties signed another treaty authorizing the United States to maintain military bases in Japan and Okinawa.

Tensions led to a new U.S.-Japan security agreement in 1960 providing for more mutual consultation on defense, but many Japanese still feared that Washington's policies might drag Japan into an unwanted war.

JAPAN, U.S. MILITARY INVOLVEMENT IN. Initial U.S. military involvement with Japan occurred in 1853, when Comm. Matthew C. Perry led a naval expedition there. Perry sought to compel the ruling Tokugawa Shogun to open Japan to foreign commerce on American terms. In the face of superior technology, the Japanese acceded to Perry's demand in 1854. In the early twentieth century, despite disputes over immigration restriction and mistreatment of Japanese residents in the United States, the two Pacific nations became major trading partners and cooperated in creating a balance of power in the Asia-Pacific region. The collapse of world trade after 1929, however, prompted Japanese militarists and nationalist politicians to abandon the framework of cooperation established with the West under the "League of Nations (1919) and "Washington Naval Arms Limitation Treaty (1922) and to seek creation of a self-supporting Japanese empire. In 1931, the Japanese Army seized Manchuria, and in 1937 it invaded China proper.

Japan's cooperation with Nazi Germany from 1936 on, as well as its threat to the American and European colonies in Asia, prompted the Roosevelt administration to begin aiding China in 1938. By July 1941, Japan's occupation of French Indochina prompted President Franklin D. "Roosevelt to embargo all sales to Japan and boost military aid to China. Months of fruitless negotiations culminated in the attack on "Pearl Harbor, 7 December 1941.

In the three months following the outbreak of war, Japanese air, sea, and land forces swept over colonial Southeast Asia and the western Pacific, including the Philippines. Although Roosevelt and his military advisers adopted a "Europe-first" strategy, they were able to send sizable military and naval resources to the Pacific before Germany's defeat. U.S. intelligence also broke important Japanese naval codes. By the end of 1942, the Japanese lost the initiative in the Pacific. American forces then embarked on the long push to Tokyo.

In the spring of 1945, the Army Air Force began massive raids on Japanese cities. At about the same time, after incredibly bloody fighting, U.S. forces seized two strategic islands, part of Japan's inner defense ring, in the battles of "Iwo Jima and "Okinawa. In June, President Harry S. "Truman authorized plans for the invasion of Japan, tentatively scheduled for November. The successful testing of the atomic bomb that July provided the United States an alternative to invading the home islands. The shock of the new weapon, U.S. strategists hoped, would convince deadlocked Japanese decision makers to surrender quickly. Besides saving lives on all sides, an early surrender might keep Soviet troops from occupying China and gaining a foothold in Japan.

The air force dropped the first atomic bomb on Hiroshima on 6 August 1945, the second against Nagasaki 9 August. The combined shock of the atomic bombs and the Soviet entry into the war prompted Japanese emperor "Hirohito to break the deadlock among his advisers in favor of agreeing to U.S. surrender terms. President Truman accepted the surrender 15 August 1945, and the Japanese signed surrender documents at a ceremony aboard the battleship *Missouri* in Tokyo Bay 2 September. Over 2 million Japanese (including some 400,000 civilians) and 100,000 Americans died in the Pacific War.

The American military occupation of Japan lasted from August 1945 through April 1952. Gen. Douglas "Mac-

Arthur served as Supreme Commander of the Allied Powers until his removal in April 1951. Gen. Matthew B. "Ridgway succeeded him. Among the many liberal reforms instituted by the Americans was Article 9 of the new Japanese Constitution barring the establishment of armed forces or the right to conduct war, a clause regretted by U.S. policymakers in the "Cold War. When the "Korean War broke out in June 1950, the United States ordered Japan to create a small "national police reserve" that assumed the defense duties of American forces shifted to Korea. Gradually, this evolved into Japan's Self-Defense Forces.

In September 1951, when the United States and its allies signed a peace treaty with Japan, it compelled Tokyo to sign a bilateral security treaty with Washington that permitted sizable American forces to use military bases in Japan indefinitely. The arrangement, which many Japanese saw as a demeaning continuation of the occupation, was extremely unpopular. However, it was understood as the price that must be paid to regain sovereignty. The treaty was revised in 1960 to make it more equitable.

During the "Korean and War the "Vietnam War and in Cold War "strategy, military base and logistic facilities in Japan were vital for U.S. military operations. In the late 1990s, sizable American military units remained stationed on Okinawa and Japan proper. Since the early 1950s, the United States has encouraged Japanese rearmament and urged Tokyo to take a more active role in Asian security matters. Public opinion in Japan has resisted expanding the limited role of the Self-Defense Forces, but the Japanese government appeared ready by the late 1990s to play a more active role both in regional military defense and in international "peacekeeping operations.

JAPANESE-AMERICAN INTERNMENT CASES. During World War II, the U.S. Army, acting under Executive Order 9066 signed by President Franklin D. "Roosevelt on 19 February 1942 (and ratified by Congress a month later), ordered nearly 120,000 Japanese nationals and Japanese Americans from the West Coast where the majority of them lived to move to prisonlike "relocation" camps in the interior of the United States. In the case of U.S. citizens, such action was taken only against those of Japanese ancestry, not against German Americans or Italian Americans. As a November 1941 civilian report stressed the loyalty of most Japanese Americans to the United States, and the FBI and U.S. military intelligence had planned only to detain potential spies or saboteurs, Roosevelt's claim of "military necessity" appears to have been a legal cover for the administration's concession to anti-Japanese-American groups. These included economic competitors, racists, and politicians appealing to a public frightened after the attack on

*Pearl Harbor. Gen. John L. De Witt, army chief of the Western Defense Command, declared that racial ties made all ethnic Japanese potentially disloyal, and directed their immediate removal from their homes on the West Coast. Most internees remained in the camps until 1944; they were not closed until late 1945.

The Japanese-American Internment Cases resulted from legal claims by Japanese Americans that these actions violated their rights as U.S. citizens. Gordon Kyoshi Hirabayashi was born in Seattle in 1918 and was a senior at the University of Washington when he was arrested in 1942 for failing to register for evacuation and for violating the curfew imposed on all ethnic Japanese. In *Hirabayashi v. U.S.* (20 U.S. 81) in 1943, the U.S. Supreme Court unanimously upheld the military curfew regulations under the war powers, and thus his conviction, but declined to consider the issue of Japanese exclusion from the area. The Court similarly upheld the curfew conviction of Minoru Yasui, born in Oregon in 1916, who was a lawyer and a second lieutenant in the U.S. Army Reserve.

In December 1944, the Supreme Court upheld the legality of the forced evacuation of U.S. citizens of Japanese ancestry in *Korematsu v. U.S.* (323 U.S. 214). But three justices, Robert Jackson, Frank Murphy, and Owen J. Roberts, dissented, claiming the relocation program was unconstitutional. Fred Toyosaburo Korematsu, born in Oakland, California, in 1919, had been arrested in 1942 for refusing to comply with the military's exclusion order. In a gesture to the dissenters, in *Ex parte Endo* (323 U.S. 283), the Supreme Court held in 1944 that the War Relocation Authority, which oversaw the relocation program, could not detain a person whose loyalty had been established.

Thus, the Supreme Court largely upheld the government during the war, limiting the Constitution's guarantees of equal protection under the law, and allowing the supremacy of military over civil judgment and authority on the basis of claims of "military necessity."

In 1983, a team of attorneys reopened the internment cases based on documentary findings that in their original presentation to the Supreme Court, the government's lawyers had suppressed evidence and made false statements. Lower courts vacated the wartime convictions of Hirabayashi and Korematsu, but refused to hear Yasui's petition, and the government chose to end the litigation by not appealing those decisions to the Supreme Court, the sole court with the authority to reverse its own rulings. In 1988, Congress provided for partial restitution payments of \$20,000 to each of the 60,000 surviving internees from the camps.

JAVITS ACTS. See War Powers Resolution (1973).

JEFFERSON, THOMAS (1743-1826), secretary of state, vice president, and third president of the United States. Thomas Jefferson believed that a large military establishment would both increase the nation's debt and threaten American liberty. As the first secretary of state (1789-93), he urged "neutrality in the war between England and France; as president (1801-09), he pursued a policy of "peace, commerce, and honest friendship" with all nations, but "entangling alliances with none." Jefferson's administration cut military spending drastically, from over \$3 million annually to \$1.9 million, although his administration also founded the U.S. Military Academy, first proposed by Washington, at West Point, New York, in 1802. Neutrality, though, was not isolation: Jefferson sent the U.S. Fleet to the Mediterranean in 1801, and cooperated with Sweden, Portugal, Naples, and other neutral powers in a multinational alliance against Tripoli. To replace the expensive frigates built by the Federalist administrations, Jefferson built 180 gunboats, 50 feet long, with crews of 20 and cannon mounted in bow and stern, primarily to defend American harbors. Instead of military force, the United States would use economic pressure in international affairs. The Europeans, he reasoned, depended on American grain and fish to feed their large armies and overtaxed populations. When both France and England attacked American commercial policy in 1807, Jefferson closed U.S. ports, depriving the belligerent Europeans of American goods. Though the embargo of 1808-09 did not force France or England to negotiate, Jefferson did not lose faith in economic power as the most potent weapon in the American arsenal.

JOHNSON, ANDREW (1808-1875), vice president, seventeenth president of the United States. As a Tennessee congressman in 1843-53 and senator in 1857-62, Johnson provided mixed signals on military issues. In 1850, he remarked that he might like to have one of his sons in the navy, and he worked to get Tennessee boys into West Point and the U.S. Naval Academy. Yet Johnson was at heart a small government Democrat, with special concerns about money and class privilege. Thus in a speech on appropriations in August 1852 he derided the "imbecile" congressional sons who got preference; proposed to close both academies; attacked the wasteful War and Navy Department bureaucracies; and called the army and navy expensive and oppressive in the European style.

Johnson was a strong nationalist, who favored expansion and strongly supported the administration during the "Mexican War, even though he and President James K. Polk openly despised each other. During the secession crisis, Johnson remained firmly loyal to the Union. Abraham Lincoln, needing a strong-willed figure to begin "Reconstruction in Tennessee, appointed Johnson military governor in 1862. This was an anomalous position in American law, and one that the fortunes of war and necessities of

politics made frustrating. Johnson's relations with Union generals were often strained.

Upon Lincoln's death (1865), Johnson succeeded to the assassination presidency. In implementing Reconstruction policy the army played a central role in the institutional struggle between Congress and the president in 1866-67. Johnson's efforts to bring Ulysses S. *Grant into his political circle led to a public breach with the popular general. Johnson did have friendly relations with William Tecumseh *Sherman, who nonetheless refused a political role. Impeachment proceedings in 1868 were on an asserted violation of the Tenure of Office Act, arising out of the removal of Secretary of War Edwin M. *Stanton—a step Johnson justified both on his general executive authority under the Constitution and his specific function as commander in chief.

JOHNSON, LOUIS (1891-1966), secretary of defense. As defense secretary from 28 March 1949 to 19 September 1950, Louis Johnson was best known for his controversial money-saving measures. The most contentious was his decision in April 1949 to cancel the navy's experimental flush-deck "supercarrier," the *United States*, which was in the initial stages of construction. Johnson thought the supercarrier would duplicate strategic bombing functions performed by the air force, but his cancellation order outraged the navy and its partisans and provoked a congressional investigation. Johnson insisted he was only complying with President Harry S. *Truman's instructions to hold down defense spending. He was absolved of any wrongdoing, but some critics felt his economy drive went too far and weakened the armed forces.

Johnson's tempestuous tenure as secretary of defense came in the wake of earlier controversy surrounding his actions as assistant secretary of war (1937-40). At that time, Johnson had pressed vigorously for U.S. rearmament as war clouds gathered over Europe and the Far East, even though U.S. policy stressed *neutrality and noninvolvement. During World War II, Johnson served briefly as U.S. representative to India.

As secretary of defense, Johnson favored a defense posture resting on strategic nuclear airpower, while his rival, Secretary of State Dean *Acheson, wanted a more broadly based military that would allow greater diplomatic flexibility. Their differences came to a head in the spring of 1950 during deliberations over a paper (NSC 68) recommending a U.S. military buildup to counter recent increases in Soviet military power. President Truman sided with Acheson and decided to fire Johnson in the light of early U.S. reverses in the *Korean War. Though Johnson had once aspired to the presidency, he felt disgraced and quietly returned to his West Virginia law practice.

JOHNSON, LYNDON B. (1908-1973), thirty-sixth president of the United States. Johnson was born on 27 August 1908 in the Hill Country of central Texas. His father was a Democratic politician from whom Lyndon inherited his lifelong passion for politics. He was educated in nearby schools and Southwest Texas State Teachers College in San Marcos. He then taught in Cotulla and Houston.

In the thirties, Johnson went to Washington and became an ardent admirer of FDR and his New Deal. In 1938, he captured his first elective office for the Tenth Congressional District, including the Hill Country and Austin, and was reelected several times. In 1948, he "won" an extremely close and tainted election to the Senate. He became minority leader of the Senate (1953), where he was a master congressional politician and emerged as a candidate for president.

The 1960 election was Johnson's big chance. But he believed it hopeless because he came from the South and the convention would be dominated by northern Democrats. He entered no primaries and made virtually no campaign, thereby ceding the nomination to John F. *Kennedy on the first ballot. But Kennedy, concerned that his Catholicism would bring defeat in the South, offered Johnson the second place, and he accepted. Johnson's powerful campaign in the South made victory possible by a thin margin. Thus, for almost three years he served in the meaningless job of vice president, loyal, to be sure, but bored and frustrated. On 22 November 1963, Lee Harvey Oswald's bullet catapulted him into the presidency.

Johnson, with his exceptional intelligence, his feel for the legislative process, and his experience on Capitol Hill, was superbly qualified in domestic policy; he was less experienced in international affairs. Among the most aggressive cold warriors, Johnson determined to halt Soviet and Chinese expansion. His key advisers, Secretary of Defense Robert S. *McNamara and national security adviser McGeorge Bundy, both holdovers from the Kennedy administration, shared these views.

The Eisenhower and Kennedy administrations were baffled by the problem of Communist-Nationalist influence in Vietnam. Kennedy had increased the number of U.S. advisers and introduced "Green Beret" *counterinsurgency combat advisers. He had supported Ngo Dinh Diem in South Vietnam. But Diem and his family were brutal and corrupt; the Viet Cong controlled much of the country; there was bitter Catholic-Buddhist conflict; the Soviets and the Chinese supplied *Ho Chi Minh in the North. The assassination of Diem and his brother with U.S. assent was followed by a revolving door of "governments" that quickly collapsed. There seemed no way to save South Vietnam from the Communists. A military : enture appeared reckless, but the United States refused to accept Communist control of the South. The result was a limited commitment: financial support; U.S. military supplies and *covert operations; and training the Vietnamese forces. This was the situation Johnson inherited.

As an accidental president obligated to complete Kennedy's legacy, he was not ready for war in 1964. He needed to legitimize his own presidency, which he achieved in November with his landslide electoral victory against Barry Goldwater.

Johnson's primary advisers concluded that South Vietnam was the linchpin of the *Cold War. If it fell, the

Communists would take over Southeast Asia, perhaps followed by South Korea, Taiwan, India, and Iran. This was Eisenhower's "domino theory" writ large. South Vietnam was so weak that the United States had no bargaining power with the North. To achieve peace, therefore, the United States must smash North Vietnam by bombing. The advisers did not mention a land war, but that was the only alternative if bombing failed.

This made no sense. The Communist world was divided and South Vietnam was in reality no linchpin at all. Air bombardment was little threat to an agricultural nation supplied by the Soviets. If the United States moved to a land war, Ho Chi Minh held the winning cards because it would mean "guerrilla warfare. Dissenters, Undersecretary of State George Ball, Senate majority leader Mike Mansfield, as well as French president Charles de Gaulle, all made these arguments, but Johnson would not heed them.

Early in 1965, Johnson started air attacks with Operation Flaming Dart, which soon widened into Rolling Thunder. In March, the Marines splashed ashore to establish a base at Danang. On 6 April, Johnson signed National Security Action Memorandum No. 328, which authorized the use of American combat troops.

Gen. William C. Westmoreland, the U.S. commander in Vietnam, made enormous demands for troops; the president gave him part of what he asked. By mid-1966, Westmoreland had 600,000 American troops with immense firepower, a huge air force, and a giant infrastructure. Johnson controlled their use, particularly the air war. The bombing had little military effect. Westmoreland waited for major battles where his firepower would prevail, but they seldom took place. Meantime the North Vietnamese and the Viet Cong imposed a heavy toll in U.S. and South Vietnamese "casualties.

Support for the war at home, strong at the outset, eroded steadily. Mounting casualties, lack of victory, and increasingly skeptical television coverage fed opposition. Opponents of the war staged massive demonstrations, and the Johnson administration started to crack internally.

The "Tet Offensive, launched by the Viet Cong at the end of January 1968, caught Westmoreland by surprise. There were attacks on cities and towns throughout the country with many initial successes. Though American forces recaptured these places, it was at heavy cost to both sides.

Tet convinced the American people that the war could go on for years and might never be won. The Johnson administration was shredded, the "peace and antiwar movements grew dramatically, conservatives in Congress ran roughshod over the Great Society, and the Democratic Party split. Johnson withdrew from the presidential race in 1968; Bobby Kennedy and Martin Luther King, Jr., were assassinated; and there were riots at the Democratic National Convention in Chicago. Richard M. Nixon prevailed over Johnson's vice president, Hubert Humphrey, in the 1968 election, with a promise to end the war with honor.

In 1969, Lyndon Johnson returned to his ranch to spend his few remaining years with his memories. He had been a bold president on domestic issues and a misguided one on the Vietnam War.

JOHNSTON, JOSEPH E. (1807-1891), "Confederate army general. Born near Farmville, Virginia, Johnston attended Abingdon Academy and graduated from West Point in 1829. He fought in the "Seminoles and "Mexican Wars, was often breveted for gallantry, and became quartermaster general (with staff rank of brigadier general) of the U.S. Army in June 1860.

Johnston joined the Confederacy as a brigadier in May and became a full general in August 1861. He stood fourth in general's rank, and that led to a caustic breach with President Jefferson Davis that affected Johnston's, and the Confederacy's, career.

First assigned to the Shenandoah Valley, he eluded a Union force and marched his troops to aid Gen. P.G.T. Beauregard at First Manassas. In 1862, Johnston, in command of the army, moved his force south to oppose Gen. George B. McClellan's advance toward Richmond. He attacked at Seven Pines on the York peninsula in May 1862, failed to achieve a decisive victory, was severely wounded, and was replaced by Robert E. Lee.

In November 1862, Davis, overcoming doubt and dislike, gave Johnston one of the great opportunities of the war as commander of the new Department of the West. Failing to understand a unique experiment in theater command or that he had been handed a satrap's wide powers, Johnston missed his chance to combine the military, social, and economic resources of a vast area against various enemy armies in a grand scheme to save the western flank of the Confederacy. He lapsed, instead, into the role of a local army commander in trying to relieve the siege of "Vicksburg. Understanding the crisis there, he worked earnestly to build an army with which to attack Ulysses S. Grant's siege lines from behind. But he could not gather enough men or supplies quickly enough to save that important Mississippi River bastion.

In November 1863, Johnston took command of the Army of Tennessee, which languished in the doldrums after the loss of Chattanooga, Tennessee. His masterly strategic retreat down the Western & Atlantic Railroad from Dalton to Atlanta, Georgia, ahead of William Tecumseh Sherman's larger army ranks as a model strategic retreat. His withdrawal into Atlanta's defenses displeased Davis, however, who replaced him with the more aggressive Gen. John B. Hood in July 1864. Recalled to duty in February 1865 to command the remnants of his old army, after Hood's shattering defeats, he could not halt Sherman's march. Johnston surrendered at Durham Station, North Carolina, 26 April 1865.

In 1874, Johnston published *Narrative of Military Operations*. Subsequently a congressman from Virginia (1879-81), he became U.S. Commissioner of Railroads, 1885-91. He died in Washington, D.C., in March 1891 from a cold apparently caught while marching bareheaded in General Sherman's funeral procession.

Was Johnston a defensive genius or a nonfighter? The question persists. His quarrel with Davis limited his usefulness, but his Atlanta campaign shows him to have been a brilliant defensive tactician. Critics say he lacked aggres-

siveness and brand him too harshly as "Retreating Joe." Audacity is often urged on the weaker side, but Johnston's method of staging fighting retreats, which inflicted more * casualties than he took, might have prolonged the Confederacy's existence.

The JOINT CHIEFS OF STAFF (JCS), who consist of the head, or chief of staff, of each military service and an additional high-ranking officer from one of the services who serves as chair, function as the virtual high command of the U.S. armed forces, the key planning organization for and coordinating link between the services, and the foremost military advisers to the president, secretary of defense, "National Security Council, and Congress. The organization was established informally during World War II and institutionalized by an act of Congress in 1947. It has been altered on numerous occasions since then, with the emergence of a powerful chairman and joint staff the most notable change.

The roots of the JCS date back to turn-of-the-century managerial revolution in warfare that resulted in the establishment throughout the world of general staffs headed by chiefs of staff to plan for and command national military establishments. Although the United States lagged behind many of its European counterparts in this development, in the first two decades of the twentieth century it did create army and navy staffs headed by service chiefs, as well as a Joint Army-Navy Board composed of these chiefs and their key strategic planners. However, widespread fears of militarism, as well as intense interservice rivalries and bureaucratic political conflicts, for many years precluded the chiefs from exercising any real power or influence.

President Franklin D. "Roosevelt altered this situation in 1939 by personally selecting and directly consulting with Gen. George C. "Marshall and Adm. Harold E. Stark as the army and navy chiefs, and by placing the Joint Board into the newly created executive office of the president. In doing so, he bypassed the secretaries of war and navy, established a direct link between the chiefs and the White House, made those chiefs his foremost military advisers, and altered and expanded their powers. Nevertheless, the Joint Board continued to exhibit severe problems and limitations between the outbreak of World War II in 1939 and U.S. entry in late 1941 in terms of both inter service coordination and civil-military coordination, and by early 1942 it was apparent that the organization was simply inadequate for the conduct of global war.

At that time the JCS came into existence and replaced the Joint Board. This occurred during and immediately after the Anglo-American Arcadia Conference of December-January 1941-42, which established the Anglo-American Combined Chiefs of Staff to plan global strategy. The British section of this organization was to be composed of the already existing British Chiefs of Staff Committee; the U.S. Joint Chiefs of Staff was formed along roughly parallel lines to ensure effective Anglo-American, as well as U.S. Army-Navy and civil-military, coordination. In its original

form, the U.S. organization consisted of army chief General Marshall; naval chief Admiral Stark; Army Air Forces Commanding Gen. "Hap" Arnold; and Commander in Chief of the U.S. Fleet Adm. Ernest J. "King.

This was not an exact duplication of the British organization, which consisted of independent army, navy, and air chiefs along with a special officer to represent the defense minister and Prime Minister Winston S. "Churchill. Roosevelt at first opposed the appointment of such a special officer within the U.S. organization as an infringement upon his powers. Furthermore, unlike its British counterpart, the American air force was a part of the army rather than independent, and the inclusion of Arnold on the JCS so as to parallel the British chiefs of staff thus aroused naval fears of being outvoted. This problem, and the one caused by the still limited powers of the U.S. chief of naval operations, were temporarily resolved by including King in the new organization as a second admiral.

Two alterations were made in the membership of the JCS between March and July 1942. In March, Stark left for England to head U.S. naval forces in Europe and King assumed the title of chief of naval operations while retaining his previous one of commander in chief of the fleet. Then, in July, Marshall succeeded in convincing the president to appoint the former chief of naval operations and Roosevelt's close confidant Adm. William D. Leahy as chief of staff to the commander in chief. This reestablished an army-navy balance on the JCS, provided a direct link to the president, and stabilized the organization's membership: Marshall, King, Arnold, and Leahy would constitute the JCS for the duration of the war. Roosevelt, however, refused to allow Leahy to assume the functions Marshall had desired for him as chairman of and representative to the president. Leahy did preside over JCS meetings, but essentially remained merely Roosevelt's "leg man" to the chiefs, while Marshall himself gradually and informally assumed the leadership role within the organization as "first among equals."

The U.S. JCS, the British chiefs, and the Combined Chiefs of Staff all proved to be highly effective organizations in the strategic direction of global war. By agreements reached at the Arcadia Conference and soon thereafter, the combined chiefs would meet in continuous session, in person when Churchill and Roosevelt met, and via deputies in Washington at other times. They were charged with planning for and directing all Anglo-American land, naval, and air forces, which would be commanded in each theater by a single officer under the principle of unity of command. This critical decision made possible the effective integration of British and American forces as well as, for the first time, all U.S. Army and Navy forces. Within this system, the combined chiefs as a whole were responsible for the European-Mediterranean theater of operations. Responsibility for the other theaters was divided between the British and the U.S. chiefs, with the British in charge of the Indian Ocean/Middle East theater and the Americans in charge of the Pacific theater (Southwest Pacific under Gen. Douglas "MacArthur and Pacific Ocean Areas under Adm. Chester "Nimitz). As the war progressed, the JCS developed an extensive structure of joint army-navy planning committees staffed by officers from each service, who also served on an equally extensive series of Anglo-American Combined Chiefs of Staff committees.

Numerous strategic conflicts arose both within the U.S.

chiefs and between them and the British on the Combined Chiefs of Staff, most notably over cross-Channel vs. Mediterranean operations and Europe vs. Asia/Pacific priorities. Overall, however, these organizations succeeded in compromising interservice and national differences, in working with their political superiors, and in developing and implementing an effective global strategy to defeat the Axis powers. Indeed, both U.S. Army-Navy and Anglo-American military cooperation and coordination during World War II reached unprecedented levels and played a major role in Allied victory. Consequently, there was fundamental agreement at war's end that some form of continued interservice coordination and control at the chiefs' level would be mandatory. The form eventually selected was essentially a retention of the World War II system into the postwar era.

Throughout World War II, the JCS had existed solely at presidential discretion. Two years after Allied victory, however, Congress formalized the institution as the centerpiece of the postwar U.S. military establishment in the National Security Act of 1947. This formalization, and the other components of the National Security Act, were the end result of an extensive debate between the services and their congressional allies over the proper shape of the postwar armed forces. American Air Force officers pressed for independence as a third branch of service, and—together with army officers—for full unification of the three services under a single military staff, a single chief, and a single cabinet secretary. Naval officers remained fearful of being outvoted and overwhelmed in such a unification and proposed instead continuation of the World War II system whereby the separate service chiefs would retain their individual powers while serving as members of the JCS. The final act was largely a naval victory, which preserved this "federal" or "dual-hat" system of World War II, whereby the JCS represented both their individual services and the armed forces as a whole, rather than creating any true unification. Instead of a single general staff under one chief, the U.S. armed forces would include separate army, navy, and air staffs as well as separate civilian departments for the army, navy, and air force. The chiefs of the three military staffs would retain full powers within their services and meet as independent equals (along with the chief of staff to the commander in chief) within the JCS, where they would negotiate their differences as they had during World War II. Similarly, army, navy, and air force staff planners would meet and negotiate in a series of joint staff committees. In 1953, the commandant of the Marine Corps was added to the JCS when it considered matters of direct concern to the Marines, and in 1978 the commandant became a full member.

Continued and extensive interservice conflict, illustrated by the so-called "Revolt of the Admirals" in 1949, led Congress to amend the National Security Act in 1949 so as to create a single Department of Defense and an official chairman of the JCS, who would not, however, have a vote on issues dividing the chiefs. Although far from the single chief of staff originally envisioned by army and air force planners, that individual did become the principal military adviser to the president and the secretary of defense. Despite his lack of an official vote, he was also able to exercise some leadership over the JCS, speak for them, and clarify their authority over all theater commanders—most notably in the Truman-MacArthur controversy of 1951 dur-

ing the Korean War when Gen. Omar N. Bradley held the post of chairman.

From that time onward, the power of the chairman of the JCS has gradually increased, though haltingly, amid continued bureaucratic and political conflict, and never to the extent of creating a single chief of a general staff as reformers desired. In 1953, the chairman was given control over an enlarged joint staff and in 1958 a vote on the JCS. The most far-reaching increase in his power, and reform of the entire joint chiefs system, took place in 1986 with the passage of the Goldwater-Nichols Act. This Department of Defense reorganization act made the chairman the principal military adviser within the executive branch, enabled him to speak independently of the service chiefs, enlarged his joint staff, and gave the joint staff additional autonomy and responsibility. A few years later Gen. Colin Powell would vividly illustrate just how powerful and important the chairman had become. The service chiefs still retained enormous powers, however, and by no means did the act create a general staff with a single chief. Although reformers continue to argue that such a staff and chief are necessary to create true interservice coordination and halt service parochialism, such parochialism has combined with a continued, traditional American fear of centralized military authority to preclude the replacement of the JCS with such a system.

In September 1998, the JCS warned that the combat readiness of the armed forces was being endangered by chronic problems, from replacing aging equipment to recruiting and retaining qualified service people, particularly pilots. Gen. Henry Shelton, JCS chairman, urged fixing the military's retirement system and closing the pay gap between military personnel and civilians with similar training, recommending an additional \$40 billion over five years to a Pentagon budget that was \$271 for fiscal year 1998-99.

In effect, the JCS organization, from its World War II inception down to the present day, has attempted to provide the nation with the advantages of full interservice coordination and control, but without a loss of service identity or the creation of an all-powerful and threatening central military command. In so doing it has created a military version of the constitutional system of checks and balances, albeit between the services rather than between the different branches of government. And as a combination of external threats and internal problems led the executive branch during the twentieth century to expand enormously its powers within this system of government, so a combination of external threats and internal inefficiencies within the JCS system has led to the rise of a chairman within that body and a continual increase in his powers—though never to the extent reformers have desired.

JOMINI, ANTOINE-HENRI (1779-1869), authority on the art of war. A Swiss citizen in Napoleon's service, Jomini wrote profusely while becoming a general officer and chief of staff to Marshal Michel Ney and then had a long career in the Russian Army.

In his histories of the campaigns of Frederick the Great, the French Revolution, and Napoleon, Jomini expounded what he saw as the essence of the offensive strategy of "Napoleonic warfare. In this, he assumed dispersed armies and advocated the use of interior lines of communication and supply, concentration against the center of a too-dispersed adversary, and turning the flank of an opponent who was too concentrated. Napoleon's victories at Marengo, Ulm, and Jena illustrated this turning movement. Jomini summarized these ideas in his influential *Précis de l'art de guerre* (1837). Jomini had many expositors who helped educate English-speaking soldiers in the British empire and the United States.

Beginning in the 1950s, some American military historians incorrectly attributed to Jomini an immense influence on the generals of the U.S. "Civil War, who were, of course, influenced by Napoleon.

JONES, DAVID (1921—), air force chief of staff and chairman of the "Joint Chiefs of Staff (JCS). Jones was born in South Dakota and grew up in North Dakota. He received a commission in the Army Air Forces in 1943 and followed a career as a bomber pilot. He led a squadron during the "Korean War, and later commanded the U.S. Air Forces in Europe. Becoming air force chief of staff in 1974, he made substantial reductions in headquarters staff and reorganized the air force hierarchy. Support for the Panama Canal Treaties and cancellation of the B-1 bomber earned him congressional criticism.

President Jimmy "Carter appointed Jones the ninth chairman of the JCS in 1978. Jones's support for the SALT II agreement in 1979 and the failed Iranian hostage rescue in 1980 brought further congressional hostility and some initial opposition to his reappointment as chairman in 1980. After eight years as a JCS member, Jones recommended major changes in the joint system in 1982. He found JCS advice to the president untimely and diluted by interservice compromise, and he criticized the chair-

man's lack of authority. He proposed making the chairman the principal military adviser to the president instead of the corporate JCS, placing the chairman alone in the chain between the secretary of defense and the major commanders, and giving the chairman a four-star deputy. Neither the Reagan administration nor the other chiefs proved receptive, and no immediate action resulted. In 1986, however, the "Goldwater-Nichols Act included all of Jones's recommendations.

JONES, JOHN PAUL (1747-1792), "Continental navy officer. Born in Scotland, John Paul Jones signed on as a British merchantman at the age of thirteen. After sailing on several vessels in the West Indian trade, he became a captain in 1768. Discipline problems plagued his command. In 1770, one of his men died after a flogging, and he later killed another sailor during a mutiny. Fearing that he would be charged with murder, Jones fled to Virginia in 1774.

The American "Revolutionary War offered him a second chance at command. Appointed first lieutenant in the Continental navy in 1775, Jones received the command of the eighteen-gun sloop *Ranger* in 1777. Based in France, Jones captured the twenty-gun HMS *Drake* and attacked the northern British port of Whitehaven during a cruise in 1778. The next year, he took command of the forty-gun converted merchantman *Bonhomme Richard*. In September, he led the American assault on a British merchant squadron escorted by HMS *Serapis*. Jones's crew suffered heavy losses, but when the commander of the *Serapis* asked if he would surrender, he replied, "I have not yet begun to fight." After a grenade caused a massive explosion aboard the *Serapis*, the British captain surrendered. The fight transformed Jones into America's first naval hero. It was to be his last action. Returning to the United States as commander of the captured British sloop *Ariel*, he was assigned to command the seventy-four-gun *America*, but it was not finished until the end of the war, and was then presented as a gift to France.

JOSEPH, CHIEF (1840-1904), Nez Percé Indian chief, leader of a band living in the Wallowa Valley of eastern Oregon. Neither father nor son had subscribed to the treaties that established and then reduced the Nez Percé Reservation in Idaho. When the federal government ordered all Nez Percés to settle on the reservation, Joseph complied, but en route some young men committed depredations that set off the Nez Percé War of 1877. In subsequent battles with the U.S. Army, and in the famed trek of 800 Nez Percés in a desperate bid for a Canadian refuge, Chief Joseph was one of several chiefs. Others, war chiefs, played a larger military role. However, in the final battle at Bear Paw Mountain, with other leading chiefs dead or escaping to Canada, Chief Joseph surrendered

with the famous speech ending, "From where the sun now stands, I will fight no more forever." Thus in white perceptions Chief Joseph became the "Red Napoleon" who had repeatedly outwitted American generals and conducted a humane war. Confined with his people in the Indian Territory (later Oklahoma), he endeared himself to Americans and in 1885 was allowed to move to a reservation in Washington, where he passed his remaining years.

JUNGLE WARFARE. War in the jungle is the province of the infantry. In a tropical or semitropical environment of triple canopy forests, swamps, marshes, or densely forested mountains, tanks, aircraft, and even * artillery are of little use. The dense vegetation and general lack of infrastructure, along with reduced visibility and engagement ranges, make it extremely difficult to locate and engage enemy forces. These factors also tend to militate against the use of armored and mechanized forces and reduce the effectiveness of aircraft designed to provide intelligence and close air support to ground combat units. Further, the environment of extreme heat, virulent diseases, and frequently dangerous flora and fauna requires that units are carefully trained, equipped, and acclimated before deployment. Today, a typical operation employs * Special Operations Forces conducting long-range reconnaissance to locate concentrations of enemy forces and critical targets. Light infantry or air-mobile units then "fix" the enemy in position while air and artillery are used to complete the destruction of the hostile force.

The American military's expertise in jungle warfare has been hard won. First exposed to the phenomenon in the *Spanish-American War (1898) and the subsequent * Philippine War (1899-1902), the U.S. Army was slow to develop a doctrine for such operations. But the U.S. Marine Corps began compiling data from after-action reports of its operations in Central America and the Caribbean in the 1920s and incorporated lessons learned into its *Small Wars Manual* (1940). During World War II, both the army and the Marine Corps main forces fought a series of fierce battles in the jungles of Guadalcanal, New Guinea, and the Philippines. These main forces were augmented in the *China-Burma-India theater with smaller, fast-moving organizations. The army's "Merrill's Marauders" and the Marines' "Carlson's Raiders," along with OSS (Office of Strategic Services) Detachment 101, were specially trained in irregular warfare and employed in jungle operations deep in Japanese-held territory. Other specially trained and equipped forces such as the navy's Seabees (derived from the designation "CB" for Construction Battalion) were organized to prepare and improve beach landing sites and, later, cut airstrips out of the jungles. The medical services, faced with a bewildering array of exotic tropical maladies, were especially challenged by jungle operations.

During the 1960s and early 1970s, the United States had to relearn the lessons of jungle warfare in Vietnam. The army especially, trained and equipped for a conventional, mechanized war in Europe, was almost wholly unprepared for *guerrilla warfare in Vietnam's jungles. For a consider-

able portion of the war the American military employed large mechanized and air-mobile formations in "search and destroy" operations, hoping to force the enemy into a setpiece battle. To this end, much of the war was conducted in a fairly conventional manner but using newly developed technology and techniques such as ground surveillance * radar and remote sensors to locate enemy forces, and defoliants and napalm (jellied gasoline munitions) to expose and destroy those forces. North Vietnamese Army (NVA) regular forces occasionally committed to conventional battle, but in accepting battle on U.S. terms almost invariably fared badly. Thus the bulk of the conflict was characterized by ambushes and hit-and-run assaults by small units of Viet Cong irregulars, and it was not until the period of "Vietnamization" and the withdrawal of U.S. main forces that the NVA regular forces began to reappear in strength. Throughout the conflict, U.S. Army Special Forces detachments worked at raising, equipping, training, and advising Vietnamese auxiliary troops composed of the Hmong and Montagnard tribes of the highlands. These native forces were later abandoned, but many carried on the war for years after the withdrawal of U.S. forces. The U.S. Marine Corps, having experienced some significant successes with their CORDS (Civil Operations and Revolutionary Development Support) program, which assigned small units to patrol and administer specific villages and environs, abandoned that program after the *Tet Offensive (1968) and embraced a policy almost indistinguishable from the army's.

Jungle warfare techniques, informed by the Vietnam experience, were being taught in the 1990s at the U.S. Army's John F. Kennedy Special Warfare Center and School (Fort Bragg, North Carolina) and Ranger School (Fort Benning, Georgia). It should be noted that the Vietnam War proved such a traumatic experience for the U.S. Army that until the 1980s virtually no aspect of that war was addressed in its formal schooling programs (i.e., at the Basic and Advanced Officer Training Courses and at the Command and General Staff and War Colleges).

JUSTICE, MILITARY. *This entry consists of a seven-part examination of the system of military law and justice, the system established by Congress for the government of persons in the armed forces. The organization is topical and then chronological within each article. The entries are:*

Articles of War (1775-1950)
Uniform Code of Military Justice (1950-Present)
Military Crimes
Military Police
Military Courts
Military Punishment
Military Prisons

For related entries involving military or war crimes, see Atrocities; Desertion; Genocide; Laws of War; Martial Law;

Mutiny; Rights in the Military, Citizens'; Rape by Military Personnel; Treason; War Crimes.

JUSTICE, MILITARY: ARTICLES OF WAR (1775-1950)

Articles of War was the term used to describe the statutes governing military discipline and justice in the American armed services from 1775 to 1950, when they were replaced by the Uniform Code of Military Justice.

With the outbreak of the * Revolutionary War, the Continental Congress in 1775 adopted two codes of military law: the "Rules for the Regulation of the Navy of the United Colonies" and the "American Articles of War" (the latter revised in 1776). Both were written by John

* Adams—then an attorney, representative from Massachusetts, and chair of the Naval Committee—and both were drawn largely from the codes governing the Royal Navy and the British army.

After the adoption of the Constitution and the establishment of the federal government, the first Congress merely stated that the provisions from the earlier period would continue to apply. The U.S. Navy was expanded in the late 1790s, and in 1799, Congress adopted an Act for Government of the Navy, revising the Continental Rules. These also applied to the Marine Corps, as part of the navy. A year later, Congress passed the Articles for the Government of the Navy (1800). Within the navy, this governing statute was nicknamed "Rocks and Shoals" because that phrase was included in the provision authorizing punishment for those responsible for damage to ships due to improper navigation. The statute was amended periodically to reflect changes in the service. In one important reform of discipline, flogging (the whipping of sailors with a lash) was abolished as a punishment in 1850. An amendment in 1855 authorized summary courts-martial, with a single officer sitting as the military tribunal. During the dramatic, if temporary, expansion of the navy in the * Civil War, the Articles for the Government of the Navy were recompiled, and this compilation, as amended, remained in effect through World War II. The navy's ambitious plans to rewrite the articles after 1945 were overtaken by the drive for "unification" of the armed services and by the passage of the Uniform Code of Military Justice, which was modeled largely after the army's Articles of War.

The Articles of War governing discipline and justice in the army, first formulated in 1775 and revised in 1776, underwent minor revisions in 1806 by John Quincy Adams, son of the original drafter. The basic Articles of War remained in effect for 111 years, from 1776 to 1917. During that period, there were a number of important changes: one in 1830 regarding the appointment of courts-martial; and several during the Civil War, primarily intended to extend courts' jurisdiction over crimes and persons. Some articles of the code were deleted, such as those relating to irreverent or indecent behavior at worship services, or the use of oaths or other offensive utterances.

The Articles of War were substantially revised to deal with the mass army of *citizen-soldiers in World War I. At the instigation of Enoch Crowder, judge advocate general of the U.S. Army, Congress passed a complete revision in March 1917. There were major problems with this revision, however. For example, in November 1917, under its wartime provisions, thirteen black enlisted men were too hastily executed after a court-martial following a race riot

in Houston. Secretary of War Newton D. *Baker prohibited any further executions without express approval from Washington. During World War I, a number of other citizen-soldiers were sentenced to long prison terms or even to death for breaches of military discipline, although these sentences were subsequently modified. Widespread complaints in the press and Congress against such mistreatment led to Senate hearings in 1919, which contributed to a revision of the Articles of War in 1920, although the liberal reforms proposed by Samuel T. Ansell, acting judge advocate general while Crowder had been provost marshal general in charge of the draft, were rejected after a heated public debate.

Similar complaints of the harshness of military discipline during and after World War II led Congress to adopt the Elston Act of 1948, modifying the code of conduct for the army and the newly independent air force. In 1950, as part of the movement toward unification as well as modernization of the postwar armed forces, Congress made the name Articles of War obsolete when it adopted the Uniform Code of Military Justice.

During the period 1775-1950 in which the army and navy Articles of War were in effect, they were supplemented by a number of various publications. General Orders issued by the commanding general of the army or his subordinates, particularly during the Civil War, set maximum punishments, established court-martial procedures, and formally supplemented the Articles of War. The *general regulations* for the navy and Marine Corps, first published in 1841, contained provisions relating to courts-martial. The army published its first *Manual for Courts-Martial* in 1917, an amended version in 1921, and another in 1928; the last remained in effect through World War II. The navy's counterpart to the army's *Manual* was *Naval Courts and Boards*, the 1937 edition of which was used throughout World War II. These manuals provided details for the implementation in all services of the military laws designed to maintain discipline and secure justice in the armed forces.

JUSTICE, MILITARY:

UNIFORM CODE OF MILITARY JUSTICE (1950-PRESENT)

The Uniform Code of Military Justice (UCMJ) is a comprehensive federal statute that established essential procedures, policies, and penalties for the military justice system. Enacted by Congress in 1950, the UCMJ continues in effect to the present with few alterations since its passage.

The UCMJ actually resulted from the confluence of two factors. First was underlying dissatisfaction with some existing practices of military justice, especially as related to

courts-martial appeals. Second was the unification of the armed forces into one Department of "Defense "establishment" in 1947-48. This step rendered retention of traditional systems such as the army's Articles of War and the navy's Articles for the Government of the Navy impractical and unnecessary.

The UCMJ was essentially the work of civilian committee selected by Secretary of Defense James V. "Forrestal. It included the three undersecretaries of the army, navy, and air force, with a well-known professor of evidence from Harvard Law School, Edmund Morgan, as its chair. This committee was assisted by a "working group" that consisted of several military lawyers, as well as some civilian attorneys from the newly established Defense Department. Although the military was well represented on the working group, which undertook the initial drafting of most articles in the new code, in general the UCMJ was a civilian effort. Indeed, Forrestal made it clear that where the Morgan Committee could not agree, he would ultimately decide, and that once the proposed code was submitted to Congress, the military's role was over. Unlike earlier attempts to reform military justice, in the case of the UCMJ, although the military might discuss and even debate, it was unable to derail.

Nevertheless, Morgan's committee recognized that the two basic sources of military discipline that had effectively guided the armed services since the Revolutionary era had to be considered and to a great extent integrated into the new legislation. Indeed, its great challenge was to synthesize key provisions from both army and navy regulations into a uniform, workable system, as well as to introduce new innovations now deemed necessary. Thus, it retained—and still retains—some traditional prohibitions that had existed for almost two centuries such as the bans against "conduct unbecoming an officer and a gentleman," "dueling," and "improper use of a countersign."

Based upon plenary congressional authority to enact rules and regulations for the military, the UCMJ ranks just below the Constitution as the basis for federal military regulation. Indeed, on several occasions its provisions have been held to supersede those found in the *Manual for Courts-Martial*, the detailed book of regulations supposedly issued by the president in his capacity as commander in chief, but in fact drafted largely by the military. The court that made these rulings may be the best example of innovative change produced by the UCMJ.

Creation of an appeals court within the military had been proposed during World War I by acting Judge Advocate General (JAG) officer Samuel Ansell, but strong opposition from the army doomed both Ansell's efforts and his continued military career. He was still alive, however, in 1951 when the UCMJ, replete with not one but two levels of appellate review, became law. As submitted to Congress, the UCMJ included two separate appellate systems: an intermediate court, administered within the military; and an appellate tribunal, to consist of three judges drawn from "civilian life." Morgan had intended the new court to have the same perquisites and benefits as other federal Courts of Appeals, including life tenure; and indeed, as passed by the House in 1949, the UCMJ so provided. But the final Congressional product rejected life tenure, and substituted limited terms of fifteen, ten, and five years. To this day, while emphasizing that its highest court for military appeals is no different from other federal appellate tribunals

in terms of salary, Congress has consistently declined to give its judges life tenure.

Although justifiably described a civilian effort, the UCMJ was heavily influenced by the military viewpoint. Thus, commanders retained (and still do) authority to select members of a court-martial. The intermediate appellate courts, controlled by the military, received greater authority than Morgan had originally intended. Moreover, the code failed to set out a clear demarcation between the JAGs and the new court concerning supervision over military justice. In spite of these possible weaknesses, the basic premises of the UCMJ—that a single military justice system can be applicable to all branches of the American military, and that its "uniformity" would not undercut its effectiveness in time of armed conflict—have been vindicated since 1951.

JUSTICE, MILITARY: MILITARY CRIMES

The Articles of War adopted by the Continental Congress in 1775 and based largely on those of the British army specified military offenses ranging from mutiny to misbehavior before the enemy. However, there was no American counterpart to a British provision which, if the offenses occurred where there were no civil courts, granted jurisdiction over soldiers who committed common law crimes (murder, theft, robbery, and rape) to courts-martial. Congress assumed that these crimes, if committed by soldiers, would be punished by U.S. civilian courts. The navy and Marine Corps were, of course, permitted to try their overseas and afloat offenders according to naval custom. A congressional act of 1863 first gave the army concurrent jurisdiction over common law crimes, if they occurred where the civil courts were functioning; otherwise, the military had exclusive jurisdiction. Thus, any history of military crimes must distinguish between the land and sea services and between military offenses and civil offenses, while recognizing that some military offenses, such as theft of government property, will have a civil analog.

The military crimes specified in the present Uniform Code of Military Justice can be found in the 1775 articles: absence offenses, disrespect and disobedience, offenses involving military property, misbehavior ("mutiny, malinger, provoking speech or gestures). The articles followed British practice and provided for the discharge of any officer convicted of "behaving in a scandalous, infamous manner, such as is unbecoming the character of an officer and a gentleman."

In 1776, when the articles were revised, Congress added a provision that had, in various forms, been in the British code since 1686 and that prohibited "[a] 11 Crimes not Capital and all Disorders and Neglects, which Officers and soldiers may be guilty of to the Prejudice of good Order and Military Discipline, though not mentioned in the above Articles of War." The "conduct unbecoming" provision was amended in 1806 by deletion of the phrasing "scandalous and infamous," although the words were retained in the Naval Code. Nineteenth- and early-twentieth-century military law treaties listed the kinds of behavior

that usually involved lying or dishonorable failure to meet financial obligations but also applied to public drunkenness, bigamy, wife abuse, association with prostitutes, and mistreatment of, or undue fraternization with, enlisted men. The 1951 *Manual for Courts-Martial* discussion of Article 133, where the provision is now found, acknowledged the presence of women in forces by providing that they should be held to the standards of a "gentlewoman." In recent years, however, officer misconduct is usually charged under Article 134, as conduct prejudicial to good order and discipline.

Article 134 serves as the legal basis for charging three classes of offenses, two found in the 1776 articles: crimes and offenses not capital, and conduct prejudicial to good order and discipline; while the third, conduct of a nature to bring discredit upon the military service, was added after World War I. The "crimes and offenses" provisions incorporate all federal crimes that are not punishable by another article. Thus, a military counterfeiter of U.S. currency would be charged under this provision. If there were a violation of a state law that had no federal counterpart, the offender could only be charged under Article 134 if the conduct was service-discrediting. Officers who failed to pay their debts were often charged under this provision which, unlike the "conduct unbecoming" article, did not require dismissal on conviction. Gen. Billy *Mitchell was court-martialed in 1925 for service-discrediting behavior after issuing a press release accusing the War and Naval Departments of "incompetency, criminal negligence, and almost treasonable administration of the National Defense."

Of the three provisions, that relating to conduct prejudicial to good order and discipline is the most comprehensive and potentially the most subject to abuse; hence its traditional British nickname, "the Devil's Article." The 1928 *Manual for Courts-Martial* listed typical offenses ranging from abuse of a public animal to self-maiming. The list was not intended to be exclusive: adultery was added in the 1951 *Manual*, but there had been prosecutions for adultery during and immediately after World War II. Fraternization—undue familiarity between individuals of different rank—is considered to be prejudicial to good order and discipline. However, a 1985 decision by the Court of Military Appeals, *Johanns v. United States*, concluded that a male officer's sexual relationship with three enlisted women in his unit was not prejudicial in the absence of an explicit prohibition in service regulations. Subsequently the services issued regulations intended to define fraternization.

Crimes that have no counterpart in civilian life—mutiny, *desertion, misbehavior before the enemy—have been the subject of numerous monographs, as have *war crimes. The term *war crime* has no legal meaning, but it is used to describe deviations from accepted standards of what used to be called the law of war and now is called international humanitarian law. General Order 100 (1863), "Instructions for the Government of Armies of the United States in the Field," prepared by Professor Francis Lieber of Columbia College, was the first codification of these standards. War crimes encompass both offenses against a belligerent's armed forces and against the civilian population in the war zone.

Crimes committed overseas by visiting forces create particular problems because international law gives the local country the right to prosecute. When U.S. troops were first

deployed overseas to France and England during World War I, Washington agreed to a distribution of jurisdiction based on the nature of the offense. Similar agreements were entered into during World War II and became formalized as Status of Forces Treaties when *Cold War requirements mandated a continued U.S. troop presence in Europe and the Far East. The treaties established three categories. Behavior that was a crime in the sending state but not in the receiving state would be tried by the sender. Behavior that was a crime in the receiving state but not in the sending state would be tried by the receiver. When behavior violated both countries' laws, the receiving state had primary claim but was expected to give "sympathetic consideration" to the sender's request to try the offender. Host country waivers of jurisdiction, permitting the United States to try military rapists and murderers of local citizens, were, and continue to be, a persistent source of controversy.

JUSTICE, MILITARY: MILITARY POLICE

Military forces have always assigned some personnel to ensure that order was maintained, stragglers or deserters were brought under control, and prisoners of war taken into custody. In the * Revolutionary War, the *Continental army in 1778 adopted British practice by creating a provost unit, but calling it by the French name, the *Maréchaussée* Corps. From 1783 to 1861, however, the U.S. Army simply detailed regular troops to perform military police functions when necessary.

The * Civil War led to the creation of a massive if temporary system of provost marshals. The huge armies of citizen-soldiers proved unruly in camp and field. Consequently, in 1861, the * Union army established regimental provost marshals assisted by designated enlisted personnel to serve as a permanent police force, with the duties of preventing riotous conduct, controlling stragglers, and preventing looting and personal violence against civilians as the army advanced into the South. In March 1863, the army created a Provost Marshal Department, which, with congressional authorization, extended the role of the provost marshals from controlling undisciplined Union troops and guarding Confederate prisoners of war to including operation of the system of "conscription even at the local level, as well as control of local government in occupied Southern states.

In World War I, a temporary Military Police Corps was created, with assigned soldiers wearing "MP" armbands. It garnered soldiers absent without leave (AWOL), guarded prisoners of war in France, and investigated *desertion, draft evasion, and related military offenses, as well as policing military prisons and prisoner-of-war camps in the United States. In 1920, Congress refused a permanent MP corps, but authorized reserve MP units.

Similarly, for most of its history, the navy relied primarily upon temporary assignment of regular personnel to maintain order and discipline. The navy assigns sailors to

duty as a shore patrol (with "SP" armbands) to prevent disorder between crew members on liberty and local civilians. Longer-term security is provided by naval masters-at-arms or by Marines, who are assigned to guard naval "brigs" aboard ship or ashore.

With the United States' mobilization for World War II, Secretary of War Henry L. *Stimson, on 26 September 1941 authorized a Military Police Corps, and it has remained a permanent part of the U.S. Army ever since. Nearly 210,000 officers and enlisted personnel served in the army's MP Corps in 1941-45, and an MP school was established, first in Arlington, Virginia, and after the war in Fort McClellan, Alabama. During World War II and the wars in Korea, Vietnam, and the Persian Gulf, MPs secured movement in and out of theaters of operation, processed and guarded thousands of prisoners of war, and in war and peace provided protection for military facilities.

During the guerrilla-style * Vietnam War, MP units sometimes engaged directly with the enemy, securing lines of communication by preventing Viet Cong roadblocks, ambushes, and attacks on U.S. facilities. Such active participation in tactical operations led to the redesignation of the Military Police Corps as an arm and a service with a primary mission of combat support. In Kuwait during the * Persian Gulf War, the MPs processed and secured nearly 70,000 Iraqi prisoners of war.

JUSTICE, MILITARY: MILITARY COURTS

Military courts can be classified by the persons over whom they exercise their jurisdiction. Courts-martial and military courts of inquiry are concerned with members of the armed forces. Military commissions and provost courts (operated by officers of the provost marshal general) exercise their power over civilians who, although not affiliated with the military, may face a military court in time of war or rebellion. In the early days of the republic, the distinction was not as clearly drawn. Winthrop's *Military Law and Precedents* remarks on the courts-martial of civilians for collaboration with the traitor Benedict * Arnold in 1780, for spying on New Orleans in 1815, and for inciting and supplying the Creek Indians in Florida in 1818.

The same confusion attended courts of inquiry, authorized by the Articles of War, and considered to be quasi-judicial boards of investigation; yet it was such a court, convened by Gen. George *Washington, which recommended that Maj. John André of the British army be treated as a spy and executed. Courts of inquiry were common in the 19th century, when one was used to inquire into the conduct of Major Reno at the 1876 Battle of the *Little Bighorn. However, they came to be replaced by less formal administrative boards. Still authorized by the Uniform Code of Military Justice, they have in recent years only been utilized by the U.S. Navy, for example, to deal with the losses of vessels such as the USS Scorpion, and in the * *Pueblo* incident (1968).

Similarly, military commissions (established to try civilians for criminal offenses) and provost courts (intended to resolve civil disputes) are still authorized by the Uniform Code. When established in occupied territory and utilized to try cases involving local residents, these courts derive their authority from international law. Their authority over U.S. citizens was challenged in *Ex parte *Milligan* (1866) and *Duncan v. Kahanamoku* (1946), in which majorities of the Supreme Court held that jurisdiction could not be exercised in areas where U.S. civil courts were open and functioning. However, in *Ex parte Quirin* (1942), a case involving Nazi saboteurs, a majority of the Court approved of a commission that tried alien enemies found in the United States. The Court similarly approved their use to try *war crimes overseas, for example, in *In re Yamashita* (1946), which led to the execution of the Japanese general in charge of Manila in 1945.

Courts-martial are the best known military courts. The 1775 Articles of War, following British practice, established three categories of such courts for the army: general, for the most serious offenses and for cases involving officers; regimental; and detachment or garrison courts. The so-called inferior courts were limited in their jurisdiction to noncapital offenses, to offenders who were enlisted men (and, in the case of regimental courts, to enlisted personnel who were members of that unit), and by the kinds of punishment they could impose. The Naval Rules made no such distinction and relied on naval custom. Military law treatises uniformly state that courts-martial were always composed of officers; had to consist of at least three members; and that there was no American equivalent of the English "Drum Head" court-martial, where punishment was summarily imposed. However, Stephen Ambrose's account, in *Undaunted Courage* (1996), of the *Lewis and Clark Expedition (1804-06) reports instances where enlisted men were appointed as the court-martial to decide what punishment should be imposed on a fellow soldier, and one case in which the joint commanders appointed themselves as the court. The punishments imposed (typically flogging) were within statutory limits. The history of such informal courts remains to be written, as does the use of these courts to try prisoners of war (POWs). During World War II, seven German POWs in the United States were convicted of murder of fellow prisoners and were executed at the U.S. Disciplinary Barracks at Fort Leavenworth.

Nonjudicial punishment, permitted by naval custom (called in the navy, "Captain's Mast," and in the Marine Corps, "Office Hours"), was prohibited in the army, whose statutes and regulations required a court-martial composed of at least three officers. During the *Civil War, single officer field officer's courts were permitted but ceased at the war's end. In 1890, the first single army summary courts were established by regulation; it was not until World War I and congressional passage of Article 104 that army commanders were permitted to impose minor punishments without trial. Even as army commanders' authority was thus enhanced, it was also curtailed by legislation which required that courts-martial convictions be scrutinized by Boards of Review. With the passage of the Uniform Code of Military Justice (1950) that practice was extended to the air force, Coast Guard, the navy, and the Marine Corps. Board decisions could be reviewed by the Court of Military Appeals, subsequently renamed the U.S. Court of Appeals for the Armed Forces, as the boards be-

came known as Military Courts of Appeal. Thus, for the past half century, the organization of courts-martial has remained unchanged.

JUSTICE, MILITARY: MILITARY PUNISHMENT

Few punishments were specified in the American Articles of War of 1775. The death penalty was limited to specified offenses—"nor shall any punishment be inflicted at the discretion of a court-martial, other than degrading, cashiering, drumming out of the army, whipping not exceeding thirty-nine lashes, fine not exceeding two months pay of the offender, imprisonment not exceeding one month." The articles' naval counterpart similarly relied on custom rather than specifying punishments. The most noticeable characteristic of the "old" (pre-Civil War) army and navy is the fact that deterrence seems to have been punishment's only goal. This policy is exemplified by the navy's practice of summarily executing seamen who left their posts in battle. Because a jailed soldier or sailor was considered to be evading the hardships of military life, commanders relied on flogging as the punishment. The maximum number of lashes allowed to army courts-martial was increased to 100 in the 1776 articles and then curtailed to 50 in 1806. In 1812, Congress eliminated flogging as a permitted punishment in the army, reinstated it for "desertion in 1833, and finally abolished it in 1861.

Flogging and "colting" (striking with a rope end) were the main punishments used in the navy. Naval regulations permitted up to 12 lashes as nonjudicial punishment; naval courts-martial awarded 100 lashes for drunkenness and mutinous behavior. Branding with a hot iron or tattooing was permitted until Congress forbade the practice in 1872. Army records confirm the wearing of irons, placarding, gagging, standing on or wearing a barrel, and tarring and feathering. The navy imposed similar punishments after flogging was abolished by Congress in 1850 following a campaign waged by the author Herman Melville, who had served on the "hell ship" *United States*. Sweatboxes, dousing with bilge water, tricing to the rigging, or hanging from a boom were other naval punishments. Not all punishments were, to modern eyes, barbaric: dismissal or dishonorable discharge; demotion, fines, or forfeitures (the last from pay prospectively due); confinement; and, for officers, suspension from command or active command or active service were also permitted.

The military courts' discretion, in noncapital cases, to impose punishment was gradually curtailed. In 1855, when Congress established naval summary courts-martial, limits on minor punishments—confinement and reduced rations—were included in the statute. In 1862, President Abraham Lincoln issued a list of maximum punishments that could be imposed for various offenses, and in 1890, Congress ordered that, where an article provided

that punishment would be left to the discretion of the court, the punishment could not exceed that directed by the president.

The army and navy codes limited the death penalty to specified offenses, or those made capital by local state law, and required a higher percentage of the court members to agree on the sentence than was required for lesser punishments. Statutes required presidential approval of the penalty if it had been imposed by a court-martial within the United States; when, in 1849, Commodore Thomas Jones of the Pacific Squadron permitted the hanging of two mutineers in California, he was court-martialed and received five years' suspension from duty. Nineteenth-century army tradition dictated that capital military offenses, with the exception of desertion, be punished by shooting, while hanging was dictated for civilian capital crimes, or for desertion or spying. Naval tradition called for hanging from the fore yardarm of the vessel. The 1917 Texas "Mutiny Cases, in which black American soldiers were hastily hanged after their court-martial, led to a revision of the 1916 Articles of War, as the World War II execution of Private Eddy Slovik after the Battle of the "Bulge led to postwar reform efforts, although the death penalty is still permitted by the Uniform Code of Military Justice.

After 1916, the army articles, unlike those of the navy, required a Board of Review if the sentence included the death penalty or dismissal of an officer (which required presidential approval in the navy) or dishonorable discharge (there was no similar provision in the navy). However, in the post-World War II period, when manpower requirements exceeded enlistments, prisoner rehabilitation units were established in each of the armed services. With the advent of the "All-Volunteer Force in 1973 and its higher standards of pay and performance, such units were disbanded.

JUSTICE, MILITARY: MILITARY PRISONS

For short-term confinement for purposes of discipline or criminal proceedings involving their own military personnel ("prisoners of war fall into a separate category), the armed forces have used various temporary and long-term facilities. Temporary arrangements range from the U.S. Navy's brigs (restraining cells aboard ship or guardhouses ashore) to the U.S. Army's stockades at particular posts or camps or holding cells in nineteenth-century fortresses. Some of the short-term facilities were subsequently expanded for long-term use. The navy established prisons at Portsmouth, New Hampshire, and later on Treasure Island near San Francisco. The army long maintained a prison at Fortress Monroe, Virginia. Most famously, the army created a prison on Alcatraz Island in San Francisco Bay, where a wooden stockade added to the fort there in 1861 was replaced by a modern concrete cell block in 1909. In

1934, the military prison on Alcatraz became a federal civil penitentiary (nicknamed "the Rock"), which it remained until closed in 1963.

The first federal military prison was the U.S. Military Prison, established at Fort Leavenworth, Kansas, in 1875, in response to complaints of varied and often harsh treatment of military prisoners at post stockades and state penitentiaries. In 1873, Congress had approved a military prison, but directed that it be constructed near the federal arsenal at Rock Island, Illinois, to employ prison labor. After the Ordnance Department and the secretary of war protested that prisoners could not be trusted to work with munitions, Congress passed an 1874 amendment to locate the prison at Fort Leavenworth, a military post dating from 1827.

The Leavenworth facility, about twenty miles from Kansas City, later also served as a federal prison for civil offenders. In 1895, it was transferred to the U.S. Department of Justice, but returned in 1906 to the army and renamed in 1915, the U.S. Disciplinary Barracks. During World War I, a number of conscientious objectors were confined there along with uniformed personnel. In 1929, the facility was again transferred to the Department of Justice and designated the Leavenworth Penitentiary Branch.

In November 1940, it was returned to the army and redesignated the U.S. Disciplinary Barracks. Since then, it has been operated by the army. Today, it is the only long-term maximum security facility operated by the Department of * Defense, and includes inmates from each of the armed services.

Although the maximum housing capacity is 1,500, the average population in the 1990s was 1,350 inmates. These men and women, officers and enlisted personnel, were serving terms from a few years to life imprisonment; half a dozen were serving death sentences. The average sentence length is fourteen years; most inmates were first-time offenders.

In the 1990s, approximately three-quarters of the inmates at the U.S. Disciplinary Barracks were confined for crimes against persons—from assault to murder. Nearly half were convicted of sexually related offenses. Slightly more than 10 percent also involved drug-related offenses. Another 10 percent had committed property crimes. In the 1990s, only 1 percent of inmates were confined for strictly military-related offenses. Nearly 96 percent were sentenced to punitive discharge. In addition to the military prison, a civil prison, the U.S. Penitentiary, Leavenworth, is also located on the grounds of Fort Leavenworth.

—John Whiteclay Chambers II

JUST WAR THEORY. The term *just war* in its fullest sense refers to the broad tradition of interrelated theory and practice that defines for Western culture when the use of armed force for political purposes is justified and what limits or restraints ought to be observed in the employment of such force. Reflecting both the practical experience of war and normative thought on the place of force in statecraft, just war tradition first coalesced during the Middle Ages as a cultural consensus drawing on canon law, the dominant Augustinian theology and political theory, in-

herited Roman concepts of *jus gentium* and *jus naturale*, existing customs and practices of statecraft, and the code of chivalry. The roots of this tradition reach back through theology and law to classical Rome and Greece and to biblical Israel, and through chivalry to earlier Germanic conceptions of war and the soldier. The classical and biblical heritage was principally mediated to the Middle Ages by Augustine, who took the phrase "just war" itself (*bellum justum*) and a number of associated concepts from late Roman theory and practice, wedding them to a Christian ethic of intention based on love of neighbor and a concept of divinely instituted justice drawn from the Old Testament. Other elements of the medieval just war consensus traveled other routes. The result exceeded the sum of its parts both in content and in the breadth of its implications: a collection of restraints on war shaped by legal, moral, and practical concerns, and molded by the experience of war and statecraft.

This conception of just war sought to deal with two main concerns: the justification and limitation of the resort to armed force (in traditional terms, *the jus ad bellum*) and restraints on the actual employment of force (in traditional terms, *the jus in bello*). In its fullest and classic form, reached by the end of the medieval period, the *jus ad bellum* was defined by seven distinct requirements: just cause (defense, retaking something wrongly taken, punishment of evil); right authority (temporal rulers with no superior); right intention (no hatred of the enemy, desire for vain-glory or power, bullying, etc.); the goal of peace; a reasonable hope of success; and the two conditions that the use of force in question achieve more good than harm and that the use of force be a last resort. The *jus in bello* took shape around two further requirements: that the force employed not cause more destruction than necessary, and the concept of immunity from harm for noncombatants, persons not directly involved in the waging of war.

In such form, just war tradition carried into the early modern period. Theorists like Vitoria, Suarez, Gentili, and Grotius assumed this concept of just war. Shakespeare displayed a remarkably complete knowledge of the conditions for just war in *Henry V*. Apologists on both sides of the post-Reformation wars of religion employed just war criteria to argue the rightness of their respective causes. The early codes of military discipline which appeared in this period similarly reflected the influence of the inherited just war synthesis.

Yet while the tendencies of the Middle Ages were centripetal, those of the modern era have been centrifugal. Just war tradition in the modern period has been carried and developed not as a single entity but in the form of various distinct streams of thought and practice, sometimes in relation to one another, but more often moving according to their own logic.

One of the major streams of development of just war tradition through most of the modern period has been international law, from naturalists like Vitoria and Grotius through the juristic theorists to present customary and positive law. Contemporary positive international law on war includes a detailed *jus in bello* defined by the *Geneva Conventions, the Hague Rules, various international efforts to limit or forbid use of certain weapons, and the findings of the Nuremberg and Tokyo war crimes trials, as well as a somewhat truncated *jus ad bellum* focused on the right of defense as defined in the *United Nations Charter.

The development of military codes of conduct, theories and practice of limited war, and the persistence of the idea of chivalry in some form together make up a second major stream of just war tradition in the modern era. A landmark among the military regulations is the U.S. Army's *General Orders No. 100 of 1863*, a comprehensive code for conduct during war that strongly influenced both subsequent military codes and later positive international law on war. The limited war idea, operationalized in the "sovereigns' wars" of the eighteenth century, has emerged into new prominence in post-World War II military thought.

Within the sphere of religion, just war tradition remained acknowledged but without much attention or development through most of the modern period. In the last half of the twentieth century, however, led by American thought, a highly creative recovery of religiously based just war reasoning has taken place, responding to the strategic bombing of cities by both Axis and Allied powers during World War II, the development of "nuclear weapons and strategic targeting doctrine, and the "Vietnam War. This development within religious thought has in turn stimulated both the emergence of philosophical just war analysis and efforts to recover and understand historical just war tradition.

The recovery of just war thought in the religious sphere was largely initiated by the Protestant theologian Paul Ramsey, who in influential books and articles written mostly during the 1960s argued after the manner of Augustine for a conception of just war based in Christian love. Ramsey's historical context was the developing debates over strategic nuclear targeting and the initial stages of American involvement in Vietnam. Taking on various sorts of pacifists and others who argued that no contemporary war can be just because of the destructiveness of nuclear and other weapons, Ramsey insisted that there remains a place for responsible use of force by nations. Such a use, as he described it, would both serve justice and reflect the concerns of political prudence, traditional just war aims. The major focus of his work, though, was the just conduct of war. Hence he stressed the importance of discrimination (noncombatant immunity), which he understood as a direct requirement of Christian love, and the requirement of proportionality of means, an expression of political prudence.

Ramsey's importance for contemporary just war thought follows both from what he argued and from the partners he engaged in dialogue on just war terms: Protestant and secular pacifists; Catholic thinkers through detailed comments on papal and Vatican II statements on nuclear war; the secular policy community through debate with figures like Herman Kahn, Thomas Schelling, Robert W. Tucker, and many others; philosophers and theologians in America and other countries like Elizabeth Anscombe and Walter Stein in England. Though not himself a historian, he also encouraged historical efforts like those of James Turner Johnson to recover just war tradition as it existed and was applied to war in the past.

Use of just war categories and the effort to engage the policy community also characterize prominent recent church statements on ethics and war, such as the pastoral letters of the American Catholic bishops (1983) and the United Methodist bishops (1986). Both these documents, however, also nod significantly toward "pacifism. The Catholic pastoral, for example, grounds just war thought in

a presumption against war, while the Methodist document explicitly rejects war as incompatible with Christ's teachings and example. Both these concepts are at odds with the traditional Christian derivation of just war from the moral obligation to seek justice and protect the innocent.

In the philosophical sphere, the most important and most comprehensive recent treatment of just war ideas is Michael Walzer's *Just and Unjust Wars*. Aiming explicitly at recapturing just war reasoning for political and moral theory, this book develops the major traditional just war criteria through a mix of thematic analysis, utilitarian reasoning, and historical examples out of which the various just war principles arise as responses to evil in one or another concrete form. Like other modern just war thought, Walzer's analysis dwells heavily on the problem of ethical conduct during war; like positive international law, he treats the question of justification for use of force in the truncated terms of aggression and defense. Some of his most creative thought presses hard cases: whether the strategic bombing of German cities during World War II was justified by "supreme emergency," for example. But on most matters Walzer concludes in or near the mainstream of the tradition, connecting especially strongly with developments in international law.

Recent military thought has also proved a fertile ground for recovery and development of just war thinking. Examples abound: Walzer's book has served as a text at the U.S. Military Academy; the service academies, the war colleges, and the National Defense University have sponsored various conferences and lectures examining or seeking to apply just war reasoning; a joint service committee on professional ethics provides a regular forum for consideration of just war and other ethical concepts related to the use of military force; revisions of the air force and army manuals on the law of war in the 1980s took close account of developments in international law on war and traditional principles like chivalry; the "Weinberger doctrine" of 1986 specifying conditions for commitment of American military forces closely correlates with the structure and elements of the content of traditional just war theory; and the formal justifications of the largest American military commitment since Vietnam, the "Persian Gulf War, closely followed the form of just war tradition as found in international law, while the conduct of that war in numerous ways reflected the debate over ethical conduct in war developed in just war terms over the previous three decades.

Contemporary just war thinking is challenged in three major ways: by the growth of pacifist rejection of all war; by the question of how to relate historical just war tradition to contemporary international politics and war; and by the growing problem of cultural relativism, which challenges the universality of just war principles and sets up alternative traditions as guides for international conduct in the use of force.

Yet, as the above religious, philosophical, military, and legal examples show, just war tradition is deeply embedded in Western culture and is particularly vigorous in recent American debate over the proper role, structure, and use of armed force. Contemporary American discourse on war reflects both the traditional just war categories and the content of those categories, mediated through the streams of modern thought that have carried this tradition. By merging these streams in a common debate, moreover, recent American just war thought has tended to reestablish

their relationship as elements of a broader tradition, restoring a synthesis approach to just war long absent in Western thought.

K

KALB, JOHANN [BARON DE] (1721-1780), Revolutionary War general. Johann Kalb grew up a peasant's son in the Bavarian town of Hüttendorf. Despite humble origins, he became a military officer, a French Army veteran with service under *maréchal de Saxe*, and a protégé of the militarily influential Broglie family. He first traveled to North America in 1768 to assess the growing Anglo-American split, and with the outbreak of war returned to seek a command in the *Continental army.

Kalb's skill and credentials, coupled with the Marquis de *Lafayette's influence and devotion to the Revolution's principles, overcame Congress's suspicion of foreign adventurers and earned a major general's commission. Despite the appointment, Kalb found battle elusive. Congress made him second in command for a proposed invasion of Canada in 1778, then canceled the operation. Washington subsequently ordered him to relieve the Continentals at the siege of "Charleston, South Carolina, but the city fell before Kalb's arrival. He reorganized the Southern Department's remaining forces, only to have Congress place Horatio "Gates at their head. On 16 August 1780, Kalb led a Continental regiment at the disastrous Battle of Camden, where he received numerous bayonet wounds. He died three days later.

KEARNY, STEPHEN WATTS (1794-1848), frontier army commander, conqueror of New Mexico, governor of California. Born in Newark to a prominent New Jersey family, Kearny became a regular army lieutenant in the "War of 1812. He served with distinction at the Battle of Queenston Heights on the Niagara frontier. Promoted in the postwar period, he served in several expeditions and posts on the western frontier and molded the dragoons into one of the U.S. Army's crack units.

During the "Mexican War, Colonel Kearny received orders to organize an expedition of dragoons and Missouri Volunteers and seize Santa Fe, the provincial capital of New Mexico. Commanding the Army of the West, Kearny led 1,800 men 700 miles from Fort Leavenworth, Kansas, on 30 June 1846, arriving at Santa Fe on 18 August. As a brigadier general, he established a U.S. civil government and a territorial constitution there, then left on 25 September with 700 men for his second objective, the seizure of California. Learning that Commodore Robert F. Stockton had already conquered California, Kearny sent half his command back to Santa Fe and proceeded with 300 troops overland to California.

In December, he arrived near Los Angeles, which had been retaken by Mexican Californians. On 6 December, at San Pascual, Kearny defeated a Mexican detachment. After reprovisioning in San Diego, Kearny's soldiers and Stockton's sailors and Marines defeated 600 Mexicans at San Gabriel and retook Los Angeles. A feud between Kearny and Stockton, the latter supported by John C. "Fremont, over who was in charge in California led to Kearny's recognition as the military governor and ultimately to Fremont's court-martial for insubordination. Kearny died from yellow fever.

KENNAN, GEORGE F. (1904-), diplomat, historian, foreign policy critic. Born in Milwaukee, Wisconsin, in 1904, Kennan attended Princeton University and joined the foreign service in 1926. Over the next two decades he labored as a diplomat in relative obscurity at postings in Riga, Moscow, Vienna, Prague, and Berlin, and earned some reputation for expertise on the Soviet Union. His obscurity ended with the dispatch from Moscow of his Long Telegram in February 1946 and especially with the publication of his 1947 article, "The Source of Soviet Conduct," in *Foreign Affairs*. He was accorded authorship of "containment" doctrine and deemed a principal architect of America's Cold War strategy.

As director of Policy Planning Staff in the State Department from 1947 to 1950 Kennan principally advocated political and economic measures, such as the "Marshall Plan, to implement containment. He objected to what he considered the overmilitarization of containment as evidenced by "NATO, the hydrogen bomb, and NSC 68. Although he supported U.S. entry into the "Korean War, he unsuccessfully opposed crossing the 38th parallel there. Kennan left the State Department in 1950 in dissent from the expansive national security strategy favored by Dean "Acheson. His direct influence on U.S. foreign policy ended then.

While pursuing a distinguished career as a historian at the Institute for Advanced Studies, Kennan also engaged in commentary on foreign policy matters. He contributed significantly to the realist approach to international relations characterized by a fundamental concern to root foreign policy in calculations of national interest. In the 1950s, he argued for the reunification of Germany and the withdrawal of American troops from Europe. Later, he opposed U.S. involvement in the "Vietnam War, offered constructively critical support to the Nixon-Kissinger policy of detente with the Soviet Union, and passionately opposed the resumed nuclear "arms race that characterized the late

Carter and early Reagan presidencies. With the end of the Cold War, Kennan continued to emphasize the limits of American power and the need for restraint in the exercise of it.

KENNEDY, JOHN F. (1917-1963), thirty-fifth U.S. president. Born in Brookline, Massachusetts, to a large, wealthy, politically active Irish American family, "Jack" Kennedy graduated from Harvard in 1940 when his financier father, Joseph Kennedy, was U.S. Ambassador to Britain. In the navy (1941-45), John Kennedy commanded a torpedo boat in the Pacific. He was hailed a hero when he helped rescue crew members after a Japanese destroyer sank PT-109 in 1943.

As a *Cold War Democrat from Massachusetts, Kennedy served in the House of Representatives (1947-53) and U.S. Senate (1953-61), calling for increased military spending and the vigorous containment of communism, particularly in the Third World.

In 1960, Kennedy defeated Vice President Richard M. Nixon to become the first Catholic and the youngest man (at forty-three) to become president. In the campaign, Kennedy had incorrectly charged that the Eisenhower administration allowed a "missile gap" to develop in the Soviet Union's favor. Kennedy's failure during the CIA-sponsored invasion of the Bay of Pigs by Cuban exiles in April 1961 may have emboldened him to be assertive elsewhere. Kennedy and Secretary of Defense Robert S. McNamara dramatically expanded the defense budget, increasing nuclear 'missiles (from 63 to 424 ICMBs, 1961-63) and conventional forces (including the elite 'counterinsurgency 'Special Forces) under the concept of "flexible response." Kennedy also instituted 'covert operations to depose Cuba's Fidel Castro, and mobilized military reservists in the Berlin Crisis of 1961. During the 'Cuban Missile Crisis of October 1962, Kennedy directly challenged Soviet deployment of medium-range missiles in Cuba, even risking nuclear war before the Soviets backed down. Afterwards, Kennedy obtained a 'Limited Nuclear Test Ban Treaty (1963), but continued the arms buildup. 'NATO allies, meanwhile, began to complain that the United States too seldom consulted them.

To combat suspected communism in the Third World, Kennedy developed the Peace Corps and the Food for Peace program, but he also used military force. Responding to Communist 'guerrilla warfare in Southeast Asia, Kennedy accepted neutralization of Laos, but he committed American military assistance to South Vietnam, increasing the number of U.S. military "advisers" attached to the South Vietnamese Army from 685 to 16,732. By the end of 1963, 120 Americans had died in combat there. The administration later tacitly authorized the Vietnamese generals' coup against the unpopular Ngo Dinh Diem, although not his murder on 1 November 1963. Kennedy himself was assassinated three weeks later in Dallas, Texas.

The debate over what Kennedy would have done had he lived continues. He offered some statements favorable to hawks, others to doves. His actions, however, dramatically

increased the U.S. military role in Vietnam and emphasized it as the test case against Communist wars of "national liberation." At the end, ambiguity marked his presidency, as mystery shrouded his assassination.

KETTLE HILL, BATTLE OF. See San Juan Hill, Battle of (1898).

The KEY WEST AGREEMENT (1948) was a major step toward composing differences between the military services over their respective roles and missions. The immediate purpose was to reconcile the inconsistent treatment of service functions in the 'National Security Act of 1947, which had unified the armed forces under the National Military Establishment (later the Department of 'Defense), and its companion Executive Order 9877. Two issues were uppermost: in regard to air power, whether the air force should share its strategic nuclear bombing function with the navy's carrier-based aircraft; and in regard to ground forces, whether limitations urged by the army should be imposed on the size and capabilities of the Marine Corps.

Growing interservice friction over these issues prompted Secretary of Defense James V. Forrestal to meet privately with the 'Joint Chiefs of Staff at Key West, Florida, 11-14 March 1948, where he brokered a compromise. Although primary service functions—air, land, and sea warfare—remained unchanged, each service received a secondary, or collateral, assignment. These were summarized in a paper entitled "Functions of the Armed Forces and the Joint Chiefs of Staff," which replaced the executive order. Forrestal hoped that this agreement would encourage more interservice collaboration—between the air force and the navy in planning nuclear warfare, and between the army and Marine Corps in amphibious operations.

Although the Key West Agreement provided a framework for resolving disagreements over service functions, it did little to eliminate the underlying sources of interservice rivalry. Money remained tight up to the outbreak of the 'Korean War in June 1950, and until then, no service would readily part with or share responsibilities on which its budget claims rested. The Key West Agreement stood as the official statement of service functions until an updated directive replaced it in March 1954.

KHE SANH, SIEGE OF (1968). Among key engagements of the Vietnam War, the siege of Khe Sanh also marked one of the largest setpiece battles of that conflict. The relationship between Khe Sanh and the 'Tet Offensive of 1968 con-

tinues to be the most controversial aspect of the siege. In fighting prior to the offensive, U.S. commander Gen. William C. Westmoreland became convinced that this base at the northwestern corner of South Vietnam would be the major objective for North Vietnamese forces in the attack he expected. Instead, the forces directed by Gen. V. Nguyen "Giap struck cities and towns throughout South Vietnam. Whether or not Hanoi mounted a deliberate deception remains at issue. In any case, Westmoreland's focus on Khe Sanh helped Hanoi gain position for its assaults at Tet.

In the prelude to the Khe Sanh siege, increasing numbers of Hanoi's troops were detected in the vicinity of the combat base, which had been a military post or Special Forces camp since July 1962. That Special Forces camp was first hit by mortar bombardment in January 1966; in May 1967, after the facility moved to nearby Lang Vei, it received a ground attack. U.S. Marines began operating in the area, establishing and improving the Khe Sanh combat base and gradually reinforcing it as the suspected North Vietnamese presence grew to an estimated 25,000-40,000 men. By January 1968, the combat base was manned by 6,806 American troops (including 5,905 Marines) under Col. David E. Lownds. There were also about 360 Americans and indigenous soldiers at Lang Vei Special Forces camp and another 175 troops in and around Khe Sanh village.

The events of the seventy-eight day siege began with an attack on an outlying position (Hill 861) on 20/21 January 1968, coupled with a bombardment of the main base that destroyed much of the Marines' reserve ammunition. The force at Khe Sanh village withstood an attack the next night but was then withdrawn. There were several pitched battles for outposts but no more than probes at the combat base. These included the battles at Hill 861A (5 February), Lang Vei (7 February), and Hill 64 (8 February). All the posts except Lang Vei were successfully defended. On 21 February, there was a probe against South Vietnamese Ranger positions in the main base. The base and its outposts were heavily supported throughout the siege by U.S. firepower and artillery fire in an exceptional effort that General Westmoreland called Operation Niagara. It remains unclear whether the lack of a big North Vietnamese attack was intentional or resulted from losses inflicted by this firepower. Khe Sanh was relieved by an overland attack, Operation Pegasus, involving some 30,000 troops, that made contact with the isolated base on 7 April 1968. After a period of mobile action, the United States withdrew from Khe Sanh on 6 July.

Official U.S. figures for "casualties, which exclude several sources of losses, amount to 205 killed and 816 wounded who were evacuated; a more detailed assessment indicates about 730 battle deaths, 2,598 wounded, and 7 missing. Losses during the period of mobile operations in the surrounding zone include another 326 killed, 1,888 wounded, and 3 missing. North Vietnamese losses have been estimated by Americans at between 10,000 and 15,000 in dead alone.

KING, ERNEST J. (1878-1956), American admiral; chief of U.S. naval forces in World War II. Born in Lorain, Ohio, King graduated from the U.S. Naval Academy in 1901. King's first command was with destroyers. But during World War I, he served as assistant chief of staff to Adm. Henry Mayo, commander of the Atlantic Fleet, joining him at conferences in England. After the war, Captain King studied and took leadership roles in two of the navy's new branches, submarines and aviation, in 1930 being given command of the aircraft carrier, *Lexington*. In 1933, when Chief of the Bureau of Aeronautics, Rear Adm. William A. Moffett, died in a crash, King, his former assistant and now a rear admiral, succeeded him as the navy's aviation chief. In 1938, he commanded the navy's aircraft carrier force in the Pacific. King had hoped to become chief of naval operations (CNO), the navy's service chief, but in 1939 that position went to Adm. Harold Stark.

It was King not Stark, however, who would command the navy during World War II. In January 1941, as vice admiral and soon a full admiral, King with a reputation as knowledgeable, tough and dedicated officer, was appointed commander of the Atlantic Fleet with the mission of protecting vital supplies being sent to the Allies. In December 1941, after the Japanese attack on "Pearl Harbor and the U.S. declaration of war, President Franklin D. Roosevelt created a new position and appointed King, commander in chief, U.S. Fleet, as head of all naval operating forces. Conflict between King and Stark led Roosevelt in March 1942 to appoint King also as chief of naval operations and send Stark to London as commander of U.S. naval forces in Europe. Holding these two positions as well as a seat on the "Joint Chiefs of Staff for the rest of the war, King had unprecedented authority over all aspects of the navy and its operations as well as joint planning. As his personal adviser, however, Roosevelt appointed Adm. William Leahy, a trusted friend and former CNO, as chief of staff to the president.

During World War II, King accepted the decision that Germany should be defeated first, but with the U.S. Navy's major combat role against the Japanese navy, he insisted that as many resources as possible be sent to the Pacific. His continued insistence led to disagreements with Gen. Dwight D. Eisenhower, the U.S. military commander in Europe. King also clashed with Gen. Douglas "MacArthur, senior army commander in the Pacific over priorities in the region, leading Roosevelt to divide the area between MacArthur and Adm. Chester "Nimitz. In the summer of 1943, as MacArthur drove through the Southwest Pacific, King and Gen. H. H. ("Hap") Arnold, chief of the Army Air Forces, pressed for a major drive by Nimitz through the Central Pacific. Roosevelt controversially accepted both campaigns, but in 1944, the president sided with MacArthur in favor of liberating the Philippines rather than bypassing them and taking Taiwan as the navy recommended.

In December 1944, King was given the five-star rank of fleet admiral. When Japan surrendered in September 1945, King recommended abolition of the position of commander in chief, U.S. fleet. He remained CNO until his retirement from the navy in December 1945.

KING, MARTIN LUTHER, JR. (1929-1968), religious and protest leader and recipient of the 1964 Nobel Prize for Peace. King gained national prominence as a black civil rights leader and, during his final years, as a critic of American military involvement in Vietnam. In his memoir, *Stride Toward Freedom* (1958), King recalled that when initially exposed to *pacifism, he concluded that war "could serve as a negative good in the sense of preventing the spread and growth of an evil force." Only after becoming familiar with Gandhian notions of nonviolent resistance was he convinced that "the love ethic of Jesus" could be "a potent instrument for social and collective transformation." As the president of the Southern Christian Leadership Conference (SCLC), King became a nationally known advocate of civil disobedience. He led protest movements in Montgomery (1955-56), Birmingham (1963), and Selma (1965), Alabama, that demonstrated the effectiveness of nonviolent tactics in spurring passage of the 1964 Civil Rights Act and the 1965 Voting Rights Act.

Although King was reluctant to risk his prestige as a civil rights leader by opposing the *Vietnam War, he eventually publicly criticized President Lyndon B. *Johnson's war policies as immoral and a harmful diversion of funds from antipoverty programs. On 4 April 1967, in his first major public statement against the war, King explained at New York's Riverside Church that "if we are to get on the right side of the world revolution, we as a nation must undergo a radical revolution of values." King's advocacy of *conscientious objection to military service and his call for a unilateral cease-fire in Vietnam hurt his popularity and ability to influence domestic policies; nonetheless he remained an internationally recognized advocate of world peace and militant *nonviolence until his assassination on 4 April 1968.

KING PHILIP'S WAR (1675-77). The first large-scale military action in the American colonies, King Philip's War pitted bands from various tribes against the New England colonists and their Indian allies. The causes of the war were rooted in the frictions between an expanding, assertive culture and a threatened, increasingly dependent one. Native Americans, whose currency (wampum) was losing value, had to sell land to acquire trade goods. Tribal leaders also resented the imposition of European authority and the decline of their own power. Indians had other grievances as well.

The war began in Plymouth Colony in 1675, then spread throughout New England. Although colonists blamed "King Philip," principal sachem of the Wampanoags, for starting hostilities, his warriors probably acted indepen-

dently, not as part of an intertribal conspiracy. The colonists' clumsy reaction to a local uprising soon produced a major rebellion. Nipmucks, Pocumtucks, Abenakis, and other resisting groups either cooperated with Philip's few hundred Wampanoags or conducted their own operations. A preemptive campaign by Josiah Winslow's 1,000-man army against the menacing but officially neutral Narragansetts resulted in the fiery destruction of the tribe's fort and the killing of hundreds of men, women, and children. But colonists' victories were rare in the first half of a war that saw more than a dozen towns burned and entire companies ambushed by Indian marksmen firing flintlock muskets. Had warriors not been reluctant to assault garrison houses, colonial losses would have been even higher.

Distrust of Indian auxiliaries handicapped militia units for crucial months. Europeans who trained to fire volleys on open battlefields were unprepared for fights with warriors who aimed at individuals from behind trees and used stealth, surprise, and mobility. Eventually, resourceful officers put Native Americans to work as scouts, fighters, and informants. Adopting Indian raid and ambush techniques, companies hunted down their starving enemies. Philip fell in 1676, shot by an Indian in Benjamin *Church's mixed force. The Mohawks in New York also contributed to the defeat of the insurgents by preventing outside assistance or escape.

Resistance finally ended in 1677. Thousands had perished, including approximately 500 colonial soldiers. It took years to rebuild frontier towns. The war caused higher taxes and damaged the economy, particularly the fur trade. All the southern New England tribes lost cultural autonomy and political and military influence. Nevertheless, the tactical lessons learned from Indians in this costly war had a lasting impact on American military *doctrine.

KINGS MOUNTAIN, BATTLE OF (1780). The defeat of Maj. Patrick Ferguson's loyalist force at Kings Mountain in northwest South Carolina by a coalition of frontiersmen on 7 October 1780 marked the start of the American recovery in the South during the Revolutionary War and the beginning of the end for Britain's hopes of using loyalists to suppress the southern countryside. Following British victories at the siege of *Charleston and the Battle of Camden in May and August 1780, strong British and loyalist forces roamed the backcountry, intimidating rebels and heartening those who favored royal government. Settlers on the North Carolina and Virginia frontier—mostly Scots-Irish—feared that the British would unleash Indian attacks on their communities. On 26 September, a nucleus of "over-the-mountain men" gathered at Sycamore Shoals, near present-day Johnson City, Tennessee, and resolved to defend their families and farms.

By the time they ran Ferguson's 1,100-man army to ground at Kings Mountain, the frontier militia numbered between 1,500 and 1,800, most armed with "longrifles." Leaders of individual groups regarded William Campbell

of Virginia as their commander, but the force really consisted of independent men who shared a common purpose. Ferguson's loyalist militiamen waited atop the wooded King's Mountain ridge, treeless at the summit, for the climactic battle of the backcountry civil war. Ferguson, an urbane man with a flair for tactics and invention, had chosen a position that allowed his opponents to use their rifles to inflict maximum damage on his force. Campbell's men surrounded the loyalists late in the afternoon of 7 October, and kept up such an accurate and deadly fire that Ferguson's worn-down force surrendered an hour later, its leader dead from multiple gunshot wounds. Having accomplished their objective, the winners dispersed to their homes, stopping long enough to execute nine of the captured loyalists.

King's Mountain was the turning point of the South's bitter civil war. Potential loyalists would thereafter sit on the fence until Britain could reestablish its military domination, something the British lacked the resources to accomplish.

KINKAID, THOMAS C. (1888-1972), career naval officer and commander during World War II. Promoted to rear admiral on the eve of World War II, Thomas C. Kinkaid developed a reputation for completing assignments successfully. During 1942, Admiral Kinkaid commanded cruiser divisions in the battle of the Coral Sea (May) and at Midway (June), and then carrier task forces in engagements around the island of Guadalcanal (August-November). In December 1942, Kinkaid took command of the North Pacific Force, a joint navy, army, and Army Air Force command in Alaska. His troops ejected the Japanese from Attu in May 1943 and forced their retreat from Kiska in July. For his accomplishments, Kinkaid received a third Distinguished Service Medal and promotion to vice admiral.

Successful at joint operations, in November 1943 the admiral transferred to the Southwest Pacific Area to serve under Gen. Douglas MacArthur. Here he commanded all Allied naval forces, including the U. S. Seventh Fleet. In October 1944, Kinkaid's Seventh Fleet landed MacArthur's forces at Leyte Gulf in the Philippines. Japanese attempts to drive the Americans from the island failed in the decisive Battle for Leyte Gulf, 23-24 October 1944. Following this great naval victory, in January 1945 Kinkaid's Seventh Fleet landed MacArthur's troops on Luzon at Lingayen Gulf. With Luzon secured, Kinkaid became a full admiral. Known as a "fighting admiral," with a deserved reputation for outstanding interservice operations, Kinkaid is honored in American naval history.

KISSINGER, HENRY (1923-), Statesman. Kissinger's family emigrated from Fuerth, Germany, to escape Nazi

persecution in 1938. After U.S. Army service during World War II and with the occupation forces in Germany, Kissinger compiled a superlative record as an undergraduate and graduate student at Harvard University. He then became a prominent academic specialist in international relations and nuclear strategy. While a professor of government at Harvard (1955-68), he wrote widely on international relations and nuclear weapons, arguing that the possession of nuclear weapons by the United States and the Soviet Union had not fundamentally altered the balance of power. States still pursued basic interests, nuclear weapons were a tool of influence, and the nuclear powers could manage to contain a destructive arms race.

Kissinger advised New York governor Nelson Rockefeller, Republican presidents, and their senior foreign policy subordinates. During the 1960s, he tried to fashion NATO's nuclear strategy in light of France's withdrawal, urging understanding of French and German pride. As the Vietnam War intensified after 1965, Kissinger was drawn deeply into efforts to end it. He undertook an important diplomatic mission for President Lyndon B. Johnson (1967), but his attempt to arrange a cease-fire faltered when the U.S. government refused to promise an unconditional halt to bombing of all North Vietnam.

President Richard M. Nixon named him national security adviser in 1969; in September 1973, Kissinger was also confirmed as secretary of state, a position he held concurrently until November 1975, when President Gerald R. Ford appointed Brent Scowcroft national security adviser; Kissinger remained secretary of state until the end of Ford's administration.

During these eight years, Kissinger helped craft the policy of detente with the Soviet Union and to end U.S. involvement in Vietnam. Under his direction, the United States and the Soviet Union made significant progress toward arms control, with the Interim Agreement of Limitations of Strategic Armaments (SALT I, 1972), the Anti-Ballistic Missile Treaty (1972), and the Vladivostok Agreement (1974). These efforts provoked opposition from conservatives both Democratic and Republican who incorrectly accused Kissinger of drafting agreements that gave the Soviet Union a military advantage over the United States.

Kissinger worked with Nixon to reduce U.S. involvement in Vietnam, concluding the Paris Peace Agreements establishing a cease-fire in January 1973. The peace proved remarkably short-lived: both North and South Vietnam repeatedly violated the cease-fire. Kissinger argued strenuously for additional aid to South Vietnam, but by 1975 U.S. public opinion had turned sharply against any additional involvement.

Kissinger's accomplishments before 1974 won him wide public praise; he earned the Nobel Peace Prize for arranging the cease-fire in Vietnam. After 1975, however, his reputation diminished. His diplomatic triumphs often were based on illusion and manipulation. Believing that only power mattered in international affairs, both Kissinger and Nixon often expressed contempt for the democratic processes of foreign policy. Further, Kissinger appeared arrogant and showed little desire to promote traditional U.S. standards of human rights in other countries.

KNOX, HENRY (1750-1806), "Revolutionary War general, secretary of war. As a twenty-five-year-old Boston bookseller, Knox became a colonel and head of the "Continental army's artillery regiment in November 1775. In the prewar period he had served in a local militia unit, observed British regulars, and read extensively in military works. Thirteen months later, Congress made him a brigadier general and the chief of a growing "artillery corps.

Knox's corps distinguished itself in sieges, most notably at Boston and Yorktown, and also in open field engagements, like those at Trenton and Monmouth, where he made mobile and effective use of his cannon.

In the postwar period, Knox headed the War Department (1874-94). During his tenure as secretary of war, he oversaw an extensive coast artillery construction program. He also faced the difficult task of reconciling the country's security needs with an anti-standing army bias, financial limitations, and embryonic political structure. A strong nationalist, Knox proposed a small regular army, an academy to train officers, and a nationalized militia of adult male citizens. Though not fully accepted before his retirement in 1794, Knox's ideas helped lay the foundations of American military policy for the next century.

KOREA, U.S. MILITARY INVOLVEMENT IN. U.S. military involvement began almost from the outset as the United States sought in the mid-nineteenth century to establish commercial and diplomatic relations with the so-called "Hermit Kingdom." After a number of Korean attacks on American merchant ships trying to penetrate the peninsula, a U.S. naval squadron of launched an unsuccessful punitive assault near Seoul (1871). China soon gained control of Korea and opened it to other countries, beginning in 1882 with the United States. In the Sino-Japanese War (1894-95) and the Russo-Japanese War (1904-05), Tokyo increasingly took over Korea, which became part of the Japanese empire, 1905-45.

With the defeat of Japan in 1945, the United States and the Soviet Union shared a trusteeship over the Korean peninsula, the Red Army occupying the area north of the 38th parallel and the U.S. Army under Gen. John R. Hodge the South. That division, meant to have been temporary, became permanent with the hardening of the Cold War.

In 1948, after Moscow rejected a "United Nations plan for free elections throughout Korea, elections in the South led to the Republic of Korea; a former exile from the United States, Syngman Rhee, served as president (1948-60). In response, Moscow created the Democratic People's Republic of Korea in the North, headed by Communist leader Kim Il Sung (1948-94).

Although the Republic of Korea initially received some U.S. assistance, the "Joint Chiefs of Staff advised President

Harry S. Truman that the United States had little strategic interest in maintaining American troops and bases there. In June 1949, the troops were withdrawn; Soviet troops also withdrew that year. In January 1950, Secretary of State Dean "Acheson publicly defined the U.S. defense perimeter as including Japan and Taiwan but not Korea. Six months later, after a series of border clashes, Soviet-backed North Korean forces invaded and conquered much of the South. The Truman administration reevaluated its position and led a UN-authorized military coalition to repel the Communist aggression.

The "Korean War (1950-53), in which the U.S. military suffered 196,000 "casualties, including 54,000 dead, in a war against North Korea and ultimately also "volunteers" from the People's Republic of China, ended in a truce signed in Panmunjon by military representatives from the United States and North Korea but not South Korea. Rhee's resistance was softened, however, by guarantees of increased military assistance, continued U.S. troops, and a mutual security treaty with the United States.

As a symbolic bastion of containment policy during the Cold War, Korea remained an area of major U.S. military commitment and periodic incidents, particularly along the fortified demilitarized zone (DMZ) between North and South. Under Gen. Park Chung Hee (president, 1961-79), South Korea sent troops to fight alongside U.S. forces in South Vietnam. In 1968, North Korea curtailed U.S. seaborne electronic intelligence gathering off its coast by capturing the USS *Pueblo* and its crew. In the early 1970s, the Nixon administration's Asian self-defense policy led to the removal of one U.S. division from Korea, but an attempt by the Carter administration to reduce U.S. forces there was thwarted. When Park's successor, Gen. Chun Doo Hwan, used the South Korean Army to crush a May 1980 insurrection in Kwangju, there were allegations of U.S. complicity.

The collapse of the Soviet empire in 1989-90 rendered Communist North Korea increasingly isolated and impoverished, while the South Korean government flourished with the resumption of popularly elected government in 1987. The North Korean nuclear program, which may have included nuclear weapons, led to a major international crisis in 1994, when Pyongyang initially rejected UN monitoring. The Clinton administration threatened an economic blockade and there was speculation about possible U.S. air strikes. However, the crisis was defused with the help of former President Jimmy "Carter. The United States and the two Koreas began talks, which continued in the late 1990s despite the death of Kim Il Sung (1994) and periodic North Korean incidents such as the shooting down (1994) of a U.S. Army helicopter that had strayed into the DMZ, and the foiled attempt (1996) to stage commando raids from a submarine off South Korea. With North Korea facing economic collapse that might lead to military action, the United States retained some 36,000 military personnel in Korea, its third-largest permanent overseas contingent in the 1990s.

KOREAN WAR (1950-1953). War came to Korea in 1950-53 as both a civil war on the Korean peninsula and the first military clash of the *Cold War between forces of the Soviet Union and its Communist clients and the United States and its allies. It was, therefore, potentially the most dangerous war in world history.

Even before the war against Germany and Japan drew to a close in 1945, the United States and the Soviet Union assumed competing roles in shaping the postwar world. As the two undisputed victorious powers, they influenced the course of every political problem emerging from the debris of war. Unfortunately, hostility between the two powers increased at the same time and threatened the outbreak of another war, which after 1949 risked the use of atomic weapons.

The conservative forces eventually coalesced in the Republic of Korea under the leadership of President Syngman Rhee. A North Korean state, The Democratic People's Republic created by the Soviet Union and headed by Premier Kim Il-sung, adopted a policy of opposition to Rhee's government and for unification of the Korean peninsula by armed force.

North Korean ground forces crossed the 38th Parallel into South Korea about 4:30 A.M. on 25 June 1950 (24 June Washington time). The main attack, led by two divisions and a tank brigade, aimed at Uijongbu and Seoul. In the central mountains, two North Korean divisions drove toward Yaju and Wonju and on the east coast, a reinforced division headed for Samchok.

In an emergency session on Sunday, 25 June, the UN Security Council (with the USSR boycotting because of the refusal to admit the People's Republic of China) adopted an U.S.-sponsored resolution branding the North Korean attack a breach of the peace and calling on the North Korean government to cease hostilities and withdraw. The North Koreans did not respond to the UN resolution, so on the following Tuesday, the United States offered a follow-up proposal that "the members of the United Nations furnish such assistance to the Republic of Korea as may be necessary to repel the armed attack and to restore international peace and security in the area." Subsequently, the UN Security Council designated the president of the United States as its executive agent for the war in Korea. President Truman, in turn, appointed Gen. Douglas MacArthur as the Commander in Chief, United Nations Command (CICUNC). The military organization to wage war was in place.

Saving South Korea was certainly the most urgent UN war aim, but President Harry S. Truman also believed that the Soviet Union was the most dangerous threat to the western allies. The UN Command had to stop the North Koreans and eject them from South Korea by military means, no small task with the North Korean army rolling south and no UN troops on the ground. Moreover, while accomplishing this, the UN coalition had to avoid expanding the war into Asia and to Europe by provoking China or the Soviet Union to enter the struggle. So the Truman administration adopted additional, unilateral war aims de-

signed to keep the violence confined to the Korean Peninsula, to keep the Soviets out of the war, to maintain a strongly committed UN (and *NATO) coalition, and to buy time to rearm the United States and its allies.

At first, MacArthur had little choice in how to fight the North Koreans. Somehow he had to slow down their offensive sufficiently to give him time to mount a counter-attack against their flanks or rear. His forces consisted of four undermanned and partially trained U.S. Army divisions comprising Gen. Walton Walker's Eighth Army, the South Korean army, then falling back in front of the enemy, an ill-equipped U.S. air force, and growing naval U.S. strength. When the President ordered use of American troops, the * Joint Chiefs of Staff (JCS) immediately sent additional army forces, marines, and air and naval forces to strengthen MacArthur's command. As these units began to deploy, MacArthur requested more reinforcements that included between four and five additional divisions.

In all, fifty-three UN member nations promised troops to assist South Korea. Of all, the nations of the British Commonwealth were most ready to fight when war broke out. Great Britain, Australia, New Zealand and Canada were the first to send air, sea, and ground forces. Eventually UN allies sent over 19,000 troops to Korea. All were assigned to the U.S. Eighth Army.

MacArthur's first task was to block what appeared to be the enemy's main attack leading to the port of Pusan in the south. Rushing American ground and air forces from Japan to Korea, he hoped to delay the enemy column and force it to deploy, then withdraw UN forces to new delaying positions and repeat the process. With any luck, he could gain enough time to muster an effective force on the ground. For this task he ordered General Walker to send units to confront the enemy on the road to Pusan. Walker sent a small infantry force—Task Force Smith—to lead the way. While reinforcements were moving to Korea, MacArthur pushed the rest of Walker's Eighth Army (less the 7th Infantry Division) into Korea to build up resistance on the enemy's main axis of advance. With these forces and the South Koreans, Walker hoped to delay the enemy north and west of a line following the Nakdong River, to the north, then east to Yongdok on the Sea of Japan. If forced to withdraw farther, he proposed to occupy the Nakdong River line as the primary position from which Eighth Army would defend the port of Pusan.

With the main enemy force applying heavy pressure along the primary axis aimed at Pusan, Walker had to fight off two North Korean divisions, advancing around the west flank deep into southwest Korea. From there they could turn east and strike directly at Pusan. To head off this threat, Walker sent the 25th Infantry Division to meet the North Koreans west of Masan and stop them. In savage battle, the 25th slowed the North Koreans, and Walker pulled the Eighth Army and Republic of Korea Army (ROKA) behind the Nakdong River line to defend Pusan.

Walker's retirement into the Pusan Perimeter fit MacArthur's plans perfectly. Now he could exercise close control over both the battle on the peninsula and preparations for an amphibious counterstroke, now planned for mid-September. As reinforcements poured into Pusan and combat strength began to favor Walker, MacArthur started to shunt units, equipment, and individual replacements to Japan to rebuild a corps for use in the amphibious operation. With complete superiority of air power and growing

strength in tanks, artillery, and infantry, MacArthur believed that Eighth Army and the ROKA could hold Pusan.

North Koreans launched violent, piecemeal attacks against the perimeter beginning on 5 August. By the end of August, the defenders had thrown back the first barrage of attacks, but a new onslaught began on the night of 31 August. This time the enemy hit simultaneously and even more savagely. American reinforcements had, however, greatly increased the combat power of the allies, and by 12 September the North Korean offensive had spent itself on all fronts against Walkers' skillful defense.

While the Eighth Army fought to hold Pusan, MacArthur readied the forces he had assembled in Japan to eject the North Koreans from Korea. He selected the port of Inchon near Seoul as the objective in spite of undesirable hydrographic characteristics. High tides, swift currents, and broad mud flats threatened the safety of an amphibious assault force. But Inchon also had some features that convinced MacArthur that the prize was worth the risk. The North Koreans, concentrated around Pusan in the south, would be vulnerable to an attack so far to the north, and the capture of Inchon would lead directly to the fall of Seoul. Because Seoul, the capital of South Korea, was the intersection of most of the major roads and railroads in South Korea, its capture would trap the North Koreans and force them to surrender or escape to the mountains, abandoning all their heavy equipment. MacArthur believed he could defeat the North Koreans in one decisive battle—the *Inchon Landing.

Early in September, naval air forces struck targets up and down the west coast of Korea. As D-day for Inchon approached, surface gunfire support ships began to add their weight. On 15 September, U.S. Marines of the newly formed X Corps successfully assaulted the port, paving the way for army troops that followed. In the ensuing campaign, North Korea forces fought bitterly to hold the capital. On September 28, Seoul fell, and by October 1, Marines held a line close to the 38th Parallel, blocking all roads and passes leading to Seoul and its port at Inchon.

Weakened by the heavy fighting of July and August, the Eighth Army could not at first break out of the Pusan perimeter. Finally, a week after X Corps landed at Inchon, the North Koreans began to waver. On 23 September they began a general withdrawal, and Eighth Army units advanced to link up with X Corps. MacArthur had won his battle and the UN was poised to exploit his success.

In retrospect, the turning point in the Korean War was the decision now made to cross the 38th Parallel and pursue the retreating enemy into North Korea. At President Truman's direction, the *National Security Council (NSC) staff had studied the question and recommended against crossing the 38th because ejecting the North Koreans from South Korea was a sufficient victory. To this, the JCS objected. MacArthur, they argued, must destroy the North Korean army to prevent a renewal of the aggression. On 11 September—four days before the Inchon Landing—the president adopted the arguments of the JCS. Most importantly, Truman changed the national objective from saving South Korea to unifying the peninsula. After the UN Assembly passed a resolution on 7 October 1950 calling for unification of Korea, MacArthur was free to send forces into North Korea.

MacArthur's attack on North Korea never achieved the success of his earlier operations. Beginning 7 October, he

sent the weakened Eighth Army in the main attack against the North Korean capital of P'yongyang without adequate combat support. As the supporting attack, he planned another powerful amphibious assault by X Corps to strike the east coast port of Wonsan on 20 October. Although the Eighth Army advanced rapidly toward P'yongyang against light resistance, the amphibious attack by X Corps was six days late landing in its objective area because mine sweepers had to clear an elaborate minefield. On 11 October, Wonsan fell to a South Korean corps, almost two weeks before the marines could land. P'yongyang fell on the 19 October.

After the capture of P'yongyang and Wonsan, allied troops streamed north virtually unopposed. Truman worried about possible Chinese intervention, but at a conference at Wake Island on 15 October, MacArthur belittled this possibility and was optimistic about an early victory. There was, however, little time to enjoy the successes of mid-October. Beginning on the 25 October, a reinvigorated enemy struck the Eighth Army in a brief but furious counterattack. By 2 November intelligence officers had accumulated undeniable evidence from across the front that Chinese forces had intervened, and the Eighth Army had to stop its advance.

Chinese leaders had tried to ward off a direct confrontation with the Americans by warning the UN not to cross the 38th Parallel. American leaders interpreted these statements as bluff rather than policy. But they were wrong; Josef *Stalin, the Soviet premier, asked Mao Zedong, the Chinese premier, to send Chinese forces to the aid of his clients, the North Koreans. After much deliberation, Mao decided to intervene. On 19 October Chinese Peoples Volunteers (CPV) crossed the Yalu River and massed some 260,000 troops in front of the UN Command.

After replenishing supplies, MacArthur's forces were ready. On 24 November the troops of the Eighth Army, unaware of the presence of massed Chinese forces, crossed their lines of departure. Within twenty-four hours after the Eighth Army jumped off, the Chinese struck back, aiming their main attack at the South Korean ROKA II Corps on the army's right flank. Two days later the CPV hit U.S. X Corps as it advanced into the mountains of eastern Korea. Stunned and outnumbered, American and South Korean units recoiled, beginning a long retreat that ended in January 1951, only after the UN forces fell back south of the 38th Parallel and once again gave up the city of Seoul. X Corps fought its way back to the port of Hungnam on the east coast and then rejoined Eighth Army in the south.

During the first week of December 1950 when reports from the front were incomplete and most grim, President Truman met in Washington with Prime Minister Clement Attlee of the United Kingdom. Though initially far apart, Truman and Attlee, after four days of intense discussion, reached a compromise solution on Korea. They would continue to fight side-by-side, find a line and hold it, and wait for an opportunity to negotiate an end to the fighting from a position of military strength. Moreover, they reaffirmed their commitment to "Europe first" in the face of Soviet hostility toward NATO. In this way, the decision to unify Korea was abrogated and a new war aim adopted.

The most immediate military effect of the talks was to prevent MacArthur from exacting revenge for his humiliating defeat. The JCS limited his reinforcements to replacements, shifted the priority of military production

to strengthening NATO forces, and wrote a new directive for MacArthur requiring him to defend in Korea as far to the north as possible. MacArthur disagreed with giving priority to Europe at the expense of the shooting war in Korea. He was outraged at the thought of going on the strategic defensive and fought against his new directive with all his might. Nevertheless, on 12 January 1951, the JCS sent him the final version of the directive, and the UN coalition had a new war aim designed to bring about a negotiated settlement.

Just two days before Christmas 1950, the command of the Eighth Army passed to Lt. Gen. Matthew B. *Ridgway after Gen. Walker died in a truck accident. From his position on the Department of the Army staff in Washington, Ridgway came to the Eighth Army well informed of the strategic situation in Korea. He arrived at his new headquarters determined to attack north as soon as possible. Somehow he had to stop the retreat and turn the army around; until then the Eighth Army continued to withdraw. In early January 1951 UN forces gave up Seoul.

Finally, Ridgway's front line units began reporting light contact with the enemy. Sensing the opportunity to turn on the Chinese, Ridgway stopped the army on a line from P'yongt'aek in the west, through Wonju in the center, to Samch'ok on the east coast. When American divisions, withdrawn with X Corps, moved up to thicken the line in the lightly held center, Ridgway ordered his forces to patrol north and find the enemy. In a series of increasingly powerful offensives, he then sent the Eighth Army north: Operation Thunderbolt jumped off in January, Roundup in February (though a tactical setback), Killer in late February, Ripper in March, and Rugged in April. By this time, Ridgway's army had once again crossed the 38th Parallel where its forward units dug into strong defensive ground in anticipation of an enemy counteroffensive. Surprisingly, the shock came, not from the enemy as Ridgway expected, but from Washington, when MacArthur was dismissed by President Truman.

MacArthur's dismissal resulted from his rejection of Truman's policy. As Ridgway neared the 38th again, the position of military strength envisioned in the Truman-Attlee conference had seemed near at hand. Truman took advantage of Ridgway's success to invite the Communists to negotiate a cease fire. After reading the text of Truman's proposed message, MacArthur broadcast a bellicose ultimatum to the enemy commander that undermined the president's plan. Truman was furious. MacArthur had preempted presidential prerogative, confused friends and enemies alike about who was directing the war, and directly challenged the president's authority as "Commander in Chief. As Truman pondered how to handle the problem, Congressman Joseph W. Martin, Minority (Republican) Leader of the House of Representatives, released the contents of a letter from MacArthur in which the general repeated his criticism of the administration. The next day Truman began the process that was to end with MacArthur's being relieved from command on 11 April 1951.

After MacArthur's dismissal, Ridgway took his place as Commander in Chief, Far East and CINUNC. Lt. Gen. James A. Van Fleet, an experienced and successful World War II combat leader, took command of the Eighth Army. On 22 April, as Van Fleet's Eighth army edged north, the CPV opened the expected general offensive, aiming their main attack toward Seoul in the west. The Chinese, num-

bering almost a half million men, drove Van Fleet once again below the 38th Parallel. On 10 May, the Chinese jumped off again after shifting seven armies to their main effort against the eastern half of the UN line. Taking advantage of the Chinese concentration in the east, Van Fleet attacked suddenly in the west, north of Seoul. The effect was dramatic; surprised CPV units pulled back, suffering their heaviest "casualties of the war, and by the end of May found themselves retreating into North Korea. By mid-June, UN forces had regained a line, for the most part, north of the 38th Parallel.

Regardless of UN success on the battlefield, ending the war turned out to be a maddeningly long process. U.S. planners knew that the Truman-Attlee agreement made it unlikely that the war would end in a conventional victory. The UN allies had even adopted negotiating an armistice as a war aim. The time seemed right for the Chinese and North Koreans as well since they needed a respite from the heavy casualties suffered in the UN offensive. They agreed to meet with UN representatives when in late June 1951, the Soviets proposed a conference among the belligerents.

Negotiations were initially hampered by silly haggling over matters of protocol and the selection of a truly neutral negotiating site. Even so, on 26 July 1951 the two sides finally reached an agreement on an agenda containing four major points: selection of a demarcation line and demilitarized zone, supervision of the truce, arrangements for "prisoners of war (POWs), and recommendations to the governments involved in the war. With an agreed agenda in hand, and Panmunjom—a town between opposing lines, suitable to hold talks—the negotiators began the lengthy process of debating each item. Handling POWs proved to be the most difficult problem on the agenda, but fixing the demarcation line was the most damaging. By dealing with the final position of the armies *first*, the UN negotiators blundered into an agreement that permitted the Communists to stalemate the battlefield and to wage a two-year political war at the negotiating table.

At issue was a U.S. scheme seeking quick agreement on a demarcation line. On 17 November the UN delegation proposed the current line of contact as the demarcation line providing that all remaining agenda items were resolved within thirty days. The communists accepted the proposal on 27 November debated the remaining agenda items for thirty days, and then failed to reach agreement. They used the thirty days to create a tactical defense so deeply dug in that both sides had to accept a stalemate.

From that moment on, the battlefield changed to a static kind of war, more reminiscent of World War I than anything that had happened since. Beginning in the winter of 1951-1952, the war came to be defined by elevated sites named Porkchop Hill, Sniper's Ridge, Old Baldy, T-Bone, Whitehorse, Punchbowl and a hundred other hilltops between the two armies. There followed a seemingly endless succession of violent fire fights, most of them at night, to gain or maintain control of hills that were a little higher and ridges that were a bit straighter. All of them, no matter how large the forces engaged, were deadly encounters designed to provide leverage for one side or the other in the protracted political battle going on at Panmunjom. In an historical age when technology enabled greater mobility than at any other time, tactical warfare in Korea went through a regression that can only be explained in terms of

its close relationship to the negotiations. Constant pressure was its purpose, not decisive victory.

In Panmunjom negotiators plodded through the remaining agenda items. Supervising the armistice agreement was an extremely complex issue, but a compromise emerged that permitted rotation of 35,000 UN troops and supplies each month through specified ports of entry. In addition, both sides accepted Swedish, Swiss, Polish, and Czech membership on an armistice commission. Political recommendations to the belligerents were agreed in the astonishingly short period of eleven days. Both sides called for a conference to convene three months after a cease fire. At that time all political issues that had not been settled during the negotiations would be discussed.

What to do about prisoners of war was the major obstacle to final agreement. The UN Command wanted prisoners to decide for themselves whether or not they would return home. The Communists insisted on forced repatriation. To restore movement to the talks, the International Red Cross polled prisoners as to where they wanted to go. The results, announced early in April 1952, surprised everyone. Of 132,000 Chinese and North Korean POWs screened, only 54,000 North Koreans and 5,100 Chinese wanted to go home. The communist delegation was incredulous and accused the United Nations of influencing the poll. From that moment on, negotiations bogged down on the POW issue.

At about this time, May 1952, General Ridgway left Tokyo to become Supreme Allied Commander, Europe. Gen. Mark *Clark, who had made his reputation during World War II in Italy, replaced Ridgway as CINCUNC and inherited a difficult situation. Unable to carry the war to the enemy in a decisive way and stalemated in the armistice talks, Clark—with the approval of the administration—finally ordered the UN delegation to walk out of Panmunjom on 8 October. With no one to talk to, the Communists hammered away at UN treatment of POWs and alleged UN violations of the neutral zones surrounding the negotiating site.

Over the fall and winter of 1952-53, three events broke the impasse. In November, Dwight D. *Eisenhower won the election for the presidency, ushering in a new style of toughness toward the Communists—including discussion of using atomic weapons. In December, Clark read about an International Red Cross resolution calling for the exchange of sick and wounded POWs. In February 1953 Clark sent letters to the Chinese and North Korean leaders proposing that they exchange the sick and wounded. Before the Communists could respond, the third and perhaps most important event occurred: Josef *Stalin died on 5 March 1953.

So achieving a cease-fire was the result of a complex set of circumstances and interwoven pressures. Eisenhower's toughness increased the pressure on the battlefield. He believed that the Truman strategy was the only practical one, but still something ought to be done to give the Communists an incentive to reach agreement. He permitted Clark's aircraft to bomb dams in North Korea, flooding the countryside. He instructed the JCS to prepare plans for more intensive maneuver—even atomic warfare—should negotiations break down. He authorized movement of atomic delivery aircraft to the Far East and initiated training for low-level attack with atomic bombs. And he sent John Foster *Dulles, his Secretary of State, to India in April to let it

be known that the United States was prepared to renew the war at a higher level unless progress was made at Panmunjom.

Clearly, Chinese leaders carefully considered these news signals, but it is conjectural to connect Ike's toughness and Stalin's death directly to the Communist agreement to end the war. Still, we do know that Stalin's death resulted in a deadly power struggle in the Kremlin that probably focused Soviet leaders on settling their internal problems rather than supporting a prolonged war. Moreover, East European states needed to be kept in line after Stalin's death, and something had to be done to restore deteriorating relations with the governments of China and North Korea, both of which had lost confidence in the Soviet government for not taking a more active part in the war.

On 26 April, negotiating sessions resumed at Panmunjom where a final solution to handling the remaining POWs took shape in the months that followed. Those who chose not to go home were to be turned over to a neutral repatriation commission. If they still did not want to go home, the neutral commission would release them to whichever government they chose. As the delegations wrapped up the details, it seemed that a cease-fire was not far off.

While the UN worked diligently toward an armistice, South Korean President Syngman Rhee became obstructive. Rhee saw the rush toward an armistice as contrary to South Korea's best interest, and he did not trust the Communists should the UN Command pull out. So on the night of 18 June, Rhee ordered his guards on the POW compounds to release some 25,000 friendly North Koreans. The Communists cried "foul." Eisenhower, feeling betrayed, was outraged. But in order to save the cease-fire, he negotiated with the South Korean president, pledging a mutual security pact after the cease-fire, long term economic aid, expansion of the South Korean armed forces, and coordination of U.S. and ROK objectives at the political conference. Though costly for the United States, the agreement secured Rhee's cooperation and cleared the way for an armistice.

While negotiating the final details of a truce, the Chinese communists sought one last military advantage. They mounted a limited offensive that was designed to push UN negotiators toward a settlement more agreeable to the Communist side; managed carefully, the offensive might also create the illusion of a peaceful settlement following a Communist victory. The attacks began on 10 June 1951 and by 16 June the UN line had been pushed back some 4,000 yards. Although some ground was recovered, fighting slackened as commanders of contending armies prepared to sign the truce. At 10 A.M. 27 July 1953, the darkest moment in Mark Clark's life, he signed the armistice documents to end the Korean War.

For a war intended to be limited, the human toll was staggering. Although Chinese and North Korean casualties are unknown, estimates of total losses amounted to almost two million, plus perhaps a million civilians. The UN Command suffered a total of 88,000 killed, of which 23,300 were American. Total casualties for the UN (killed, wounded, missing) were 459,360, 300,000 of whom were South Korean.

Nevertheless, limiting the war in Korea made a significant contribution to the history of the art of war. First, the Korean War demonstrated alternative strategies designed

to gain national objectives without resorting to atomic war. For this reason, the Korean War is less about tactical evolution than about political goals, the strategy to achieve those goals, and the operational art designed to make the strategy succeed. Second, the war caused the U.S. government to arm the nation and its allies on a permanent basis and to bring its military force to a high state of combat readiness, prepared to respond quickly to any threat to national or alliance security. Never again would the United States find itself as ill-prepared as it had been when the Korean War began.

KOREAN WAR, U.S. AIR OPERATIONS IN THE. Aerial operations controlled and conducted by the U.S. Air Force (USAF) played a major part in the prosecution of the Korean War by the *United Nations Command. These operations fell into several categories: the campaign to gain and retain aerial superiority over the North Korean and later the Chinese Communist air forces; the bombing campaign against military and industrial targets in North Korea; close air support to the ground forces of the United Nations; airlift operations, both intratheater and intertheater; coordination of air assets provided not only by the USAF but the U.S. Navy and Marine Corps and a half dozen other UN air forces. In addition, there were many other duties, such as search and rescue operations, aeromedical evacuation, aerial reconnaissance, and air defense operations over the Korean peninsula and Japan.

The Far East Air Force (FEAF) controlled and coordinated all operations from its headquarters in Japan through four subordinate commands: the Fifth Air Force (responsible for close air support, interdiction, and reconnaissance); Bomber Command (responsible for strategic bombing); Combat Cargo Command; and the Japan Air Defense Force. In practice, however, the U.S. Navy and the U.S. Marine Corps were semiautonomous in their air operations.

During the opening weeks of the war in July and August 1950, the close air support provided by the FEAF was often responsible for the survival of the ground forces, and throughout the war, it was often the decisive factor in ground combat. This critical support came at a price, however. The USAF had considered close air support obsolescent after World War II and had virtually abandoned it, closing down the Tactical Air Command responsible for the mission. As a result, the FEAF had neither equipment nor trained personnel, and had to resort to inappropriate aircraft, including strategic bombers and high-speed jet

aircraft, for bombing missions supporting ground forces.

* Friendly fire casualties were common among ground troops. The Marine Corps, by contrast, had emphasized close air support in the postwar years, and its pilots were trained and had the planes to deliver accurate ordnance in support of ground troops. Throughout the war, Marine aircraft were the supporting weapon of choice among ground troops of all services.

The Korean War occurred as all air forces were making the transition from propeller-driven craft to jets. The Chinese forces had the best jet fighter early in the war in the Soviet-supplied MiG-15, until the USAF F-86 Sabrejet arrived, late in 1950. The Sabrejets quickly became the "MiG killers"; by the end of the war, FEAF had downed more than 950 enemy aircraft, while losing only 147 in air-to-air combat.

The Strategic Bombing Survey ordered after World War II had convinced aerial planners that it was critical to concentrate on one key component of an opponent's assets for victory in a bombing campaign. In the little-industrialized country of North Korea, such strategic targets were sparse; FEAF settled on the electrical power grid—particularly the large dams that generated hydroelectric power near the Chinese border—and in the waning months of the war on agricultural irrigation dams. Both campaigns were largely successful in achieving their goals of destruction, but their effect on shortening the war is debatable.

The political aim of avoiding a wider war prohibited bombing outside North Korea's borders. This provided a sanctuary for enemy aircraft in Manchuria, a bitter frustration for U.S. airmen throughout the war. Often forgotten, however, is that by tacit agreement Chinese aircraft did not bomb FEAF bases in Japan or South Korea, providing the United Nations a sanctuary as well.

Airpower achieved several important innovations during the Korean War. Delivery of personnel and supplies was much improved, particularly using the C-119 "Flying Boxcar." Given the primitive road network on the Korean peninsula, delivery by parachute was often the only way of getting supplies to isolated areas. Parachute delivery of bombs allowed bombers to fly much lower and to drop with far greater accuracy on such targets as bridges.

Helicopter operations became routine, foreshadowing their role in the *Vietnam War. *Helicopters were used for search and rescue of downed aviators on land and sea; for medical evacuation from the battlefield; for tactical reconnaissance and staff transport; and, to a limited degree, for moving troops on the battlefield.

In the aftermath of the war, advocates of airpower maintained an exaggerated primacy for aerial weapons in bringing it to a close, not unlike the arguments that would be used after the *Persian Gulf War.

—Kenneth E. Hamburger

KOREAN WAR, U.S. NAVAL OPERATIONS IN THE. In addition to the role of the U.S. *Marine Corps, the ships and planes of the U.S. *Navy played a vital role in the *Korean War (1950-1953). When President Harry *Truman

ordered U.S. forces to try to block the North Korean invasion of South Korea, the first units deployed were aircraft from the navy and the air force. U.S. naval forces in the western Pacific in 1950 included Vice Admiral C. Turner Joy's force in Japan consisting of a light cruiser and four destroyers and the Seventh Fleet in the Philippines under Vice Admiral Arthur D. Struble, comprising the carrier *Valley Forge*, a heavy cruiser, and several destroyers and submarines. Since the North Korean navy consisted only of 45 small craft, these U.S. naval vessels eventually joined by the British light carrier *Triumph* and a some other warships, took command of the seas around the Korean peninsula. Naval and air force planes also quickly destroyed the small North Korean air force. This allowed the forces of the "United Nations to move and be supplied unimpeded and it enabled carrier-based planes and sometimes surface ships to bombard the enemy forces and supply lines.

The navy's most dramatic exploit was the "Inchon Landing (1950), a daring amphibious envelopment planned by Gen. Douglas "MacArthur, Commander in Chief Far East, to capture the South Korean capital of Seoul and its port, Inchon, then deep behind North Korean lines. The difficulties were enormous, for Inchon lay behind miles of islands, shoals, and mud flats, approachable from the sea only through two narrow, winding channels. These could be easily mined and if an attacking ship were disabled by mine, bomb, or a shell from the guarding fortified island it would trap those ahead and block those behind. Nevertheless, Admiral Forrest "Sherman, chief of naval operations, agreed, and an international fleet of 230 ships carried the more than 70,000 soldiers and Marines to the successful Inchon landing, catching the defenders, who had not mined the harbor, largely by surprise.

Later, when the Chinese intervened and the war turned against the U.N. forces again, the navy evacuated 100,000 army and Marine forces from the northeast coast. Despite the Chinese advances, air strikes from land- and ship-based planes destroyed bridges and interdicted roads and railroads by day. Truman rejected MacArthur's proposal to widen the war by bombing the Peoples Republic of China and using the Seventh Fleet to blockade its coasts and transport Nationalist Chinese troops from Taiwan to fight in Korea or mainland China. But the communist forces were soon halted in 1951 and agreed to truce talks.

Naval success in the Korean War, in particular the Inchon landing and the continual employment of carrier-based air attacks, won congressional support for an expanded navy, including supercarriers, to implement the navy's forward maritime strategy in the Cold War.

KOSCIUSZKO, THADDEUS (1746-17), Polish patriot, Revolutionary War general. Revered for his role in Poland's political struggles, Thaddeus Kosciuszko was also a significant figure in the Revolutionary War, principally for his expertise as a military engineer. Born in the province of Polisie, Kosciuszko was educated in Poland's finer schools,

and enlisted in its Corps of Cadets before departing for advanced training in "artillery and engineering at Paris. Returning to Poland in 1774, he found his country divided, his family finances in disarray, and opportunities in North America appealing. In mid-1776, he sought a "Continental army commission.

The Polish captain stood out in an army bereft of military engineers, a shortage of immense concern to Washington and Congress. On 18 October 1776, Congress commissioned Kosciuszko a colonel and later authorized an "Army Corps of Engineers, long delayed by the dearth of qualified candidates. The arrival of Louis Le Bègue de Presie Duportail with a coterie of French veterans hastened the Corps' formation but slowed Kosciuszko's ascent, for the two men distrusted one another. Nevertheless, Kosciuszko served with distinction throughout the war, most notably in laying out West Point's defenses, fatally slowing Gen. John "Burgoyne's 1777 expedition below Ticonderoga, and selecting the battlefield for the American victory at Bemis Heights.

KOSOVO CRISIS (1999). In spring 1999, a major crisis erupted over Kosovo, the southernmost province of the Federal Republic of Yugoslavia, with the forces of Yugoslavian president Slobodan Milosevic escalating a terrorist campaign to drive out the ethnic Albanian Muslim majority and ensure dominance of the historic region by the Serbian Orthodox Christian minority. When Milosevic had earlier revoked the province's semi-autonomous status and begun the persecution, ethnic Albanians had protested, then formed a rebel terrorist group, the Kosovo Liberation Army, seeking independence. In early 1999, "NATO sponsored talks between Kosovo Albanians and Serbs in Rambouillet, France, but although the Kosovo Albanians grudgingly accepted a proposed settlement for broad autonomy for the province for three years (with possible independence afterwards) and 28,000 NATO troops in Kosovo and Serbia to enforce it, the Serbs rejected it.

Milosevic increased his forces in Kosovo and began mass terrorism of the ethnic Albanian population, killing some inhabitants to frighten the rest and burning entire villages. NATO had already authorized the use of force, and on 23 March 1999, President Bill "Clinton declared that military means were necessary to halt the Serbian aggression. The next day, NATO forces began an extensive air assault on targets in Serbia, Montenegro, and Kosovo, the majority of cruise missiles and bombs delivered from American planes and ships. It was the biggest allied military assault in Europe since World War II and NATO's first actual combat, but Serbian forces quickly continued to drive ethnic Albanian refugees—ultimately a million of them—from their homes into neighboring Macedonia, Montenegro, and Albania, as the Kosovo Crisis threatened to spread throughout the Balkans.

In the next ten weeks, NATO waged an escalating air war against military and other targets in Serbia and Kosovo, flying 35,000 missions, including 10,000 in which 23,000 bombs or missiles were dropped. Hampered by bad weather and political fears in the alliance, the air campaign

started slowly and ineffectively, but over time, more aggressive bombing and the use of *precision-guided munitions enabled NATO to destroy numerous military targets as well as targets in the urban infrastructure, including ultimately electricity grids and water supplies. NATO estimated that at least 5,000 Yugoslavian soldiers and police were killed (Serbia said 600); in addition, perhaps 1,200 civilians died as a result of mistaken bombings of trains, hospitals, and most prominently, the Chinese embassy in Belgrade. NATO lost only two aircraft, one of them a Stealth fighter, but both American pilots were rescued. By the end of May, a ground offensive along the Kosovo borders by the rebel Kosovo Liberation Army dislodged many Serbian forces out of their hiding places, allowing NATO aircraft to destroy them. The civilian population in the Serbian cities was suffering deprivation from the bombings. Although the British government pressed for a ground attack, political opposition to the war grew within Italy, Greece, and Germany, and the resolve of the NATO alliance showed signs of weakening.

On 3 June 1999, responding to the deteriorating situation and pressed by Russian and Finnish envoys, Milosevic declared that he accepted an international peace plan aimed at ending the Kosovo conflict and allowing the ethnic Albanian refugees to return to what remained of their

homes in Kosovo. Under its terms, all of the 40,000 Serbian military and police forces would withdraw rapidly from Kosovo which they did beginning 10 June, following another week of bombing, and some 50,000 foreign troops all under a *United Nations flag—many of them, including an estimated 7,000 U.S. forces, from NATO and under NATO command—would move in to police the province. Independence for Kosovo was not part of the new proposal, instead there would be “substantial autonomy” to be decided by the UN Security Council. The sixteen-member NATO alliance had held together long enough to force Milosevic to let the Kosovar refugees return, but what remained uncertain was the ultimate future of Kosovo as well as the long-term use of NATO military forces in such wars and *peacekeeping operations in the twenty-first century.

KOSZKIEWSKO, TADEUSZ. See Kosciuszko, Thaddeus.

LABOR AND WAR. The relationship between the paid labor force (union and nonunion workers) and the government at war is twofold. First, any country engaged in hostilities needs the ability to employ an ever-increasing proportion of the general population in both military service and defense industries. In the twentieth century, demands for wartime labor increased dramatically from earlier centuries. Labor shortages were among the greatest obstacles to steady production of armaments and war materiel and the mobilization of mass armies. Need for labor increased its value, necessitating serious consideration of workers' demands. As a result, the major wars of the twentieth century witnessed record levels of union growth and labor militancy. Such militancy was farther spurred by inflation and food and housing shortages. At the same time, political pressure to produce materiel and to reduce social conflict provided the context for the suppression of civil liberties and the right to organize and collectively bargain with employers. Both world wars were followed by prolonged civil conflict, political repression—especially on the basis of class politics—and widespread antiunion sentiment. The Red Scare of 1919, McCarthyism in the 1950s, and the *Cold War had detrimental effects on organized labor and workers' welfare in general, leading to antiunion activism, labor legislation that undermined union legitimacy, and declines in membership.

The *Revolutionary War and the *Civil War, while massive in their social impact, were little affected by battles over labor. In the both cases, domestic military conflict and its drain on labor power were confined to local areas, undercut by the widespread use of mercenaries in the Revolution and by military bounties and paid substitutes for those conscripted in the Civil War. In the Civil War, military forces in excess of 1 million men exacted far greater strain on the Southern economy than on the Northern. Wartime laborers seemed to acquire few gains from participation either as soldiers or as workers in defense industry. The production of armaments and supplies expanded, but the demands on the labor force were comparably light. Hundreds of thousands of workers volunteered or served as conscripts in the armed forces, but millions more were able to continue regular lives. Resistance to the draft in New York City, and in outlying regions such as the anthracite country of Pennsylvania, did have a class character, as workers were little able to afford the costs of substitutes, and draft quotas appeared to be rigged to weed out political rivals and labor militants. Some workers abandoned their occupations and fledgling unions to join the army as "Christian Soldiers" of the republic. Under the banner of free labor, Northern workingmen fought the Civil War as a crusade. Southern urban workingmen, far

less organized or numerous, nonetheless went to battle, oftentimes to defend states' rights, or (some have argued) to prevent the use of slaves in industry.

Few labor unions survived the Civil War. What did remain was a loose confederation of local unions. Fearing prosecution for conspiracy and blacklisting in the workplace, workers often formed secret associations (such as the Molly Maguires) to elude political and economic repercussions; and they echoed fraternal and military orders in their organization. Such precautions were necessary, given the widespread use of troops in labor conflict. Yet the activists of the 1870s and 1880s often were *veterans of the Civil War and members of the *Grand Army of the Republic. By the 1880s, they publicly acknowledged both their veteran status and their status as "workingmen" in political campaigns. Much labor protest of the period was framed in the language of the *citizen-soldier, who had sacrificed his country and deserved his share of prosperity.

At the end of the century, the labor movement found its strongest expression in the American Federation of Labor (AFL), a conservative trade union organization. Labor employed military metaphor to describe both conflict and solidarity, sharing much with the political language of the time. As a farther consequence, the AFL shared republican suspicion of *expansionism and contributed to the debate over U.S. entry into the *Spanish-American War. Small in scale and short in duration, that war required little additional armament production; volunteer soldiers provided its military labor force. Labor's gains and losses were few. Still, as the United States debated territorial acquisitions from Spain and its new status as a world power, the U.S. labor movement made itself heard in opposition to annexation of colonies.

European colonial expansion, an escalating *arms race, and increasing ethnic and nationalist tensions laid the preconditions for World War I. The onset of war in Europe and later entry of the United States presented labor with its first major political crisis of the twentieth century. Labor leaders, socialist advocates, and rank-and-file unionists were deeply divided over the role the United States should play, their support for both military preparedness and the draft, and their response to the final Treaty of *Versailles. While the Socialist Party and the Industrial Workers of the World opposed U.S. participation and its policy of military *conscription, the AFL and the Railway Brotherhoods (which constituted the great bulk of organized labor) supported the Wilson administration's decisions. The AFL voluntarily offered a "no-strike" pledge, and its leaders participated in many governmental bodies that regulated defense industries. Labor leaders sought to parlay bargaining power from the convergence of labor shortages and the

new position of organized labor in government. Nearly 5 million soldiers, the majority draftees, entered the wartime army. Their absence created a great void in domestic industrial production and service. For the first time, large numbers of women workers replaced men in defense industries.

Wartime inflation and the context of fighting a "war for democracy" (and, by extension, for industrial democracy) encouraged the rapid growth of unions and labor militancy, even in such nonunion strongholds as mass production industries (textiles, steel, meatpacking) and clerical and service sectors (including police, telephone operators, and transport workers). Government administration of the railroads created the first Federal Mediation Board for labor disputes. Union membership was phenomenal, the numbers rising from 3 million (1916) to 5 million after the war. In 1919 huge strikes, such as those in the steel industry and meatpacking, mobilized 1 million workers to strike for better wages, working conditions, and the right to bargain collectively. A postwar Red Scare involving the imprisonment and deportation of radicals, the use of troops to suppress strikes, and the depression soon quelled labor militancy. The termination of wartime agencies also removed organized labor from government.

A decade of depression coincided with the resurrection of the labor movement during the 1930s. By the end of the decade, organized labor had the nominal support of the new National Labor Relations Board, millions of new union members, and considerable influence in Democratic Party politics. When the United States started to rearm and mobilize its army in 1940 in response to fascism in Europe and the expansion of Japan in Asia, the labor movement was in the best bargaining position in its history.

During World War II, the massive efforts of the United States in war production and the addition of over 16 million men and women to the armed forces led to an unprecedented drain on labor power and to new government intervention in employment. Several agencies were created to facilitate and regulate hiring (the War Manpower Commission and the U.S. Employment Agency), to set production goals (the War Production Board), and to intervene in labor relations (the War Labor Board). In each, leaders from organized labor played a major role. Wartime policy sought to prevent the pirating of skilled labor in vital defense industries—shipbuilding, aircraft, and armaments. At the same time, political pressure—from both labor and civil rights organizations—strove to maintain labor standards (wages and hours) during the war, and to make some inroads against race and sex discrimination (Executive Order 8802 established the Committee on Fair Employment Practices).

Organized labor, in the form of the Congress of Industrial Organizations (CIO) and the AFL offered the cooperation and support of unions, an offer that culminated in the CIO's no-strike pledge. In return, major industrial unions received guarantees on wages and union membership. Dues were no longer collected individually but through the "dues check-off" from paychecks in unionized firms. Unions pushed for—and often received—the guarantee that the job, if not the worker, would remain unionized. High demand for labor, guaranteed profits in defense industries, and the War Labor Board's favorable policies resulted in a membership increase of nearly 50 percent, from 9 million to 14.5 million.

Yet workers in defense industries were not entirely co-

operative. Wartime inflation, increased pressures in production industry, tight control of the workplace, and the no-strike pledge opened the door to "wildcat" strikes (work stoppages unsanctioned by unions). Further complications arose with the increase in the paid labor force of African American and Latino workers and women as well. Minority workers occasionally met with conflict, and in certain factories, white workers conducted hate strikes. Women workers were trained but not always placed in defense production jobs. When they arrived on the shop floor, veteran workingmen, who viewed women as temporary replacements at best, were sometimes hostile. Both during and after the war, mass production in steel, mining, aircraft, and other defense industries was the target of a new, broad-based militancy. Mobilization reached its peak after the war, in 1946, when the greatest number of workers in U.S. history went on strike.

In the postwar world, the United States entered into a long-standing conflict with the Soviet Union, a Cold War fought in economic, ideological, even military terms. Though the two nations never fought one another on the battlefield, each was involved in small "hot" wars—especially in regions recently emerged from colonialism. Domestically, these developments found expression in McCarthyism, and organized labor was one of its targets. At the same time, the escalating "arms race between the United States and the USSR led to an expansion of defense industries and a continued high wage economy in this highly unionized sector. The labor movement supported U.S. foreign policy and the military interventions around the globe that came under the rubric of "containment." Unions on the home front even voluntarily purged members who refused to sign anti-Communist affidavits required by the Taft-Hartley labor law.

The "Vietnam War, the major military action stemming from containment policy, lost the long-standing support of mainstream labor. Initial union support for U.S. intervention in Vietnam was followed, in the late sixties and seventies, by individual and later organizational opposition to the war. The United Auto Workers were among the first publicly to oppose U.S. policy under the Johnson and Nixon administrations. Newspapers reported confrontations between "hard-hat workers" and war protesters, yet the actual stance of workers and their union organizations was far more complex. Working-class disillusionment with U.S. foreign policy, and, in particular, the growing belief in unequal sacrifice—"a rich man's war and a poor man's fight"—led to growing opposition to the war.

Overall, the contemporary labor movement has followed an increasingly autonomous path in foreign policy. In one prominent case, labor joined in domestic opposition to U.S. military aid to governments in Central American conflicts. Though such efforts express an incipient "internationalism, organized labor remains primarily a national movement, combining a strong voice for workers' rights with working-class patriotism, and a history of labor militancy with an equally militant history of working-class support for the nation in time of war.

LAFAYETTE, MARQUIS DE (1757-1834), French statesman and *Revolutionary War general. The marquis de Lafayette was the most influential Frenchman in the early American republic. The prospect of military advancement and an affinity for republican principles drew the young cavalry captain to join the *Continental army during the Revolutionary War. Americans appreciated his powerful court connections, unwavering enthusiasm for their cause, and offer to serve without pay. Despite Congress's growing irritation with troublesome foreign adventurers, the nineteen-year-old nobleman acquired, on 31 July 1777, a major general's commission in the army, albeit without pay or a command.

Lafayette's notable services, first at the Battle of Brandywine in September 1777, eventually won him his own troops. In 1778, Congress designated him to head the proposed invasion of Canada, a plan eventually canceled; then George *Washington gave him a division to strike the British near Monmouth, an assignment that Charles *Lee ultimately claimed on the basis of higher rank. Lafayette finally led six light infantry battalions in 1780 and a Light Corps in 1781, moving to the Southern Department, where his troops help confine Charles *Cornwallis's army to the Virginia coast and set up the decisive siege of Yorktown.

Lafayette remained a supporter of the United States during the French Revolution, despite considerable risk to himself and his family. In 1824-25, he returned to the United States for a triumphal tour that symbolized the passing of the revolutionary generation.

LAIRD, MELVIN R. (1922-), secretary of defense, 1969-73. Laird began his political career in the Republican Party after military service in World War II, serving in the Wisconsin State Senate (1946-52) and then in the U.S. House of Representatives (1953-69). President Richard M. *Nixon appointed him secretary of defense in 1969.

Under Laird's leadership, the *Pentagon experienced cuts in military spending, the closing of military installations, and withdrawal of forces in the *Vietnam War. However, he pleased the services by ending many procurement policies of Secretary of Defense Robert S. *McNamara. During Laird's tenure, the United States under the *Nixon Doctrine urged its allies to do more for their common defense via emphasis on regional alliances and increases in their defense budgets.

Besides focusing on Vietnam, Laird also dealt with arms control issues and changes in the military draft. In 1972, the United States and USSR agreed to a treaty limiting each country to two antiballistic missile sites of 100 missiles each. In response to controversy over inequities in *con-

scription, Laird helped move to "zero draft calls" and an

* All-Volunteer Force by 1972. —Mark R. Polelle

LAND WARFARE. By definition, warfare involves military operations to defeat an adversary to attain political, economic, or social ends. It is conducted on behalf of a nation-state, international coalition, or other political entity, usually, or at least initially, in accordance with a strategy formulated to achieve specific ends. Actual warfare, however, may not be necessary to compel or deter an adversary's behavior; the threat of military force may be sufficient.

Though conducted on land, modern land warfare doctrine incorporates the combined capabilities of landpower, seapower, and airpower to achieve operational objectives. Land warfare integrates maneuver of forces and firepower, in coordination with air and naval support, to take advantage of an adversary's weaknesses, avoid his strengths, and defeat him in the accomplishment of assigned campaign objectives with minimum expenditure of resources. Complete victory over an adversary is assured only through land force dominance.

Technology has played a central role in defining how armies fight to win wars. Historically, the application of technology to weaponry, beginning with the bow and later the musket, has allowed combatants to fight at ever-increasing ranges and with greater lethality. Today, enemy targets can be engaged at ranges where they are seen on an electronic device solely as an item of electromagnetic, infrared, or acoustic data.

Ancient Roots. Land warfare originated in the conflicts of ancient tribes, villages, and city-states. Early combatants on foot engaged in brutal hand-to-hand combat using bare hands and objects within reach, such as stones, to subdue an adversary. To gain some protection by distancing themselves from the dangers of close combat, early fighters used throwing weapons—slings, bows, javelins, and spears. Thus began the cycle of using advancing technology to improve the weapons of war to gain advantage over an enemy.

The Assyrians left one of the earliest records (1000 B.C.) of weaponry, tactics, and battlefield engagements. They were adept at maneuvering military formations to their advantage. Soldiers were armed with bow and arrows, spears and slings; they fought on foot, on horseback, or on horse-drawn chariots. The military capabilities of the Assyrians were enhanced by the combined effect of firepower and maneuver of forces to overwhelm an adversary and ultimately his will to fight. This approach remains the cornerstone of modern military *doctrine.

The Persians further refined the execution of massed firepower and maneuver. In response, the Greeks made use of large formations of well-disciplined infantry; each soldier in the phalanx was protected by a helmet and a large shield and armed with a lengthy spear. The Greeks used the heavily protected formation to reduce the effects of Persian massed fire. The Romans further improved on the use of combat formations by making them more flexible in size and spaced so that spears could be thrown by soldiers while bearing a large shield for protection. Short swords proved highly effective in hand-to-hand combat.

Ancient civilizations have contributed strategists, generals, and great captains who have had lasting effects on

the art and science of warfare. Their contributions remain relevant to modern land warfare doctrine, often articulated in principles of war and their application in battle. Current U.S. Army doctrine recognizes nine principles: objective, offensive, mass, economy of force, maneuver, unity of command, security, surprise, and simplicity.

Ancient military thinkers and generals included China's Sun Tzu (ca. 500 B.C.), who defined the fundamentals that underlie modern-day principles of war; Alexander the Great (ca. 300 B.C.) of Greece, who conquered Persia, Egypt, and India, adapting firepower, movement, and organization to the nuances of his enemies; Hannibal (ca. 200 B.C.), the Carthaginian, who crossed the Alps into Italy, avoiding Rome's major forces, then marched through forboding terrain to surprise and defeat other Roman legions; and Julius Caesar (ca. 50 B.C.), the Roman who adapted the tactics of the legion to the terrain and enemy, maintained the discipline of soldiers in battle, and attacked at the decisive time and place to defeat tribes of Gaul (France). Other great captains have included Gustavus Adolphus of Sweden (seventeenth century); Marlborough of England and the Prussian Frederick the Great (both eighteenth century); and France's Napoleon Bonaparte (nineteenth century). Historians debate who are the great captains of the twentieth century.

Evolution of Land Warfare. The weapons of ancient land warfare that brought about significant changes included the short bow, sling, and javelin. Chariots gave soldiers a mobile, stable platform from which to employ weapons. The soldier wore helmet, breastplate, and shin guards; protection also came from a shield. He was armed with a spear, ax, or sword. City-states were defended by works of earth and stone. They were besieged by opposing armies using towers, battering rams, catapults, and flame weapons.

In the first millennium A.D., the soldier on horseback used a saddle and stirrup to provide a stable platform and leverage to employ his weapons. The individual mounted soldier replaced the two-horsed chariot with driver and archer. This saved resources by reducing the number of soldiers per horse and also forage. The long bow and the cross-bow were used on the battlefield at the start of the second millennium.

The battlefield of the 1400s saw the introduction of gunpowder, cannon, and musket—missile weapons. This gave armies the ability to inflict significant "casualties on opposing forces at a distance. The musket also ended the dominance of the armored knights on horseback. During the next four centuries, the increasing improvements and variety of cannon, "artillery, and firearms further revolutionized the battlefield. The bullet, more lethal explosives, improved powders, fuse, shrapnel, the accuracy of rifled weapons, artillery that could be breech-loaded, the repeating rifle, and "machine guns beginning in the late nineteenth century increased rates of fire, range, and casualties. With the Industrial Revolution came the means to mass-produce weapons. Mobility was enhanced first by the locomotive and then by the internal combustion engine. The telegraph gave commanders the ability to control operations from great distances, and the political hierarchy a means to keep rein on field commanders.

More lethal weapons meant ever greater casualties, particularly among the mass "conscription armies of the nine-

teenth and early twentieth centuries. This was evident in the era of Napoleon, the American "Civil War, the Russo-Japanese War, and in "World War I, the last with the extensive use of artillery, the machine gun, and chemical weapons.

The airplane and armored tank were introduced in World War I to overcome the stagnation and attrition of "trench warfare. The two systems became the centerpieces of war fighting in World War II and remain so to this day. The breadth and depth of military operations were greatly expanded by these systems; warfare could be extended to the industrial capabilities of the enemy and their civilian populations. "Radar, advanced communications, and encryption were added to "World War II capabilities.

The mobility inherent in World War II mechanized forces, with their improved firepower, supporting close air support, and artillery preparations, allowed attacking forces to engage an opposing force at its point of greatest vulnerability while avoiding its strengths. This combined arms approach, used initially with great success by the Germans in World War II, was adopted by the Allies and has provided the framework for the weapons, tactics, and doctrine of land armies throughout the "Cold War era.

Modern Land Warfare. The information revolution of the post-Cold War period, exemplified by the modern computer and coupled with rapidly expanding technological innovations in materials, propellants, and electronics, is revolutionizing land warfare.

Traditional land war systems now have microminaturized components. Near real-time dissemination of information, ground positioning systems, satellites, laser designation of targets, increased lethality and accuracy of laser-guided warheads, and improved armor protection all are examples of the new generations of technological adaptations, occurring every few years, that define the core process of emerging modern warfare. The twenty-first century will include information warfare, making the field commander aware of the friendly and enemy situations in real time while thwarting the enemy's attempts to do the same.

The accelerated pace of improvements can be seen in the modern-day U.S. battle tank. The operational readiness of the U.S. Army M1A1 Main Battle Tank in the "Persian Gulf War with Iraq (1991) exceeded 90 percent, even after four days of almost continuous operation. In a night movement across open desert, all tanks—more than 300 of them—arrived at their destinations, demonstrating their excellent reliability. M1A1 tanks that received frontal hits from antitank rounds sustained little or no damage. The special armor was made of depleted uranium. The thermal night sight gave crews the ability to see through smoke; the laser range finder, with gun stabilization on the move, allowed crews to destroy targets at ranges that exceeded 3 kilometers. The 120mm antitank round, using a depleted uranium core, penetrated the earthen berms protecting enemy tanks and destroyed them.

An individual soldier with night-vision equipment can see at night. The combat soldier can designate targets with "lasers for engagement by artillery and armed "helicopters, fire antitank "smart" rounds, and use a shoulder-fired, heat-seeking antiaircraft missile system against enemy close air support aircraft and helicopters. He can locate his position within a few feet with a hand-held global plotting

device that receives the information from reconnaissance *satellites.

Fire support for the soldier includes artillery weapons that fire smart rounds to seek out and destroy tanks from overhead. Artillery projectiles also scatter antipersonnel and antitank mines over terrain the enemy might use. A counterbattery radar system can backtrack the path of enemy projectiles to the launch site and automatically provide location information, telling friendly forces where to fire. Modern ground forces use aircraft in traditional close air support roles. Add to this capability the missile-armed helicopter, which can maneuver against and engage enemy tanks by day or night; during periods of reduced visibility, using *missiles that can hit targets designated by a laser or emitting infrared emissions, it can hit targets otherwise invisible to the naked eye.

Twenty-first-Century Land Warfare. Since the Gulf War, the international arena has seen few purely military operations; most efforts are humanitarian or for 'peace-keeping. The United States, with the strategic capabilities to respond promptly, has supported numerous operations, including those in Somalia, Rwanda, Haiti, Bosnia, and Macedonia.

Weapons of mass destruction, including chemical, biological, and even *nuclear weapons, particularly under the control of rogue states and terrorists, pose an additional destructive dimension in land warfare. Compounding this situation, several states are gaining ballistic missile capabilities that can launch these terrifying weapons on the battlefield and elsewhere as terrorist weapons. The challenge is preparing for this diverse, unpredictable future, which will be further complicated by the availability on the world market of relatively inexpensive advanced weapons systems to lesser powers.

Technology will continue to expand and provide exponential improvements to traditional weapons systems. The success of this revolution in land warfare depends on the ability of individuals to use the systems under extreme conditions on the battlefield. Balances of automation, robotics, and the ability to process selective information in order to make good decisions—by the tank gunner to fire at a target or the corps commander to launch a combined arms attack at the right time and place—will have to be continually assessed. Warfare, ancient and modern, still depends on the initiative, tenacity, and competence of the soldiers and generals who do the fighting.

LANGUAGE, MILITARY: OFFICIAL TERMINOLOGY.

Official military terminology takes a wide range of forms, some intended purely for internal use, others meant to represent the military to the outside. At its most basic level, official terminology functions to narrow the potential meaning of particular words. In casual speech, there is often substantial ambiguity in the way a given word is used.

There can therefore be a wide range of possible interpretations. This is tolerable in informal conversation, where a misunderstanding can usually be rectified; but military organizations must be prepared to operate under great stress, in situations where misunderstanding can lead to catastrophe. Thus, official terminology for internal use attempts to foreclose as many interpretive options as possible in order to reduce the likelihood of error or misjudgment.

As with most specialized language forms, focusing on the function that language plays within an organization is not sufficient. All use of language bears an implicit logic about the world that can provide insight into the organization responsible for that language. Put more broadly, whenever a specialized language exists for the use of a particular group, that language can provide evidence useful in understanding the way the group views itself, its role in the larger world, and the world as a whole. Language use carries with it implicit arguments, which can be made explicit through careful analysis in order better to assess the world view the language helps to create and sustain. The use of language always has embedded within it these implicit arguments. A statement as simple as, "Forward presence is a vital naval mission," contains a variety of assumptions about the likelihood of future conflict, the likely locations of future conflicts, the probability that future conflicts will involve national interests, and the way military power can be manipulated to affect the chance of conflict starting. Language, then, constructs a social reality.

Official military language has at least three characteristics that are revealed through linguistic analysis. It tends to be a sanitized form of language; it emphasizes the expertise of those who use it; and it contains a specific notion of hierarchy.

The language of expertise marks any professional community. Indeed, the ability to use and understand specific technical language is a large part of what determines membership in professional communities. This aspect of technical and professional language is even more marked when the language is in large part characterized by acronyms and jargon that in effect create another language altogether. Technical language of this type emphasizes the expertise necessary for participation and therefore implicitly makes the argument that knowledge of the language serves in effect as a threshold for participation: If you cannot understand and use the language, you mark yourself as being unqualified to participate in the technical debates taking place. This is no less true of official documents emanating from the Department of *Defense (which are likely to make arcane statements such as "SECDEF authorized CINCENT's use of two JSTARS") than those written by doctors, lawyers, or engineers.

Euphemistic language can serve to mask and deemphasize what it is that the words are actually referring to. It is easier to refer to "surgical strikes" and "collateral damage" than to bombing attacks in which civilians are killed. Such indirect language is especially notable in military discussions about the use of *nuclear weapons: phrases like "first," "second," or "preemptive" strikes, or "ride out" and "assured destruction" are preferred over those connoting apocalyptic levels of destruction.

By the same token, this creation of what is virtually another language not only builds a wall between the insider and the outsider but simultaneously reinforces the connection between those who are masters of the form. The abil-

ity to control and manipulate an insider linguistic form identifies one as a member of the institution, forging an automatic link between people who have the same ability, while reinforcing the distinction between these insiders and outsiders. Indeed, military service has its own jargon, acronyms, phrases. Not only do different services use different terms; sometimes the same word can mean different things to different services.

Yet another form of official language is used when the military communicates with those on the outside. During conflict, for example, official rhetoric can emphasize the humanitarian concerns with which we go to war, or can distract attention from the costs that are inevitably involved in the use of military power. Descriptions center on the technology that has been destroyed, so that there are reports of the number of sorties successfully completed, the number of aircraft or * tanks destroyed. This permits a focus on the objects, the things, and away from the people close to or within the objects destroyed.

—Cori Dauber

LANGUAGE, MILITARY: INFORMAL SPEECH. Through language, groups of individuals form what can be termed *discourse communities*. By using slang and jargon unknown to the outsider, individual members of specific groups form bonds of identification with one another. The language used within a given community serves both to construct a vision of the world into which initiates are socialized and to draw a line between those in the group and those on the outside. In official language, this occurs through the use of technical terms—acronyms and jargon. In informal language, it is accomplished by knowledge of terms whose meanings are not available except through direct participation in the group—meanings that appear in no formal glossary.

Informal military language reinforces a service member's primary identity as being part of the group, along with those who share his or her language. Beyond that, informal language constructs a vision of the world that becomes the defining characteristic of group membership. This is done most directly through *naming*. The names we give to things are of vital importance in understanding the view of the world the namers participate in and is an important part of all language use. Names of objects, perhaps more than any other words, constitute implicit arguments. In informal language, names are often metaphors. Sometimes, these metaphors are obscure. When naval officers associated with aviation refer to the surface fleet surrounding and supporting the carriers as "greyhounds," they use language that seems positive, implying an image of sleekness and speed. However, the relationship drawn on is that between dog and master. The argument, in other words, is that the rest of the surface fleet is useful insofar as it serves the needs dictated by the carriers. Similarly, members of the U.S. military who handle *nuclear weapons informally use metaphors, naming places where U.S. nuclear bombs are aimed as "home addresses" and referring to nuclear

missiles on board U.S. *submarines as "Christmas trees." These homey and domestic metaphors convey the meaning that U.S. nuclear weapons, although extraordinarily destructive, are safe for the U.S. military to handle.

Such examples point to another important function of language. The arguments that are implicit in the words we use, particularly the names, often are those that construct hierarchies. Discourse communities use language that possesses its own internal symbolic logic, and this places the members of the community in a hierarchical relationship with those of other communities. Language not only bonds the membership; it also helps construct a world view in which that membership can be secure in the superiority of its knowledge. Because language is never value-neutral but always contains embedded arguments, it is always taking a position on whether that which is named is "good" or "bad." Thus, homey metaphors such as the one about "Christmas trees" bond members of the military community and place a positive value on their work.

This function of informal language will generate terms and labels that differ from official usage in several ways. Such terms may be less euphemistic. This is in part because official terminology is intended as an aid to the institution as it represents itself to outsiders, while informal language is designed to emphasize the insider status of participants. Further, informal language is likely to create a bond between the members of the community even if that bond is created by highlighting divisions between the individuals and the institutions they represent that would not be acceptable in formal use.

In the U.S. military, a proportion of informal language is used to reinforce a worldview that emphasizes the importance of a given service or warfare community versus others. All are members of the military, officially a single institution with the same mission and perspective. Unofficially, informal language creates connections and identity particularly through defining the group in terms of what it is *not*: the navy, then, defines itself in part as being *not* the army or air force. Naval personnel who do not serve on submarines will say that there are two kinds of ships: "submarines and targets." Air force personnel refer to anyone in naval uniform as a "squid." Such distinctions can be achieved through joking and narratives as well. Army personnel will say that "the difference between the Army and the Marines is that the Army will call in air strikes and then take the hill, while the Marines will take the hill and then call in air strikes."

Informal language can also serve, particularly during times of war, to dehumanize the enemy. This can be accomplished, as in official terminology, through the naming of enemy combatants in a sterile or neutral way, in order to elide the fact that combat involves the killing of human beings. But it is more likely to function by referents implying that enemy personnel are inferior, that they are "gooks" or "camel jockeys."

Because of the extensive media coverage of most military operations, many military terms have entered into the civilian lexicon. Indeed, a feedback loop of sorts operates, wherein military terms enter civilian usage as metaphors while linguistic terms from civilian life simultaneously enter military usage. In many civilian communities, militarized language denotes a level of seriousness that could not be conveyed as effectively in other ways. Thus, the Clinton headquarters in the 1992 presidential campaign was the

"War Room"; Arkansas's system of substitutions in college basketball is known as "platooning"; team leaders are "floor generals"; and business schools assign Sun Tzu and the U.S. Marine Corps doctrinal manuals about tactics and strategy. At the same time, language and metaphors from civilian life cycle into military usage, downplaying the level of seriousness involved. Particularly prevalent is the language of sports and games, so that the now famous "Left Hook" in the Saudi Desert was the "Hail Mary pass" and the war began with a "kickoff" or a "tip-off."

All of these linguistic tools facilitate the use of language itself as both a source for, and mechanism to sustain, a given community, while simultaneously serving to define the community in positive ways by the use of arguments implicit in the words chosen.

LANSDALE, EDWARD G. (1908-1987), U.S. intelligence officer and general. Born in Detroit, Michigan, Lansdale attended UCLA and then became an advertising executive. He served with the Office of Strategic Services (OSS) in World War II, but achieved fame during the "Cold War" as one of the most celebrated U.S. intelligence officers. While he was never an employee of the "Central Intelligence Agency (CIA), he often worked on behalf of the CIA using the cover of an Air Force officer.

Technically a mid-level operative, Lansdale became legendary for identifying and fringing effective non-communist alternative leaders, becoming known in the 1950s as "our man in Asia." In the Philippines, he played a controversial but important role in helping President Ramon Magsaysay gain power and defeat communist insurgents. Later, in Vietnam, he engineered psychological warfare operations in North Vietnam in 1954-55 and channeled U.S. support to the newly created Republic of South Vietnam and its president, Ngo Dinh Diem. Under President John F. "Kennedy, Lansdale was put in charge of Operation Mongoose, which involved a series of attempts to eliminate Fidel Castro and disrupt the economy of communist Cuba.

Seen by many during the Cold War as "America's Number One Spy Master," Lansdale was famously reviled in *The Quiet American* (1955) an attack on U.S. foreign policy by British novelist Graham Greene (despite the fact that both Lansdale and Greene denied the connection). But the 1958 Hollywood film version reversed Greene's judgment by portraying the Lansdale-type character as a true hero. By the 1960s, Lansdale's public persona had overshadowed the real actions, and he had become a legend of American success in the Cold War.

LA ROCQUE, GENE (1918—), naval officer, founder of the Center for Defense Information. Born in Kankakee, Illinois, commissioned in the naval reserve (1940), La Rocque served thirty-one years on active duty, participating in thirteen major battles in the Pacific during World War II. His postwar career included a variety of ship commands and seven years in the Strategic Plans Directorate of the "Joint Chiefs of Staff (JCS).

Retiring in 1972 and disillusioned over the "Vietnam War, La Rocque established the Center for Defense Information as source of critical information on military spending and policies. Staffed by retired military officers, the center opposes excessive spending and encourages efforts to prevent nuclear war, believing that social, economic, political, and military structures contribute equally to national security. It also publishes *The Defense Monitor*, founded in 1972.

La Rocque and his colleagues testified before Congress, appeared frequently in the media, and consulted many national and international political leaders. In the 1980s, La Rocque founded a weekly public affairs television program, *America's Defense Monitor*.

La Rocque's stature as a "peace admiral" won him praise from peace leaders and hostility from military ones. In August 1983, 575 retired admirals, led by former chairman of the JCS Thomas "Moorer, placed an advertisement in *The Washington Times* criticizing La Rocque for appearing on Soviet television. La Rocque refused to yield to "Cold War animosities, however, and organized ground-breaking meetings between retired military officers in the United States and the Soviet Union. In August 1985, he was credited with playing a significant role in persuading Mikhail Gorbachev, to declare a moratorium on nuclear testing. La Rocque retired from the center in 1993.

LASERS. *Laser* is an acronym for light amplification by stimulated emission of radiation. External energy pumped into the atoms of the lasing medium excites electrons to higher energy states; returning to their base state, they emit photons. Cascading photons produce a narrow, tightly focused beam of intense, coherent, monochromatic light.

The special properties of laser beams—intensity, coherence, directionality—held obvious promise for military purposes. Beginning promptly with the 1961 invention, mission-oriented laser research and development centered on such practical applications as range finding and guidance.

Operational range finders began seeing field service during the "Vietnam War by the mid-1960s. Incorporated in fire control systems, they especially suited direct fire weapons like tank guns; such units for the M-60 tank began service in 1968. Immediately successful, laser range-finding and fire control systems rapidly became standard equipment. Laser simulators have also sharply enhanced training realism for tank gunners and infantry small arms.

Laser guidance, teaming ground-based or airborne target designators with projectile-borne sensors, was one of

the precision methods that began revolutionizing air attack on surface targets from the late 1960s onward. The designator directs a laser beam at the target, the laser seeker picks up the reflected light, and the bomb or missile homes in on the illuminated target.

Laser-guided bombs made their first appearance under the U.S. Air Force's Paveway program. Field modification kits for several standard bomb models began reaching Vietnam in 1971. Each included a laser seeker, guidance unit, and control canards bolted to the bomb's nose, enlarged tail fins bolted to the rear. This first Paveway generation met outstanding success in 1972 attacks on North Vietnamese bridges. Paveway II arrived in 1980, Paveway III in 1987, each kit more sophisticated and costly than its predecessor.

Augmented with an off-the-shelf rocket motor, Paveway II also became the basis for the navy's Skipper II air-to-surface missile. It entered service in 1985 as a low-cost (though less capable) alternative to the Maverick, a 1977 version of which was the first U.S. laser-guided missile. Superseded in 1983 by an upgraded model with a better laser seeker and larger warhead, the Maverick now largely serves a Marine close air support role.

The army fielded its first laser-guided missile, the Hellfire, in the early 1980s. Developed specifically as an antitank missile for Apache attack helicopters, it could acquire its target after launch. Outstanding capabilities and performance led the army to adapt Hellfire for other aircraft and make it the focus of antitank tactics.

Less successful was the Copperhead cannon-launched guided projectile, also intended as a tank killer. Production began in 1981, but persistent technical difficulties and escalating costs ended its procurement in 1990.

From the beginning, the laser's potential as a weapon excited military interest, peaking in the proposed missile defense system called the Strategic Defense Initiative. Other potential military roles for lasers, more or less speculative in the early 1990s, include laser equivalents of radar (LADAR), beam-riding missiles, and communication systems.

—Barton C. Hacker

LAWS OF WAR. The idea of laws of war is ancient and ubiquitous; fragmentary indications appear in the records of most known civilizations and cultures. The international laws of war as known today, however, are of relatively modern and regional origin. The Roman concept of a law of nations (*jus gentium*), persisting through Europe's medieval centuries and ingesting elements of Christian "just war" doctrine, chivalric honor, military professionalism, and commercial prudence, produced by the sixteenth century a body of customary principles and rules purporting to show how to judge whether a war was justified (*jus ad bellum*) and how wars should ideally be conducted (*jus in bello*). Reality, always falling short of the ideal, became so horrific in the Thirty Years' War that the Dutch Christian-humanist-diplomat Hugo Grotius (1583-1645) was prompted to publish in 1625 *De jure belli ac pacis* (*Concerning the Law of War and Peace*), usually

considered the first definitive text on international law. Accepting war as a legitimate political institution, he maintained the just war thesis that it should not be begun without good cause, and argued with moral fervor that war could, indeed should, be conducted with more moderation than was usually the case. When, in the later nineteenth century, modern international law crystallized and the customary laws of war began to be codified, Grotius's visions of international community and universal standards renewed the respect for him that persists today.

The temporary eclipse of *jus ad bellum* did not mean that *jus in bello* was neglected. Men of honor took it seriously. Self-respecting commanders of opposing forces made local agreements ("conventions") to facilitate exchanges of prisoners and protect medical units. Recurrent disputes about particular incidents testified to the persistence of the ideas that there must be standards for governing the conduct of military operations, and that civilized states should wish their armed forces to observe them. So demanding had these ideas become by mid-nineteenth century that they issued in four epochmaking and trailblazing events: the Paris Declaration of 1856, regulating the relations of belligerents and neutrals in maritime war; the Geneva Conventions of 1864; General Order No. 100 of the U. S. Army of 1864, Instructions for the Government of [Its] Armies in the Field—often known, after its principal author, as "the Lieber code"; and the St. Petersburg Declaration of 1868, a prohibition of an "atrocious" new weapon (explosive bullets).

From those close-bunched beginnings, the laws of war developed along two main lines. "Geneva law" aimed to protect victims and innocents: the 1929 revision added to the existing conventions (for sick and wounded combatants on land and sea), a third regarding prisoners of war; in 1949, a fourth aimed to protect civilians who fell into enemy hands at the outbreak of hostilities or because of military occupation. The other line, law regarding the conduct of hostilities, of which Francis Lieber's code was for long the most famous and complete national example, became known as "Hague law" after the international standard setting in 1899 (reaffirmed by the Fourth Hague Convention of 1907) of the Hague Regulations Respecting the Laws and Customs of War on Land. Supplemented since 1977 by the First Protocol Additional to the Geneva Conventions (in fact, a convergence of Geneva and Hague law, to which most states by now have acceded), the Hague Regulations have ever been, and still are, fundamental to the laws of land war. Along with the Geneva Conventions, they formed the basis for the war crimes trials after World War II; most of which had to do with the behavior of armed forces in (contested) occupation of alien territories, and with the treatment of prisoners.

Standards for the conduct of war by air and sea have not been so easily reached. In these fields especially, military applications of science and technology have posed problems defying simple solution. New inventions promising military advantage have often at first been denounced as dishonorable or inhumane, but a few have ultimately been added to the list of weapons (e.g., chemical and biological weapons) covered by multilateral treaty prohibitions (1925 and 1972, respectively). It remains to be seen how effective will be the 1981 prohibitions or restrictions on the use of

certain conventional weapons (mainly land *mines, boobytraps, and incendiary weapons). Efforts were made between 1919 and 1939 to restrict submarine and aerial warfare, but they proved useless during World War II. *Submarines were so vulnerable on the surface that, having to stay submerged, they could not observe the classic distinction between civilian and military; together with mines, they revolutionized war at sea by making possible *blockades more total than ever before. Bombers dared not fly so low or slow that they could guarantee to hit only military objectives; at the same time, the passions of prolonged total war tended to encourage the indiscriminate and terroristic *bombing of civilians. Both sides having waged air and sea war in these extreme and disproportionate ways, they figured hardly at all in the Nuremberg and Tokyo International Military Tribunals and the many nationally run war crimes trials. Not until 1977 were these specific problems addressed. Among the more valuable achievements of the First Additional Protocol is civilian-protecting definition of military objectives, and, associated with it, rules of proportionality aimed at reducing to the realistic minimum the incidental risks to nonmilitary persons and places.

The laws of war are incapable of perfect observance. Beyond the fact that law like all other elements of war is subject to the erosions of confusion, error, and chance, observance is likely to be highest when states wish a war to remain limited, when neutrals are critically watchful, and when well-disciplined armed forces fight one another in a relatively civilian-free environment. The "desert war" in North Africa (1940-43), and the brief Falklands War in the South Atlantic between Britain and Argentina (1982) are exceptional. Circumstances are rarely so favorable. Wars between states are more likely to be all-out than limited; nor are they often simply between states. The laws of war make some room for "noninternational armed conflict," but nonstate parties may not wish or be able to conduct hostilities in a style consistent with the law, while states combating them may not like to regard them as if they were lawful belligerents. Civilians tend to be difficult to distinguish from combatants in * guerrilla warfare, or revolutionary and people's wars; in such situations, all parties are tempted to turn to terror. And through it all runs the problem that has forever dogged the laws of war, and whose handling reveals the quality of the culture and the politics of which the warrior is the armed representative: how to distinguish what may be militarily necessary from what is merely convenient, and how to judge when enough violence is enough. Important to all, the laws of war are not a matter of concern solely to the military.

LEADERSHIP, CONCEPTS OF MILITARY. Within the U.S. military, leadership is generally considered something of a given. It is a fundamental ingredient of warfare, without which the outcome of a combat operation cannot be assured. The leader is the brain, the motive power of command, upon whom subordinates rely for guidance and wisdom, and depend upon for good judgment. The leader must be determined, unflappable and charismatic; confident in delegation of authority; able to combine the various strands of command into a common thread; seasoned, intelligent, and thoughtful.

When judging the qualities of leadership, there is a tendency to think of the gifted, or natural leader, involving some expectation that leadership is an inherent personality quality that some have, and others have not. Military history is full of "born leaders," suggesting that "inspired leadership" is the only true measure of the trait. For a very long time the American people relied on the emergence of just such an individual when necessity demanded it, and fortunately the country has been well-served in this respect. Much of this has been due to American military egalitarianism, which presumed that any individual, regardless of background, could lead a body of troops in combat as long as the leader had the requisite ability. An obvious case in point is the * Civil War, which gave rise to a number of gifted commanders—Joshua Chamberlain, Nathan Bedford *Forrest, John *Logan, and Nelson A. Miles, to name but a few—who yet had little, if any, military training. So great was the renown of such natural leaders that a veritable school of military command grew up around them, declaring that genius alone was the true sign of leadership, and that leaders were born, not made.

As the army matured and professionalized after the Civil War, these sorts of arguments met the resistance of educational reformers who argued that certain principles of leadership *could* be taught, given the proper lessons from military history. Beginning in the 1880s, the army and navy both sought to teach certain principles of leadership, although they were not so-called at the time, through the Infantry and Cavalry School, the U.S. Army Staff College, and the Naval War College. Historical examples of military success and failure featured prominently in their curricula, on the assumption that trial-and-error under combat conditions was a poor method of inculcating leadership skills. Lessons learned in the classroom were then effected in map and field exercises. The expectation was, and still is, that non-combat training would provide a fund of practical knowledge upon which a commander could use as a point of departure under battlefield conditions.

For the educational reformers, emulation was key, although they admitted that talent was also valuable. Raw talent, however, was no substitute for its disciplined application. Considering the growing complexity and lethality of war, education was regarded as the surest means of directing talent toward the desired end. Yet the question of native ability remained; could those without it become effective leaders? A problem reformers grappled with was the difference between leadership and command; they are not the same thing, for not all commanders are good leaders, and not all leaders are good commanders. During the Civil War, Gen. George *McClellan, for example, was a truly

inspirational leader who won the total devotion of his troops, yet consistently failed to achieve decisive "victory in battle. Gen. Ulysses S. "Grant, on the other hand, was an excellent commander, to whom few would attribute any great affection by the soldiers of his command at the time. Gen. Robert E. "Lee would seem to encompass the best qualities of both.

The essence of military leadership is not, of course, embodied in how much devotion a commander may inspire among the troops. While the ability to command is tied to a leader's general competence—the commander's ability to make correct decisions based on a given situation—the ability to lead remains more ethereal. Because of the intrinsic individuality of leadership, the military encourages the adoption of a particular "style" suited to the personality of the leader or to the situation at hand. One may be a director, a participant, or a delegator, but the centrality of the leader remains unquestioned. Whichever style is used, the expectation is that a positive result will emerge.

Because there seems to be no precise definition of what leadership is, the use of historical example (lessons learned, in current military jargon) has generally been the method through which qualities of leadership have been ascertained. Just as important are examples of bad leadership, which is apt to get troops killed. The balance between the two provides the would-be leader with patterns to avoid and copy.

Definitions of military leadership generally describe what a good leader *does*, not necessarily what leadership *is*. According to current U.S. Army doctrine, "leadership is the process of influencing others to accomplish the mission by providing purpose, direction, and motivation." Traditionally, applying those skills competently has been achieved through intensive theoretical and practical training.

The learning-by-example method might thus be described as a means of augmenting the capabilities of those who, for whatever reason, show promise of true leadership skill, while eliminating those who have no aptitude. Testing and promotion review replace the combat situation, while leadership itself becomes genuine military doctrine. The guiding assumption of leadership doctrine is that incapable practitioners will be winnowed out before their mediocrity costs lives in battle.

Battle represents the severest test of a commander's mastery of leadership doctrine, for the commander must stimulate subordinates to do things that would imperil their health, even cost them their lives. It is here that the leadership role diverges from the command role. Command merely vests the leader with authority to define and order the accomplishment of an objective. Achieving it requires the additional influence of leadership. Ideally, the leader sets the standard for command through personal example and shared sacrifice. He must, therefore, demonstrate confidence in the troops and in his own abilities, while acknowledging the risks his decisions may entail. If subordinates trust the leader's judgment and abilities, and believe that he would not unnecessarily expose them to danger, his authority and decisions will not be questioned. Under the stress of combat, however, a leader cannot assume instant obedience. Fear and the instinct for self-preservation are powerful disincentives to any dangerous enterprise, and the commander cannot simply will them away. He must, therefore, anticipate their appearance while limiting their effect through assiduous training, prepara-

tion, and the promotion of team spirit and identification.

Military leadership is thus a continuous process that extends well beyond the battlefield. Its application and cultivation are as important in times of peace as in war. While the essence of leadership remains beyond easy or precise definition, its fruits are readily apparent. The concepts on which leadership is built—courage, intelligence, experience, discipline and decisiveness, among a score of other virtues—combine to produce an idea of what leadership is, and how it may be achieved. *j r Brereton*

The LEAGUE OF NATIONS (1919-46) "peacekeeping organization began when Woodrow Wilson secured the inclusion of its charter in the Treaty of "Versailles (1919). The League's "Covenant" represented the work of many internationalists on both sides of the Atlantic. It contained provisions for the arbitration of international disputes, the reduction of armaments, and for the imposition of collective military and economic sanctions against any nation that violated the political independence and territorial integrity of another (Article X).

The Covenant, like all constitutions, was subject to interpretation. Two competing tendencies existed in the American internationalist movement, both born of the politics of "neutrality and preparedness of 1915-16. "Progressive internationalists" considered peace essential to the cause of domestic reform. Like Wilson, they saw European "imperialism, "militarism, and balance-of-power politics as the root causes of the war; in their stead, they promoted the idea of a "community of nations," to be sustained by a league.

Conservative internationalists, led by William Howard Taft and the League to Enforce Peace, also advocated a world parliament; but, while more or less endorsing the principle of collective security, most of them believed that the United States should expand its army and navy and reserve the right to exercise force independently. Disarmament and self-determination were not among their concerns. Progressive internationalists viewed their conservative rivals as enemies of reform and as advocates of militarism. The two sides disagreed over domestic politics and foreign policy alike.

Had a national referendum been held in July 1919, the United States almost certainly would have joined the League. Two main factors, however, compounded the problem of ratifying the treaty. First, the Republicans, having captured majority control of Congress in the 1918 midterm elections, launched a fierce attack on Wilson's overall program. Second, large numbers of progressive internationalists had begun to abandon Wilson because the peace settlement had fallen short of the promised "Fourteen Points; moreover, his acquiescence in the wartime suppression of civil liberties had further eroded his support among progressives.

As for the Senate itself, the preponderance of opposition was grounded in both partisanship and ideological principle, though only a few of the League's critics were irreconcilable isolationists. In part to preserve America's freedom of action, the Republicans, led by Henry Cabot "Lodge, drew up fourteen reservations as conditions for ratification. Some of these reservations would have undermined the League's ability to arbitrate disputes, to supervise a reduction of armaments, and to impose sanctions

embodied in Article X. In September, Wilson embarked upon a strenuous speaking tour on behalf of unqualified American membership. His exertions brought on a nearly fatal, paralytic stroke that rendered him a recluse. Political gridlock then ensued.

The Senate roll was called three times, in November 1919 and March 1920; but whether on a motion to ratify unconditionally or with the Lodge reservations, the necessary two-thirds majority could never be mustered. In November 1920, the Republican Warren G. Harding won a landslide victory over Democrat James M. Cox. Alluding to Wilson's erstwhile wish that the election might take the form of a referendum, Lodge now declared, "that League is dead."

Some historians have argued that Wilson's stroke prevented him from striving for the middle ground on the question of reservations. Other historians maintain that even a healthy Wilson would have refused to compromise, owing to his personality. Still others have stressed that the ideological gulf that separated the two branches of American *internationalism, along with the president's failure to rekindle his own progressive coalition just as the parliamentary struggle began, sealed the fate of a Wilsonian league.

At least in part because of the absence of the United States, the fledgling organization boasted few achievements in the interwar period. Republican administrations assiduously avoided all formal association with it throughout the 1920s, even, for example, when promulgating the Dawes Plan of 1924, the effort to compose Europe's reparations-war debt tangle. Yet, in this endeavor, the League undoubtedly facilitated Secretary of State Charles Evans Hughes's labors. Then, too, Hughes staunchly (if ineffectively) advocated American membership in the World Court. The United States further underscored its ambivalence in the salutary achievement of the Washington Naval Conference of 1921-22 as well as in the innocuous Kellogg-Briand Pact of 1928; in both instances of internationalist foreign policy, the Americans conspicuously ignored the League. Perhaps the final blow came during the Manchurian incident of 1931-32. While condemning Japanese aggression there, the League proved utterly powerless to undertake effective sanctions; the United States merely refused to recognize Japan's puppet state, Manchukuo. During the 1930s, the League receded further into impotence as mounting crises led to renewed international conflict.

By 1944-45, many Americans had concluded that World War II might have been averted had they followed Wilson's counsel. Franklin D. *Roosevelt successfully championed a new international organization, the *United Nations, whose Charter incorporated many of the reservations prescribed by the Republicans in 1919. Although the United States took the lead in founding the United Nations in 1945, American foreign policy makers deemed it an inadequate instrument and they created regional alliances, particularly *NATO, as the means of collective security.

LEAVES AND FURLOUGHES, long a benefit reserved for officers, were not a right for enlisted men until the mid-twentieth century, when some of the links between rank and privilege slowly dissolved in the American military. After the * Revolutionary War, the American military incorporated British principles on leaves into the Articles of War. A commanding officer exercised wide discretion over how to maintain discipline within his command, ranging from the reward of a leave to punishment with a court-martial. The only restrictions placed on officers granting furloughs limited leaves to no more than thirty days for 5 percent of the unit at one time. The statute authorizing * conscription during the *Civil War reiterated this principle. By 1890, however, the continually high *desertion rate in the regular army led to calls for a new approach in using leaves to improve *morale among enlisted troops. Over a period of seven years, an enlisted man was entitled to a three-month annual furlough after serving three years of his five-year enlistment. Officers' complaints about constant unit disruption caused Congress to end this experiment in 1897. A simultaneous reform impulse was evident among naval officers who argued that punishing sailors by restricting liberty caused, rather than prevented, desertion. It remained up to the naval commander, whether or not to give half the crew liberty during a port call (three-quarters if anchored in a navy yard).

In marked contrast to the enlisted man or sailor, officers enjoyed a legal right to request and take paid leaves and furloughs. In 1835, the secretary of the navy lost his ability to save money by furloughing officers waiting for a new posting. Naval officers could still request a paid three-month leave to attend to domestic business or an indefinite furlough to leave the nation's borders. Army officers took advantage of their more extensive privileges to work for civilian engineering companies, lobby in Washington on their unit's behalf, or enjoy eastern urban attractions. In addition to the possibility of a personal leave of up to eighteen months, a doctor's certificate was all an army officer needed for a year of sick leave in the nineteenth century.

The creation of a conscripted army of citizen-soldiers during World War I brought the nation's attention to the problem of fighting a war for democracy with an army that maintained a sharp distinction between the privileges enjoyed by commissioned officers and enlisted troops. After World War II, Congress reacted to a similar public outcry by giving enlisted men the legal right to a paid thirty-day leave each year. The Armed Forces Leave Act of 1946 continued to democratize military leaves by giving officers and troops equal amounts of annual leave and paying them for up to sixty days' accumulated leave when their term of service ended, in 1975, Congress rejected a General Accounting Office proposal to eliminate the financial incentive this second benefit gave to save rather than take leave after the Department of *Defense argued that servicemen would lose an advantage still enjoyed by civilian federal employees.

LEBANON, U.S. MILITARY INVOLVEMENT IN. Lebanon, a multi-ethnic, multi-religious nation situated between Syria and Israel on the eastern edge of the Mediterranean Ocean, became of particular importance to America in 1957 when President Dwight D. "Eisenhower issued the * Eisenhower Doctrine declaring the Middle East vital to U.S. national security interests. Subsequently, fighting and political disputes in the "Lebanon Crisis (1958) caused three U.S. military incursions, actions that proved only marginally successful in producing stable solutions favorable to America's Middle Eastern policies.

Following Eisenhower's announcement, the U.S. Sixth Fleet, patrolling the eastern Mediterranean, became a visible symbol of U.S. interest and power in the region. However, such a display of force failed to stymie the onrush of events that challenged American aims. The creation of the United Arab Republic, an anti-U.S. union of Syria and Egypt in early 1958; the outbreak of civil war in Lebanon in May 1958; and finally, the overthrow of a pro-Western regime in Iraq in early July, all provoked Eisenhower to order three U.S. Marine Corps battalion landing teams ashore in Lebanon on 15-16 July 1958. U.S. Army airborne forces were flown in from Germany on 19 July. By August, the American military contingent in the country consisted of over 15,000 troops. An uneasy truce came about in September, and when elections were announced, U.S. forces were withdrawn in October 1958.

The 1958 American incursion in Lebanon was practically casualty-free, but the 1982-84 involvement was wholly different. When Israeli forces invaded Lebanon in an attack on anti-Israeli forces in June 1982, the administration of President Ronald "Reagan became concerned over the region's instability and opted to land Marines at Beirut in August to help restore stability in the divided country. The 800-man unit, the 32nd Marine Amphibious Unit, was withdrawn in 15 days. Negotiating with its Western allies, the United States participated in a multinational stability effort later that fall. Two U.S. military missions were established. First, Army Special Forces units were deployed to Beirut with the task of training pro-Western Lebanese forces; second, U.S. Marines were once again landed with the assignment to protect the Beirut airport. The Marines went ashore amid lavish press coverage and promptly became targets of snipers and occasional artillery fire. Attempts to quell these attacks by U.S. naval gunfire and air strikes failed to stop the harassment. Special Forces troopers kept a low profile in Lebanon, dodging the press and melding in with their Lebanese trainees.

In mid-April 1983, a truck bomb exploded near the U.S. Embassy in Beirut, killing more than 60 people, including 17 Americans. Despite this episode, on 23 October 1983, a terrorist was able to drive a truck loaded with explosives past Marine guards and into the Marine headquarters. The terrorist detonated the load, killing himself and 241 of the 300 Marines asleep in the building. The Marines were withdrawn from Lebanon on 26 February 1984; in March, the United States announced its abandonment of the multinational security effort. Army Special Forces elements remained in Lebanon and continued their mission for a few more months without incident. Fighting in Lebanon continued through most of the 1980s.

• Roger J. Spiller, *"Not War But Like War": The American Intervention in Lebanon*, 1981. Eric M. Hammel, *The Root: The Marines in Beirut, August 1982-February 1984*, 1985. r_oj p_spc_hall

LEBANON CRISIS (1958). The underlying cause of the 1958 Lebanon crisis was the instability of the country's Christian-Muslim political coalition under pressure from the "Cold War Pan-Arab nationalism of Egypt's Gamal Abdel Nasser. Following creation of a pro-Soviet United Arab Republic by Egypt and Syria in February 1958, severe rioting broke out against the pro-Western Lebanese government of President Camille Chamoun, a Christian. The crisis came to a head on 14 July, when an Arab nationalist coup in Iraq overthrew King Faisal and similar coup attempts in Jordan and Lebanon appeared likely. Invoking the "Eisenhower Doctrine, Chamoun immediately requested U.S. troops.

At Eisenhower's orders the first of the three Marine battalions located in the Mediterranean landed to take control of the Beirut airport on 15 July. The other two were ashore by 18 July, plus a fourth battalion airlifted from the United States. Opposition to the Marine presence was limited to snipers and small groups of "rebels" who probed Marine positions but did not attack. An understanding with the initially hostile Lebanese Army resulted in provision of liaison officers and some joint operations.

A U.S. Army airborne battle group from Germany landed at Beirut airport on 19 July. More units followed by sea and air until a maximum of 14,357 troops (8,515 army, 5,842 Marine) was reached on 8 August. An orderly presidential election was held in Lebanon on 31 July; American troop withdrawals began in late August and were completed by 15 October.

The United States's first intervention in the Middle East was also the first time "NATO-committed troops were withdrawn for out-of-area operations. Although the planning and initial operations suffered from important American misconceptions about Lebanon and lack of joint service doctrine, the intervention helped stabilize Lebanon for another twenty-four years.

LEE, CHARLES (1731-1782), British army officer, Revolutionary War general. Born in Cheshire, England, Lee fought in the "French and Indian War, serving from Edward "Braddock's ill-fated campaign against Fort Duquesne to the 1760 conquest of Montréal.

Siding with America's revolutionaries, the politically radical Lee became the "Continental army's third-ranking general in 1775. He improved coastal "fortifications and helped George "Washington's army escape from a precarious position on Manhattan. A student of war and society, Lee advocated a mass guerrilla conflict because he believed that Americans, accustomed to liberty, lacked the discipline necessary to defeat professional soldiers in conventional battle.

Late in 1776, Lee's career began to deteriorate. Having lost faith in Washington and hoping to sustain popular resistance in New Jersey, he defied the commander in chief's orders to move his detachment west of the Delaware River.

Captured and imprisoned, he submitted military plans to the British that could be construed as treasonous. Exchanged in April 1778, he commanded 5,000 Continentals at the Battle of "Monmouth, where his decision to order a retreat resulted in an angry exchange with Washington. Lee demanded a court-martial. Found guilty of disobedience, disrespect, and misbehavior before the enemy, he was suspended from the army for a year, then dismissed. His outspoken opposition to Washington, not incompetence or disloyalty, caused his downfall.

LEE, HENRY (1756-1818), Revolutionary War officer and early national statesman. Born in Prince William County, Virginia, Lee graduated from the College of New Jersey in 1773. An exceptional cavalryman, he rose to lieutenant colonel in the "Continental army, where he commanded "Lee's Legion" and was known as "Light-Horse Harry" Lee. In 1779, he captured a British force at Paulus Hook, New Jersey, and performed with distinction during the 1780-81 southern campaign.

Lee's military experience convinced him that American liberty depended on a strong central government led by proven patriots. He was a friend and supporter of George "Washington, whom he eulogized as "first in war, first in peace and first in the hearts of his countrymen." A staunch Federalist, Lee defended the Constitution at the 1788 Virginia ratifying convention and while serving as governor of Virginia commanded the 1794 Federal expedition against the "Whiskey Rebellion.

In private life, Lee fared poorly. Failed speculations landed him in debtor's prison in 1808. Four years later, a Baltimore mob injured him after he attempted to defend the office of an unpopular newspaper. In 1813-18, he convalesced in the West Indies, but never recovered; he returned to die at the Georgia home of his late comrade, Nathanael "Greene. One of his sons, Robert E. "Lee, would become the leading general of the Confederacy.

LEE, ROBERT E. (1807-1870), Confederate Civil War general. Born at Stratford, a family plantation in Virginia, Robert E. Lee was the son of Henry "Lee ("Light-Horse Harry") of the "Revolutionary War. He graduated with great distinction from West Point in 1829, and in 1831 he married Mary Custis, daughter of Martha Washington's grandson, George Washington Parke Custis, who was also George "Washington's adopted son. The Lees made their home at Arlington, the Custis mansion overlooking Washington, D.C. The marriage produced four daughters and three sons. The sons—George Washington Custis Lee, William Henry Fitzhugh Lee, and Robert E. Lee, Jr.—all served as officers in the "Confederate army.

Lee's continuous and distinguished service in the U.S. Army before the Civil War included highly acclaimed ac-

tion in the "Mexican War, the superintendency at West Point from September 1852 to March 1855, and western Indian fighting. Lee was a protégé of Gen. Winfield Scott, general-in-chief of the U.S. Army at the outbreak of the Civil War. When Virginia seceded, Colonel Lee resigned his commission in the U.S. Army (he had previously been offered high Federal command, but rejected it) and accepted command of his state's military forces. After service that included a position as military adviser to Confederate president Jefferson "Davis, Lee in June 1862 succeeded Joseph E. "Johnston as commanding general of the Army of Northern Virginia. Three years later, in February 1865, he was also appointed general-in-chief of the Confederate forces. In April 1865, having been besieged in the Richmond defenses, he surrendered the Army of Northern Virginia to Gen. Ulysses S. "Grant at Appomattox, Virginia. Lee and his soldiers were paroled by Grant to go home.

After the war, Lee rejected lucrative business opportunities and accepted the presidency of Washington College at Lexington, Virginia. An excellent educational administrator, Lee's leadership was marked by curriculum development in advance of the times. He died there in 1870 and is buried on the campus of the college, subsequently known as Washington and Lee University.

Lee was a man of high personal character and intelligence, charismatic and charming, a natural leader. As a leading actor in the Civil War legend of martial glory, he has become a legendary figure, an American hero of exceptional nobility. The legend rationalizes or rejects characteristics of the man that might lessen his appeal.

Lee's fame rests principally on his leadership of the Army of Northern Virginia. Having driven a numerically superior Federal army from the Virginia Peninsula near Richmond in 1862, Lee, ably supported by "Stonewall" "Jackson, won a series of brilliant tactical victories in 1862 and 1863 at the Second Battle of "Bull Run, and the Battles of "Fredericksburg and "Chancellorsville, and he fought George B. "McClellan to a standstill at the Battle of "Antietam. These battles were followed, however, by defeat at the Battle of "Gettysburg in 1863. Subsequently, Lee conducted a skillful, costly defense against Grant's Overland Campaign in Virginia in 1864-65, but in this he eventually failed.

Questions have been raised about Lee's leadership. In strategic terms, Lee believed that the South had to defeat the North militarily, that is, by actual combat in the field as distinguished from conducting the contest so that the North would give it up as too costly in blood and treasure. Thus, in a letter to President Davis on 6 July 1864 he wrote that it was necessary for the Confederacy to "defeat or drive the armies of the enemy from the field." Accordingly, before being besieged, Lee took the offensive whenever possible. Critics argue that in view of the South's manpower and materiel disadvantages, it could not defeat the North militarily. Lee's strategic and tactical aggressiveness produced unnecessarily large and disproportionate Confederate "casualties, which the outnumbered South was unable to replace. These casualties significantly reduced the number of troops, increasing the South's disadvantage. This, in turn, deprived his army of mobility and ultimately led to its being caught in the fatal siege.

Lee's defenders reply that a desperate situation required desperate gambles, and that his battlefield successes were perhaps the principal encouragement to the continued

Confederate resistance. Whatever his shortcomings, Lee became the white South's greatest hero, and many northern and foreign commentators have praised both the man and the general.

LEJEUNE, JOHN A. (1867-1942). Major general, commandant of the Marine Corps (1920-29), reformer, and champion of * amphibious warfare. An 1890 Annapolis graduate who spent twenty-seven years in shipboard service and expeditionary duty in the Caribbean, Lejeune, a tough-minded Louisianan with sharp political skills, emerged from divisional command in Europe in World War I with a reputation second only to George Barnett and Smedley *Butler as a Marine Corps leader. Replacing Barnett as commandant amid controversy about the Corps' future functions, Lejeune stressed a single reason for Corps' existence: wartime seizure and defense of advanced naval bases in a Pacific war against Japan. In July 1921, Lejeune endorsed a study of Pacific Ocean offensive amphibious operations by Maj. "Pete" *Ellis and announced that henceforth Marine Corps officer education, troop training, major exercises, and equipment development would focus on amphibious landings. He also stressed that Marine aviation belonged within the assault force. He sponsored expeditionary force exercises in 1924 and 1925, but the undeclared Corps lost its landing forces to interventions in China and Nicaragua until 1934. Nevertheless, Lejeune set the Corps on its most important and persistent mission. After retirement in 1929, he served as president of Virginia Military Institute until 1937.

LEMAY, CURTIS E. (1906-1990), air tactician and *World War II general. Lemay began his career in 1929 as a fighter pilot and transferred to bombers in 1937. In May 1942, he took command of the 305th Bomb Group. He trained the group and took it to England. LeMay increased bombing accuracy by discontinuing evasive action during bombing and substituted straight, level approaches, resulting in no increase in *casualties. By June 1944, he commanded almost 500 heavy bombers. After transferring to the *China-Burma-India Theater in August 1944, he next transferred to Twenty-First Bomber Command in Guam. In March 1945, he abandoned daylight attacks, stripped his B-29s of unnecessary weight, and began a campaign of night fire bombing that damaged numerous Japanese cities. This campaign was a decisive factor in Japan's defeat.

In October 1947, LeMay became the commander of the

newly created U.S. Air * Force (USAF) in Europe. He organized the Berlin Airlift before returning to the United States to take over the Strategic Air Command (SAC) in October 1948, where he changed a dispirited force into an elite unit. His nine-year tenure (unheard of in the U.S. military) enabled him to apply consistent management practices and his remake of the organization was his most important achievement. SAC became an all-jet bomber force, developed in-flight refueling, and increased readiness to unprecedented heights. It served as the linchpin of the

• Eisenhower administration's military/diplomatic philosophy of massive nuclear retaliation. In 1957, LeMay became the Vice Chief of Staff, USAF—the man responsible for the day-to-day operations of the service—and in 1961, he became Chief of Staff. He found himself in the invidious position of opposing the strategic and tactical philosophies of the * Kennedy and *Johnson administrations with their emphasis on conventional warfare and * tactics, especially in Southeast Asia. LeMay further objected to the analytical management style of Secretary of Defense Robert S. *McNamara. LeMay retired in 1965.

LEMNITZER, LYMAN (1899-1988), World War II planner and negotiator; Chairman, *Joint Chiefs of Staff (JCS); NATO *Supreme Allied Commander, Europe. Lemnitzer was educated at West Point and served in the U.S. Army. In 1942, he was chosen as air-land planner for the *North Africa campaign, and later, as a planner for Gen. George S. *Patton, he helped plan the Allied invasion of Sicily. Along with Allen Welsh *Dulles he was selected in April 1945 as an Allied negotiator for the German surrender.

From 1945 to 1950, Lemnitzer was a military representative in diplomatic negotiations leading to the signing of the North Atlantic Treaty creating NATO and headed the U.S. program providing military assistance to Europe (MDAP).

During the 1950s, Lemnitzer served as CINCFE (Commander in Chief—Far East), became army representative to the JCS, and was promoted to chairman of the JCS in 1960 under the Eisenhower administration. As chairman, he was cognizant of the decision to launch the ill-fated Bay of Pigs invasion (April 1961), although he later maintained that the joint chiefs were asked only to evaluate the feasibility of the plan and did not approve it as finally executed. Despite harsh criticism of his tenure, the JCS's involvement in this debacle, and at one juncture his threatened removal, in July 1962 he was appointed as NATO's Supreme Allied Commander in Europe, the highest military position in the organization. In his six-and-a-half-year tenure, he dealt with the French withdrawal from NATO (1966), the relocation of NATO headquarters from Paris to Brussels, and the crisis in Cyprus. He retired at the rank of four-star general in July 1969 after fifty-one years of service.

LEND-LEASE ACT AND AGREEMENTS (1941). When the British could no longer pay cash for arms and munitions in December 1940, after the presidential election Franklin D. "Roosevelt suggested leasing or lending war supplies to those fighting the Axis. He likened it to lending a garden hose to a neighbor whose house was burning. Once the fire was out, said FDR, "he gives it back to me and thanks me very much," or, if damaged, he replaced it. For three months Americans debated the Lend-Lease bill in Congress. Isolationists condemned it as leading America into another European war, as in World War I. But many Americans saw the need to aid Britain and China against Germany and Japan. Numbering the bill H.R. 1776 gave it a patriotic aura, and Lend-Lease eventually passed by a 60-31 vote in the Senate and 317-71 in the House.

Signed into law on 11 March 1941, Lend-Lease permitted the president to "sell, transfer title to, exchange, lease, lend, or otherwise dispose of" defense articles to "any country whose defense the President deems vital to the defense of the United States." Congress initially appropriated \$7 billion, with a total expenditure of more than \$50 billion by the end of World War II. The British received the lion's share, \$31.6 billion in Lend-Lease aid. After the German invasion of the Soviet Union in June 1941, Roosevelt provided Lend-Lease to the USSR, \$11 billion, without which "the war would have been lost," as Josef "Stalin admitted. That "most unsordid act," as Winston S. "Churchill called Lend-Lease, turned the United States into the "arsenal of democracy" that forged victory in World War II.

LESBIANS IN THE MILITARY. See Gay Men and Lesbians in the Military.

LEWIS AND CLARK EXPEDITION (1804-06). In 1803, Thomas "Jefferson commissioned Capt. Meriwether Lewis and Lt. William Clark to explore what is now the north-west United States. The Louisiana Purchase later the same year altered the character of the planned expedition from an exploration of French territory to a first glimpse of lands that, in the view of many contemporaries, were essential to maintaining the agrarian, republican character of the nation.

The party of nearly thirty men—including Lewis and Clark, three sergeants, twenty-two enlisted men, volunteers, interpreters, and Clark's slave—departed St. Louis in May 1804 heading up the Missouri River. They wintered at the present site of Bismarck, North Dakota, where they acquired a guide and translator, the Shoshone woman Sacagawea. In spring 1805, they continued to the headwaters of the Missouri River, struggled across the Continental Divide, and headed west along the Salmon, Snake, and Columbia Rivers to the Pacific. They returned to St. Louis the following year.

Their exploration revealed both the absence of a trans-continental water route and a wealth of information, including detailed maps of their route, the earliest descriptions of Plains Indian culture, and observations of the

environment. Until the development of the railroad and steamboat, however, the region they had explored remained a fur-trapping ground and repository for removed Indians.

LEXINGTON AND CONCORD, BATTLES OF (1775). The political dispute between Britain and its American colonies flared into open conflict on 19 April 1775 at two towns outside Boston, Massachusetts. Maj. Gen. Thomas "Gage, commander in chief and governor of Massachusetts, dispatched some 800 soldiers to confiscate provincial military supplies stockpiled at Concord, about twenty miles inland. Six months earlier, colonial leaders, anticipating British action, had formed a quarter of the militia into a force ready to repel any attack on short notice. Warned of the British expedition by several dispatch riders, including Paul Revere, these "minutemen" gathered in the path of the advancing British force.

As dawn broke on the 19th, the British advance guard, roughly 250 men under Maj. John Pitcairn, approached Lexington, where the militia company, perhaps 70 men under Capt. John Parker, was assembling on the green. Pitcairn, seeing armed men on his right flank, deployed part of his command. Suddenly, nearby, a gun fired—perhaps accidentally. The British soldiers, thinking they were under attack, fired on Parker's company. By the time Pitcairn restrained them, eight colonists lay dead or dying on Lexington green.

When the raiders reached Concord, they found that the colonists had removed the stores, and that groups of armed men were converging on their line of march. In a firefight at the North Bridge over the Concord River, the militiamen demonstrated that they were capable of resisting by force of arms the passage of British regulars through the countryside.

Although it lacked central direction, resistance to the raiders mounted as they marched back to Boston. Pecked at by several thousand colonists, mostly firing from behind the stone walls that lined the route, the column was saved from destruction only by a force sent by Gage to ensure its safe return. The British retreat to Boston was the high-water mark for American militiamen during the war. Operating in small groups on home ground against an outnumbered enemy, they used their skills to best advantage. The colonists would have to create more permanent forms of military organization, however, to bring their rebellion to a successful conclusion.

LEYTE GULF, BATTLE OF (1944). Leyte Gulf—23-25 October 1944—the largest naval battle in history, was precipitated by the U.S. invasion of the Philippines during

World War II. Carrying out the landings at Leyte were the amphibious ships of the Seventh Fleet commanded by Vice Adm. Thomas C. *Kinkaid; providing cover against the Japanese Imperial Navy were the fast carriers and *battleships of the Third Fleet under Adm. William F. *Halsey. This divided American command, with no common superior nearer than Washington, afforded the weaker Imperial Fleet an opportunity.

Operation Sho-I, a typically complex Japanese plan, called for closely coordinated movements by four separate forces. To lure Halsey's Third Fleet away, the Japanese dangled far to the north four *aircraft carriers, which had lost most of their planes in June during the earlier Battle of the *Philippine Sea. Meanwhile, Vice Adm. Takeo Kurita's central force, composed of the strongest gun ships, including the giant battleships *Yamato* and *Musashi*, was to pass through San Bernardino Strait and fall upon Kinkaid's transports and supply ships from the east. The Japanese southern force, composed of two weaker groups of gun ships, would advance through Surigao Strait and assail the American landing from the south.

The battle started badly for the Japanese when their central force was ambushed on 23 October by *submarines, which sounded the alarm and sank two *cruisers. Alerted to the approach of Kurita, Halsey's aviators concentrated on the *Musashi*, sinking that battleship and compelling the central force to reverse course. Halsey next sighted the Japanese carriers, and thinking that Kurita was in retreat, headed north with his entire force. Unobserved, Kurita soon doubled back and slipped through San Bernardino Strait.

Simultaneously, the Japanese gun ships making up the southern force approached Surigao Strait. They ran headlong into Kinkaid's warships: destroyers, cruisers, and six old battleships, five of which were veterans of the attack on *Pearl Harbor. In history's last clash between battleships, the Japanese were routed early on 25 October at trifling cost to the Americans.

But at sunrise the same morning, the larger Japanese gamble seemed to have paid off. Kurita's ships fell on the few American vessels steaming to the east of Leyte Gulf: six small escort carriers with their spare destroyer screen. Tailored to the support of ground troops, these American vessels were ill-prepared to deal with the largest ships in the Imperial Fleet. Yet off the island of Samar, American sailors fought for over two hours with such skill and bravery that Kurita, after losing three heavy cruisers to "torpedoes, and believing he confronted Halsey's Third Fleet, ordered withdrawal. Having sunk only the escort carrier *Gambier Bay* and three smaller ships, Kurita limped back through San Bernardino Strait leaving untouched the vital American transports and landing craft at Leyte.

Overall, the American triumph was not unalloyed. Kurita's appearance off Leyte had compelled Halsey to break off his pursuit of the remainder of the Japanese northern force, although not before his aviators had sunk all four of the enemy carriers. The Japanese also won some successes with their land-based aircraft. On 24 October, a dive-bomber hit the torpedo storage area of the light carrier *Princeton*, setting off explosions that sank the ship. The next day, the first kamikazes of the war damaged five escort carriers and sank a sixth, the *St. Lô*.

Still, the battle was an overwhelming defeat for the Im-

perial Fleet. Of the 282 warships engaged (216 American, 2 Australian, and 64 Japanese), the Japanese lost 4 carriers, 3 battleships, 10 cruisers, and 11 destroyers. American losses totaled one light carrier, two escort carriers, and three destroyers. For all practical purposes, the Japanese navy had ceased to exist as an organized fighting force.

LIDDELL HART, BASIL H. (1895-1970), English military writer and theorist. Liddell Hart, Cambridge-educated, served as an infantry officer on the western front in World War I (twice wounded) and retired from the army as a captain (1924) for health reasons. He was a lifelong student and critic of war and generalship, though never a pacifist. He became military correspondent for the *Daily Telegraph* (1925-35) and *The Times* (1935-39), reaching the peak of his influence as an innovative thinker on army reform. His tactical ideas (the "expanding torrent" of attack, based on the German World War I offensive of spring 1918), spread to the strategic sphere, and ultimately to grand strategy and national policy (the "British Way in Warfare," based on naval power and economic blockade, and "limited liability" with regard to a British army commitment on the Continent). In the United States he was probably best known for his biography, *Sherman* (1929). Above all, with Maj. Gen. J. F. C. Fuller, Liddell Hart became internationally famous as the proponent of mechanization and armored warfare by highly trained professional forces. He fostered a remarkable number of influential contacts in the British army, and also in Weimar and Nazi Germany, though he was probably not as influential there as he and others were to claim after 1945. Emphasizing the importance of air support to "tanks, as well as the need for mechanized infantry, he argued that such forces would restore mobility and decisiveness to warfare.

Liddell Hart opposed sending the British army to Europe in 1939, and then argued against Winston S. "Churchill's policy of Total War, including "conscription, strategic bombing, and a goal of "Unconditional Surrender." After the war, his reputation as a military theorist revived, Liddell Hart published his interviews with German generals and edited Erwin *Rommel's papers. Among the first to argue that nuclear weapons could deter all-out conflict between nations but not prevent conventional warfare, his advocacy of restraint and avoidance of showdowns seemed more acceptable by the nuclear age than in the dark days of Nazi ascendancy. His final book about contemporary strategic issues, *Deterrent or Defence* (1961), was well received; he was knighted in 1966. His reputation is now being reassessed, but Liddell Hart will figure prominently in any account of twentieth-century military history and strategic thought.

The LIMITED TEST BAN TREATY (1963) prohibits all but underground nuclear weapons tests. It has been joined by most countries of the world.

Support for a treaty to ban nuclear weapons tests ballooned in 1954 during the *Cold War, when radioactive fallout from U.S. nuclear tests above the South Pacific fell on a Japanese fishing boat, the *Lucky Dragon*, after it entered a zone that ships had been asked to avoid during testing. The fallout was thought to have caused the death of one fisherman and sickness for several others. India's Prime Minister Jawaharlal Nehru spoke for many when he called for a ban on all further testing.

President Dwight D. *Eisenhower and Soviet premier Nikita Khrushchev authorized talks that came close to producing a treaty banning tests and did produce a temporary suspension of testing from 1958 to 1961. But the United States insisted on on-site inspections to verify that the Soviet Union was not testing, and the Soviet Union rejected such inspections as a form of espionage. Finally, after coming close to a nuclear exchange in the * Cuban Missile Crisis of 1962, Khrushchev and President John F. *Kennedy compromised in 1963 on a treaty that banned all but underground tests. Onsite inspections were most important for these tests; by not including underground tests in the treaty, the inspection issue went away. The treaty did not deal with the nuclear *missiles of the Cuban crisis but it symbolized the two leaders' desire to reduce tensions through negotiations to limit nuclear weapons.

Though the treaty was opposed by some responsible for designing nuclear weapons, it was welcomed around the world. Efforts since 1963 to extend its ban to underground tests produced 1996 agreement on a Comprehensive Test Ban Treaty. India, whose prime minister first called for an end to testing, refused to sign the treaty and set off underground nuclear weapon tests in May of 1998. Pakistan followed suit. The condemnation of both countries that followed was world-wide; economic sanctions were imposed by the United States and a few others. While most countries of the world had signed the treaty, many delayed their ratification. India and Pakistan indicated they would sign the new treaty if sanctions were lifted and other demands were met. But, by the end of 1998, they had not signed and the new treaty could not go into effect without them or without several other countries that had signed but not ratified, including China, Russia, and the United States.

LIMITED WAR, JOINT CHIEFS OF STAFF AND. During the *Cold War, the American military became involved in two major if limited wars or police actions: Korea (1950-53) and Vietnam (1964-72). Before the large-scale commitment of American military forces to these Asian

nations, the military leadership, the *Joint Chiefs of Staff (JCS), was. conservative in estimating the strategic importance of both areas, hesitant about U.S. involvement, and disagreed over the form of involvement. The impetus came from other agencies such as the State Department, and JCS endorsement was based upon psychological rather than military grounds. However, after the introduction of American forces in each case, military leverage on the policymakers increased; and as the wars dragged on, JCS identification with the policy became closer.

In the *Korean War, the JCS supported a policy labeled as "no win" by the field commander, Gen. Douglas *MacArthur, many congressmen, and a significant part of the public. In the *Vietnam War, the JCS advocated a policy that continually raised the stakes in a desperate attempt to achieve some form of victory. During Korea, President Harry S. *Truman fired the recalcitrant field commander and relied heavily on the JCS. During Vietnam, President Lyndon B. *Johnson fired Secretary of Defense Robert S. *McNamara "when he became soft," and again began to depend heavily on the JCS.

The joint chiefs played a role in keeping with the American tradition of civil-military relations. In Korea, the JCS took part in every major decision from the first involvement to the dismissal of MacArthur and the move toward a negotiated settlement. Both Truman and Secretary of State Dean *Acheson in their memoirs have nothing but praise for the JCS's conduct during the conflict.

JCS advice was solicited throughout the American involvement in Southeast Asia. The battlefield tactics of Gen. William C. *Westmoreland, Vietnam commander 1964-68, may have been questionable, but his support for administration objectives was never doubted. His successor, Gen. Creighton *Abrams, also loyally supported Washington policy.

The JCS did become involved in bureaucratic struggles with the Kennedy and Johnson administrations. Throughout, the joint chiefs always wanted to expand the war in Vietnam and make it more extensive than did most of their civilian counterparts. The resultant infighting led to actions by both sides that could have upset the civil-military balance. Initially, no member of the JCS was summoned to President Johnson's Tuesday White House lunches where U.S. bombing policy was established. After negative reaction in Congress and the press, Gen. Earle G. *Wheeler, chairman of the JCS, was invited.

The JCS recommended and supported the U.S. military withdrawal from Korea (1949) that helped precipitate the Communist invasion. In 1950, the chiefs urged the president to allow MacArthur to cross the 38th parallel, then refused to curb the field commander's provocative tactics, which ultimately led to massive Chinese intervention and near annihilation of American forces. Beginning in 1961, the JCS, accepting the ill-conceived domino theory, urged the commitment of significant numbers of American ground troops into Vietnam. Early in the Johnson administration, the JCS importuned the chief executive to bomb North Vietnam and recommended a strategy of provocation. Once troops had been committed and the bombing begun, the JCS urged the introduction of more troops and heavier bombing despite evidence that both were ineffective in getting the North Vietnamese to accept American war aims.

Responsibility is a two-edged sword. The joint chiefs

can claim credit for some of the successes of both wars. The decision of the Truman administration to seek a negotiated settlement in Korea rather than attempt a military victory over the Chinese was aided by JCS support. Likewise, the actions that apparently helped convince the North Vietnamese to accept a negotiated settlement—the mining of Haiphong Harbor in May 1972 and the massive bombing of Hanoi in December 1972—were originally conceived by the JCS.

LINCOLN, ABRAHAM (1809-1865), sixteenth president of the United States. Born into a poor family in Hardin County, Kentucky, Lincoln moved with his family to Indiana in 1816 and to Illinois in 1830. In 1831, he settled in New Salem, near Springfield; in 1842, he married Mary Todd, daughter of a prominent family. Lincoln pursued the law and politics, both successfully. As a Whig he served in the state legislature (1834-41) and in the House of Representatives (1847-49), where he criticized the "Mexican War. The slavery expansion controversy prompted his reentry into public life in 1854, now in the new Republican Party. His national stature was enhanced when he challenged and lost to Stephen A. Douglas for the U.S. Senate in 1858.

In 1860, Lincoln won the Republican presidential nomination because of his reputation for public honesty, his availability, and because his rivals had too many political enemies. Winning popular votes only in the North, Lincoln carried the electoral vote against three opponents (including Douglas) and took office on 4 March 1861. The country was divided by the secession of seven Southern states, whose white population believed that Lincoln's election portended the death of slavery. In his inaugural address, Lincoln tried to reassure his "dissatisfied fellow countrymen" that he would not attack slavery where it existed, but neither would he allow the Union to be destroyed. The Southern capture of "Fort Sumter in April 1861 did lead to war, to the secession of additional Southern states, and ultimately to the end of slavery.

Thus, Abraham Lincoln addressed two mortal public issues: war and freedom. He addressee, men with a political skill never before demanded of a U.S. president and never matched thereafter. Lincoln understood his limitations and his strengths, at once willing to defer to men of demonstrably greater knowledge or ability yet willing to impose his authority over them. As commander in chief, Lincoln understood that mobilizing an effective military force was similar to forming a political coalition, that political goals were akin to grand strategy. He also promoted professional soldiers, usually West Pointers, to significant commands, but he was chided too for appointing "political generals," which he believed necessary in order to gain popular support for the war. Some of the most egregious tactical blunders on both sides—from Malvern Hill to Cold Harbor to Franklin—occurred under the command of West Pointers.

During 1862-63, when Lincoln effectively acted as general in chief, he tried to impress upon his generals the need for precise aims and energetic execution of plans. Most notable was his frustration with George B. "McClellan, a general of ability who seemed reluctant to engage the enemy even when he held a military advantage, which he always did. When McClellan refused to press Robert E. "Lee after the Battle of "Antietam, Lincoln removed him from command. He also removed another general given to inertia, Don Carlos Buell, Union commander in Kentucky. Only days later, Lincoln wondered if the problem was "in our case" and not in the generals. Their successors (Ambrose "Burnside and William S. "Rosecrans) could do no better. Hard facts of terrain, distance, and a determined enemy would dictate military progress or the lack of it.

The "Union army did know success, however, notably in the major Battle of "Gettysburg (July 1863) and the siege of "Vicksburg (which ended with Vicksburg's surrender on 4 July 1863). Yet there was no decisive, or Napoleonic victory, nor could there be, as Lincoln came to understand; there would be only a remorseless and bloody struggle until the "Confederate army and the Southern will were broken, as they finally were in 1864-65. Victories in Virginia and Georgia were achieved by veteran armies led by redoubtable soldiers, Grant and Sherman, men of ability and determination, educated by their victories and their defeats. In order to overcome criticism of his wartime policies—the "Habeas Corpus Act, the establishment of martial law, censorship of opposition newspapers, and arrests of vocal opponents of the war—and to gain the support of War Democrats, Lincoln led a Union Party in 1864 and named Andrew "Johnson of Tennessee as his vice president. The Democrats nominated George B. McClellan, but military success, especially after the Battle of "Atlanta in September 1864, assured Lincoln's reelection.

Emancipation is the event most associated with Lincoln next to the preservation of the Union. His enemies, North and South, resisted freedom for the slaves during the "Civil War; his public friends thought that he was a reluctant emancipator, too calculating in advancing the great cause. A politician of Lincoln's time and place could not be unaware of the depths of racial animosity in the North, a social bias offset only by an intensity of feeling for the Union; yet this should not obscure the time and thought Lincoln gave to emancipation. He commented favorably on various options: colonization; gradual and compensated emancipation; and in 1862, he proposed an amendment to the Constitution that would abolish slavery. On 22 September 1862, after Antietam, he announced the "Emancipation Proclamation, a war measure grounded in his constitutional mandate as commander in chief, to take effect on 1 January 1863. Lincoln's eloquence of advocacy thereafter elevated political rhetoric to levels unequalled before or since. The Union could be saved only through military force, he said, and emancipation was a necessary corollary to military action. Thus were joined the great issues of war and freedom. Lincoln had effected a revolution and said as much in his immortal speech at Gettysburg.

In his second inaugural address, Lincoln suggested that the Civil War was God's punishment for the great sin of slavery, and that even if it continued "until every drop of blood drawn with the lash, shall be paid by another with the sword, as was said three thousand years ago, so still it

must be said, 'the judgments of the Lord are true and righteous altogether.'" Five days after the war ended, Lincoln was shot by John Wilkes Booth while watching a play at Ford's Theatre. He died on Good Friday, 15 April 1865.

LINDBERGH, CHARLES (1902-1974), U.S. flier, aviation consultant, author, and conservationist. An army-trained pilot who also flew the mail, Lindbergh achieved world fame in 1927 for his New York-to-Paris flight, the first solo transatlantic air crossing. The hero was awarded the Distinguished Flying Cross, the Medal of Honor, and promoted to colonel in the Air Corps Reserve.

While in Europe in the 1930s, Lindbergh made several visits to Germany and was credited with obtaining valuable air intelligence for the United States. In 1938, the U.S. ambassador in London, Joseph Kennedy, asked Lindbergh to assess the military situation in Europe. Lindbergh argued against fighting Germany because he believed German airpower would be overwhelming.

Upon returning home in 1939, Lindbergh advised the Air Corps on its expansion. When war came in Europe, he spoke out against U.S. involvement and eventually joined the isolationist America First Committee. Denounced by President Franklin D. *Roosevelt for his stand, he resigned his reserve commission. In a Des Moines speech (1941), he singled out the Roosevelt administration, the British, and the Jews as "war agitators." The speech caused a furor in which Lindbergh was widely attacked as an anti-Semite.

After the attack on *Pearl Harbor, Roosevelt blocked Lindbergh from serving in uniform. Nonetheless, Lindbergh joined the war effort. He became a consultant at the Willow Run bomber plant, and evaluated the F4U Corsair fighter for United Aircraft. Although a civilian, Lindbergh made his way to the Pacific and persuaded local commanders to allow him to fly in combat. He completed fifty missions and was credited with downing one Japanese plane.

Lindbergh traveled to Europe after V-E Day to study German jets and rockets. As an air force adviser he inspected military units, helped select the Air Force Academy site in Colorado, and served six years on the Scientific Advisory Committee of the Department of *Defense. In 1960, he retired as a reserve brigadier general, having been appointed to that rank in 1954.

LISBON AGREEMENT ON NATO FORCE LEVELS (1952). The Lisbon force goals, which were adopted by the

North Atlantic Council (NAC) in February 1952, represented the high point of *NATO's attempt to build up the conventional forces defending Western Europe following the outbreak of the Korean War. They were based on the recommendations of the Temporary Council Committee (TCC), an ad hoc body established by the NAC the previous September to reconcile NATO's military requirements with the political and economic constraints that were already causing the initial rearmament efforts of the European members to falter. In December, the TCC presented a detailed program that called for the creation by the end of 1954 of a total of forty-two ready divisions and forty-five (increased to forty-eight by the NAC) reserve divisions mobilizable within thirty days. Soon after these goals were adopted, however, it became clear that they could not be achieved, primarily because the economic assumptions on which they were based were overoptimistic. The NATO force goals for the end of 1952 adopted at Lisbon were twenty-five ready divisions and twenty-eight and two-thirds reserve divisions mobilizable within thirty days. Actual forces in existence at the end of 1952 were twenty-five ready divisions and twenty reserve divisions. Although the goals for 1952 were largely met by the end of the year, further significant increases, especially in mobilizable divisions, seemed doubtful. Force goals for the end of 1953 were thirty-six and two-thirds ready divisions and thirty-five and two-thirds reserve divisions; in April 1953, however, the NAC revised these goals downward to thirty and one-third ready divisions and twenty-six and one-third reserve divisions.

LITERATURE, WAR AND THE MILITARY IN. Fascination with war continues in the twentieth century, and no less fascinating is the literature that war has spawned. In novels, poems, memoirs, and plays, the subject finds an immense readership. Half a century after the end of World War II, books continue to issue from major publishers. Manuscript memoirs circulate widely among former warriors. Diaries and journals (kept secretly during wartime service, and subject to court-martial if discovered) surface every day to find their way into print. As the literature of war grows, readership grows too among combat veterans, professional historians, and students of the matrix of twentieth-century military life who yearn for the intimate details of war told by those who experienced it.

War fiction—short stories and novels—has had a major impact on readers in this century. For the most part, the significant war fiction finds its roots in the classic tales of earlier centuries. Writers on war often cite Leo Tolstoy's *War and Peace* and Stephen Crane's *Red Badge of Courage* as inspiration. At the core of Crane's small masterpiece lies a preeminent theme: the rapid, tragic maturation of youth. This theme is also included in Erich Maria Remarque's classic, *All Quiet on the Western Front*, the tale of a naive and idealistic German lad who slowly loses his idealism as *trench warfare inexorably destroys his comrades and, eventually, himself. No novel of World War I more poignantly captures the utter futility of war and of an epoch.

Much of this nihilistic attitude is also found in William March's *Company K* and Ernest Hemingway's *A Farewell to Arms* and *The Sun Also Rises*. Although the last cannot be

categorized as a novel of World War I in the sense that it is a chronicle of combat, it does speak of the aftermath of that war and the symbolic emasculation of all its participants. The Australian novelist Frederic Manning addresses this same futility in *The Middle Parts of Fortune*, first published anonymously in 1929 and a year later in an expurgated version, as *Her Privates We*.

The poetry of World War I continues to reach as wide an audience as did the fiction of that war. Thematically, this verse differed little from the novels: loss of innocence, idealism, and patriotism; the shock of combat and its aftermath; the wanton destruction of the natural world. Wilfred Owen (the best of the poets), Rupert Brooke, Julian Grenfell, Isaac Rosenberg, Edward Thomas, and the American soldier-poet Joyce Kilmer, all died in the Great War, leaving behind them a considerable body of small masterpieces. Others—Edmund Blunden, Herbert Asquith (son of the British prime minister), Robert Graves, A. R. Herbert, Herbert Read, and Siegfried Sassoon—survived the war, but each in his own way was indelibly marked by it. They expressed their psychic wounds in a number of memorable poems, all speaking to the same theme: the intense violence of battle, the long reflection after combat, and the anguish suffered over lost comrades. The war's greatest verse is marked by these themes.

Much of the literature evinces language that war itself engenders. Warriors tend to be word merchants. They manufacture words and phrases that seem appropriate to themselves and to their plights. In every war—and surely most obvious in World War II—warriors created a vocabulary that proved to have remarkable staying power. Few military men or women speak a genteel language, for the very magnitude of what they do and the traumas they undergo spawn a vocabulary that fits their moods, actions, thoughts, and ideals. The ubiquitous *wordfuck* (used with great frequency for every situation and as practically every part of speech) began to appear in print soon after the end of World War II. (In World War I, the British *bloody* served a similar function.) Hemingway's *Across the River and into the Trees* appeared first in *Cosmopolitan* magazine. His Colonel Cantwell's "f - was considered a breakthrough in the era's publishing censorship; but in Norman Mailer's *The Naked and the Dead*, *fuggin* became for the general reading public what all veterans of World War II (and other wars) understood: The warriors' curse. The ingenuity of their cursing became the subject of some mirth and eventually found its way into a great deal of the literature of the twentieth century. Some language was simply dusted off from earlier wars: *K.P.* and *AWOL* date from the American *Civil War. But the scope, mechanization, and immensity of World War II gave rise to an entirely new and highly imaginative language. The acronyms *WAVE, WACK, and SNAFU, along with words and phrases like "TS cards," "flak," "chickenshit," "K rations," "jerry cans," "gremlins," "sky pilot," and the ubiquitous "Kilroy Was Here," all attest to the fanciful coinages of war. Thus no novel, poem, or short story needed a gloss to help readers define terms or fathom dialogue. And years after that war, many such words and phrases (for veteran and civilian alike) remain in our vocabulary. The wars in Korea and Vietnam have added to, and in some cases enriched, the language. The flexibility and breadth of English in great measure account for this phenomenon.

The huge differences between World Wars I and II ac-

count in some ways for the quality and scope of their literature. World War I, as historians and literary critics have noted for years, was a relatively contained war; that is, the major battles were fought in the trenches and bunkers of Western Europe. Day after day, week after week, stalemated armies fought and died over a few yards of mud and rubble. There were no great decisive sea battles in World War I—battles involving massive task forces, submarines, and thousands of aircraft. The daily horrors of trench warfare, then, became the metaphors of the war and found their way into impressive works of literature. World War II was a vastly different war. It covered a huge geographic area, involved far more combatants and civilians, and resulted in far greater *casualties. It also involved massive amounts of highly sophisticated and deadly efficient weapons (*radar, aircraft, *tanks, and the like) and at times moved with blinding speed across the terrain. Unlike World War I, when battles like the Somme and Verdun symbolized the entire war experience, World War II was marked by many battles sprawled across vast areas, each one a tragic symbol of the era. Guadalcanal, Midway, Iwo Jima, Kasserine Pass, Anzio, Leyte Gulf, Okinawa, the bomber campaign over Germany, the invasion of *Normandy, the Battle of the *Bulge—all represented separate and distinct facets of the World War II experience.

Just as American novelists from the World War I era strove to share their stories soon after the armistice was signed (William Boyd's *Through the Wheat* and William March's *Company K*), novels of World War II began to appear as early as the mid-forties and into the early fifties. First, in 1944, was John Hersey's *A Bell for Adano*. In 1946, Thomas Heggen's *Mr. Roberts* was published. John Horne Burns's *The Gallery* and James Michener's *Tales of the South Pacific* appeared in 1947; and a year later came James Gould Cozzens's *Guard of Honor*. Irwin Shaw's *The Young Lions* and Norman Mailer's *The Naked and the Dead* were both published in 1948. James Jones's *From Here to Eternity* appeared in 1951, as did Herman Wouk's *The Caine Mutiny*. All were critically acclaimed; several became successful films; Hersey, Cozzens, and Michener won Pulitzer Prizes.

American dramatists soon followed suit. In 1947, Arthur Miller's *All My Sons* was staged. In one sense, Miller's drama was a more political statement than the famous World War I play by Maxwell Anderson and Laurence Stallings, *What Price Glory?* A chronicle of wartime profiteering, *All My Sons* dwelt on many of the same themes employed by the fiction writers of the period: human waste, Pyrrhic victories, and self-aggrandizement in both military and civilian life. Since then, Vietnam (far more than Korea) has become a metaphor for American involvement in foreign wars—as well as the basis for a literature of angst that has dominated the contemporary creative imagination.

England's role in World War II has been captured in a number of significant novels, many of them masterpieces of the genre. Alexander Baron's *From the City; from the Plough*, written soon after the novelist's return from six years as a combat infantryman in the British army, is a graphic account of a rifleman's life given in a tone that belies its content. No better novel of the war at sea has been written than Nicholas Monsarrat's *The Cruel Sea*; and few novels of World War II—or any war—captured the degradation and pain suffered in prisoner-of-war camps better

than Pierre Boulle's *Bridge on the River Kwai*, based on the story of the Burma-Thailand rail line built by British POWs and impressed native laborers.

Now, more than half a century from the end of World War II, personal memories dominate the English and American literary scene. In recent decades, the works of both professional and amateur writers have flooded the market; many have received high praise, and rightly so. Joseph Heller's *Catch-22* is both a comic novel and a bitter indictment of war. The book quickly became a cult favorite, and the title has become part of contemporary vocabulary. War in the air has been graphically portrayed by Samuel Hynes's *Flights of Passage*, Elmer Bendiner's *Fall of Fortresses*, and Richard Hillary's *The Last Enemy*. *Last Letters from Stalingrad*, edited by Franz Schneider, reveals the full horrors of Adolf Hitler's military and political madness in throwing German youth against Russia's might and its winter ally. Guy Sajer compounds those horrors in *The Forgotten Soldier*, the best German warrior's memoir of the eastern front. Harold Bond's *Return to Cassino* and Farley Mowat's *And No Birds Sang* are gripping accounts of the Allied campaign in Italy. John Hersey's *Into the Valley*, Richard Tregaskis's *Guadalcanal Diary*, and Eugene Sledge's *With the Old Breed on Peleliu and Okinawa* deal with Pacific "jungle warfare in all its Goyaesque images. Few prisoner-of-war chronicles achieve such power and poignancy as Manny Lawton's *Some Survived*. Donald Burgett's *Currahee*, told with chilling fidelity to detail, is the only first-person account of the invasion of Normandy by an American paratrooper. *D-Day*, a collection of memoirs by participants in the greatest seaborne invasion in history, has been edited by Stephen Ambrose.

In all of these memoirs, themes found in World War II fiction are evident; and all speak of the sense that each participant in war is aware in some vague way that he or she is involved in a monumental undertaking—but that the full scope and significance of that participation can never be fully fathomed. Personal memoirs of war also focus on the demeaning nature of man in battle, the atavistic nature of combat, and the agony experienced by boyish warriors assigned tasks they never believed they would experience. The most memorable memoirs all ring with war's bitter truth spoken by Walt Whitman: "I was the man, I suffered, I was there."

World War II memoir writers pay homage to their predecessors, especially the artists of World War I. English participants in the Great War wrote a remarkable number of evocative memoirs. The tone of most is modest and straightforward, but beneath their surface lies a deep vein of anger, fear, and chaos engendered by the daily brutality of trench warfare. Among the genuine classics in this genre is Siegfried Sassoon's trilogy, *Memoirs of a Fox-Hunting Man*, *Memoirs of an Infantry Officer*, and *Sherston's Progress*. Assuming the persona of George Sherston, Sassoon relates his wartime experiences, the Edwardian world he grew up in, and his growing bitterness at the graft, political maneuvering, and civilian indifference to the meaningless slaughter on the western front. No writer of his generation was more responsible for the widespread anti-war movement in England in the years following the war.

War correspondents—men and women who sketched, painted, photographed, and wrote about war from frontline positions or as part of vast sea and air armadas—achieved some considerable measure of distinction

through the quality and quantity of their work. Their collected dispatches have now become a distinct genre in the literature-of war and deserve high praise. Among the best journalistic writings to emerge from World War II are those of Ernie Pyle—*Brave Men*; Bill Mauldin—*Up Front*; and Homer Biggart—*Forward Positions*. Biggart's fierce competitor and colleague, Marguerite "Maggie" Higgins, reported brilliantly from Korea. Her dispatches are among the finest from that war.

Stanley Karnow's *Vietnam: A History* is the definitive work on the period and the war, while Michael Herr's *Dispatches* is among the best work by a correspondent who covered the jungle battles. A gripping, fanciful novel on Vietnam is Tim O'Brien's *Going After Cacciato*. Ron Kovic's *Born on the Fourth of July* is among the finest of the personal accounts of war and the nation's attitude towards its returning veterans. Nathaniel Tripp's *Father, Soldier, Son* is a brilliant memoir of Vietnam; the work alternates between the Vietnam years and Tripp's father's emotional struggles in World War II.

To many, verse is not an art form that lends itself to a depiction of war. Yet the shock of combat and the chaos of the battlefield became a muse for a number of American and British warrior-poets of World War II. The best of these poets seemed to find that only verse could capture the immensity of what they had experienced—that only verse could speak the unspeakable. World War I verse disproves William Butler Yeats's maxim that "passive suffering is not a theme for poetry." Compared with the quality and quantity of poetry of the Great War, however, little verse from World War II measured up. The lengthy immersion in war by British soldiers on the western front from 1914 to 1918 supplied them with the subject matter of the loss of all illusions and death in its most horrible forms. At the same time, there seemed to develop among these poets a particular sensibility and ironic feeling that in the beauty of verse lay the vehicle to express that what they were doing and seeing. During and after World War II, no American poet captured the vision or intensity of an Owen or a Sassoon. But a handful of American poems stand out. Among them are Randall Jarrell's "Death of the Ball Turret Gunner," Richard Eberhart's "The Fury of Aerial Bombardment," and Louis Simpson's "The Runner." In England, Henry Reed's collection, *Lessons of War*, represents one powerful voice to emerge from the era.

From the ancient historian Thucydides to those writing in the waning decades of this century, men and women continue to strive for words to articulate their war experiences and to share them with others. One thing is certain, however. Thomas Hardy, too old to serve in World War I but caught up in the hideous drama unfolding before him, wrote that one day "war's annals will fade into night." Judging from the continuing flow of war literature in our time, it appears that "war's annals" are far from that. Rather, they lie at the dawn of the memories and imaginations of creative artists.

LITTLE BIGHORN, BATTLE OF THE (1876). This clash between U.S. cavalry and Sioux and Cheyenne Indians has gained renown in both history and legend. Although a triumph for the Indians, the disaster celebrated as "Custer's Last Stand" so outraged the American people that the army launched a counteroffensive that ended warfare on the northern plains.

The Sioux War of 1876 originated in the Treaty of 1868, which established the Great Sioux Reservation in Dakota Territory. Part of the seven tribes of Lakota Sioux and their Cheyenne allies settled on the reservation, while the rest gathered with *Sitting Bull, *Crazy Horse, and other "nontreaties" in the "unceded" Powder River country to the west. After discovery of gold in the Black Hills in 1874, the government sought to buy the hills from the reservation chiefs. The attempt failed in large part because of the opposition of the nontreaty chiefs. To destroy their independence, the government ordered all Indians to their agencies by 31 January 1876 or face military action. The nontreaties did not comply.

Lt. Col. George Armstrong *Custer's Seventh Cavalry marched with one of three columns that converged on the unceded territory. Battlefield reverses turned back Gen. George Crook, but Gen. Alfred H. Terry and Col. John Gibbon united on the Yellowstone River at the mouth of the Rosebud Creek and formed plans to strike the Indians, thought to be in the Little Bighorn Valley. Custer would march up the Rosebud and hit from the south, while Terry and Gibbon would ascend the Yellowstone and Bighorn and position themselves to head off any Indians flushed by Custer.

On 25 June, before Terry and Gibbon were in position, Custer found and attacked the Indian village on the Little Bighorn. It contained about 7,000 people, 2,000 fighting men. Custer's regiment numbered about 600, which he divided into three battalions, one under Maj. Marcus A. Reno, one under Capt. Frederick W. Benteen, and one under his personal command. Benteen departed on a mission to ensure that no Indians camped in the valley above the main village. Custer and Reno approached the village itself, which Custer apparently intended to strike from two directions. While Custer and five companies rode downstream behind masking bluffs, Reno and three companies charged the upper end of the village.

Although surprised, the warriors rallied and threw Reno's small command back across the river with heavy *casualties. Reno's retreat freed the Indians to concentrate on Custer at the other end of the village. They caught him in broken terrain east of the river. Within an hour, all five companies, 210 men, had been wiped out. No man survived. Joined by Benteen, Reno held hilltop positions four miles to the south through the next day, when the Indians, discovering Terry's approach from the north, pulled off to the south.

The disaster promptly set off a controversy that still rages. Whether a reckless glory hunter or a capable field commander victimized by bad luck, in defeat Custer gained an immortality that no victory could have conferred.

LOBBIES, MILITARY. Curiously absent in discussions of American *civil-military relations is any mention of the lobbying organizations that do the daily work of politics. Yet the defense arena features organizations very similar in form and action to those that permeate the political system. Although not as well known as the veterans' organizations, organizations such as the Association of the United States Army (AUSA) and the American Defense Preparedness Association play active political roles. While not all "lobby" in the legal sense, all seek to influence government decisions by mobilizing attention, money, and votes.

The history of these organizations reflects the history of the American political system and the American military. The late nineteenth century saw the first foundings of military professional and political organizations. For example, the National Guard Association of the United States (NGAUS) was formed in 1878 for "practical reform which would make the Militia a more effective instrument... of National Defense." Today, some of these organizations are narrowly professional; others have evolved into politically active organizations.

The history of two organizations of this era, the Navy League and the Marine Corps Association, however, illustrates the difficulty of separating the professional from the political. The Navy League, sponsored by Theodore *Roosevelt, was founded in 1902, "not to formulate specific needs for Navy ... but rather to educate the people on the importance of sea power." Education about the navy was in fact education about Theodore Roosevelt's expansionist policy. The Marine Corps Association was founded in 1911, born in the heat of politics as a response to an effort to reduce the role of the *Marine Corps. It succeeded in sustaining the Corps in part because of the political connections of its members.

Several organizations were founded after World War I, including the Reserve Officers Association (ROA) and the Fleet Reserve Association. There was a second surge of foundings between 1946 and 1955; many of these were industrial organizations, like the American Defense Preparedness Association. Organizations founded in the 1960s through the 1980s were more specialized (the Army Warrant Officers Association) or focused on enlisted members and families (the Non-Commissioned Officers Association and the National Military Family Association). Today, fifty to sixty organizations claim to represent the views of military members or their families.

Lobbying organizations fall into three main types. First are the industry-based educational associations, such as Armed Forces Communications and Electronics Association (AFCEA, with 25,000 individual members and 12,000 corporate sponsors), which operate under sections of the Internal Revenue Code that restrict explicit lobbying and political activity. They do not employ registered

lobbyists or undertake explicit political efforts. They do sponsor educational activities on general issues, such as the health of the military's industrial base, and develop policy agendas. Their budgets may be substantial, in the \$1—\$7 million range.

Other organizations, such as The Retired Officers Association (TROA) and the National Association for Uniformed Services (NAUS), specialize in personnel issues and have memberships of 100,000 or more; ROA is the largest at 400,000, with an \$11 million annual budget. These organizations may employ registered lobbyists, and NAUS has its own political action committee, a rarity. To sustain their membership base, they feature extensive membership packages ranging from credit cards to health insurance.

The third major type is the "peak organization," as in the AUSA and the Navy League. Though they receive Department of *Defense (DoD) support for annual meetings, they are independent organizations, have corporate members and individual memberships of 50,000-170,000 people, and budgets of \$3.5-\$ 13 million. Several have registered lobbyists, and all undertake extensive political activity, in the broadest sense. The ROA, for example, publishes a legislative agenda and organizes "meet your congressman" breakfasts.

All of these organizations monitor governmental activity, seek to shape public opinion, and intervene in the policy process. They are not direct channels of campaign contributions. Rather, they gain influence either through their voting strength (military personnel groups represent 3.75 million voters) or personal contacts (most organizations employ veterans from the executive branch or Capitol Hill).

How much impact do these organizations have? Personnel issues have shown where they are most influential. Since the 1970s, the organizations have won improvements in pay and personnel support. They have been relatively effective, though not triumphant, in mitigating efforts to reduce military and retiree benefits. They also have had impact on actions within the DoD. For example, the DoD comptroller once got 7,000 letters prompted by lobbying groups when he proposed cutting commissary benefits; he reversed his course.

These organizations serve a classic political function: the representation of citizens before their government. Though they frequently support articulated DoD positions, they are not mere mouthpieces. For example, NGAUS and ROA have provided active voices for the reserve components, sometimes in quiet opposition to DoD and occasionally in active battle with DoD and each other. Study of the "losses" of these organizations is also instructive. The Air Force Association undertook an effort to fund additional B-2 bombers. This effort was contrary to DoD policy, but featured several recently retired generals pressing the case. The effort died; absent administration support, it was not able to develop congressional support. Lobbying organizations have also failed in the effort to gain greater access to the military commissary system for reservists.

Some of the issues that activate these organizations have nothing to do with pay or procurement. The Air Force Association started the controversy in 1995 over the Smithsonian Institution's *Enola Gay* exhibit. The association's membership was very active in the campaign to change the

exhibit, in coalition with veterans' groups. For the Air Force Sergeants' Association, one of the biggest nonbenefits issue* has been its opposition to gays in the military. Lobbying organizations have also been active at the state level: the California department of the ROA has been an opponent of efforts to remove *ROTC from state colleges.

Military lobbying groups have a long history. Though their policy positions differ from the Sierra Club, say, they perform a similar function and use similar techniques. But declining defense budgets, aging memberships, smaller armed forces, and the decline in military experience in Congress all signal a potential for more limited effectiveness.

LODGE, HENRY CABOT (1902-1985), senator and diplomat. Born in Massachusetts, Lodge was the grandson of the Massachusetts senator for whom he was named. Elected to the U.S. Senate in 1936 and 1942, he resigned in 1944 to go on active duty in Europe with the Second Armored Division. Lieutenant Colonel Lodge received several combat decorations. Reelected to the Senate in 1946, he lost his seat to John F. * Kennedy in 1952. Lodge served from 1953 to 1960 as U.S. ambassador to the *United Nations and was the Republican nominee for vice president in 1960.

President Kennedy named Lodge ambassador to South Vietnam. When Lodge arrived in Saigon in August 1963, members of South Vietnam's armed forces were plotting the overthrow of President Ngo Dinh Diem. Lodge tried unsuccessfully to get Diem to remove his unpopular brother, Ngo Dinh Nhu, from the government, and the ambassador concluded that Diem was politically doomed. On 1 November 1963, a coup toppled Diem's government and led to the murders of Diem and Nhu. Lodge emphatically denied subsequent allegations in *The Pentagon Papers* (1971) and other accounts that he authorized or encouraged the coup on instructions from Washington. The embassy had knowledge of the plot, he admitted, but not of its timing and details, especially the murders.

Lodge resigned as ambassador in June 1964 to participate in the Republican presidential nomination process, but he returned to head the U.S. Embassy in Saigon July 1965-April 1967. From June to December 1966, he engaged in Project Marigold—secret but futile talks through Polish intermediaries to explore a negotiated settlement with North Vietnam. In March 1968, Lodge was part of the group of elder statesmen, the Wise Men, who advised Lyndon B. *Johnson not to send more troops to Vietnam. He was a delegate to the Vietnam peace talks in Paris in 1969 and served as ambassador to Bonn and the Vatican before retiring in 1977.

LOGAN, JOHN (1826-1886), *Civil War general, politician, author. Logan abandoned his political career in 1861 to raise an Illinois volunteer regiment for the Union during the Civil War. "Black Jack" Logan served in the western theater, where he won a major generalcy by 1863. Following division and corps commands, he temporarily led the Army of the Tennessee in the 1864 Atlanta campaign.

Subsequently, Logan chaired the Military Affairs Committees during his years in the House and Senate (1866-86); he founded and was three-time president of the *Grand Army of the Republic, 1869 through 1871. In both roles, he extolled the volunteer *citizen-soldier and excoriated the dominance of military high command by "aristocratic" army officers. Logan's ponderous *The Volunteer Soldier of America* (1887) reiterated these themes.

Logan's attacks on the regular army represented in part resentment following Gen. William Tecumseh *Sherman's selection (1864) of a West Pointer to permanent command of the Army of the Tennessee. Logan was more than the mere political hack and unthinking military critic some scholars have depicted. Recognized as the one of best of the "political" volunteer generals, his ideas for training citizen-soldiers and opening high command opportunities for them were not mindless. The hyperbole of Logan's rhetoric, however, gravely weakened his assessment of postwar military policy.

LOGISTICS. Early in the twentieth century, Secretary of War Elihu *Root observed that for Americans the difficulties of making war lay not in the raising of soldiers, but in equipping, supplying, and transporting them. The evolution of modern warfare since 1898 amply demonstrates the truth of Root's observation. The scale and scope of modern wars, rapidly changing technology, and new military doctrines involving the rapid movement of large forces over great distances have made logistics the key to modern warfare.

The Definition of Logistics. The word *logistics* comes from the Greek *logistikos*, meaning one expert in enumeration. First used in the eighteenth century, the word in its current meaning became popular during World War II. In 1949, the army's *Field Service Regulations* defined logistics as "that branch of administration which embraces the management and provision of supplies, evacuation and hospitalization, transportation, and services. It envisages getting the right people and the appropriate supplies to the right place at the right time and in the proper condition." In his 1966 history of army logistics, James A. Huston points out that logistics is the application of time and

space factors to war and consists of "the three big M's of warfare—*matériel*, *movement*, and *maintenance*."

Narrowly construed, logistics encompasses the four main activities noted in the 1949 *Field Service Regulations*: supply, transportation, evacuation and hospitalization, and services (maintenance being the most prominent). A broader understanding might encompass all measures taken by a state to raise, arm, equip, feed, move, maintain, and otherwise care for its armies in the field. In its broadest construction, logistics also properly includes the mobilization of industry and manpower, research and development, procurement, construction of facilities, personnel management, and allied tasks.

Logistical Functions. Each of the armed services maintains its own logistical system. Despite obvious differences in equipment and certain specialized activities, such as underway replenishment of ships at sea and the aerial refueling of aircraft, each of these systems performs essentially the same five functions: the determination of requirements; acquisition; distribution; maintenance; and disposal. The determination of requirements involves the statement of needs and the definition of the resources required to meet those needs. Acquisition encompasses research and development, design, testing, production, and purchase of ships, aircraft, weapons, vehicles, ammunition, fuel, rations, clothing, and other equipment and supplies. Distribution includes the *transportation, receipt, storage, and issue of materiel of all kinds. Maintenance involves the inspection, service, lubrication, and adjustment of equipment, and its calibration, repair, or refurbishment. The final logistical function is the disposal of worn, damaged, or surplus supplies and equipment.

Principles of Logistics. Although logistical organization and procedures vary among the services, the logistical systems of the army, navy, Marine Corps, and air force all respond to the same set of logistical principles. Most students of military affairs are familiar with the nine "Principles of War"—Mass, Objective, Simplicity, Unity of Command, Maneuver, Offensive, Surprise, Security, and Economy of Force—developed to serve as guides to the conduct of * strategy and *tactics. The principles governing the conduct of logistics are less well known but no less important.

Many commentators have tried to formulate the "principles of logistics." Huston, for example, proposes fourteen principles based on the American experiences in war, and the army officially adheres to the nine set forth in chapter 3 of *Army Regulation 11 -8: Principles and Policies of the Army Logistics System* (1976). Both are too long and complex for practical purposes, but can conveniently be summarized under five headings: *Concentration*, *Austerity*, *Visibility*, *Mobility*, and *Flexibility*. Concentration is the key, and its accomplishment involves the positioning of superior combat power at the decisive time and place. Allied successes in World War II, and more recently during the * Persian Gulf War in Operation Desert Storm, were due to observing just this principle. Resources are always limited, and thus logisticians must always observe the principle of Austerity, which has two aspects. The first is economy—the conservation of available resources before battle and the economical distribution of materiel to other, less vital, areas. Economy involves avoiding both excessive expenditure and unnecessary duplication of resources. The second is Simplicity. Simplicity of doctrine, organization, equipment,

and plans is essential to the successful logistical support of combat operations. The third principle is that of Visibility. Because the inability to locate a critical item is tantamount to not having it at all, the successful commander or logistician must always know what he or she has and where it is. Mobility is the fourth principle. Insofar as mobile troops are essential to success on the modern battlefield, adequate transportation must be provided for all military operations, and all military equipment must be designed for agility and transportability. The final principle is Flexibility, or the capacity to accommodate the unforeseen. This can be accomplished by flexibility of organization, plans, and materiel, and, above all, by flexibility of mind.

Periods in the History of American Military Logistics. The history of American military logistics can be divided into four grand periods, each of which has posed new challenges for American logisticians. The period from 1775 to 1845 was an Era of Creation, in which civilian and military leaders struggled to establish effective mechanisms for supporting the armed forces just as the nation searched for effective mechanisms of political and social organization. The challenges of creating effective logistical systems were ultimately met, but not without significant delays, setbacks, and near disasters. The second period ran roughly from the "Mexican War (1846–48) to the "Spanish-American War (1898). In this Era of Professionalization, primitive logistical organizations and procedures were placed on a regular and continuous basis, and the practitioners of logistics developed standards of training and performance suitable for a well-established organization. The development of modern technology and the necessity of worldwide operations after 1898 thrust logisticians into a new Era of Specialization, which lasted roughly until the end of World War II. The relatively simple logistical tasks and organizations that had met the needs of earlier times became much more complex, requiring more and better trained personnel, larger and more diverse logistical organizations, and greater management and control. The Era of Specialization overlapped the fourth phase, the Era of Integration, which began before World War II and continues today. This most recent period is characterized by an emphasis on centralized direction of logistical activities, organization along functional lines, and joint and combined operations employing a variety of advanced technologies.

Themes in American Military Logistics. A chronological account alone cannot fully explain the uneven history of logistical organization and doctrine, in which many key concepts cannot be pigeonholed, and prominent themes cross the boundaries of the four periods. Fortunately, although the history of military logistics in America is complex, its nine salient themes can be concisely stated.

1. *Increasing importance of logistics vs. strategy and tactics.* Since 1898, logistical considerations have increasingly dominated the formulation and execution of both strategy and tactics; yet obvious as it may seem, in practice many military leaders continue to ignore the importance of logistics. At best, logistical considerations and logisticians are seen as unwelcome, if necessary, adjuncts to strategic planning and the management of "important" problems such as tactical doctrine. Nevertheless, logistics is the primary consideration in all modern military operations. World War II provides an excellent example. Allied victory depended in large part on America's ability to organize and to project its industrial might. Indeed, the great demand

for logistical support engendered in World War II had a basic and profound effect on the organization of forces and the strategies adopted. The basic American strategic decision of the war—to defeat "Germany First"—and its corollary—the abandonment of U.S. forces in the Philippines—were dictated mainly by logistical considerations. So too were such key strategic decisions as the timing of the invasion of Europe and the pace of the attack across France in 1944. Many military leaders have failed to understand the significance of this trend, and exclude logisticians and logistical considerations from planning.

2. *Increasing complexity and scale.* The United States has been a major power with global responsibilities since the Spanish-American War. As the armed forces have become larger, used more sophisticated weapons, and operated further from home in a variety of climates and terrain, their supply and movement have become increasingly complex. At the same time, technology has evolved at a heady pace, and the tactical doctrines and organizations required to incorporate new technology have demanded correspondingly new and complex logistical doctrines and organizations.

3. *Increasing proportion of manpower required in the logistical "tail."* The increasingly logistical demands of modern warfare have required that an ever-increasing proportion of total manpower be dedicated to the task of supporting combat forces. Indeed, the adequacy of logistical support has proven critical to the success of combat operations, and a nation's ability to mobilize and support its combat forces has become equal in importance to the actual performance of such forces on the battlefield. Many American commanders have fought to keep their military forces lean and simple, with a very high proportion of combat troops. World War II proved such thinking to be shortsighted by demonstrating that modern, complex, mechanized, and technically sophisticated armies, operating worldwide and often in conjunction with allies, require that much if not most of the total force be dedicated to supporting those few who actually do the fighting. The bigger "tail" and fewer "teeth" of today's army may be a function of modern warfare rather than the perversion of military organization that critics often proclaim it to be.

4. *Specialization.* The same stimuli that influence the structure of combat forces—changes in organization, doctrine, and technology—also shape logistical organizations, which respond with special sensitivity to technological developments and the widening scope and scale of modern war. As warfare in the last two centuries has become more mechanized, the demand for specialized personnel to sustain the equipment of war has increased dramatically. This is particularly true for American armed forces, which have traditionally relied on advanced technology rather than mass manpower to achieve victory. Since 1775, the increasing size and diversity of American military forces, and the wide variety of geographic and climatic conditions under which they have operated, have also had a significant impact on the size and composition of logistical forces. Modern, mechanized, total war, conducted with allies on a global scale, has demanded the creation of ever greater numbers and types of logistical units, staffed with highly trained soldier specialists. This trend is not unique to military affairs. Since the Industrial Revolution in the late eighteenth century, there has been an increasing drive toward specialization and division of labor in all human activities.

5. *Rationalization.* The trend toward specialization has been accompanied by increasing centralization of control over logistical planning and operations focused at the highest, Department of * Defense (DoD) level, and by a parallel effort to increase efficiency by organizing logistical tasks along functional rather than commodity-related lines. These efforts have involved the increased application of modern business management techniques to achieve a "rational," and thus more efficient, system. For the army, this process began with the reforms carried out by Secretary of War Root in 1903 in response to problems uncovered during the Spanish-American War and issues that emerged from the creation of a General Staff. Root described the army as a "big business," which could best be managed by commercial methods. Later, army depots and navy shipyards experimented with Frederick W. Taylor's "time and motion" prescriptions, and World War I brought to the services the concept of statistical controls. World War II saw increased use of statistics, as well as the advent of "operations research" and "systems analysis." Since World War II, the independent service logistical systems have been linked by the consolidation of selected logistical functions (e.g., the acquisition of food, fuel, and housekeeping supplies) at DoD level for greater managerial efficiency and economy of scale. This rationalization process intensified in the 1960s under the administration of Secretary of Defense Robert S. *McNamara. McNamara and his so-called Whiz Kids employed techniques derived from the business world to transform military logistics. The military forces have benefited in many ways from the utilization of civilian experts and civilian techniques for the management of logistics; but there have been serious adverse effects as well, of which the "body count" and "cost-effectiveness analysis" are prominent examples.

6. *Changing the civilian-military mix.* Finding the manpower needed to provide adequate logistical support to the combat forces has been a continuing problem, and traditionally American military leaders have relied heavily on civilians to perform logistical tasks. Overseas operations and the drive toward specialization in the first half of this century led to an increased emphasis on uniformed, disciplined logistical personnel. Nevertheless, the overall trend has been toward increasing "civilianization" of military logistics, particularly at higher management levels.

7. *Cyclical attention.* Historically, American military leaders have tended to neglect logistical activities in peacetime and to expand and improve them hastily once a conflict has broken out. Politicians and generals have proclaimed at the end of every war that the nation will never be caught unprepared again; but inevitably the nation has been unprepared for the next conflict and has only been saved by its enormous resources of human and material capital. The nineteenth-century military critic Emory Upton was among the first to decry this "chronic unpreparedness." Since World War II, the demands of a constant state of "near war" have demonstrated that the United States can no longer afford a cavalier attitude toward military readiness; although specific instances continue to arise, the trend appears to have been broken since the * Vietnam War.

8. *Primacy of logistical mobilization.* Given a tradition of cyclical attention to things military and a myopic focus on combat forces, it is not surprising that logistical support forces have been the first to be demobilized at the end of one war and the last to be formed once a new war has be-

gun. It takes comparatively little time to assemble men and begin their military training, but the lead time for housing, clothing, feeding, and equipping them is much longer, a fact that * mobilization planners tend to forget. The results have been all too obvious: troops guarding the Capitol in 1861 without trousers and soldiers in 1941 training with wooden "guns," stovepipe "artillery," and cardboard "tanks." Yet Americans have thus far escaped the consequences of such faulty planning. Until now, the United States has always had the time needed to correct the worst problems, and in the end an enormous industrial capacity has allowed the nation to compensate for many mistakes.

9. *Coalition logistics.* American warmaking in the twentieth century has been largely a coalition activity, and since World War I, the United States has been forced to provide support to its allies or, in some cases, to receive logistical support from them. This trend has introduced further complexities into the problem of providing adequate logistical support for forces in the field, and on occasion America's productive capacity has been severely challenged by the competing demands of supporting both American and allied forces. Although cooperative logistical arrangements have worked effectively in most instances, national preferences and prejudices make the logistician's job more difficult by expanding the number and types of items that have to be supplied. Recently, in an effort to do more with less and to reduce costs, American military leaders have turned increasingly to "host nation support" and "burden sharing" with their allies as means of providing their combat troops with the necessary logistical support.

Modern war requires nations to commit their total resources and victory is determined less by the brilliance of a nation's strategic and tactical thought, and even the valor and skill of its soldiers and leaders, than by its ability to organize and direct the vast machinery needed to project combat power onto the battlefield. From the establishment of the U.S. armed forces in 1775, American military leaders have had to wrestle with the problem of providing adequate logistical support to the combat forces in the field and at sea, in garrison, in port, and in the air. Finding the necessary resources, creating efficient organizations and efficient military *doctrine, and achieving a proper balance between fighting and supporting forces has never been easy. Only the quality of the men and women who provide support to the combat forces has remained constant. Without their dedication, skill, and endurance, military success remains uncertain, regardless of the number of machines and the sophistication of the doctrines employed.

LONGSTREET, JAMES (1821-1904), Civil War general. Born in South Carolina, Longstreet grew up in Gainesville and Augusta, Georgia. Graduating from West Point in 1842, he served in the * Mexican War and was a major when, in June 1861, he resigned, offering his services to the Confederacy.

Longstreet was commissioned brigadier general in June 1861, major general in October 1861, and lieutenant general in October 1862. Except for medical leave when wounded in the *Wilderness to Petersburg Campaign, he led the First Corps of the Army of Northern Virginia from its establishment in 1862 to the surrender at Appomattox in 1865. He fought in every major battle in the East except Chancellorsville, and took the First Corps west on detached service to participate in the Confederate victory at the Battle of *Chickamauga in September 1863.

Robert E. *Lee selected Longstreet as his second in command, and although authorities differ, it can be agreed that Longstreet, not "Stonewall" *Jackson, was Lee's most trusted and perhaps most talented subordinate. Outstanding in combat, Longstreet was an excellent corps-level commander and one of the most modern soldiers of his day. He helped to popularize the use of extensive field *fortifications and foreshadowed later Prussian doctrine by favoring the use of maneuver to compel the enemy to attack at a disadvantage. He argued that Northern civilian morale should be the true target of overall Confederate strategy. Longstreet was immensely popular with his men, who called him "the Old Bulldog."

During *Reconstruction, Longstreet settled in New Orleans and joined the Republican Party. He held a variety of political patronage positions until his death in 1904. Viewing him as a traitor to the white South, many former comrades turned against him and attacked his military record. His enemies' lies and fabrications, particularly in relation to the Battle of *Gettysburg, where he was unfairly accused of deliberately delaying the attack on the second day, were accepted uncritically by later historians, such as Douglas Southall Freeman, who misrepresented both Longstreet's personality and his record.

LOUISBOURG SIEGE (1745). The French commander of Louisbourg fortress at the entrance to the St. Lawrence River launched the renewed Anglo-French war in 1744 by capturing Canso, besieging Annapolis (Nova Scotia), and encouraging raids on New England shipping. New England responded by besieging Louisbourg with 4,000 volunteers, led by William Pepperrell and supported by Commodore Peter Warren's British naval squadron. With French aid intercepted, and the fortress bombarded by both field cannon and those of its own captured Grand

Battery, Louisbourg's 600-man garrison surrendered after a 39-day siege in which 101 attackers and 53 defenders were killed.

Louisbourg's fall had wide-ranging consequences. Cancellation of Britain's planned invasion of Canada in 1746 allowed relieved Canadian defenders to capture both Fort Massachusetts and Saratoga. France's Indian allies in the Ohio Valley, deprived of supplies by the siege of Louisbourg, formed a pro-British "Indian Conspiracy." France sent a massive sixty-four-vessel armada to Louisbourg, only to have it disrupted en route by storms, calms, and disease. Naval escalation strained British colonial resources, necessitating imperial assistance and causing the frictions that provoked a three-day impressment riot in Boston late in 1747. New Englanders felt betrayed when Britain returned Louisbourg to the French at the Peace of Aix-la-Chapelle (1748).

LOW-INTENSITY CONFLICT (LIC is the *Pentagon acronym) refers to a level of hostilities or use of military power that falls short of a full-scale conventional or general war. It includes *peacekeeping, antiterrorism, assistance to foreign countries for internal defense, fulfillment of international treaty obligations, assistance to foreign law enforcement agencies, and commando operations.

Interest in LIC began in the years after the *Vietnam War. In the immediate post-Vietnam era, events overseas made it very clear that U.S. military power remained essential diplomatic currency. Major regional wars in Central Asia and the Mideast served as grim reminders that diplomacy alone could not stop potentially dangerous conflicts. The Arab oil embargo of 1973 emphasized the importance of the Persian Gulf to the economic existence of the industrial West. Washington watched with anxiety as Cuban troops moved into Angola and Mozambique, raising the possibility of major conflict between Soviet-backed Havana and Pretoria. The dramatic rise in terrorism during the 1970s, much of it supported by hostile nations, posed a new challenge to the United States.

As these events unfolded, the Pentagon, regardless of the lingering effects of the Vietnam trauma, realized it was very likely that a limited use of military power would again be needed to support American foreign policy objectives.

In the late 1970s, when defense budgets began to climb again, much thought and planning inside the military was devoted to low-intensity conflict. The military also altered its force structure to meet the demands of LIC. Some army divisions shed heavy equipment so they could be moved rapidly to areas facing limited threat. Because speed in LIC operations was considered paramount, the Pentagon invested substantial resources in flexible air deployment of ground forces. Sophisticated "smart" weapons, such as cruise *missiles, although originally designed for general war with the nations of the *Warsaw Pact, also proved ideal for a "surgical strike" against a lesser foe. The navy pointed to *aircraft carriers, with their ability to "show the flag" or project airpower quickly, as excellent weapons for low-intensity conflict. Sophisticated communications allowed tight control of complex operations anywhere in the world. LIC also required a high degree of interservice co-

operation, accelerating the trend toward operational integration within the armed forces.

There were several examples of LIC during the Reagan and Bush administrations. The first was an inauspicious beginning for the return of the U.S. military to the world stage. In 1982, Israel invaded Lebanon and surrounded Beirut. President Ronald Reagan and Secretary of State George Shultz agreed to send a Marine contingent to Beirut as part of an international force to escort elements of the Palestine Liberation Organization out of the city. That objective was completed quickly. However, despite strenuous objections from the Pentagon and Secretary of Defense Caspar Weinberger, the United States soon became involved in the Lebanese civil war itself. In October 1983, a suicide attacker drove a car bomb into the Marine headquarters and killed 241 Marines and 50 French troops. Lebanon, in the Pentagon's eyes, was developing into exactly the kind of situation they feared the most: an open-ended struggle with no clear objective. Despite the humiliation (more Marines died in the bomb attack than were lost later by the entire U.S. force during Desert Storm), Reagan was wise enough to withdraw the Marine contingent.

The setback in Lebanon did not seriously concern Reagan nor did it harm his resilient popularity. The Caribbean and Central America were particular points of attention. In the late 1970s, the Sandinista regime in Nicaragua had taken a sharp turn to the left. Marxist insurgencies were building in both Guatemala and El Salvador. A pro-Marxist government was in power on the small island of Grenada. Reagan believed, with some reason, that Fidel Castro and the Soviet Union were involved with all of these problems. When an extremist Marxist faction violently overthrew the government in Grenada, Reagan sent in the troops. In October 1983, two weeks after the suicide bombing in Beirut, American forces quickly occupied Grenada. In marked contrast to Lebanon, the Americans were treated like liberators by the local population. During the U.S. intervention in Grenada, the military put on a major show of force in Central America. The army airlifted men to Honduras and a large naval task force staged a maneuver off the coast of Nicaragua.

Both Congress and the Pentagon were very uneasy about a direct American military involvement in Central America. American participation in the conflict remained deep as Reagan sent economic aid to anti-Communist governments in the region. The Pentagon stayed in the background, however. Except for a small team of military advisers sent to El Salvador, military training for Central American officers was done in the United States. The United States did funnel aid to anti-Sandinista guerrilla forces, nicknamed the "Contras," but this project was run by the Central Intelligence Agency and individuals inside the White House. The same was true of American aid sent to back up "guerrilla warfare opposing Cuban-aided Marxist governments in Africa. Later, George Bush extended covert aid to Afghan forces fighting the Russians.

In the 1980s, the American military became involved in some unfamiliar territory. Because the United States was Israel's strongest supporter, American civilians had become frequent targets for Arab terrorism. Unfortunately, it was very clear that many terrorists were receiving direct support from several governments—including Iran,

Syria, Iraq, and Libya. On 15 April 1986, the United States launched a heavy air strike against several targets in Libya. Since that time the Pentagon has developed extensive contingency plans for dealing with a serious terrorist threat in the United States or abroad. Indeed, many officials believe that a terrorist group procuring "nuclear weapons raises one of the most serious threats facing the United States today.

The Pentagon also became entangled in the "war" against the illegal drug traffic first announced by Reagan and endorsed by all subsequent administrations. This is another area where the military has preferred to stay in the background. Nevertheless, military advisers have helped governments in Latin America operate various drug interdiction and drug eradication programs. Although the military views drug interdiction as a law enforcement problem, the Pentagon continues to play a role in this politically sensitive issue.

The stunning collapse of the Warsaw Pact and the Soviet Union in 1991 caused a difficult reappraisal of the essential mission of U.S. armed forces. Fighting a massive conventional war with the old Warsaw Pact nations was no longer a realistic possibility. A nuclear threat remained, but the direct military confrontation that would trigger an exchange of strategic weapons became far less likely. The fall of the Soviet Union raised the possibility of ethnic conflict and political breakdown throughout the Eurasian landmass. The United States, by default, found itself the only major military power in a dangerous and disorderly world. Consequently, LIC became, outside the nuclear realm, the principal mission of the American military. Although it is impossible to foresee events, the Pentagon believes that LIC will continue to be crucial in the decades to come.

LUCE, STEPHEN B. (1827-1917), naval officer, reformer, and founder of the Naval War College. Born in Albany, New York, Stephen Luce became a naval midshipman in 1841 and spent six years at sea, before being appointed to the Naval Academy at Annapolis. Graduating in 1849, Luce's experience caused him to think about improving naval training and education, and he became an instructor of seamanship and gunnery at Annapolis in 1860. During the "Civil War, Luce alternated between the academy and participating in the Union blockade of the Confederacy.

After the war, Luce experimented with training reforms, corresponding with Gen. Emory Upton and observing Gen. William Tecumseh Sherman's efforts to establish an army postgraduate school system. Luce's efforts resulted in the establishment of the Naval War College at Newport in 1884. He was its president from 1884 to 1886, when, promoted rear admiral, he turned the college over to his friend and protégé, Capt. Alfred T. Mahan, and took command

of the North Atlantic Station until his retirement in 1889. Luce continued to write, served as president of the Naval Institute, and later rejoined the Naval War College staff.

While not as intellectual as Mahan, Luce was a reformer and a practical sailor, who saw education as a way to harness technology. Luce influenced a generation of officers and played a crucial role in American military * education.

LUDENDORFF, ERICH (1865-1937), German general. Ludendorff embodied two of the twentieth century's shaping events: German * imperialism and total war. As a young General Staff officer his outspoken advocacy of engaging the army earned him a punitive transfer. On the outbreak of World War I, he was the architect of the victory over the Russians at Tannenberg (August 1914), while serving as chief of staff to Paul von *Hindenburg. Through political intrigue and battlefield victories the ambitious, mercurial Ludendorff sought to become chief of staff of the German Army. When Erich von Falkenhayn was dismissed in 1916, Hindenburg became supreme military commander and Ludendorff his deputy—reflecting the doubts about Ludendorff's character that permeated the German hierarchy.

Ludendorff galvanized what remained of Germany's human and material resources behind the war effort. He also overhauled the army's tactical doctrines. In domestic politics, he orchestrated the dismissal (July 1917) of Chancellor Bethmann Hollweg and dominated his successors. With the collapse of Russia, Ludendorff extended German power far eastward in the vindictive Peace of Brest-Litovsk. But his deficiencies as a general brought about his downfall. Ludendorff's spring 1918 offensives in the west lacked strategic objective and exhausted Germany's fighting power. With the Allies on the offensive, Ludendorff in September demanded an armistice. He was dismissed by the new government. In the Weimar Republic, he took part in two unsuccessful rightist putsches—by Friedrich Kapp (1920) and Adolf *Hitler (1923)—and became an outspoken "Aryan" racist.

LUSITANIA, SINKING OF THE (1915). On 3 November 1914, Great Britain began mining the North Sea as part of a blockade of Germany, during World War I, ultimately including foodstuffs. German proclaimed a "war zone" around the British Isles (4 February 1915), advising merchant shipping that it must anticipate attack without warning. Berlin cited the submarine's vulnerability to justify abandoning rules of cruiser warfare, which called for warnings and then visit-and-search of merchant ships suspected of transporting contraband. If contraband were discovered, the belligerent must ensure the crew's safety before seizing or destroying the vessel. Britain deemed the war zone an illegal blockade, armed its merchant ships, and ordered them to attack surfaced *submarines. The United States, not yet in the war, announced it would hold Germany to "strict accountability" for loss of American lives and property.

On 7 May 1915, the German submarine *U-20* sank the unprotected British liner *Lusitania* without warning in its approach to the Irish Sea. The giant Cunard Vessel sank in twenty minutes. Of 1,959 passengers and crew, 1,128 perished—128 of them Americans. Although the *Lusitania* was carrying 4,200 cases of contraband ammunition, the reasons why it sank so quickly are still debated.

Attack without warning defied American support of neutral/noncombatant rights. On 13 May, President Woodrow *Wilson asked Germany to disavow its action but avoided a diplomatic break, having noted that a people could be "too proud to fight." When Germany delayed, Wilson moved to preserve national honor, rights, and prestige, insisting on visit-and-search, indemnity, and no further attacks on liners. Secretary of State William Jennings *Bryan resigned in protest. Eventually, Germany suspended unrestricted attacks, and in February 1916 it apologized and offered indemnity without acknowledging illegality. But the incident strengthened America's perception of Germany as a ruthless and lawless nation.

M

The M-1 RIFLE was the standard small-arms weapon of the U.S. Army in World War II and the * Korean War. Its inventor, Canadian-born John Cantius Garand, developed the gas-operated semiautomatic rifle at the Springfield Armory during the 1920s. Gen. Douglas *MacArthur ordered Garand's original .276-caliber changed to .30-06 (.30 caliber cartridge developed in 1906) as the army retained vast stocks of such cartridges from World War I. In 1936 the army officially adapted the M-1 Garand rifle. Officers were assigned M-1 carbines, smaller and lighter. The rifle weighed 11.25 pounds with an eight-round clip and had a maximum range of 460 meters. The weapon could be fitted with a knife bayonet.

The Marine Corps favored its own semiautomatic rifle, designed by Marine Corps Officer Melvin Johnson, but Congress opted for the M-1. World War I veterans preferred the 1903 Springfield bolt action and were concerned about the M-1 semiautomatic's reliability and accuracy in combat situations. Those questions were emphatically vindicated in World War II. In that war, most other armies still used bolt-action rifles. Although both the Germans and the Russians fielded small numbers of semiautomatic rifles, the United States was the only nation to fight the war armed primarily with a semiautomatic rifle. The Garand M-14 model was eventually replaced by the *M-16 rifle in the 1960s.

M-16 RIFLE. The prototype for the M-16 rifle was developed by Armalik Division of Fairchild Corporation in the late 1950s. In 1959, Colt purchased the right to manufacture the rifles. This rifle could fire in either semiautomatic or automatic mode. The South Vietnamese, who favored a light, almost recoilless rifle, field-tested the weapon in 1962 and found it ideally suited to mobile combat "counterinsurgency operations. The M-16 rifle along with 120 rounds of ammunition weighed only 11.1 pounds compared to the M-14's 18.75 pounds. The M-16, with its twenty-round magazine, had an effective range of 460 meters and a high rate of fire. In 1965, Gen. William C. *Westmoreland ordered 100,000 M-16 rifles for the U.S. Army and Marines in Vietnam, and in 1969 the M-16 officially replaced the M-14 Garand as the standard small arm.

Controversy erupted immediately and continued for years. Reports from Vietnam of jamming led to questions of reliability. Investigation proved jams resulted from not cleaning the rifle, and that it was not a self-cleaning

weapon as manufacturers claimed. Some complaints indicated that the small 5.56-caliber 55-grain bullet lacked adequate impact. Conversely, others charged the ultrafast munition caused inhumane internal damage to its victims. Soldiers eventually adapted to the M-16 and accepted its capabilities along with its shortcomings.

In the 1990s, the model M-16A2 was still the standard small arm for the United States. The 7.78-pound rifle is equipped with a 30-round magazine and fires a 62-grain bullet with an effective range of 550 meters.

MACARTHUR, DOUGLAS (1880-1964), American general in World War II and the Korean War. Born in Little Rock, Arkansas, and raised on army posts by his father, Gen. Arthur MacArthur, and mother, Mary, Douglas MacArthur graduated from West Point in 1903. An engineering officer, he served in the Philippines and Panama. In 1913-17, he was assigned to the army's General Staff. During World War I, he was chief of staff of the 42nd (Rainbow) Division in France and subsequently commanded the 84th Infantry Brigade as a brigadier general. In 1919-22, he was superintendent of West Point, then served two tours of duty in the Philippines. As army chief of staff (1930-35), MacArthur evoked much criticism by using military force in 1932 to disperse encampments in Washington, D.C., of unemployed veterans, "Bonus Marchers," seeking their pensions. In 1935, President Franklin D. *Roosevelt appointed MacArthur military adviser to the U.S. colony of the Philippines, and the general spent the next six years training the Filipino Army.

In July 1941, MacArthur was appointed to command all U.S. forces in East Asia, but when Japanese planes attacked American bases near Manila several hours after their attack on * Pearl Harbor, they destroyed most of the American warplanes on the ground. For three months, MacArthur led the defense of the Philippines; but in March 1942, Roosevelt ordered him to Australia to command the Southwest Pacific Area theater. MacArthur vowed: "I shall return."

While the U.S. Navy pushed through the Central Pacific, MacArthur, with American reinforcements, launched an offensive from Australia against Japanese forces on the coastline of New Guinea, using highly successful "leapfrogging" flanking envelopments with combined air, land, and sea forces. The high point of MacArthur's campaign came

in October 1944, when despite the reluctance of the "Joint Chiefs of Staff (JCS), he convinced Roosevelt to allow him to liberate the Philippines rather than bypass the archipelago. The image of MacArthur with his crushed officer's hat, aviator sunglasses, and corn cob pipe was familiar to Americans. Most famously, photographers showed him wading ashore at Leyte in the Philippines as he launched the liberation that continued through July 1945. In December 1944, he was promoted to the new rank of general of the army (five stars). He accepted the Japanese surrender on the USS *Missouri* on 2 September 1945.

Appointed by President Harry S. "Truman as Supreme Allied Powers Commander, MacArthur directed the occupation of Japan (1945-50), implementing generally liberal economic, social, and political reforms, but delaying rebuilding of Japan's industrial economy until ordered by Truman in 1948. As a conservative Republican, MacArthur was seriously considered for the GOP presidential nomination in 1948, but he was defeated in the early primaries.

With the outbreak of the Korean War in June 1950, Truman also named MacArthur commander of the U.S. and "United Nations forces there. The general persuaded the JCS to authorize an amphibious flanking envelopment at Inchon in September, and by October, South Korea had been liberated. Truman, with MacArthur's concurrence, then expanded the war aims to unify the peninsula. When UN forces crossed the 38th parallel and advanced toward the Yalu River, the border with China, despite warnings from Beijing, MacArthur met with Truman on Wake Island, dismissing the danger of Chinese intervention and predicting quick victory.

China intervened massively in late November, pushing the UN forces back to the 38th parallel and beyond. MacArthur then clashed with the JCS and the White House, blaming them for forcing him to fight a limited war. Arguing that there was "no substitute for victory," MacArthur sought permission to expand the war to China by bombing bases in Manchuria, perhaps with "nuclear weapons, and by assisting Chinese Nationalist troops from Taiwan to invade the mainland. However, as the JCS discovered early in 1951, MacArthur exaggerated the Communist Chinese threat to overrun South Korea. Battle lines stabilized in March 1951 when a new field commander, Gen. Matthew B. "Ridgway, rallied the U.S. and UN forces.

Truman proposed a cease-fire that month, but MacArthur sabotaged the plan. When the press printed a letter from the general to Republican congressman Joseph Martin condemning Truman's policy in Korea as appeasement, an outraged president, supported by the JCS, removed MacArthur from all his commands on 11 April 1951. Two weeks later, after returning to a hero's welcome, MacArthur addressed a joint session of Congress and appealed for public support for his strategy. But although Americans were frustrated with the stalemated war, Senate hearings into MacArthur's accusations revealed that most military and diplomatic experts opposed his plan at a time when the Soviet Union in Europe was seen as the main threat to U.S. interests. Few Americans wanted an expanded war with China.

After fifty-two years of active service, the general with his flare for the dramatic gesture and his penchant for political controversy retired from the army and became an officer of a large business corporation. Another effort to nominate him for president failed in 1952 when the GOP

chose a far more genial and less controversial general, Dwight D. "Eisenhower.

MACHINE GUNS are repeating firearms that when triggered will load and fire automatically until their ammunition is exhausted. In 1861, the U.S. Army was offered its first machine gun: Wilson Ager's single-barrel, hand-cranked weapon, often called the "coffee mill" gun due to its resemblance to a coffee grinder. At the order of President Lincoln, a few Ager guns were purchased; however, mechanical problems and the opposition of chief of ordnance, Brig. Gen. James W. Ripley, blocked adoption of the gun.

Patented in November 1862 by Dr. Richard J. Gatling, early versions of the "Gatling gun were rejected by the conservative Union Ordnance Department. Purchased in 1866, improved .50-caliber and 1-inch versions of Gatling's hand-cranked, multibarreled machine gun were intended for use in the close-in defenses of coastal "fortifications, frontier forts, and aboard ship. The .50-caliber version of the gun weighed 224 pounds and the 1-inch version 1,008 pounds; later rifle-caliber Gatlings weighed from 135 to 200 pounds.

Because he feared the weapons might hamper his column's movement through the rugged valley of the Little Bighorn River, Lt. Col. George Armstrong "Custer declined an offer of Gatling guns. Complex, heavy, and difficult to transport and supply, early machine guns saw little use during the "Civil War and in the Indian wars. For almost four decades the Ordnance Department procured a small number of Gatlings. Interest in the weapon lagged, however, and doctrine for its use and a unit to use it were neglected.

The perfection of smokeless powder in 1886 and the final development of small-caliber, high-velocity rifle ammunition made the development of fully automatic machine guns practical. In 1898, American expeditionary forces in Cuba included an improvised machine-gun unit with Gatling guns manned by infantrymen. Commanded by Lt. John Henry Parker, the Gatlings provided decisive support for the attack during the Battle of "San Juan Hill. In 1900, the army tested replacements for the Gatling gun. Among the competitors were two American designs: a recoil-operated gun patented by Hiram "Maxim in 1885, and the gas-operated Colt machine gun patented by John M. Browning in 1895. Adopted in 1904, the heavy and complex Maxim gun (gun, tripod, and full water jacket weighed 153.5 pounds) was replaced in 1909 by the French-designed Benét-Mercié, an air-cooled weapon weighing 27 pounds. However, the fragile Benét-Mercié also failed to meet army needs, and in 1916 it was replaced by a new weapon, the water-cooled, British Vickers machine gun (gun, tripod, and full water jacket weighed 75.5 pounds).

Despite domination of World War I battlefields by machine guns and "artillery, each U.S. infantry regiment in 1917 had only six machine guns, and the army possessed a total of fewer than 1,500. The first twelve American divisions sent to France were equipped with French Hotchkiss

machine guns. By July 1918, embarking American units were issued the new water-cooled, .30-caliber Browning machine gun (gun, tripod, and full water jacket weighed 74 pounds) and the "Browning Automatic Rifle (BAR; 19.4 pounds), developed to provide an air-cooled, light machine gun carried and operated by a single infantryman. From 50 machine guns in early 1917, U.S. infantry divisions ended the war with 260 machine guns and 768 BARs per division.

In the 1930s, the army adopted the air-cooled .30-caliber Browning M-1919A4 (gun and tripod weighed 45.5 pounds) and the more powerful, air-cooled, .50-caliber Browning M-2, heavy machine gun (gun and tripod weighed 128 pounds). During World War II, the number of machine guns multiplied in the increasingly mechanized American forces. In 1943, each American infantry division was issued 157.30-caliber and 236.50-caliber Browning machine guns. In addition, Browning .50-caliber guns were standard on most American aircraft; they also saw widespread use as anti-aircraft weapons.

In 1957, the .30-caliber Browning was replaced by the 7.62-millimeter, air-cooled M-60 machine gun, weighing 23 pounds; the BAR was replaced by a version of the M-14 service rifle. The .50-caliber M-2, however, remained the standard American heavy machine gun. During the 1990s, American forces were equipped with a variety of air-cooled machine guns—the 5.56-millimeter, M-249 squad automatic weapon, which performed a function similar to the BAR (gun and 200 rounds of ammunition weigh 22 pounds); the M-60, and the 7.62-millimeter, air-cooled, M-240C coaxial machine gun mounted in tanks and armored fighting vehicles; as well as the .50-caliber Browning M-2.

Adoption and use of machine guns has been affected primarily by mechanical problems such as overheating, by their size and weight, and by problems of transport and ammunition supply. Development of metallic cartridges and smokeless powder and design improvement—recoil and gas-operated guns and reliable, air-cooled weapons—gradually produced lightweight machine guns suitable for widespread combat use. Mechanization of American forces overcame logistical constraints and by mid-twentieth century the machine gun was fully integrated into the armory of the American military.

MADISON, JAMES (1751-1836), statesman, fourth U.S. president. After growing up at his lifelong home, Montpelier, in Orange County, Virginia, and graduating from the College of New Jersey in 1771, Madison entered politics. As a Confederation congressman (1780-83 and 1787-89), he favored strengthening the national union but never endorsed Robert "Morris's" fiscal agenda. Service in the Virginia legislature (1784-86) convinced him that individual liberties needed protection from majority tyranny.

Having studied ancient and modern confederacies (thereby becoming the best-prepared delegate at the 1787

Constitutional Convention), Madison concluded that republics would perish without strong central governments. To help achieve ratification, he penned twenty-nine of the celebrated *Federalist Papers*. No. 10, his most famous essay, argued that large republics, if properly constructed, could endure best because conflicting factions would make majority tyranny unlikely. During the first Federal Congress, Madison drafted the Bill of Rights. In the 1790s, he resisted Federalist financial and diplomatic policies in favor of perpetuating an agricultural republic friendly to France. His opposition culminated in his authorship of the 1798 Virginia Resolutions, which called for repeal of the "Alien and Sedition Acts."

As Thomas "Jefferson's" secretary of state (1801-09), Madison tried to force Great Britain to grant neutral rights through economic coercion. When this policy failed, Madison as president obtained a declaration of war in 1812. Blame for the military disasters that ensued—including botched invasions of Canada and the burning of Washington, D.C.—belong to Madison. He failed to prepare the country for hostilities, tolerated incompetent generals, and proved a weak commander in chief. These shortcomings resulted from his inveterate determination to allow neither war nor the threat of war to endanger republicanism or personal rights.

MAGIC. By the late summer of 1940, American cryptanalysts managed to break some of Japan's most secret diplomatic codes. This remarkable achievement was designated MAGIC. Although American officials frequently used the same cover name referring to later successes against Japanese military and naval codes, which were called "ULTRA," the MAGIC operation dealt primarily with Japanese diplomatic communications. The road to the major breakthrough, however, was long and uneven.

In the mid-1930s, the U.S. "Navy concentrated on Japanese naval cryptographic systems while the U.S. Army Signal Intelligence Service (SIS), under the direction of William F. Friedman, tackled Japanese diplomatic codes. By 1935, the SIS managed to crack Japanese diplomatic messages encrypted by the sophisticated "Red Machine," which was put into use in the early 1930s. The accomplishments of Friedman and his team were short-lived because in late 1938, the Japanese foreign ministry introduced a new and more secure cipher machine, the "Purple Machine," for its top-secret messages. By the spring of 1939, the new Purple Machine replaced much of the Red Machine traffic. As a result, the SIS found that its vital source of intelligence on Japanese intentions and developments dried up completely. Immediately, Friedman and a group of SIS colleagues focused their attention on unraveling this setback. Friedman benefited immensely from the input of his team, including mathematicians, cryptanalysts, and linguists. They worked laboriously for the next eighteen months to solve Purple and also to construct a Purple Machine.

The breaking of Purple was such a daunting and seemingly unachievable endeavor that Brig. Gen. Joseph O. Mauborgne, chief signal officer, referred to the cryptanalysts as "magicians" and to their results as "magic." From then onward, the codeword MAGIC was given to the solution of Japanese diplomatic messages that were encrypted by the Purple Machine.

After the initial breakthrough in the fall of 1940, the Americans swiftly found that they had access to a huge volume of radio traffic between Tokyo and its diplomatic representatives throughout the world. Cryptanalysts were soon processing fifty to seventy-five Japanese messages a day. The increase in workload strained the resources of the understaffed SIS. Consequently, the U.S. Army and the U.S. Navy made an agreement to share responsibility for MAGIC whereby the army was in charge of decrypting and translating materials on odd days while the navy was given even days. This arrangement between both services continued until early 1942.

The United States realized that MAGIC provided invaluable insights into the inner workings of the foreign ministry in Tokyo. In order to protect this secret source of intelligence, American authorities adopted stringent security measures for the dissemination of MAGIC reports. Distribution of the highly sensitive materials was intentionally limited to a select group of the highest-ranking officials. Neither the secretary of state nor President Franklin D. *Roosevelt was permitted to retain copies of MAGIC. The army, and the navy later, even took President Roosevelt off the list of authorized personnel for a short time when it was discovered that a copy of MAGIC found its way into the wastebasket of a senior official at the White House.

In early 1941, Friedman and his group managed to recreate several duplicate copies of the machine that enciphered Purple. By the end of the year, eight of these machines had been built. Four remained in Washington (two each for the army and navy), three were given to the British, and one was sent to intelligence headquarters of Gen. Douglas *MacArthur on Corregidor Island in the Philippines.

A staggering amount of Japanese messages became available to American intelligence agencies by 1941 because MAGIC included diplomatic communications between Tokyo and all its consular and embassy representatives throughout the world. Given the limited number of personnel, especially experienced linguists, working on this secret program, Washington had to make a choice from among the flood of despatches that were being intercepted. Since crucial negotiations between the United States and Japan were taking place in 1941, priority was given to the Tokyo/Washington circuit. Working under pressure and tight schedules, the MAGIC team of codebreakers made outstanding progress. As the historian David Kahn, a leading authority on code and codebreaking, has noted, from March until December 1941, only 4 messages out of 227 relating to the talks between Secretary of State Cordell Hull and Ambassador Kichisaburo Nomura failed to be picked up by the United States.

MAGIC revealed only what the foreign ministry discussed with its diplomats and what these representatives reported back to Tokyo. Accordingly, the U.S. government did not obtain a complete picture of Japanese military planning, which was often not passed along to their dip-

lomats until matters had proceeded well along course. In fact, the United States had been unable to break high-level Japanese Army and naval codes until after the attack on

* Pearl Harbor, especially since each Japanese agency utilized systems entirely different systems from the foreign ministry.

Unexpectedly, MAGIC turned out to be an excellent source of military and diplomatic intelligence on the war in Europe, especially on German plans and intentions. While serving his second tour as Japanese ambassador to Germany from February 1941 to May 1945, Hiroshi Oshima, who had direct access to Adolf *Hitler and his closest advisers, sent to Tokyo detailed reports on his conversations with German officials and also his observations while touring the German front lines. Even Gen. George C. *Marshall, U.S. army chief of staff, acknowledged privately in 1944 that Oshima's despatches were one of the most important sources of intelligence on Germany during World War II. The United States had forewarning and details of Hitler's planned invasion of the Soviet Union in spring 1941 because of reports from Oshima. Another vital piece of intelligence surfaced in May 1944, when the Japanese ambassador informed Tokyo that Hitler remained convinced that the main Allied invasion of France would take place near Calais and that operations against Normandy were diversionary.

Despite strenuous measures to conceal MAGIC, certain aspects of the operation became public knowledge in late 1945 during the joint congressional investigations into the Pearl Harbor attack. In response to a determined national quest to find blame for one of America's worst military and naval disasters, President Harry S. *Truman reluctantly reversed his initial decision and authorized the release of limited MAGIC messages dealing with U.S.-Japan relations prior to 7 December 1941. The revelation immediately generated sensational headlines and commentaries. No further materials on MAGIC were released until 1977, when the Department of *Defense published a five-volume history of communication intelligence and the Pearl Harbor attack. Since then, the U.S. government has periodically declassified its records on MAGIC and continues to do so.

Ever since MAGIC was made public, historians have drawn upon the vast collection of translated messages to reevaluate certain aspects of American history between 1940 and 1945. These despatches have provided fuel for both proponents and opponents of the theory that the United States had prior warning of the bombing of Pearl Harbor. To this day, no specific evidence shows that there were definite indications within the messages that referred to the Japanese plans for the attack. However, a careful and thorough analysis could have shown that Japan in late 1941 was determined to confront the United States and that plans for an attack on U.S. forces somewhere in the Pacific were underway.

The MAGIC materials have also been used to justify or deny the successful efforts by Japanese Americans during the 1980s to obtain redress from the U.S. government for the wartime internment of Americans of Japanese ancestry. Opponents pointed out that several communications from the West Coast Japanese consulates and the embassy in Washington in 1941 reported that they were attempting to recruit second-generation Japanese Americans for propaganda and espionage purposes. On the other hand,

Japanese Americans have argued that there has never been a documented case of any disloyalty among them.

In recent years, MAGIC intercepts helped fuel the heated controversy over the American decision to order the atomic bombings of "Hiroshima and Nagasaki." Indeed, intercepted messages confirmed that the Japanese government was deeply divided over whether to accept the Allied ultimatum for an unconditional surrender. Critics of the bombing emphasized that in 1945, strong elements within the government of Japan desperately sought the mediation of the Soviet Union so that the war could be ended without the termination of the emperor system and the imperial household. Proponents of the atomic bomb, however, suggested that these MAGIC messages indicated that Japan would not have agreed to the unconditional surrender if "nuclear weapons had not been used.

In the final analysis, contrary to popular belief, MAGIC did not provide any specific indications of Japan's surprise air attack on Pearl Harbor, nor—unlike the breaking of the Japanese Navy and Army codes in 1942 through ULTRA—did it have any significant impact on operations during the Pacific War.

MAHAN, ALFRED T. (1840-1914), naval officer and theorist. Born to Mary Okill and Dennis Hart Mahan, the latter a professor of civil and military engineering at West Point, Mahan became a career naval officer. He also became a historian and strategic analyst upon his appointment to the new Naval War College in Newport, Rhode Island, in 1885. Over the following quarter century, he wrote some of the most influential works on history and strategy ever produced.

Mahan's studies range widely, incorporating innovative and resourceful historical research and analysis with the perceived strategic and political needs of his day. Though his writings were long ago distilled into dogma from which U.S. naval doctrine has frequently been derived, Mahan himself aimed for accuracy and insight as much as for political or strategic influence. In fact, by the 1906 all-big-gun battleship controversies, Mahan had already been outpaced by enthusiasts willing to go even further in defense of these behemoths of concentrated fire.

Much of Mahan's forty-year naval career passed with barely a hint of his future influence. Prickly young Mahan completed two years at Columbia College before entering the U.S. Naval Academy's Class of 1859. His "Civil War service was limited to blockade duty except for a few hours of combat during the assault on Port Royal. In successive postwar assignments, he rose slowly through the ranks without distinction. Most of his cruises were on the remote

Pacific or Asiatic Squadrons, reinforcing his alienated nature and encouraging his chauvinistic views toward the peoples of the Pacific Basin. His High Church Episcopal beliefs aggravated the disdain he felt for most people—naval officers, sailors, and foreigners alike.

Mahan's most famous and important work—*The Influence of Sea Power upon History: 1660-1783*—first published in 1890, suggests the main thrust of his historical efforts. From 1885 to 1893 he was assigned to the Naval War College, briefly as a professor and soon as president of the fledgling institution. In the years before his retirement in 1896, he prepared his most influential studies. Originally, these were designed for his midlevel officer students. They quickly lost their heuristic value, becoming instead primers of international relations, force, and diplomacy. Over the course of a long second career, Mahan produced twenty-one books, including eleven collections of essays, two naval biographies, two memoirs, and the famous *Influence* series that examined international history from 1660 to 1815. His histories emphasized the persistent nature of international conflict, particularly between great powers competing for access to trade and resources. His religion, research, and theorizing, as well as his experiences at the First Hague Conference for limiting warfare (1899), led him to believe that diplomacy was best engaged in after successful conclusion of the battle. For Mahan, international relations hinged on power projection. In the modern era, this was best exercised by navies.

Mahan identified three critical elements of seapower: (1) weapons of war, primarily "battleships and their supply bases; (2) a near monopoly of seaborne commerce from which to draw wealth, manpower, and supplies; and (3) a string of colonies to support both of the above. His theories, however, rested on two serious fallacies. First, his overreliance upon the notion of concentrating forces falsely denied the importance of coastal defense, and undervalued commerce raiding. These assumptions forced strategists to search for a decisive, war-winning battle, often in vain. Second, he overstated the strategic benefits of controlling seaborne commerce and colonies. Whereas in peacetime these components of empire frequently contributed to wealth and consequently to long-term strength, in war they often proved to be liabilities. Mahan's timeless principles, as enacted along the lines of late-nineteenth-century navalism, had the effect of turning America's strategic vision of itself on its side; instead of remaining an unassailable continental power with maritime reach, it became an overstretched maritime power with global vulnerabilities.

From 1896 until his death, Mahan lived in New York City and at Quogue on Long Island with his wife and unmarried daughters. Though the value of his writings continues to be debated, of their influence on the navies of the United States and other countries there can be no doubt.

MAINE, SINKING OF THE USS (1898). In January 1898, Spain was winning its war against Cuban insurrectionists, but faced pressure from U.S. president William McKinley to make concessions. When in response to reforms from Madrid, Spanish officers and Cuban loyalists rioted in Havana, U.S. consul Fitzhugh Lee requested a warship to protect American lives and property. There was also concern about rumored Spanish intentions to turn Cuba over to Germany. These circumstances induced McKinley to dispatch the USS *Maine* a second-class battleship (its keel was laid in 1888, but it was not commissioned until 1895) to Havana.

The *Maine* arrived off Havana on 25 January; Spanish authorities reluctantly allowed her entry to the harbor and assigned an anchorage. On the night of 15 February, an explosion ripped the ship's hull open, and she sank with over 260 men (two-thirds of her complement) killed. Encouraged by sensationalist newspapers, many Americans believed the explosion resulted from an external mine set off by the Spaniards. On 21 March 1898, a U.S. Naval Court of Inquiry concluded that an external explosion caused by unknown persons had detonated one of the *Maine's* forward ammunition magazines. The court rejected an alternative explanation, that spontaneous combustion in a coal bunker set off nearby ammunition. So did a second inquiry held in 1911, when the *Maine's* half-submerged hulk was raised and examined before being disposed of at sea. In 1975, another inquiry, headed by Adm. Hyman Rickover, reassessed the 1911 photographs of the wreckage, and concluded that the *Maine* was the victim of an internal explosion from spontaneous combustion in an inadequately ventilated bituminous coal bunker, which then exploded adjoining magazines. But the explosion's true cause remains a mystery.

Many regard the sinking of the *Maine* as the cause of the Spanish-American War. This simplistic explanation ignores the fact that McKinley tried to avoid war for a month after the court finding. A combination of events led to war in April 1898.

MAINTENANCE is an important aspect of military logistics and includes those activities needed to keep weapons, vehicles, and other materiel in an operable condition; to restore them to a serviceable condition when necessary; or to improve their usefulness through modifications. Such maintenance activities include inspection, testing, classification as to serviceability, adjustment, servicing, recovery, evacuation, repair, overhaul, and modification. Salvage and disposal are related functions.

Modern military equipment is complex and expensive and must be designed with reliability, durability, and ease of maintenance in mind. Thus, maintenance requirements, the potential usage of repair parts, and the tools and equipment needed to effect repairs are determined during the equipment development process, and operational capabilities must sometimes be sacrificed for greater reliability or ease of maintenance. Life cycle maintenance costs are also an important consideration inasmuch as the

lifetime maintenance costs usually exceed an item's initial acquisition cost.

Traditionally, maintenance support has been divided into five levels, or *echelons*. *User* (first echelon) maintenance includes inspection, cleaning, tightening, lubrication, and minor adjustments performed by the equipment operator. *Organizational* (second echelon) maintenance is performed by unit maintenance personnel and involves recovery, evacuation, inspection, troubleshooting, and some replacement of parts and assemblies. *Direct support* (third echelon) maintenance is carried out by specialized maintenance units in fixed or semimobile maintenance facilities—or by mobile teams—and involves recovery, evacuation, inspection, replacement of major parts and assemblies, and the repair of some assemblies. Items repaired at the direct support level are normally returned to the using unit. *General support* (fourth echelon) maintenance involves the systematic repair and rebuilding of equipment and is generally performed by highly specialized maintenance units in fixed general support technical centers, each of which specializes in a particular type of equipment (e.g., combat vehicles or missiles). Items repaired or rebuilt at the general support level are returned to general stocks rather than to the using unit. *Depot* (fifth echelon) maintenance is also carried out by highly specialized maintenance personnel in fixed facilities; it involves the complete rebuilding of entire items and the renovation of major assemblies (such as motors or transmissions) for return to general stocks.

In recent years, the armed services have streamlined the maintenance process and now recognize only three echelons: *user/direct support*, *intermediate/general support*, and *wholesale*. In practice, the type and amount of work to be accomplished at each level is determined by the missions of the units involved, the probable operational situation, and the most cost-effective use of available maintenance resources. The thrust of modern maintenance doctrine is to perform maintenance functions as far forward on the battlefield as possible by employing mobile repair teams, rapid battlefield recovery, and cannibalization (the reuse of serviceable parts taken from an otherwise unrepairable item). In general, it is easier and quicker to maintain a piece of equipment in a fully equipped fixed maintenance shop rather than in the field, but by maintaining equipment as far forward as possible, evacuation and repair time is minimized. Thus, the time an item is available to perform its combat function is increased.

Although some common maintenance support is provided by the General Services Administration and the Defense Logistics Agency, each of the armed services has its own system to provide every level of maintenance support. Army wholesale maintenance activities are overseen by the U.S. Army Materiel Command, which controls seven commodity-oriented subordinate commands, each of which specializes in a particular type of materiel (e.g., wheeled vehicles or communications-electronics equipment). Most army units, including maintenance units themselves, are organized with organic maintenance personnel and equipment. Thus, an infantry company normally has an organic maintenance section and an infantry division has an organic direct support maintenance battalion. Intermediate/general support maintenance activities are usually controlled by combat service support commands (e.g., a corps support command or a theater army area command).

The U.S. *Marine Corps operates two distinct maintenance systems of its own, although the navy provides aviation and medical supply and maintenance support. Marine Corps base maintenance activities provide all levels of support for commercial-type equipment or contract out what is beyond their capability. Fleet Marine Force units are supported by a system similar to that of army field forces, with organic maintenance units backed by specialized direct and general support maintenance units. Wholesale maintenance activities are carried out at Marine Corps logistics bases in Georgia and California.

Responsibility for navy maintenance activities is assigned to the Navy Systems Command, which oversees a number of specialized commodity-oriented commands (e.g., the Naval Air Systems Command for naval aviation repair and the Naval Sea Systems Command for shipyards and ship repair facilities). User/direct support-level maintenance is performed by the using ship or air squadron. Intermediate/general support-level maintenance is performed in local repair facilities, which include combat logistics force ships and overseas bases. Wholesale-level maintenance is performed in navy or commercial facilities in the continental United States.

Air force maintenance activities are the responsibility of the Air Force Logistics Command, which monitors the operation of five Air Logistics Centers. These centers, located in Georgia, Oklahoma, Texas, Utah, and California, are centralized wholesale repair facilities. Retail aircraft maintenance is performed at air base level. For nontactical (transport and utility) aircraft, a centralized concept is employed, and the work is normally performed in fixed base maintenance facilities by air force maintenance squadrons. Tactical aircraft are also maintained by air force maintenance squadrons, using a more decentralized concept designed to produce the maximum number of combat sorties.

Effective and cost-efficient maintenance systems are essential to the success of military forces on land, at sea, and in the air. The complexity of modern weapons systems and the large number of such systems deployed in all types of climatic and terrain require extraordinarily good design and effective maintenance procedures and personnel if they are to perform their intended functions. The ability to ensure that weapons, vehicles, and other equipment are available and function properly gives a military force a decided advantage over an opponent who does not have that ability.

MANASSAS, BATTLES OF. See Bull Run, First Battle of (1861); Bull Run, Second Battle of (1862).

MANHATTAN PROJECT, the U.S. effort in World War II that developed the atomic bomb. The possibility of developing an atomic bomb became evident late in 1938 when scientists in Germany successfully split a uranium atom by bombarding it with neutrons. In the United States, Leo

*Szilard, a physicist at the University of Chicago, recognized that as a result of such nuclear fission, a critical mass of uranium could produce enough neutrons to generate a chain reaction of radioactive material culminating in an enormous nuclear explosion. Prodded by Szilard, Albert Einstein, world-renowned German physicist who had fled to the United States, wrote to President Franklin D. *Roosevelt on 2 August 1939 warning that the Nazis might develop an atomic bomb.

Roosevelt formed a committee of scientists headed first by Enrico *Fermi and subsequently by Vannevar *Bush (renamed the National Defense Research Committee) to study the feasibility of building such a weapon. In October 1941, this was merged into the new Office of Scientific Research and Development. In spring 1942, Ernest Lawrence of the University of California, Berkeley, demonstrated that in addition to the scarce uranium isotope U-235, the more available U-238 could be converted into a new element, plutonium, which was also fissionable. After the United States entered the war, Roosevelt gave the development of nuclear weapons top priority, and in August 1942 he assigned the top-secret project to the U.S. *Army Corps of Engineers. Its code name, the "Manhattan Project," derived from the Manhattan Engineer District established to supervise the weapon's construction. The commanding officer, Maj. (later Brig. Gen.) Leslie R. Groves, spent \$2 billion to develop the atomic bomb.

The Manhattan Project had four main facilities. In the basement of the unused football stadium of the University of Chicago, scientists Enrico Fermi and Arthur Compton built an atomic pile and in December 1942 produced the first chain reaction in uranium. At Hanford, Washington, a plant produced plutonium-239 from uranium-238. The Clinton Engineer Works at Oak Ridge, Tennessee, separated uranium-235 from uranium-238 through gaseous diffusion. A secret new laboratory, headed by physicist J. Robert *Oppenheimer, was built in 1943 on a secluded mesa at Los Alamos, New Mexico, to design and build atomic bombs.

Secrecy was an obsession with Groves, and only a handful of the 125,000 people at the Project's four facilities understood the purpose of their work. Just a few military and congressional leaders knew the reason for the project's huge expenditures, which were concealed within War Department appropriations.

Since scientists in Britain had been working toward a bomb since 1940 and discovered the new element called "plutonium," Roosevelt and British prime minister Winston S. *Churchill cooperated in the research. However, in September 1944, the two leaders decided not to share their information with the Soviet Union. Russia initiated an intense espionage effort in Britain and the United States to aid its own program, headed by physicist Igor Kurchatov.

Soviet leader Josef *Stalin learned details of the bomb's progress from Communist sympathizers, among them atomic scientist Klaus Fuchs in Britain, and David Greenglass, an American soldier stationed near Los Alamos. In a controversial trial in 1950, following Fuchs's postwar confession, Greenglass testified that his brother-in-law, Julius Rosenberg, and Rosenberg's wife, Ethel, had passed to the Russians atomic secrets he had obtained. The Rosenbergs were executed in 1953. (The Nazi regime did not race to build an atomic bomb, although whether this was due to pessimistic miscalculations by its leading physicist, Werner

Heisenberg, or to his moral opposition to such a weapon, remains unclear.)

Following Roosevelt's death on 12 April 1945, President Harry S. "Truman was told about the atomic bomb (code-named "S-I") twelve days later. With Germany nearing surrender and the construction of a test device only three months away, Truman created an Interim Committee to study the use of atomic bombs against Japan.

On 31 May 1945, the Interim Committee, composed of Secretary of War Henry L. "Stimson, Secretary of State designate James Byrnes, Harvard president James Conant, physicist and educator Karl Compton, Vannevar Bush, and a few others, listened to Oppenheimer predict the bomb would be equal to 2,000 to 20,000 tons of TNT and with its blast and radiation would kill perhaps 20,000 Japanese. After consulting other scientists and the "Joint Chiefs of Staff, the committee agreed on 1 June 1945 that for maximum psychological effect, the atomic bomb should be used without warning against a Japanese city containing a military facility.

Not all the scientists working on the Manhattan Project agreed with this. Szilard, James Franck, and a majority of the scientists at the Chicago laboratory asserted that military use against a Japanese city was unnecessary and immoral and would start a postwar nuclear "arms race. In response to their petition for a test demonstration and warning for Japan, a special scientific advisory committee—composed of Fermi, Lawrence, Oppenheimer, and Arthur Compton—met on 16 June but rejected the idea of a noncombat demonstration (the bomb might not explode, and even if it did, its lethality would not be adequately demonstrated).

On 16 July 1945, the first atomic weapon test, code-named "Trinity," was held on a desert bombing range at Alamogordo, New Mexico, 200 miles south of Los Alamos. Mounted on a metal tower, the test device—13.5 pounds of plutonium inside 2.5 tons of explosives—was exploded at 5:29 A.M. as Groves, Oppenheimer, Bush, and others watched in awe. The blast equaled 15,000-20,000 tons of TNT and generated a fireball visible for 60 miles.

Truman learned of the successful test while at the "Potsdam Conference in Germany. After mentioning cryptically to Stalin that the United States had a new weapon, Truman on 24 July ordered preparations for use against Japan. On the 26th, he issued the Potsdam Declaration, a vague modification of unconditional surrender. When Tokyo declined to consider the offer because it did not guarantee retention of the emperor, Truman, on 30 July, ordered the Army Air Forces to use America's two atomic bombs—one uranium-cored, the other plutonium-cored—against Japan. On 6 and 9 August, solitary American B-29s carried out the atomic bombings of "Hiroshima and Nagasaki. The bombings, combined with the Soviet Union's declaration of war against Japan on 8 August, led Tokyo to surrender on 14 August 1945. World War II ended; the atomic age had begun.

MANILA BAY, BATTLE OF (1898). As tensions between Spain and the United States over Cuba increased during 1896 and 1897, naval officers in the Office of Naval Intelligence and the Naval War College began to develop plans for a conflict with Spain. As finally adopted in the spring of 1897, these plans included an attack on the Spanish Philippines as a diversion from the Cuban theater, and as a way of improving the U.S. position in peace negotiations.

After the outbreak of war in April 1898, the commander of the Asiatic Squadron, Commodore George "Dewey, who had already been alerted to the imminence of war by Navy assistant secretary Theodore "Roosevelt, received orders from President William "McKinley to "capture or destroy" the Spanish naval squadron in the Philippines.

Dewey's six modern warships, some armed with guns as large as 8-inch caliber, completely outclassed Adm. Patricio Montojo's Spanish squadron at Manila, which consisted of seven antiquated "cruisers and gunboats; the harbor defenses were in disarray. Armed with timely reports of this by the American consul in Manila, Dewey decided from Hong Kong to attack immediately. In a few hours, on 1 May 1898, his squadron annihilated the Spanish fleet without the loss of a single American life, and blockaded Manila. This dramatic victory made Dewey a popular hero and began a chain of events that led to the U.S. annexation of the Philippines.

MARCH, PEYTON C. (1864-1955), army chief of staff in World War I. A West Pointer (Class of 1888) and "artillery officer, March won distinction in combat during the "Spanish-American War and the "Philippine War. Later, he enhanced his reputation as a troop leader in battery and regimental commands and as an efficient staff officer through his service on the first General Staff and in the Adjutant General's Office. During World War I, after serving as chief of artillery in the American Expeditionary Force, he returned to become the army's chief of staff in the spring of 1918. His hard, coldly efficient dynamism galvanized army "logistics during the remaining months of the war.

March's major achievement was the shipment of 1.75 million men to France in time to turn the tide to victory. In his remaining years in office, until 1921, he supervised the "demobilization of the wartime army and the reorganization of the postwar army. As the nation's first strong wartime chief of staff, he developed a tense relationship with field commander Gen. John J. "Pershing, but he laid the foundation for the future power of that office. In 1932, March published *The Nation at War*, an account of his and the General Staff's contributions in World War I.

MARINE CORPS, U.S.

Overview

Marine Corps, U.S., 1775-1865

Marine Corps, U.S., 1865-1914

Marine Corps, U.S., 1914-45

Marine Corps, U.S., Since 1945

MARINE CORPS, U.S.: OVERVIEW

The U.S. Marine Corps is a separate service within the Department of the Navy. The Commandant of the Marine Corps is a member of the "Joint Chiefs of Staff (ICS). The Marines changed their traditional roles of providing guards of ships and naval installations and light infantry for colonial interventions by developing in the twentieth century into an amphibious force that conducts land operations essential to a naval campaign or participates in other expeditionary operations. The Corps receives much of its support from the U.S. Navy. Particularly in the twentieth century, the U.S. Marine Corps has emphasized physical fitness, intensive individual training for combat, and *esprit de corps*.

Although it claims lineage to the Continental Marines of the "Revolutionary War, the Marine Corps began its continued existence with a congressional authorization of 11 July 1798 that established a "corps of Marines" (originally some 350 officers and enlisted personnel) headed by a Commandant, for service aboard the warships of the navy then being expanded for the Undeclared Naval War with "France (1798-99). Like the British Marines, after which they were modeled, the first American Marines functioned as ships' guards and the nucleus of ships' landing parties for raids on harbors and other coastal sites.

Two centuries after its founding, the U.S. Marine Corps, with 172,200 officers and enlisted personnel in 1998, has no counterpart of comparable size and diversity among the world's armed forces. Its Fleet Marine Forces of three divisions and aircraft wings, plus other special operational units, can provide air-ground expeditionary forces especially trained for operations from the sea, including capturing littoral objectives with amphibious assaults by surface vehicles and watercraft or "helicopters. The modern Marine Corps is larger and more capable than many armies, and its aviation component, with more than 800 fighter-attack aircraft and helicopters, is among the ten largest in the world. Although there are functional reasons for a maritime power like the United States to have such a force, the continued existence of the U.S. Marine Corps as a separate service is also a monument to the power of image, the persistence of popular and congressional support, and the unflinching belief of Marines in themselves.

The U.S. Marine Corps enjoyed no special permanence, despite its wartime origins in 1775. After the Revolution, the Continental Marines disbanded in 1783. Despite its establishment in 1798, the U.S. Marine Corps seldom exceeded 5,000 officers and men for the next 100 years. Between 1798 and 1865, its best service came as shipborne infantry and emergency cannoners aboard American warships. When not at sea, Marines lived in barracks in navy yards to provide a guard force, sometimes joining in regional defense. The Marine Corps Act of 1834 made the Corps a distinct service within the Navy Department.

The Commandants of the Marine Corps understood that sea service had its limitations, so they stressed the readiness of barracks Marines "for such duties as the Presi-

dent shall direct." These included fighting Native Americans in the "Seminole Wars, quelling urban riots and small rebellions (such as John Brown's attack on the Harpers Ferry arsenal), and adding token battalions to field armies, as in the U.S. Army's capture of Veracruz and Mexico City during the "Mexican War. In the Civil War, Congress considered amalgamating the Marines into the Army, but decided against it. After the war, some navy officers sought to eliminate the ships' guards and, perhaps, the entire Marine Corps. Other naval officers saw new missions for Marines in a modernized navy, including the seizure of advanced bases in the Caribbean.

U.S. expansion in the wake of the "Spanish-American War (1898) brought a new era to the Corps' development. The Marines added two new missions: the wartime task of defending advanced U.S. naval bases in the Caribbean and the Pacific; and putting small but highly trained light infantry forces behind U.S. interventions and occupations in the Caribbean, Central America, and Asia. Serving as colonial infantry in China, the Dominican Republic, Haiti, Nicaragua, Panama, and elsewhere gave the Marine Corps, which ranged between 10,000 and 18,000, a popular image of toughness, daring, and *esprit de corps*.

In "World War I, the Marine brigade in the American Expeditionary Forces gained combat experience and new public praise. The Corps grew to 75,000. At the Battle of "Belleau Wood and subsequent engagements it suffered 11,500 casualties. Marines also began to use heavy artillery and airplanes in combat.

With the decline of its role as colonial infantry, the Marine Corps turned its attention in the interwar period to creating a combined arms amphibious assault force with a central wartime mission: the seizure and defense of bases in the anticipated naval campaign against Japan in the Pacific. The Fleet Marine Force was formed in 1933 as the operational arm of the Corps, supported by Marine aviation.

During "World War II, the successful war against Japan (1941*5) gave the Marine Corps a favored position in the U.S. defense establishment. The Fleet Marine Force battled its way from Guadalcanal to Okinawa, solidifying in the public mind the image of the Marine as the ultimate American warrior, thus providing the Corps with the ability to survive interservice challenges, particularly from the U.S. Army. Marines paid for the glory with some 90,000 casualties, including 19,700 killed in combat. With little administrative and logistical personnel of their own, the Marines were primarily a fighting force. Almost all Marines of World War II (a total of 669,000 men and women) served overseas. Only five percent of the U.S. armed forces, the Marine Corps suffered ten percent of all American battlefield casualties. The Marines played a vital role in the defeat of Japan, and indirectly, through creating the doctrine for amphibious landings, contributed to the defeat of Germany as well.

During the "Cold War, the Marine Corps maintained its amphibious assault mission (confirmed by congressional legislation in 1947 and 1952) and added another function, the deployment to regional trouble spots of air-ground task forces. In addition, the Corps participated in the "Korean War (1950-53) and the "Vietnam War (1961-75). In Korea, the Marines played pivotal roles, particularly in the 1950 "Inchon landing and in the 1951 campaign that drove the Chinese from South Korea. Marines suffered 30,000 casualties in heavy fighting. As a result of the Corps' proven competence, it was authorized to double its

permanent size to approximately 190,000 and to maintain three divisions and aircraft wings.

The Vietnam War showed the Marines could fight well in another extended land campaign, but at great cost. More Marines served (794,000) and more became casualties (103,000) in the Vietnam War than in World War II, in what proved to be a losing cause. By 1969, the Corps had grown to 315,000. Maintaining a Marine expeditionary force of more than two divisions and one aircraft wing in the northern five provinces of the Republic of Vietnam stretched the Corps to its limit, and traditional standards of discipline, morale, and field performance suffered.

In the post-Vietnam era, internal reform helped restore public and congressional confidence in the Corps. A terrorist truck-bombing in Lebanon killed 241 U.S. servicemen, including 220 U.S. Marines in their barracks in 1983. Participation in the intervention in Grenada (1983) and Panama (1989), the Marine Corps performed an important role in the Persian Gulf War (1991). A Marine Expeditionary Force of some 93,000 troops fought in Kuwait or held some six division of Iraqi soldiers in place along the Kuwait coast while the Allied coalition forces began their major flanking attack. Two Marine divisions breached the Kuwait border fortifications, freed the capital, and took 20,000 prisoners. Although the Marine Corps was reduced from 194,000 in 1991 to 172,200 by 1998 in the contraction of the U.S. armed forces, the Corps fended off attempts to reduce its role in the post-Cold War world. It remains the nation's principal "force in readiness."

MARINE CORPS, U.S.: 1775-1865

America's Marines date back to the * Revolutionary War, when, on 10 November 1775, the Second Continental Congress authorized two battalions for expeditionary service. Functioning as ships' guards and maritime infantry, the Continental Marines resembled the British Navy's marines. In their green uniforms, Continental Marines took part in a number of naval raids and at the Battle of Princeton.

Disbanded after the Revolution, the Marines were recreated by Congress on 11 July 1798 as the United States Marine Corps, under a lieutenant colonel. Authority was ambiguously divided, for they were subject to navy regulations at sea and the army's Articles of War on land. Furthermore, their *uniforms (blue with red facing), muskets, and other equipment were furnished by the War Department. More than 300 Marines served aboard warship in the Undeclared Naval War with *France (1798-99), and fought in several ship-to-ship battles.

In the first half of the nineteenth century, Marines accompanied the navy in expeditions in the *Tripolitan War (1801-05), against the Barbary pirates in Libya and in the *War of 1812 in actions in the Atlantic and Lake Erie. Ashore in 1814-15, they helped protect the Baltimore and Norfolk naval yards and participated in the defense of New Orleans.

Under Archibald Henderson (Commandant, 1820-59),

the Corps used opportunities in the second of the *Seminole Wars and the * Mexican War to build a public reputation as effective infantry while convincing the admirals that they were necessary to guard ships and naval yards. In the Marine Corps Act of 1834, Congress ended previous confusion over the Marine's status by making the Marine Corps a service within the Navy Department, subject to naval regulations at sea and ashore. The Corps was increased "to 1,500 during the second Seminole War (1835-42). During the Mexican War, some 1,800 Marines engaged in a several effective landings in California, Mexico's east coast, and the Gulf of Mexico. A small Marine battalion participated in the Battle of *Chapultepec and the capture of Mexico City (1847).

During the *Civil War, with the dramatic expansion of the *Union navy, the U.S. Marine Corps increased to only 3,800 men. In 1861, one-third of the Marine officers joined the secession and helped establish a small Confederate Marine Corps. The U.S. Marines served mainly as guards for ships and navy yards as well as gun crews aboard ships of the Union navy. Marines took part in a number of small landing parties, but the Corps eschewed larger-scale land operations, partly out of fear that a large land role might lead to amalgamation with the army, an action considered by Congress in 1863 and 1864.

Smith, *Marines in the Revolution: A History of the Continental Marines in the American Revolution, 1775-1783*, 1975. Allan R. Millett, *Semper Fidelis: The History of the United States Marine Corps*, rev. ed. 1991. —John Whiteclay Chambers II

MARINE CORPS, U.S.: 1865-1914

Following the *Civil War, the Marine Corps survived a period of relative doldrums, including downsizing and even attempts by naval officers to disband the Marines, whose major role was as guards of ships and naval yards. By 1876, Congress had reduced the Corps from 3,000 to under 2,000 men. As commandant in 1864-76, Jacob Zeilin adopted the army's new system of infantry tactics, rearmed the Marines with breech-loading rifles, and gave them a new emblem, the Eagle, Globe, and Anchor, and the motto *Semper fidelis* ("Always Faithful"). The Marine Band also began to play a new marching song, "From the Halls of Montezuma to the Shores of Tripoli," based on lyrics written sometime after the * Mexican War. In 1880, John Philip Sousa became leader of the Marine Band. A major change in officer commissioning in 1882 limited new Marine officers to graduates of the U.S. Naval Academy.

The Marine Corps was transformed at the turn of the century by the acquisition of a U.S. insular empire following the *Spanish-American War. On 10 June 1898, a Marine battalion landed at Guantanamo Bay, Cuba, and secured an advanced coaling base from which the U.S. *Navy could blockade Santiago. Following the war, with U.S. commitment to overseas expansion in the Caribbean, Central America, the Pacific, and East Asia, naval strategists emphasized the need for a mobile force to establish advanced fueling and repair bases for the fleet. In October 1900, the navy's General Board recommended a Marine advanced base force; and in 1901, a regiment of 700 Marines landed on Culebra Island near Puerto Rico as part of the fleet maneuvers in the Caribbean. In 1913, the Ma-

rine Advance Base Force, forerunner of the Fleet Marine Forces, was established at the Philadelphia Navy Yard; it consisted of two small regiments and two seaplanes. Marine aviation dates from 22 May 1912, when the first Marine aviator, Lt. Alfred A. Cunningham, reported to naval aviation camp at Annapolis.

During the early twentieth century, the Marines were particularly active in a new role as colonial infantry in America's expanding empire. Marines landed and helped protect U.S. citizens and their property in China (the "China Relief Expedition of 1900); in the Philippines; and in Panama in 1903 and 1904, in Nicaragua in 1912, and eight landings in Cuba between 1907 and 1912. The Corps increased from 2,000 in 1896 to 9,000 by 1908, remaining at approximately that level until World War I.

While debate over the use of Marine guards on shipboard would occasionally continue to ruffle relations between the navy and the Marines, a consensus soon developed on the importance of the advance base and expeditionary roles of the U.S. Marine Corps.

MARINE CORPS, U.S.: 1914-45

In 1914, the Marine Corps stood on the threshold of revolutionary change in its traditional mission of providing guards for ships and navy yards. During U.S. participation in "World War I (1917-18), the Marines' numbers expanded from 10,000 to 73,000, one-third of whom fought in France. As part of the U.S. "Army's Second Division, the Marine Fourth Brigade distinguished itself against the German Army at the Battle of "Belleau Wood, at Soissons, at Mont Blanc, and in the "Meuse-Argonne offensive. Some Marine leaders, such as Maj. Gen. John A. "Lejeune, who was given command of the Second Division, subsequently saw the Corps' future moving away from sustained land operations.

In the decade after 1914, the Marines also developed their role as colonial infantry, imposing order and protecting U.S. interests overseas. In 1914, Marine units helped occupy the Mexican port of Veracruz and went ashore on three occasions in Haiti. In 1915, in the wake of bloody uprising, 2,000 Marines landed in Haiti with President Woodrow "Wilson's goal of restoring order and reforming that troubled nation. One of them, Smedley "Butler, took the rank of Haitian major general and organized a new national constabulary. The last of the Marines left in 1934. From 1916 to 1926, a Marine force occupied the Dominican Republic. In Nicaragua, Marines manned a legion guard, 1912-24, intervened in force in 1926, and returned in 1927 and remained until 1934. Marines also guarded the legation in Peking (Beijing), China, and kept at least one regiment in Shanghai from 1927 to 1941. In these actions, the Marines' fledgling air arm was shaped for direct support of ground operations.

The role of colonial infantry declined in the 1930s as the United States reduced the use of force in Latin America. But the diminishment of that role coincided with the expansion of a new mission: seizing and defending ad-

vanced naval bases in the Pacific. In the 1920s, with the U.S. "Navy developing contingency plans for war with Japan, the Corps cut back to 20,000, and the Marines started to develop the doctrine of "amphibious warfare. In 1921, Gen. Lejeune (commandant, 1920-29) approved a study by Maj. "Pete" "Ellis to seize Japanese fortified islands in a future war as the U.S. Fleet battled its way across the western Pacific. Some exercises were conducted through 1926, but Marine attention was diverted to China and the Caribbean. During the depression, an attempt in 1931 by the U.S. Army to drastically curtail the Marines led the Corps and the navy to refocus on amphibious operations.

The Corps created the Fleet Marine Force in 1933, published its *Tentative Manual for Landing Operations* in 1934, and began new landing exercises with the navy. Technology lagged, however. Not until the late 1930s was a suitable landing craft developed.

In World War II, the Marine Corps, headed by Gen. Thomas Holcomb (commandant, 1936-44), fought the Japanese in the Pacific. Early in the war, ground and air Marines reinforced their reputations as tough fighters in desperate battles to defend the islands of Wake, Midway, and the Philippines. In mid-1942, they shifted to their base-seizure mission in the air-land-sea campaign against an expanded Japanese empire. The first Marine Division opened the Allied ground offensive in the Pacific in August 1942 in the Battle of "Guadalcanal in the Solomons. It was a Marine and army campaign lasting through February 1943. The commander, Maj. Gen. Alexander A. Vandegrift, became Marine commandant in January 1944. The first real test of the Marines' amphibious doctrine against a hostile shore came on 20-23 November 1943 at the Battle of "Tarawa in the Gilbert Islands, where, despite severe losses, the Marines proved that they could seize heavily fortified islands. In 1944-45, improved equipment and tactics and better coordination helped the Marines, sometimes accompanied by army units, succeed against increasingly sophisticated Japanese defenses on New Britain, the central and northern Solomons, and Roi-Namur, Kwajalein, Eniwetok, Saipan, Tinian, Guam, Peleliu, Okinawa, and most famously Iwo Jima. Marine air also helped to liberate the Philippines.

During World War II, the Marine Corps expanded from 19,000 in 1939 to a peak strength of 475,000 men and women in 1945. The force structure had grown to two amphibious corps each composed of divisions and supporting units, plus five aircraft wings. The secretary of the navy declared that the historic flag-raising over Iwo Jima meant that "there will be a Marine Corps for the next 500 years."

MARINE CORPS, U.S.: SINCE 1945

Immediately after World War II, the U.S. Marine Corps, despite its battlefield successes, found itself fighting for its existence under the pressures of "demobilization, the

"unification" struggle, and contentions that the atomic bomb had made obsolete the Marine Corps' specialty of amphibious assault.

The Marine Corps reorganized its shrunken operating forces symmetrically into a Fleet Marine Force, Pacific, and Fleet Marine Force, Atlantic, each with a division and an aircraft wing.

Personnel strengths dropped from a World War II peak of 465,053 to 74,279 by the summer of 1950. Peacetime manning of the divisions and wings was at less than 50 percent. To provide a brigade for the critical defense of Korea's Pusan Perimeter in August, virtually all of the 1st Marine Division was required. To flesh out the division for the * Inchon landing in September, the Marine Corps Reserve had to be called up and the Second Marine Division stripped of its battalions.

Partial *mobilization eased the personnel situation. The Third Marine Division and 3rd Marine Aircraft Wing were reactivated. Legislation in 1952 fixed the minimum force structure of the active duty Marine Corps at three divisions and three wings, with a fourth division and wing in the Organized Reserve. Marine strength climbed to nearly 250,000 in 1953.

In experimenting on how to achieve the dispersion of an amphibious task force in light of possible use of nuclear weapons, the Marine Corps decided that *helicopters with specially configured landing ships to act as their carriers offered a solution to the critical ship-to-shore movement.

Presaging what would become an increasing involvement in the Middle East, a brigade-size Marine force was landed in Lebanon in 1958 as a *peacekeeping presence.

The civil war, and particularly the assassination of President Ngo Dinh Diem in 1963, caused an increasing involvement in Vietnam of Marine forces, initially as advisers and helicopter support. The landing of the 9th Marine Expeditionary Brigade at Danang in March 1965 was the first significant introduction of U.S. ground combat elements into South Vietnam.

The Marine Corps employed the term *Marine Air-Ground Task Force (MAGTF)* to designate tactical groupings that, with an occasional exception, came in three sizes: A Marine Expeditionary Unit (MEU) combined a battalion landing team with a reinforced helicopter squadron. A Marine Expeditionary Brigade (MEB) usually had a regimental landing team and a composite aircraft group. A Marine Expeditionary Force (MEF) was organized around a division and an aircraft wing.

The Dominican intervention of 1965 saw the employment initially of the 6th Marine Expeditionary Unit and a buildup to the 4th Marine Expeditionary Brigade.

During the * Vietnam War, the 9th MEB grew with successive deployments into the III Marine Expeditionary (alternately called Amphibious) Force. The strength of the III Marine Amphibious Force reached 85,755 in 1968, more Marines than had been ashore at Iwo Jima or Okinawa.

In size the Corps grew from a 1965 strength of 190,213 to a peak of 314,917 in 1969. With the withdrawal from Vietnam, it slipped back quickly to a plateau of just under 200,000.

In August 1982, the 32nd Marine Amphibious Unit (MAU) landed at Beirut, Lebanon, as part of a multinational peacekeeping force. The Marine Corps "presence" in Lebanon continued, one MAU relieving another at roughly four-month intervals. Early Sunday morning, 23 October,

a truck bomb detonated under the building housing the Marine Corps headquarters on the airfield, killing 241 American servicemen, 220 of them Marines.

Almost simultaneously with the Beirut barracks tragedy, the 22nd Marine Amphibious Unit landed on the northeast corner of Grenada in a near-bloodless operation.

In the absence of sufficient amphibious shipping, a new program called the *Maritime Prepositioned Force (MPF)* came into being in the 1980s. Three squadrons of cargo ships, each squadron loaded with most of an MEB's combat equipment and about thirty days of supply, were positioned strategically around the globe.

At the outset of Operation Desert Shield, the buildup for the * Persian Gulf War, in August 1990, the airlifted 1st and 7th Marine Expeditionary Brigades were met at Saudi Arabia's ports by MPF squadrons. On 2 September, the I Marine Expeditionary Force was formed by "compositing" the two MEBs. Meanwhile, the 4th Marine Expeditionary Brigade, fully equipped and embarked in amphibious shipping, was en route. On 13 November, the involuntary call-up of Selected Marine Corps Reserve units began. The 5th Marine Expeditionary Brigade sailed from San Diego in amphibious ships on 1 December. Most of the East Coast-based II Marine Expeditionary Force—numbering some 30,000 Marines and sailors, and including the Second Marine Division—started its move to the gulf on 9 December.

When actual hostilities began on 16 January 1991, the I Marine Expeditionary Force had two divisions, a very large wing, and a substantial service support command ashore. In addition, there were two Marine expeditionary brigades and a Marine expeditionary unit afloat.

When the shooting stopped on 28 February, I MEF and Marine forces afloat had a strength of 92,990 (of the 540,000 total U.S. force), making Desert Storm by far the largest Marine Corps operation in history.

Subsequent to the Persian Gulf, there was almost continuous employment of Marine air-ground task forces in peacekeeping and humanitarian missions. The I Marine Expeditionary Force deployed to Somalia in 1992. A MAU-size Special Purpose MAGTF swiftly occupied Cap Haitien, Haiti, in September 1994.

Downsizing incident to President Bill * Clinton's "bottom-up" review of the armed services took the Corps from an active strength of 193,735 in 1991 to 173,031 in 1998.

MARINE CORPS COMBAT BRANCHES: GROUND FORCES

The U. S. Marine Corps, the smaller of the naval services, traces its origins to the American * Revolutionary War. Like the navy, it was re-created in 1798 during the Undeclared

War with * France. For much of the nineteenth century, the Marine Corps served as a lightly-armed constabulary at sea, mostly to enforce order and discipline aboard ship and to man small landing parties for infrequent forays ashore. In addition to their normal duties in support of the navy, Marines also served with the army in suppressing a rebellion by the Seminoles in Florida and in the *Mexican War.

Between the *Civil War and the *Spanish-American War, various commandants of the Corps instituted reform measures. In 1870, the muster rolls listed barely 2,000 "Leathernecks" (as they were sometimes called), but one-fourth were deserters. Reformist efforts focused on the quality of the Marines. Beginning in 1883, all Marine junior officers came from the U. S. Naval Academy. A reformist element within the navy wanted to deploy Marines in battalions, readily available to the various fleet commanders. Such usage had already been demonstrated during an incursion into Panama in 1885, and again with the expeditionary force that landed at Guantanamo Bay, Cuba, in 1898. Some senior officers in the Navy argued that the manning for these "ready battalions" could be accomplished by eliminating Marines from their traditional duties aboard ship, a proposal viewed with disdain by the Marines.

Then, with the era of neocolonialism that followed the Spanish-American War, the Marine Corps was used to provide the constabulary for colonial infantry duties as part of the U. S. military involvement in the Caribbean well into the interwar era. Marines served also in a variety of overseas capacities in Latin America and East Asia. The Marine Corps also served during World War I with the American Expeditionary Forces in France.

A new justification for the Marine Corps became codified in 1927 when the Joint-Army Navy Board gave it the mission of amphibious assault in support of naval operations. It assumed that, in the event of war with Japan, the Marines would be responsible for seizing Japanese-held islands in the Pacific. The Corps developed a doctrine of *amphibious warfare, which appeared as *The Tentative Manual for Landing Operations* in 1934. During * World War II, Marines, sometimes in conjunction with the army, won a number of bloody battles on islands whose names would go down in history. Between 1941 and 1945, the Marine Corps expanded from 1,556 to 37,664 officers and 26,369 to 447,389 enlisted men. Nearly 90,000 Marines were killed or wounded during World War II; eighty Marines earned Medals of Honor.

Although a small number of women had been accepted briefly during the World War I era (known pejoratively as "Marinettes"), more than 18,000 women Marines served in World War II, and many chose to remain in uniform after the war. Some African Americans gained entry into the traditionally all-white ranks, but they were relegated to support duties. It was not until 1948 that a black American received a Marine Corps officer's commission.

A postwar effort to reduce the size and limit the mission of the Marine Corps was thwarted. Nonetheless, on the eve of the *Korean War, the Marine Corps numbered barely more than 70,000. Although used initially to buttress the collapsing forces of the Republic of Korea, an understrength division of Marines staged a successful amphibious landing behind enemy lines at Inchon in September 1950 that paved the way for the liberation of Seoul and

helped break the back of the North Korean incursion into the south.

Between the end of the Korean War and the *Vietnam War, the Marine Corps embraced the concept of vertical envelopment using *helicopters to move troops beyond the beachhead. Early in 1965, Marine units were among the first U. S. combat units deployed to South Vietnam. Ultimately, two Marine divisions and an air wing, as well as support elements and the headquarters of the III Marine Amphibious Force, served in Vietnam. The lengthy deployment taxed the capabilities of the small armed service to provide replacements and maintain its professionalism. The Marine Corps lost 12,926 men killed and 88,542 suffered wounds.

For a decade after the end of the war in 1973, the ills plaguing American society as a whole impacted upon Marine ranks: social unrest, exacerbated by racial tensions; substance abuse; and recruiting difficulties resulting from public disenchantment with the Vietnam conflict. By the early 1990s, however, the Marine Corps had coped successfully with its problems all the while enhancing its amphibious capabilities. During the * Persian Gulf War of 1991, amphibious units maneuvered and demonstrated to convince the Iraqi leadership that an amphibious invasion of Kuwait was imminent, and an entire Marine Amphibious Force (two divisions, supported by an air wing and two force service support groups) stormed north from Saudi Arabia to help breach Iraqi defenses in Kuwait.

MARINE CORPS COMBAT BRANCHES: AVIATION FORCES

Since its beginning in 1912, Marine Corps Aviation has defined an enduring relationship to Marine ground units and to aerial components of the U.S. *Navy, *Army, and, after 1947, to the U.S. *Air Force.

During World War I (1917-18), the Marine aviators flew their missions far from the Marine brigade fighting alongside the army in France, either bombing targets in Belgium or patrolling from the Azores for German *submarines. After the war, in the course of expeditionary duty in Haiti (1920-34) and in Nicaragua (1927-32), Marine airmen began specializing in the support of ground forces—conducting reconnaissance, strafing, dive-bombing, delivering supplies, and evacuating * casualties. By the time the United States entered World War II in 1941, aviation formed an integral part of the Fleet Marine Force, organized in 1933 for expeditionary service and operated from the navy's *aircraft carriers.

During *World War II, Marine aviation supported amphibious, ground, and sea operations against the Japanese. In 1945 on Luzon during the liberation of the * Philippines, Marine dive-bombers protected the flank of an

army division. Ground support, however, was overshadowed by aerial combat; Marine fighter pilots downed 2,300 Japanese aircraft.

By the "Korean War (1950-53), the Marine Corps embraced the concept of the air-ground team, normally pairing an aircraft wing with a ground division. Although Marine pilots scored a few aerial victories in Korea, they concentrated on supporting Marine ground forces.

In the "Vietnam War (1965-73), since the objective of an air-ground team under Marine control clashed with U.S. Air Force doctrine, which centralized all land-based combat aviation under air force control—overcoming intense objections—the Air Force in March 1968 obtained operational control over all Marine Corps aircraft in Southeast Asia, except for transports, reconnaissance craft, and "helicopters. In practice, such centralization proved too cumbersome, and within six months the air force headquarters in the theater began releasing blocks of sorties for the Marines to use in support of their own ground forces.

After Vietnam, Marine Corps Aviation evolved into a force—roughly 60 percent fixed-wing aircraft and 40 percent helicopters—designed to operate from small aircraft carriers in support of amphibious operations but also capable of sustained activity from airfields ashore. During the "Persian Gulf War (1991), the 3rd Marine Aircraft Wing operated against Iraqi troops opposing two Marine divisions. Because the coalition dominated the air, centralization proved unnecessary and the Marines used their sorties as they chose.

• Robert Sherrod, *History of Marine Corps Aviation in World War II*, 1952; repr. 1987. Peter B. Mersky, *Marine Corps Aviation, 1912 to the Present*, 1983. —Bernard C. Nalty

The MARINE CORPS RESERVE, established by the Naval Appropriations Act (1916), provided for the wartime expansion of the Corps without changing its statutory regular strength. The initial legislation focused on establishing the mobilization status of individuals, not units. In World War I, 7,500 Marines (including 277 women) were reservists.

Aware that its war plans required two to three times as many Marines as it could maintain on active duty, Headquarters Marine Corps gave its reserve program greater attention in the interwar period, especially training junior officers. Of the 600,000 men and women who served in the Marine Corps in World War II, about two-thirds fell into some reserve category that provided for the service of retirees, wartime volunteers and draftees, college students, volunteers below draft age, specialists, limited service personnel, and women.

The "Cold War military establishment required a higher level of reserve training readiness as well as more reservists. The Reserve Forces Act (1948) finally provided regularized pay for drills and active duty training as well as a retirement system. The Marine Corps divided its members into an Organized Marine Corps Reserve (OMCR) (drill pay units); Volunteer Training Units (no pay, but retirement credit points); and the Volunteer Reserve (a pool of veterans with no training obligations, but some active duty training opportunities). The last group became known as the Individual Ready Reserve (IRR). In 1950, the Marine Corps Reserve numbered almost 40,000 members

of the OMCR and 88,000 members in other categories. Over 95 percent of these Marines came on active duty during the "Korean War.

Reserve reform acts in 1952, 1955, and 1957 did much to improve the preactivation readiness of Marine reserves. The most important provision (1955) was that all Marine reservists complete at least six months of initial active duty training before joining an Organized Marine Corps Reserve unit. The requirements for reserve officers were even more stringent—two or more years of active duty. The requirements for training increased. Summer camps expanded to two weeks, and drills shifted from one night a week to one or more weekends a month. The Ready Reservists numbered around 45,000 in drill pay units and 80,000 in the Individual Ready Reserve.

In the early 1960s, the Organized (or Select) Marine Corps Reserve became a regular part of the Fleet Marine Force: the 4th Marine Division, the 4th Marine Aircraft Wing, and the 4th Force Service Support Group. Unlike the army, the active duty Marine Corps (around 190,000 before and after the "Vietnam War) remained four times as large as the organized reserves. Marine Corps reserve units did not mobilize for the war, but countless thousands of reservists volunteered as individuals for active duty in Southeast Asia.

After a troubled transition to an "All-Volunteer Force system in the 1970s, the Marine Corps Reserve rebuilt itself into a force of 40,000 members of the Select Reserve and 68,000 members of the Individual Ready Reserve. Around 28,000 members of this force came on active duty by volunteering or by federal activation to serve in the "Persian Gulf War (1991). Operation Desert Storm showed that the policy of extensive active duty training and a generous commitment of regulars and full-time reservists to reserve training and administration paid dividends in readiness.

MARINE CORPS WOMEN'S RESERVE, U.S. The Marine Corps Women's Reserve (MCWR) was authorized by Congress in July 1942 to relieve male Marines for combat duty in World War II. However, Maj. Gen. Comm. Thomas Holcomb delayed until October, when mounting losses, an order to add 164,273 Marines, and a plan to include draftees (viewed as a threat to the Corps' elite volunteer image) forced him to consider joining the other services in accepting women in uniform.

In January 1943, the MCWR swore in its first director, Maj. Ruth Cheney Streeter, forty-seven, wife of an attorney and mother of four. The MCWR officially began on 13 February 1943. In March, the first 71 officer candidates arrived at the U.S. Midshipmen School at Mount Holyoke College; 722 enlisted women entered boot camp at Hunter College in New York City.

Although the public wanted an acronym like the "WACs and "WAVES, the commandant refused any catchy name for Marines. The formal title remained, but informally they were called Women Reservists, shortened to WRs.

More than half of the WRs performed clerical work; the

others were assigned various duties, including radio operator, photographer, parachute rigger, motor transport driver, aerial gunnery instructor, link trainer instructor, control tower operator, automotive mechanic, teletype operator, cryptographer, laundry manager, and assembly and repair mechanic. At the end of the war, the MCWR had 820 officers and 17,640 enlisted women. They worked in 225 specialties, filling 85 percent of the enlisted jobs at Marine Corps Headquarters and comprising nearly two-thirds of the permanent personnel at all large posts and stations.

*Demobilization began in June 1945, and the office of the wartime MCWR closed June 1946. However, the need for clerks to process separation orders and transportation, and settle the accounts of thousands of combat Marines, plus a growing sense of the inevitability of a permanent women's military organization, prevented total disbandment. Several hundred WRs were retained at headquarters until June 1948, when President Harry S. *Truman signed the Women's Armed Services Integration Act giving equal status to women in uniform. Women then became part of the regular Marine Corps.

MARION, FRANCIS (1732-1795), the "Swamp Fox," Revolutionary War partisan leader. Marion looked frail and unmilitary, but he served brilliantly as a provincial lieutenant in the Cherokee War (1761), as a major defending Sullivan's Island (1776), and as a regimental commander in comte d'Estaing's attack on Savannah (1779). Escaping the British siege of *Charleston in May 1780, he raised a partisan militia to oppose the occupation of his native South Carolina. His first operation (20 August) became his trademark: surprise night attack on a larger British-loyalist force and then a skillful withdrawal. In this case he liberated 147 American prisoners. In December he became a brigadier general, commanding the militia of eastern South Carolina. He followed directives from theater commander Nathanael *Greene but opposed cooperation with fellow partisan Thomas Sumter, whom he considered a plunderer.

Marion's perseverance, leadership, and cunning kept his force alive and earned him the sobriquet, the "Swamp Fox." The partisans denied the British a secure base, terrorized the loyalists, decimated their militia, and forced British regulars to become constables instead of concentrating against Greene's army. During 1781, Marion's brigade fought twenty-five engagements, captured Fort Watson, Fort Motte, and Georgetown, and led Greene's attack at Eutaw Springs. In the postwar period, Marion campaigned in the state assembly to restore former loyalists to society.

MARNE, SECOND BATTLE OF THE (1918). Marne was the area west of Reims, France, in which the Germans made their greatest gains in World War I since the battle in

the same area in 1914. On 15 June 1918, fourteen German divisions forced the Marne River against French and British armies. A French division and two Italian divisions folded. Earlier, at Cantigny, the U.S. 1st Division had halted the Germans, and the 2nd Division helped recapture Belleau Wood and Vaux. The U.S. 3rd Division, hastily committed against the point of the German drive, stopped the advance, in bloody, hand-to-hand fighting, although the Americans were beset on three sides. The German drive continued around the Americans, establishing a sizable bridgehead across the Marne. British divisions from the north arrived and blunted the German offensive, as they and the French reconstituted defenses on the river line, building on the 3rd Division's positions. Through the ranks of the German assault troops ran the rumor, "The Americans are killing everyone."

Allied *artillery and aircraft, striking beyond the salient, destroyed the Marne bridges, disrupting German reinforcement and resupply. With the French line holding from Soissons to Reims, the German offensive was halted. By 17 July, it was apparent to the German High Command that the offensive had run its course. American forces were arriving in France at the rate of 300,000 a month. Although Gen. Erich *Ludendorff, commander of the German forces, planned another offensive in Flanders, the offensive in the Champagne-Marne marked the last westward movement of the German Army in World War I.

American forces had been "bloodied" in two scorching hot days of close combat; they had proven themselves brave, even aggressive, though still "green" in battle. The Third Division's steadfast defense, especially that of the 38th Infantry Regiment, earned it the title "The Rock of the Marne."

MARSHALL, GEORGE C. (1880-1959), World War II army chief of staff; secretary of state, 1947-49; *Korean War secretary of defense. Marshall is considered the creator of the World War II U.S. Army, the organizer of Allied victory, and the architect of key U.S. *Cold War policies. In 1953, he received the Nobel Peace Prize for the European Recovery Program (*Marshall Plan) that bears his name. He is the first professional soldier to be so honored.

Born in Uniontown, Pennsylvania, Marshall graduated from the Virginia Military Institute in 1901 and in 1902 was commissioned a second lieutenant. Throughout his early military career, he exhibited extraordinary ability as a staff officer. Consequently, he was given responsibilities far beyond his rank and deeply impressed his superiors—most notably Gen. John J. *Pershing, who assigned Marshall to his World War I staff and became his mentor and supporter. Marshall played a major role in planning the St. Mihiel and *Meuse-Argonne offensives, and developed an exceptional reputation for organizing and operating within Allied commands. During the interwar years, he developed a similar reputation for working with civilians. As head of the Infantry School at Fort Benning (1927-32) he also trained what would become the U.S. High Command

in World War II. Promotion during this time was slow, however, and only in 1936 did he obtain his first general's star. Yet in 1939 President Franklin D. *Roosevelt selected him over numerous senior officers to be the new army chief of staff.

In 1939-41, Marshall focused his energies on the creation of a large, modern army to meet the threat posed by Axis military victories. In the process he developed an extraordinary reputation with Congress for honesty as well as military expertise, and he became the administration's most convincing military advocate on Capitol Hill. Largely as a result of his efforts, the army expanded from 175,000 in 1939 to 1.4 million in 1941. Plans were also completed for additional expansion to 8 million and for a global strategy of alliance with Britain to defeat Germany before Japan, if and when the United States officially entered the war. Marshall was far less successful in halting Roosevelt's proclivity to overcommitment, however, particularly in the Far East, and over whether scarce resources should be allocated to the U.S. Army or to potential allies under the *Lend-Lease Act and Agreements.

After the attack on *Pearl Harbor, Marshall became the leading figure in the newly formed U.S. Joint and Anglo-American Combined Chiefs of Staff and gradually emerged as Roosevelt's chief military adviser. He attended all Allied wartime summit conferences and played a major role in the creation of the joint and combined chiefs and in the application of the unity of command principle to all U.S. and British ground, naval, and air forces. He also strongly promoted a cross-Channel invasion over British-supported Mediterranean operations, but he lost that debate and was forced to acquiesce in the 1942-43 *North Africa Campaign and the 1943 invasion and conquest of *Sicily and *Italy. In return, Marshall won presidential and British support for the 1944 cross-Channel assault that would culminate in the decisive invasion of *Normandy. Although it was expected he would command that operation, Marshall was not selected because he had become indispensable in Washington and because he refused to request the position. For such self-denial as well as for his accomplishments, Marshall was selected *Time* magazine's "Man of the Year" in 1944, and Congress awarded him a fifth star and the title "General of the Army."

After World War II, Marshall served as special presidential emissary to China in an unsuccessful effort to avert civil war, and then as Truman's secretary of state from 1947 to 1949. In this position he played a major role in defining, implementing, and winning bipartisan support for an activist Cold War policy of containing Soviet *expansionism, most notably in the European Recovery Program (*Marshall Plan), and won a second "Man of the Year" award as well as a Nobel Prize. He played a major role, too, in the formation of West Germany and *NATO. As secretary of defense (1950-51), he rebuilt U.S. military forces during the Korean War and took a key part in the controversial relief of Gen. Douglas MacArthur. For this, as well as his Asian policies while secretary of state, he became a target of attacks by Senator Joseph McCarthy and his associates.

Despite those attacks, Marshall's reputation continued to grow after his death in 1959. In addition to his extraordinary accomplishments, he was one of the foremost defenders of civilian control of the military, a key definer of the army's proper role in a democratic society, and a model

of both personal integrity and selfless public service. For all of this he is widely considered one of the world's greatest soldier-statesmen.

MARSHALL, S. L. A. (1900-1977), military writer, journalist, army officer, pioneer of combat history techniques in World War II. Born in Catskill, New York, Samuel A. Marshall grew up in El Paso, Texas, enlisted in the army in 1917, and won a lieutenant's commission in France. He subsequently joined the National Guard. Marshall became a journalist in El Paso in 1923, but moved in 1927 to the *Detroit News*, from which, except during tours of army duty, he covered wars for forty years. Through his syndicated column and other publications, "SLAM" Marshall became one of America's best-known military writers.

In writing battlefield history, Marshall's technique was to interview survivors, particularly enlisted men and junior officers, individually and in groups, soon after an encounter. He elicited and compared details and wrote up his findings almost immediately in a highly readable, anecdotal narrative style.

Two books (1940 and 1941) by Marshall on Germany's mobile warfare led to his appointment in 1942 as a major in charge of army orientation. In 1943, he helped found the army's Historical Branch and followed American troops through the Gilbert and Marshall Islands, where he conducted his first after action interviews. In 1944-45, he covered the Allied invasion of Western Europe, spending considerable time interviewing under fire.

Afterward, resuming his journalistic career, Marshall wrote a number of books on World War II battles. Most influential was *Men Against Fire* (1947). His assertion that only 25 to 30 percent of front-line American soldiers fired their weapons, even when under attack, provoked considerable controversy. *Infantry Journal* contained articles by professional officers challenging his figures. Despite this skepticism, Marshall's findings contributed to changes in army training doctrine.

(Marshall said his evidence came from his interviews with combat soldiers, but after his death, when no notes of such interviews were found in his papers, a new debate emerged in 1989 over the authenticity of these findings. Roger J. Spiller of the army's Combat Studies Institute challenged the evidence, but Marshall's grandson, John Douglas Marshall—who had broken with his grandfather by resigning his commission as a conscientious objector during the *Vietnam War—defended him.)

During the *Korean War, Marshall was promoted to brigadier general in 1951 and assigned to the Eighth Army. Afterward, he wrote *Pork Chop Hill* (1956), later a Hollywood film. Having accompanied the Israeli Army in 1956, he wrote *Sinai Victory* (1958).

The army sent Marshall to Vietnam in 1967. He defended U.S. military action there, criticized the press, and later opposed the withdrawal of American troops.

As a syndicated columnist, military historian, and author of more than thirty books, Marshall had a significant influence—especially in the 1940s and 1950s—on the way combat was perceived by the public and by many in the military.

The MARSHALL PLAN (1948-52) was the largest and most successful program of foreign assistance ever undertaken by the U.S. government. The harsh winter of 1946-47 underlined the inability of European countries to achieve a sustained economic recovery from the dislocations and destruction of World War II. Following the proclamation of the "Truman Doctrine in March 1947, and the failure of the Moscow Conference that April to reach agreement on German reparations, Secretary of State George C. "Marshall came to believe that "The patient is sinking while the doctors deliberate." American leaders feared that poverty and hunger would make Western European countries vulnerable to Communist appeals. Marshall's speech at Harvard University's commencement in June offered American funding for a cooperative European recovery program, including Germany. Marshall even invited the Soviet Union to participate, arguing that "our policy is directed not against any country or doctrine but against hunger, poverty, desperation, and chaos." The Soviet Union, however, refused, since Josef "Stalin feared that the Americans intended to use their economic strength to undermine Soviet control in Eastern Europe. The Soviet Union responded to the plan by further tightening its control over Eastern Europe, a reaction that encouraged Western European countries to seek a formal political and military alliance with the United States. The Marshall Plan, with its huge commitment of American prestige and treasure in Western Europe, laid the foundations for "NATO and the Atlantic alliance.

Between 1948 and 1951, the Congress authorized more than \$13 billion for the European Recovery Program, approximately 10 percent of the annual federal budget. Although some contemporaries may have exaggerated the importance of Marshall Plan assistance in Europe's reconstruction, there is little question that the aid helped overcome bottlenecks within the European economy and created a basis for rapid economic growth. Western European production rose rapidly, and by 1950 it had topped the prewar level by 25 percent.

Although the Marshall Plan was presented as part of the "containment" of Soviet "expansionism, Congress initially prohibited the use of Marshall Plan assistance for military supplies. (This did not prevent colonial powers such as the

French from indirect use of such assistance to continue their war in Indochina.) After the outbreak of the "Korean War in June 1950, the United States reversed this policy and encouraged the use of Marshall Plan assistance to provide for the rearmament of Western Europe within the NATO alliance. At the end of 1951, this change in emphasis became official when the Economic Cooperation Administration was renamed the Mutual Security Administration.

MARTIAL LAW, sometimes defined as merely the will of the commanding general or whatever is necessary to preserve governmental authority, is the temporary control by military authorities of the civilian population in a particular area. Its application is generally to battle zones during war or areas of great or potentially great public disturbance in peacetime.

Americans rejected martial law in the Declaration of Independence, indicting George III for having put colonial Massachusetts under control of the British army. The U.S. Constitution limited the federal government's application of martial law by the provision in Article I, section 9, concerning the right of habeas corpus.

After 1798, the new government differentiated between military law and martial law. The former are the rules that govern members of the armed forces. The latter is the mechanism under which the military governs civilians. Martial law by federal authorities was viewed as permissible only under extraordinary circumstances which, as with suspension of habeas corpus, presumed congressional authorization.

Martial law was imposed by U.S. forces briefly on New Orleans during the "War of 1812 and on areas of Mexico occupied by the U.S. Army during the "Mexican War. But it became a major issue in the "Civil War, when President Abraham "Lincoln and the "Union army used it in various states to restrain behavior by civilians both in the war zones and eventually in areas far removed from battle such as Ohio and Indiana. This virtual independence of military courts from supervision by civilian courts raised troubling questions; after the war, the U.S. Supreme Court in *Ex Parte *Milligan* (1866) severely limited its application by the federal government and precluded it where civil courts functioned. Although martial law has been declared by state governors for areas hit by natural disasters or extensive violence, the federal government, with the exception of the treatment of the Japanese Americans on the West Coast in World War II, has seldom used martial law in the United States in the twentieth century.

MAULDIN, BILL [WILLIAM] (1921-), trained through correspondence classes as well as a year spent at the Chicago Academy of Art, American editorial cartoonist of World War II. Mauldin was unable to gain steady employment as a newspaper cartoonist, so the New Mexican native enlisted in 1940 in the Arizona National Guard. Mauldin's talents were first recognized during his assignment to the 45th Division's newspaper staff. Still he served as an infantryman once the United States entered the war.

In 1944, Mauldin joined *Stars and Stripes* and developed the distinctive characters of "Willie" and "Joe" to depict the drudgery and misery faced by the average G.I. in the European theater. Filthy, aged beyond their years, irreverent in their attitudes toward officers and rear echelon personnel, Willie and Joe became among the most widely recognized symbols of the American combat infantryman. Mauldin was awarded the Pulitzer Prize in 1945, and the United Features Syndicate distributed his cartoons to hundreds of newspapers. In his book *Up Front* (1945), an instant bestseller, Mauldin interpreted his cartoons and the experiences of the average soldier.

After the war, Mauldin continued his career as a cartoonist, satirizing a variety of political and social topics. During the *Korean War, he visited the front and described his experiences in *Bill Mauldin in Korea* (1952). Mauldin spent much of his postwar career with the *Chicago Sun-Times*.

MAXIM, HIRAM (1840-1916), self-taught engineer and inventor of the first automatic machine gun. Born in Maine, Maxim's early work focused on electrical design and the incandescent light bulb. In the early 1880s, he moved to London as representative of the U.S. Electric Lighting Company. As a sideline, he experimented with early *machine guns. In 1885, Maxim developed a single-barrel weapon that could fire 500 rounds of ammunition a minute. Although not the first machine gun, the Maxim gun, as it was called, remained vastly superior to the earlier multibarreled hand-cranked *Gatling gun (1862) and the Nordenfelt gun (1877). An avid promoter, Maxim effectively cultivated support from the British royal family and other influential Britons, which helped promote the adoption of the Maxim gun by the British army (1889) and the Royal Navy (1892). His company was consolidated with the Vickers Company in 1896. He became a British subject in 1900 and was knighted in 1901. His brother, Hudson Maxim (1853-1927), remained in the United States and developed a high explosive (Maximite). Despite the technical superiority of the Maxim gun, the U.S. Army resisted using it until 1904.

Neither Maxim nor most military men initially recognized the revolutionary impact the Maxim gun would have on the nature of battle. Although the machine gun would be used with deadly effectiveness by British imperial forces

in suppressing colonial insurrections in Africa, few anticipated its extensive use in European warfare beginning in World War I.

MAYAGUEZ INCIDENT (1975). On 12 May 1975, Cambodian gunboats seized the U.S. merchant ship *Mayaguez* near Cambodia's Koh Tang Island. Claiming the ship was spying, Cambodia's Khmer Rouge government imprisoned the forty-member crew. President Gerald *Ford labeled the action piracy. After the fall of Saigon that year and the unsuccessful end of the *Vietnam War, Ford and Secretary of State Henry *Kissinger believed that only forceful response to the *Mayaguez* provocation could bolster damaged U.S. credibility. Also, memories of North Korea's 1968 capture of the USS *Pueblo*, an intelligence-gathering ship, and the year-long incarceration of its crew, prompted quick action. Lacking diplomatic relations with Phnom Penh, Washington attempted to communicate demands for release of the crew through Beijing and the *United Nations, but received no clear response from the Cambodians.

On 14 May, 179 U.S. Marines used *helicopters to assault Koh Tang Island while a Marine boarding party retook the empty *Mayaguez*; U.S. aircraft bombed nearby military targets. The crew was not on the island, but the Cambodians on their own released the crew from the mainland as the operation began. The Marines on the island encountered strong resistance and could not be extracted until the 15th. U.S. *casualties were fifteen killed in action, three missing, fifty wounded, and twenty-three killed in a helicopter crash.

Heeding the *War Powers Resolution of 1973, the Ford administration had notified Congress as it issued its military orders. Some legislators charged that the president had abused the law, and some historians have characterized Ford's use of force as precipitous and excessive. Ford insisted that the operation helped restore America's self-confidence. Many editorial writers agreed, and the president's public approval rating surged 11 percent.

The McCARRAN INTERNAL SECURITY ACT (1950) was enacted during the early Cold War years and shortly after U.S. intervention in the *Korean War in response to growing domestic anti-Communist fears. In the wake of Republican accusations that the Truman administration was not diligent enough against Communists and Communist sympathizers in the United States, a coalition of conservative Democrats and Republicans adopted the measure.

The act, named after Democratic senator Patrick A. McCarran of Nevada, required "communist-action" and "communist front" organizations to register with the Justice Department. It also increased the statute of limitations, required registration of individuals trained in espionage, authorized the exclusion and deportation of Communists and other "subversives," and provided for the

detention of potential espionage agents and subversives whenever the president proclaimed an "internal security emergency." President Harry S. Truman vetoed the bill, which was criticized as an abridgment of civil liberties; but the measure became law on 23 September 1950 after Congress overrode his veto. The registration measures were challenged in the courts and declared unconstitutional in the 1960s. The emergency detention provisions were repealed by Congress in 1971 during the presidency of Richard M. Nixon and the controversial *Vietnam Anti-war Movement.

McCAULEY, MARY LUDWIG HAYS. See Pitcher, Molly.

MCCLELLAN, GEORGE B. (1826-1885), Civil War general. McClellan was born to a wealthy family in Philadelphia; at the age of fifteen, he entered West Point and eventually graduated second in his class. During the *Mexican War, he won two promotions on the field for distinguished conduct under fire, but he resigned his commission (1857), becoming chief engineer and then president of railroad companies in Illinois and Ohio.

When the Civil War broke out, McClellan received an appointment as major-general and commanded Union forces that drove the Confederates out of western Virginia in July 1861. After the Union disaster at the First Battle of *Bull Run, President Abraham *Lincoln brought him east to reorganize and command the Army of the Potomac. McClellan was greeted with widespread public enthusiasm as "the Young Napoleon" who would produce a swift and decisive victory over the Confederacy. Unfortunately, these expectations—partly of his own making but mostly a reflection of a conviction early in the war that "hard fighting" would lead to a quick and relatively painless victory—would haunt McClellan's tenure as a Union general as well as his historical reputation.

In the late summer and fall of 1861, McClellan set out methodically to rebuild the Army of the Potomac. Despite public pressure for an immediate attack, McClellan prepared for an assault in the spring of 1862. His meticulous plans for one big offensive to seize Richmond, Virginia, the Confederate capital, resulted in the Peninsula Campaign from March to July 1862, in which the Army of the Potomac came within five miles of the city, but was thrown back by a determined counter-attack by Robert E. *Lee in the *Seven Days' Battle (25 June-1 July 1862). Disillusioned by McClellan's apparent lack of progress and demands for additional manpower, Lincoln withdrew McClellan and his army from the peninsula, and placed John Pope in charge of Union forces in northern Virginia.

However, after humiliating Pope at the Second Battle of *Bull Run, Lee invaded Maryland, and Lincoln recalled McClellan to lead the Army of the Potomac once again. "Little Mac" brought together the disorganized and dispirited *Union army, and after Union troops discovered the

"lost" plans to Lee's invasion, he moved rapidly to track Lee down. McClellan cornered Lee's forces near Sharpsburg in western Maryland: at the Battle of *Antietam (17 September 1862), the two armies fought the bloodiest one-day conflict of the war. Lee was forced to retreat back into Virginia. The battle has been described as a tactical draw, but a strategic victory. McClellan has been criticized by some historians for failure to commit his reserves at the end of the day to destroy the Rebels. Under substantial pressure himself, Lincoln once again relieved McClellan of command in November 1862.

Although he understood that the Confederacy had to be defeated, McClellan, a member of the Democratic Party, advocated military conduct under "the highest principles known to Christian civilization" and was generally conservative on slavery. Hence, he was never in favor with Radical Republicans, who demanded the immediate abolition of slavery and regarded McClellan as "soft" on military measures. McClellan's supposed moderation became a central issue when he ran for president in 1864. Although he strongly advocated continuing the war until victory was achieved, some historians have suggested that if McClellan had defeated the Republican Lincoln, the peace faction within the Democratic Party would have insisted that the war effort be suspended, and the Confederacy would thereby have achieved independence. Such assessments, however, are speculative.

McClellan was a brilliant organizer, who inspired devotion from the common infantryman. He could also be contemptuous of politicians, which has led some historians to describe him as vain, arrogant, and paranoid. A tragic failure, he had a Cassandra-like quality in correctly warning that it would take substantial resources and repeated attempts to capture Richmond. For the first two years of the war, each time Lincoln replaced McClellan, the Union army, in less capable hands, went on humiliating debacles. George B. McClellan proved, and will probably remain, one of the most controversial generals of the American Civil War.

MCCLOY, JOHN J. (1895-1989), advocate of national security in the *Cold War era. Born in Philadelphia, McCloy was educated at Amherst College and Harvard Law School. After attending the Plattsburgh military training camps for civilians in 1915-16, McCloy developed a lifelong interest in the military. He joined the American Expeditionary Force in World War I, and later became a Wall Street lawyer, best known for his success in pursuing the "Black Tom" sabotage case against Germany in the 1930s. During World War II, McCloy was assistant secretary of war, handling the political dimension of military problems. He advocated the racial integration of the U.S. military on grounds of increased "efficiency." However, McCloy

also was a central figure in the controversial decisions to intern Japanese Americans and not to bomb the Nazi extermination camp at Auschwitz. Along with Secretary of War Henry L. "Stimson, McCloy helped defeat the Morgenthau Plan to deindustrialize Germany, and he advocated an international tribunal to investigate German "war crimes. His willingness to countenance a significant increase in the power and secrecy of the national government places him as one of the founders of the so-called national security state. After the war, McCloy served as president of the "World Bank (1947-49) and as high commissioner to Germany (1949-52), strongly supporting the rearmament of West Germany and its entry into the "NATO alliance.

Although his position as high commissioner was his most significant public office, McCloy played a continuing role in formation of U.S. policy on "national security in the nuclear age. He was John F. "Kennedy's adviser on disarmament, and served Lyndon B. "Johnson in the Trilateral Negotiations of 1966-67, which readjusted NATO's financial burdens after the withdrawal of France. An unapologetic advocate of a Pax Americana, McCloy never wavered in his view of America's international responsibilities and the need for a strong military to exercise global leadership.

McELROY, NEIL (1904-1972), secretary of defense (1957-59). McElroy was born in Berea, Ohio, and graduated from Harvard in 1925. He was employed by Procter & Gamble, rising to the presidency in 1948. Chairmanship of a White House conference on education (1955-56) brought him to the attention of President Dwight D. "Eisenhower, who appointed him secretary of defense effective 9 October 1957.

McElroy's accession followed by a few days the launching of the first global-orbiting satellite (Sputnik) by the Soviet Union, which ushered in the age of long-range rocketry and space exploration. During McElroy's tenure, major U.S. missile projects begun several years earlier came to fruition. McElroy ordered production of two intermediate-range (1,500-mile) "missiles, Jupiter and Thor, developed by the army and air force respectively. He accelerated development of the air force intercontinental missiles, Atlas and Titan, and of the navy's Polaris (submarine) system. He also authorized development of the improved Minuteman missile by the air force and established the Advanced Research Projects Agency to supervise the development of new weapons.

McElroy presided over a comprehensive reorganization of the Department of "Defense in 1958. Initiative for this came from President Eisenhower, but McElroy appointed the committee that worked out the details and transmitted its conclusions to Eisenhower. The reorganization enhanced the position of the secretary of defense, making him virtual deputy commander in chief.

After leaving office on 1 December 1959, McElroy rejoined Procter & Gamble.

McKINLEY, WILLIAM (1843-1901), "Civil War veteran and twenty-fifth president of the United States. Born and raised in Ohio, McKinley enlisted in 1861 as a private in the 23rd Ohio Volunteer Regiment. A commissary sergeant at the Battle of "Antietam (1862), he was later promoted to captain and ended his military service as brevet major. His career in law and Republican politics included terms as congressman, senator, and two-term governor of Ohio before his election as president in 1896.

The president's own military experience and the opposition of big business made him reluctant to lead the nation into war, so he pressed the Spanish government to control a rebellion that had begun in Cuba in 1895. An astute politician, McKinley was aware of his countrymen's growing impatience as the conflict persisted, particularly after the sinking of the USS "Maine in Havana Harbor. When the Spanish government proved unable to end the war, he asked Congress for a war declaration in April 1898.

As commander in chief in the Spanish-American War, McKinley monitored all phases of the conflict. He also stepped in to run the War Department when Secretary of War Russell Alger proved incapable of the demands of managing a 27,000-man regular army and thousands of volunteers. Fortunately, the Spanish were war-weary and poorly supplied, and the U.S. Navy was newly outfitted. Only 379 Americans lost their lives in combat.

McKinley gave subordinates such as Commodore George "Dewey in the Philippines and Gen. Rufus Shafter in Cuba considerable latitude, though he approved all key decisions, such as sending ground forces to support Dewey's tenuous naval control. (He welcomed Shafter's negotiation of a peaceful occupation of Santiago de Cuba after that city had fallen under U.S. siege.)

The president controlled the diplomatic agenda as well. He supported the "Teller Amendment to the war declaration that ruled out annexation of Cuba, but refused to extend recognition to the rebel governments in Cuba or in the Philippines. The occupation government that Gen. Leonard "Wood established in Cuba was removed only when the Cubans approved the "Platt Amendment (1901) that effectively made their island a U.S. protectorate. McKinley demanded that Spain relinquish control of the Philippines to the United States in the peace treaty signed in Paris 10 December 1898, and he authorized the use of U.S. troops to put down a bloody guerrilla war against U.S. occupation of the Philippines.

McNAMARA, ROBERT S. (1916-), secretary of defense and president of the World Bank. Born in San Francisco into a family of humble means, McNamara graduated from the University of California, Berkeley, with an economics degree in 1937, and earned an MBA from Harvard

Business School in 1939, where he also joined the faculty, teaching financial management systems based on statistical controls. During World War II, the Army Air Forces appointed McNamara and several of his colleagues as officers to develop methods of statistical control for managing the strategic bombing campaign against Germany.

Hailed for their brilliance in applying statistical methods to large-scale organization in this pre-computer age, McNamara and several other "stat control" officers were hired by the Ford Motor Company in 1946 to rejuvenate the flagging auto giant. The "whiz kids" introduced new managerial and product changes and built Ford into a success. Six of the men eventually became Ford executives.

Shortly after becoming company president in late 1960, McNamara resigned to become John F. Kennedy's secretary of defense, a position he held from 1961 to 1968. Kennedy's respect for McNamara's liberal Harvard connections, youthful vigor, and reputation for efficiency and success were key factors behind his appointment. With his confidence in civilianized, centralized defense decision making, McNamara appointed a team of civilian analysts—"defense intellectuals"—to apply quantitative systems analysis for "cost effectiveness" (capability as a return on investment) over procurement and other decisions of the military. The McNamara "revolution" at the Department of Defense (DoD) included program budgeting, evaluation of systems-wide costs, five-year plans linking defense spending with missions, and efforts at reducing interservice rivalry and redundancy and increasing coordination and efficiency. Although a number of the McNamara reforms proved successful and were permanently accepted by the Pentagon, others put him continually at odds with the top brass.

While reforming Pentagon practices, McNamara also engaged in the military buildup of the early years of the Kennedy administration. He improved the strategic nuclear forces, increasing the number of intercontinental ballistic missiles and submarine-launched ballistic missiles (while reducing the number of manned bombers) and bolstering the capability of U.S. nuclear forces to survive a nuclear attack and thus mount a retaliatory "second strike." After briefly supporting a "counterforce" policy of targeting only Soviet missiles, not cities, McNamara reluctantly returned to a deterrence policy of "Mutual Assured Destruction." Endorsing the doctrine of Flexible Response, which envisioned U.S. capability of responding to a variety of levels of threat, McNamara also expanded U.S. conventional forces.

McNamara's influence on policymaking stemmed from his overwhelming use of quantitative analysis, his reputation for success, and his personal friendship with John Kennedy and later Lyndon B. Johnson. In the Cuban Missile Crisis of 1962, McNamara proposed the selective naval blockade which successfully sealed off the island.

During the Vietnam War (1960-75), McNamara supported the policies of Presidents Kennedy and Johnson to prevent the victory of Communist-led insurgents, later joined by North Vietnamese regular forces, to overthrow the U.S.-backed government of South Vietnam. This included expanding U.S. military advisers' roles under Kennedy, and then under Johnson a policy of graduated escalation that sought to maintain the Saigon government with increasing use of U.S. ground, air, and naval

forces while not disrupting Johnson's domestic reforms in the United States. Years later, McNamara said that the United States could have disengaged after Kennedy's death in 1963; but at the time, he supported Johnson's decision to remain committed. Linked to Johnson's conduct of the war, McNamara was attacked by peace and antiwar movements for continuing the war and by the political Right for restricting U.S. military force. By 1967, he privately advised the president to end the war through negotiations.

In February 1968 McNamara left the Pentagon to become president of the World Bank. He served as its head from 1968 to 1981, focusing on the Third World. In later years, he became a prolific author and lecturer suggesting in books such as *Blundering into Disaster* (1986) drastic limitations on nuclear weapons. McNamara's principal role during Vietnam, however, has continued to haunt him. His controversial memoir, *In Retrospect: The Tragedy and Lessons of Vietnam* (1995)—where the aging former secretary of defense called the war "terribly wrong"—outraged both supporters and critics of the war, and highlighted the deep divisions that still surrounded America's involvement in Vietnam.

MEADE, GEORGE GORDON (1815-1872), Union Civil War general. Born in Cadiz, Spain, Meade, the son of an American naval agent, graduated from the U.S. Military Academy in 1835 and served in the Second Seminole War and the Mexican War.

Appointed brigadier general of U.S. Volunteers when the Civil War began, Meade fought in most of the Army of the Potomac's main battles. Daring at the Battle of Fredericksburg won him a corps command. When Gen. Robert E. Lee moved his Army of Northern Virginia north in June 1863, President Abraham Lincoln gave Meade command of the Army of the Potomac (nearly 88,000 men) with orders to stop the Confederates. Three days into his new assignment, Meade faced Lee's army of some 75,000 near Gettysburg, Pennsylvania. A three-day, nearly decisive, battle began on July 1. Meade's steady command contributed greatly to a vital Union victory. Although criticized for permitting Lee's retreat to Virginia, Meade kept his command of the Army of the Potomac.

Gen. Ulysses S. Grant, appointed to head all Union armies in March 1864, put his headquarters near Meade's. Both generals handled this potentially awkward command situation tactfully and cooperated well to war's end. Meade correctly tried to stop Grant's front assaults in the Wilderness campaign.

After the war, Meade's outspokenness hurt his reputation, and he sank into undeserved obscurity. He died in Philadelphia, Pennsylvania.

MEDICAL PRACTICE IN THE MILITARY. Military medicine in the United States has both led and followed overall American medical practice. Military medicine has been responsible for some of the most dramatic worldwide advances in health care science; at the same time, it has greatly benefited from the civilian sector's progress. Not surprisingly, military medicine has been in the forefront of mass casualty treatment and trauma care. On occasion, U.S. military surgeons and physicians have also extended the capabilities of international science in diagnosing and defeating some of humanity's most powerful killers, such as malaria. Military medicine has contributed too in the field of prevention.

Colonial and Revolutionary War Practice. For the first three centuries of American history, New World military medical practices differed little from, and often trailed, European practices. In the late eighteenth century, however, at the time of the * Revolutionary War, the social standing of American medical doctors began to rise in comparison to their Old World counterparts.

Before the Revolution, following British practice, American colonial militia organizations usually provided for a surgeon to accompany a regimental-size force on campaign. In this setting, with an officer class that was heavily oriented to an aristocratic hierarchy, the decidedly middle-class medical profession was in the lower reaches of influence. Additionally, although there was considerable knowledge of anatomy, a doctor's ability to heal was extremely limited. Surgeons were not commissioned. They were regarded as contract personnel, necessary for military operations, but little more than the tradesmen and teamsters who also accompanied a military column. Military doctors were expected to be both physicians (healing primarily by medicine) and surgeons (healing by manual or instrumental operations). In the English hierarchy, the doctor was only one step above a barber.

Several prewar militia surgeons participated in the opening years of Revolutionary War. John Warren of Boston, who had studied medicine as an apprentice, served with Massachusetts units besieging the British in Boston in 1776 and performed smallpox inoculations. He accompanied Gen. Nathanael *Greene's column when the war moved to Long Island, New York, and was appointed surgeon to the *Continental army's hospital in Boston.

During the Revolutionary War, American military medical practice did not differ from European in the treatment of wounds and diseases. Such treatment had remained essentially unchanged for two centuries and would see little improvement in the first fifty years of U.S. history. University-trained physicians were rarely found in British or British colonial military organizations. A military surgeon was likely to be only modestly qualified and had simply taken the title after a period understudying another

doctor. Bleeding, based on the theory that purges rid the system of impurities, and the use of mineral drugs—especially heavy metal compounds of mercury, antimony, and arsenic—were common practices. Opium was occasionally used, but alcohol was the more common analgesic. Literature on the subject of military medicine was largely limited to Richard Brocklesby's *Economical and Medical Observations on Military Hospitals* (1764) and to Philadelphia Benjamin Rush's *Directions for Preserving the Health of Soldiers*, published during the Revolution. It was not necessarily true that those claiming to be doctors were familiar with even the most fundamental medical texts. The lack of standards on licensing allowed almost anyone to claim expertise in healing.

British physicians went mostly unnoticed during the war, but Rush and four other American medical doctors were signers of the Declaration of Independence. These men and others used their prominence successfully to impress on the Congress and Gen. George *Washington the need to create hospitals, stockpile medical supplies, and institute smallpox inoculation for U.S. military forces. Smallpox inoculation—considered a novel and advanced practice for the period—is credited with preserving the Continental army at a critical juncture. Revolutionary War military medicine left its mark on the profession when John Warren's (1753-1815) Boston Army Hospital course on surgical anatomy for young physicians provided the basis for Harvard College's new medical education department. The absence of a rigid social hierarchy in America contributed to the elevation of surgeons and physicians in the New World, rendering their advice in the young nation's governing circles more weighty than in an English setting.

American naval medical practice differed substantially from the army. Naval health care was limited to the use of contract surgeons, who signed on to a ship for a single cruise during the War for Independence. This continued after the war, but in 1801, Congress authorized half-pay for naval surgeons between cruises, thereby ensuring stability in the navy's medical ranks. The most prominent U.S. naval physician of this era was Edward Cutbush, a militia surgeon during the 1794 * Whiskey Rebellion, who worked aboard the frigate *United States* in 1799. Cutbush produced a widely used text on naval medicine in 1808 that stressed the importance of hygiene and proper diet.

Pre-Civil War Practice. The pre-*Civil War era was marked by the achievement of badly needed military medical organizational and pay changes along with welcome advances in healing. In 1818, Secretary of War John C. *Calhoun brought about a permanent medical department to administer health care for the army. His choice to head the department was Dr. Joseph Lovell, an energetic physician who began the systematic collection of medical data and standardization of entrance examinations for aspiring military surgeons. In 1834, Lovell finally persuaded Congress to tie the pay of army surgeons to a major's salary. During the *Seminole Wars in Florida, army physicians conducted experiments on malaria victims, and in contradiction to prevalent practice, discovered that large doses of quinine were effective in saving lives. The army's treatment quickly entered civilian practice and this powerful age-old killer began to be tamed. In 1847, Congress gave army medical officers commissioned rank; for the first time, they began to use military titles. Later, the navy followed suit.

While American military medicine was improving in organization, system, and prestige, it was making little headway against the appalling loss of life in military campaigns—save for the experience with malaria. During the "Mexican War, the approximately 100,000-strong U.S. expeditionary forces lost about 1,500 men in battle, but more than 10,000 to disease. Much of this loss was due to unsanitary conditions in the camps, shallow latrines, ill-sited drinking water and wash areas, and the lack of sufficient ambulance wagons. Failing to cover body wastes in open latrines promoted the spread of disease by flies. Cooks who handled food with dirty hands and washing areas sited upstream of watering areas were common practices that contributed to long sick lists. These errors and unnecessary losses, chiefly due to the chaos caused by the rapid "mobilization of an untrained, ill-experienced officer corps, were repeated at the beginning of the "Civil War.

The Civil War and Post-Civil War Eras. Shocked by the large numbers of camp deaths during 1861 and the early months of 1862, regular "Union army surgeons moved quickly to preserve lives. The Army of the Potomac's medical directors, Charles Tripler and Jonathan Letterman, created a large ambulance service to evacuate the sick and wounded, ordered vaccination against smallpox, and supervised quinine prophylaxis for malaria. These two officers also established a network of supporting hospitals and impressed on Northern officers their duties to constantly stress sound field sanitation practices. By the Battle of "Fredericksburg in December 1862, Federal forces enjoyed a decided medical advantage over their less well equipped and less well medically staffed Confederate opponents. This advantage contributed to the all-important battlefield numerical superiority of Union forces.

Neither Confederate nor Union surgeons were capable of reducing the chances of death due to gunshot wounds. Penetrating wounds by minié balls were usually fatal. A mortality rate of more than 62 percent occurred with a chest penetration, and only 11 percent of the soldiers who received a stomach wound survived.

Although the post-Civil War era, 1866-98, saw little serious American military action, it was a period of progressive change and innovation that produced the golden age of American military medicine. Army and navy surgeons embraced the best of European medical science: Louis Pasteur's germ theory of disease during the late 1860s and Joseph Lister's techniques of antiseptic surgery. Physicians in both services increasingly found themselves giving care to service members' wives and children. This change corresponded with growth in the scope and frequency of medical care for the general population of the United States. In 1884, Congress formally authorized what had been common practice for some time, health care for military dependents. Additionally, the American military, along with the rest of American society, learned about the purification of water supplies and the sanitary control of sewage.

The foundation for U.S. military medicine's claim to nineteenth-century world renown was brought about by a former Civil War surgeon, George Miller Sternberg. Sternberg, a yellow fever victim in 1875, was detailed to the National Board of Health in 1879 with the Havana Yellow Fever Commission after his recovery and began working at Johns Hopkins University in conjunction with an army assignment a few years later. Sternberg traveled to Europe and learned the best science of bacteriology of the time; he

published a book on malaria. This was followed in 1892 by the first American textbook on bacteriology. Established as the premier bacteriologist in the United States, Sternberg was appointed surgeon general of the U.S. Army by President Grover Cleveland in 1893. Using his authority and prestige, Sternberg convinced Congress to found the Army Medical School and recruited such promising young medical officers as Capt. Walter "Reed.

The "Spanish-American War of 1898 provided the opportunity for Sternberg, Reed, and others to use their knowledge in the fight against disease. As in the case of the Mexican and Civil Wars, "camp fevers" were rife, especially in the southern U.S. mobilization centers. Of the 6,400 men who died between 1 May 1898 and 30 April 1899, fully 5,400 or 84 percent died of disease. The "fevers" were variously diagnosed as typhoid, malaria, yellow fever, and typhomalaria. Reed, using microscopic examination of blood smears, discovered that the chief culprit was typhoid, a disease that could be halted by well-laiown camp sanitation practices. Unfortunately, the rapidly mobilized, mostly volunteer force had a predominantly politically appointed officer corps that was almost wholly ignorant of military affairs and proper field sanitation practices.

Twentieth-Century Medical Practice. After the war, The United States had acquired a tropical colonial empire and desired to build a canal linking the Pacific and Atlantic Oceans in Central America. It therefore had great need of experienced military physicians—for both research and teaching. Reed headed the Yellow Fever Commission in 1900-01. The commission proved beyond doubt that the previously established mosquito transmission theory for the disease was correct. Another army surgeon, William C. "Gorgas, quickly used his authority as sanitation officer in Havana, Cuba, to eliminate mosquito breeding places; he demonstrated a dramatic decline in that city's normal yellow fever and malaria sickness and mortality rates. Sent to Panama for the canal project, Gorgas brought the malaria morbidity rate down by 90 percent in 1913. The Panama Canal was made possible by the work of Reed, Gorgas, and their fellow army medical workers.

The U.S. Navy began improving its medical practices during the Spanish-American War and enhanced the prestige of its medical personnel shortly thereafter. A medical corps had been created in 1898, and while fighting was still in progress several merchantmen (commercial cargo ships) were converted into hospital ships. The next year, medical officers were given commissioned rank. Later, medical officers were given command authority over the hospital ships and crews, a controversial decision that was ultimately resolved in favor of the nautical surgeons by the commander in chief, Theodore "Roosevelt.

In 1908, the army created the Medical Reserve Corps, an augmentation organization that was separate from the National Guard. A veterinary corps was added to the medical department. Not only were veterinarians highly useful in promoting the health and utility of horses and mules, they were essential in the inspection of meat for troop consumption. Provisions were made with the "American Red Cross to supply nurses in time of emergency. The prestige of army doctors rose when Gen. Leonard "Wood, a Harvard Medical School graduate and former army physician, became chief of staff of the army in 1910.

These innovations and changes were needed when the United States became involved in World War I in April

1917, joining the Allies in opposition to the Axis powers. Some of the first medical problems faced by the rapidly expanding military medical organization centered on combat aviation. Early in U.S. operations, it was discovered that 300 percent more pilots were dying from accidents than from enemy action. Army medical officers learned that aviators were flying to the point of exhaustion. Flight surgeons were created, and these specialists impressed on commanders the need for sufficient rest between missions. Chemical warfare required the creation of mobile degassing units—organizations that operated under medical supervision and provided showers and new clothing for units that had been exposed to chemical weapons. With the aid of British researchers, the U.S. Army and Navy had adopted a typhoid fever vaccine in 1911, a practice that saved the lives of large numbers of American youth. Compared with 1898, the typhoid death rate in 1917-18 was reduced 185 times. Additionally, an antitetanus serum introduced at the turn of the century greatly reduced the incidence of wounded men succumbing to lockjaw. In France, the Allies instituted a disciplined triage system. *Casualties were sorted to facilitate life-saving priority treatment according to chances of survival. The practice of attaching laboratories to hospitals contributed to rapid diagnosis, and X-ray machines found their way into military hospitals in France. However, the greatest single improvement was undoubtedly the introduction of blood transfusion to reduce the deadly effects of shock among wounded soldiers.

Between the world wars, military medicine in the United States was influenced by socioeconomic changes and by the burgeoning technological innovations associated with increasingly complex methods of waging war. The growth in specializations within civilian medicine also affected military practice. Increasingly—especially in the navy—officers were selected for postgraduate specialty training in such fields as neurology. As greater percentages of American women chose hospital deliveries, the military services sought out training in obstetrics and gynecology from civilian medical colleges and universities so as to provide military dependents with the modern procedures that all U.S. citizens had grown to expect.

In the 1920s, the income of physicians grew faster than American society in general and service recruiting of medical practitioners became more difficult. The *Veterans Administration was divorced from the military departments, but it had the indirect effect of assisting in service recruitment by providing an added, postcareer benefit, medical care for those who incur health problems during military service. Both the army and the navy established aviation medical research facilities that developed equipment to allow aircrews to cope with high altitudes and extreme cold. At Wright Field, Ohio, Capt. Harry G. Armstrong of the Army Air Corps studied embolism in pilots and determined that the governing factor was the formation of nitrogen bubbles in the body at high altitudes. The navy also established a submarine medicine program at New London, Connecticut, which produced specially trained corpsmen for *submarines and assisted in the development of underwater breathing equipment for use in escape techniques.

During World War II, American military medicine benefited greatly from technological advances. German-developed atabrine of the 1930s produced a superior prophylaxis

against malaria; and the development of penicillin by the pharmaceutical industry vastly improved the chances that a wound victim would overcome infection. Experience with “shell shock” in World War I had stimulated the field of military neuropsychiatry to improve the treatment and handling of World War II soldiers who experienced “battle fatigue.” During that war, psychiatrists discovered that greater recovery rates were often possible if a shaken soldier was returned to his unit and resumed friendships and customary relationships than if he was retained in an unfamiliar mental treatment setting.

Further advances in life-saving techniques came about through the navy’s modification of LSTs (Landing Ship Tanks) into floating evacuation hospitals and the army’s creation of Portable Surgical Hospitals. The wide-scale use of DDT controlled a serious outbreak of typhus in Italy. Defeating typhus, a debilitating, sometimes deadly disease caused by several types of *Rickettsia* microorganisms, was critical to the Allied cause. Carried by fleas and lice, these microorganisms spread from the civilian to the military populations quickly. The menace was only quelled by a massive overall “dusting” with DDT insecticide. Finally, the scale of American military medicine in World War II explained much of its success. In 1942-45, 40 percent of the country’s physicians and health care givers served the military, a population that comprised only 8 percent of U.S. society.

In the three-decade-long Cold War era, 1957-89, military medicine continued to adapt to civilian standards, adjusting for the continued diminishment of monetary incentives for doctors choosing a military career while adding to the record of significant advances for the medical profession. Both the army and the navy established residency programs in military hospitals that were designed to meet civilian specialty requirements. Dependent care burdens were partially eased by the 1956 Dependents Medical Care Program, which permitted the use of and compensation for civilian medical care when military facilities were not available. Recruiting difficulties were somewhat ameliorated by the 1972 Health Profession Scholarship Program, which provided medical college tuition and stipends in return for a period of uniformed service. And members of the Army and Navy *Nurse Corps, given temporary commissions during World War II, were established as a regular branch and awarded permanent commissioned status.

Cold War medical professionals achieved improvement on the World War II record in saving the lives of American battle casualties. Partially due to the transport of the wounded by *helicopters, the rate of those who died from wounds was halved during the *Korean War (1950-53) over that of the 1940s. Long-range air transportation of patients, a World War II innovation, was extended so that almost 30 percent of evacuations were accomplished by this means. The technique of using helicopters and long-range evacuation continued during the * Vietnam War in the 1960s.

Medical advances by military officers in this era included the breakthrough achievements of Navy Capt. Robert Phillips’s work on carefully balanced fluids and electrolytes in the treatment of another ancient and worldwide killer, cholera. Army Capt. Edwin J. Pulaski’s pioneering work on burn victims in 1947, the establishment of the burn research unit at Brooke Army Medical Center in San

Antonio, Texas, and the skin graft innovations of Col. Curtis Artz that followed all contributed to wholly new methods in treating burns throughout the world.

Conclusion. American military medical experience in the initial years of the post-Cold War era provided every reason to expect a continuing story of successful adaptation to changing environments. By 1991 and the "Persian Gulf War, the military establishment had adjusted to its scarcity of doctors by producing an elaborate organization of helpers, technicians, and specialists, who worked under the supervision of doctors. Of the more than 24,000 U.S. Army medical personnel sent to Saudi Arabia, just over 3,000 were medical doctors or dentists. The rest—nurses, assistants, technicians, and specialists—carried on the bulk of health care tasks. Combat casualties in this war were thankfully few, but there was no reason to expect that this new structure could not have performed well in more traumatic circumstances. It had adapted successfully to changing conditions—an established and centuries-old hallmark of American military medicine.

MEIGS, MONTGOMERY (1816-1892), military engineer and quartermaster general of the U.S. Army. Born into a distinguished family, Meigs graduated near the top of his West Point class in 1836 and was appointed to the U.S. *Army Corps of Engineers. Though only a lieutenant, Meigs's natural ability won him sufficient notice to become chief engineer for the expansion of the U.S. Capitol and construction of its dome. More important was his brilliant work on the twelve-mile-long Washington aqueduct. Part of this structure, the Cabin John Bridge, remained the longest masonry arch in the world until the twentieth century. To both these projects Meigs brought speed, efficiency, and frugality. Indeed, his unwillingness to tolerate political appointees on the aqueduct's construction led to his brief "administrative exile" to positions in the Dry Tortugas, in the Florida keys.

When the Civil War began, Meigs was initially appointed to a field command, for which he was not suited. In May 1861, he accepted a more appropriate commission as quartermaster general, a post he held until 1882. Meigs was responsible for supplying the "Union army's entire war effort—a gargantuan task to which he successfully applied his considerable organizational talent. Not one to hold the reins of authority too tightly, Meigs divided his department into nine semiautonomous divisions in order to achieve both efficiency and cost-effectiveness. In con-

junction with Herman Haupt, head of the U.S. Military Railroad, Meigs saw to it that Union soldiers were never far from a supply depot and always well provisioned. His marshaling of the North's vast economic potential toward a single end was a major reason for Union victory. Meigs's example of wartime bureaucratic efficiency helped govern the economic expansion that followed, which was to turn the United States into a global industrial giant.

MEMORIALS, WAR. Wars are commemorated by an immense variety of devices—obelisks, monoliths, marble temples, battlefields and battle markers, statues, cemeteries, tombs, memorial chapels and parks, plaques and walls bearing the names of the dead, place names, and "living memorials"—including hospitals, stadiums, and highways. War memorials are designed to consecrate great struggles that protect the nation's interests and preserve its existence.

Two aspects of every war affect the way memorials represent it: (1) whether it ended in victory or defeat; and (2) whether it was believed necessary or unnecessary, morally just or wrong. To four kinds of war—victories and defeats in good causes and bad—correspond four sets of memorials. The symbolic qualities of these memorials overlap, however, because they are determined by more than the wars they represent. Memorials adapt the realities of wars to the needs and concerns of the generation that commemorates them.

The "Revolutionary War, first of America's just victories, was not widely commemorated by the generation that fought it. Throughout the late eighteenth and early nineteenth centuries, many communities devised objects to mark the war, but almost all were obscure, and even the most notable—the Bunker Hill obelisk—was meagerly ornamented and conveyed no sense of the cause it symbolized. Commemorative restraint reflected a political culture that was antiauthoritarian, suspicious of standing armies, and associated military monuments with centralized state power. Most of the monuments that presently commemorate the Revolution were erected at the turn of twentieth century.

"Civil War commemorations began as soon as the fighting stopped, but their scale was again limited. In the South, memories of a lost but noble cause took root, but a shattered economy and social system precluded extensive monument making. In the North, local cemeteries were embellished, bodies were exhumed to fill new military "cemeteries, and many monuments appeared. However, the most familiar memorials—statues of anonymous soldiers—were erected on town squares and outside city halls during the late nineteenth and early twentieth centuries. By that time the last of the Civil War generation, along with its many resentments, was dying off and the memorials assumed new meaning. Northerners and Southerners respected each other's conception of the war as a just cause; each side embraced the other as it erected similar monuments to itself. The North's largest commemorative center, "Gettysburg National Military Park, incorporated monuments to Southern soldiers; Southern cemeteries included honored places for

Northern soldiers. The ideal of regional reconciliation was made visible and tangible in monuments to the Civil War dead.

World War I cost the United States less in life and treasure than did the Civil War, but its proclaimed achievement, saving the world for democracy, was greater, and so was its monument production. Massive numbers of monuments emerged right after the armistice, ranging all the way from plaques to statues of "doughboys" (common soldiers) at city halls and town squares to massive commemorative centers. America's fatalities—117,000—were relatively light, but its memorials were grand and somber.

Early twentieth-century monument production in America was accelerated by a City Beautiful movement that used the Industrial Revolution's wealth to clear away its debris. Of the many objects chosen to beautify the city, war memorials were best suited because they symbolized the expanding power and reach of the state and the great wave of "Americanism" that inundated the society during the first quarter of the twentieth century. Nowhere is this confluence of statism and democratization better exemplified than in Newark, New Jersey's, *Wars of America* (1926)—a massive sculpture of forty-two figures representing all wars from the Revolution to World War I. What distinguishes this monument is not its size and scope, but its depiction of young men being embraced by their mothers and fathers, wives and children, as they go off to fight. In *Wars of America*, civilians and soldiers are commemorated together. This same theme, the continuity of civil and military institutions, is manifested in the Tomb of the Unknown Soldier. Dedicated in 1921 as a monument to World War I's common soldier, the Tomb ennobles the common people of a democratic society.

The Tomb of the Unknown Soldier is located in Arlington, Virginia, Military Cemetery. Military cemeteries are the most moving of all memorial forms because they embody the culture of modern democracy. Before the Civil War, soldiers were buried together in unmarked graves near the field on which they fell. During the Civil War, state governments built military cemeteries to provide the dead with "decent" (individual) resting places. However, only one of these cemeteries, Gettysburg's, became a prominent memorial site during the war; most, including thirteen federal cemeteries, were established too late to accommodate the great number killed. Not until World War I did field graves become the exception rather than the rule. Seventy percent of the World War I dead were returned directly to their families for private burial; the remainder were buried in overseas cemeteries. Almost half of these—some 14,000 men—rest in the Meuse-Argonne cemetery's separately marked but identical graves, laid out without regard to rank in rectangular equality—a perfect democracy of the dead.

World War I's techniques did not all transfer to World War II; in fact, World War II was undramatically commemorated. Arlington's Iwo Jima Memorial is probably the war's best-known and most popular memorial in the United States, but it is atypical. The typical monument is utilitarian, created by attaching the adjective "memorial" to the names of auditoriums, schools, hospitals, community centers, sports arenas, highways, and other public places. The concept of the "living memorial" proved compatible with the muted idealism and restrained nationalism of the late 1940s and 1950s. Living memorials, indeed,

desanctify war by melding memory of the hallowed dead with secular pursuits of everyday life.

Overseas, however, U.S. World War II commemorations outdid the traditional World War I pattern. Most of the American dead, as before, were returned to their families; but not all. More than 10,000 were interred in the Lorraine cemetery; 9,000, in the Normandy cemetery; and more than 7,000 in the Sicily-Rome cemetery. At each place, marble walls were built in memory of the missing. At the National Memorial Cemetery of the Pacific in Honolulu lie the remains of 13,000 soldiers who died throughout the Pacific theater of war. The cemetery wall's 18,000 names include both the missing and the dead. The United States maintains twenty-four cemeteries on foreign soil. Most of these are imposing in size and adorned with great monuments and statuary, but their most conspicuous feature is their immaculateness—itsself an aspect of democratic culture. The impressively landscaped ground with its perfectly kept graves and regularly scrubbed stones dignifies the common soldier as it legitimates his death.

America's "bad victories," unlike its good ones, were controversial at the time they were achieved and are ambivalently remembered. The Perry Peace Memorial on Lake Erie, Andrew Jackson's statue across from the White House in Lafayette Park, and the Battle of "New Orleans site in Chalmette National Historical Park symbolize the "War of 1812's high points, but are dissociated from its controversies and humiliating defeats. Baltimore's Battle Monument for the War of 1812—one of the nation's oldest war memorials—is far less notable than Fort McHenry, commemorated as the site that inspired "The Star-Spangled Banner." To the west, impressive monuments (including the Alamo and the San Jacinto Monument), are almost forgotten today. "Hiker" and "Rough Rider" statues and the memorial commemorating the sinking of the USS *Maine* (1898) in Havana, Cuba, were erected in the early decades of the twentieth century, but few Americans are familiar with these monuments or find them stirring.

One of America's several so-called bad wars, the "Vietnam War, ended in defeat; but defeat alone does not account for the new forms its memorials assumed. The most prominent, the Vietnam Veterans Memorial in Washington, D.C., lists on its black marble walls all 58,000 war dead. It is the first national monument to elevate the individual above the cause. Later, public pressure forced the U.S. Commission of Fine Arts to identify the war on the monument's wall and to place on a nearby site a statue of soldiers with the American flag.

The new Vietnam monuments expressly affirm the ideal of gender and racial equality. The inclusion of a black soldier in the Vietnam Veterans Memorial statue symbolizes the many African-American men who died, while the inclusion of a black nurse in a nearby Vietnam Women's Memorial statue represents the many African-American women who served. Elsewhere in Washington stands the African-American Civil War War Memorial commemorating black soldiers who fought to secure the Union. Across the Potomac River, in Arlington Cemetery, is the Memorial to Women in Military Service to America.

Nowhere are minorities more vividly recognized, however, than in the many memorials dedicated to the "Korean War between the mid-1980s and mid-1990s. The Korean War Veterans Memorial on the Mall in Washington includes 19 stainless-steel statues of white and black combat

troops in action, and a 164-foot wall of polished black granite with 2,400 faces of male and female, black and white support personnel. This structure, along with its local variants, is at once a return to and departure from the traditional genre. Its life-size statues, all armed, repudiate the pacifist bias of many Vietnam War memorials, while it greatly extends the recognition of the nation's minorities. The will to commemorate the "forgotten war"—as the Korean War is popularly known—and broader efforts to incorporate forgotten people into the mainstream of American society are both manifestations of a late twentieth-century culture of inclusion.

At the turn of the twenty-first century, the war memorial remains part of the symbolism of political order, its visitation part of the liturgy of public commitment. As much as any other form of commemoration, it is the vehicle by which the nation's legacy is sustained.

MERRYMAN, EX PARTE. The *Merryman* case, 17 Federal Cases 144 (Circuit Court Md. 1861) (No. 9487), raised fundamental questions regarding military authority over civilians and the president's emergency powers in wartime. Upon his arrest and detention during the *Civil War by Union military officials in May 1861, John Merryman, a civilian Confederate sympathizer in Maryland, petitioned for a writ of habeas corpus. U.S. Chief Justice Roger Taney issued the writ, challenging President Abraham * Lincoln's suspension of the privilege of the writ of habeas corpus. Following the president's order, the commanding officer refused to bring Merryman before a civil court. Outraged, Taney issued a forceful opinion denying the president's power to suspend the privilege and insisting that Article I of the U.S. Constitution granted the power to suspend habeas corpus to Congress alone. Lincoln, however, ordered the army not to obey Taney's writ, later asserting that the president and Congress shared the power to suspend habeas corpus.

METACOMET. See Philip.

The MEUSE-ARGONNE OFFENSIVE (1918) was the final and most important campaign for the American Expeditionary Forces (AEF), commanded by Gen. John J. *Pershing. This offensive was the eastern pincer of the grand Allied offensive of 1918 at the end of World War I. The American zone extended from the middle of the Argonne Forest east to the Meuse River. Although the Ameri-

can First Army of 600,000 troops deployed to begin the attack outnumbered the five German divisions defending the area, the nine forward divisions of the AEF were ill-trained and untested, and most lacked their own support. More than half of the *artillery support was provided by the French, as were the 189 * tanks (most manned by Americans) and 840 aircraft (604 piloted by Americans). After a three-hour artillery barrage, 140,000 men of the American First Army attacked on 26 September, driving north—three corps (nine divisions) abreast—in fog and light rain.

Their initial advance was rapid, with only light contact ahead of the first German line. At about 9:30 A.M., German fire from strong defenses struck the Americans. Most of the men dove for low ground, which, unknown to the Americans, had been pretargeted by German artillery. The American advance was halted in this "killing zone." However, in hard and bloody fighting, the Americans broke the German line on the second day. First Army seized the key hill mass of Montfauçon, advancing six miles. But "casualties were high, and the attacking units were disorganized, out of support and sustenance. AEF headquarters moved veteran divisions from St. Mihiel into the battle.

On 4 October, First Army resumed its offensive against the main line of the German defenses—with reinforcements, and, more wisely, somewhat more experienced leaders. The troops immediately made heavy contact with the enemy all along the front. Fighting their way up the Cunel-Romagne Heights, the Americans also drove the Germans from the Argonne Forest in bitter fighting. With the Americans holding the high ground, their artillery could strike the railroad at Sedan. But the First Army was again losing * combat effectiveness. Casualties rose to over 100,000, many stricken by influenza.

The army went into a defensive posture again on 11 October. Pershing reorganized, appointing Maj. Gen. Hunter Liggett as commander of First Army, creating a Second Army, and taking himself out of direct combat command. First Army was ordered to continue to attack north in its zone to seize the line of the Meuse River and the heights south of Sedan. Second Army, under Maj. Gen. Robert Bullard, was given the mission to attack east of the Meuse into the Woevre Plain.

At 3:30 A.M. on 1 November 1918, the last American barrage of the war struck the enemy positions, and the infantry assault broke the German defenses, the defenders fleeing northward. By 4 November, the Germans began a general withdrawal to a new line north of the Meuse. The Americans continued their pursuit. The Second Army drove east into the Woevre Plain, while the First Army attacked and seized the heights over Sedan. Both armies were preparing for further offensives north and east when the armistice went into effect on 11 November.

The Meuse-Argonne campaign lasted forty-seven days. A total of 1.2 million Americans were engaged in the campaign, of whom 117,000 were killed or wounded—about half of the total AEF casualties for the war. The AEF claimed to have inflicted 100,000 enemy casualties. In combination with British and French advances, the Meuse-Argonne Offensive helped drive the German Army out of strong defenses in France and led Berlin to accept an armistice.

MEXICAN PUNITIVE EXPEDITION. See Mexican Revolution, U.S. Military Involvement in the.

MEXICAN REVOLUTION, U.S. MILITARY INVOLVEMENT IN THE. Woodrow "Wilson ordered two U.S. military interventions into Mexico during the Mexican Revolution. In the first, at Veracruz in 1914, the president sought to influence the conflict by controlling the flow of foreign military supplies to Mexico through its chief port. In the second, the 1916 "Punitive Expedition headed by Gen. John J. "Pershing, Wilson tried to eliminate the "problem" of Francisco "Pancho" Villa and satisfy public outrage in the United States against a Villista raid on Columbus, New Mexico.

At Veracruz, despite serious reservations, Wilson yielded to pressures for intervention from U.S. business interests, cabinet members, newspapers, and representatives of the Southwest. In January 1914, the president and his cabinet agreed to prepare the U.S. armed forces for an invasion of the Mexican port. Wilson ordered Secretary of War Lindley Garrison and Secretary of the Navy Joseph Daniels to make the preparations, saying that it was "only a question of an opportune time and sufficient arrangements."

The president ordered the invasion of Veracruz on 23 April 1914. His decision followed a minor episode at nearby Tampico that revealed a U.S. admiral's readiness to fight, if nothing else. The pretext for the invasion was a so-called German ship, the *Ypiranga*, destined for Veracruz and carrying supplies for the Mexican armed forces. Actually the *Ypiranga* was at least one-half American-owned. It had received clearance for its cargo from Wilson himself well in advance of its departure for Mexico. If U.S. authorities had wanted to stop the ship, it could have been boarded at sea. When Veracruz was seized, the *Ypiranga* discharged its cargo at Puerto Mexico.

In reality, the president intended to depose the government of Gen. Victoriano Huerta by seizing and blockading Veracruz, the most important entrepôt for arms flowing to Mexico. By occupying the port city, Wilson could curtail the Mexican Army's access to military supplies and could dictate the flow of arms to the next government of Mexico. In Wilson's view, President Huerta had two major failings. First, the Mexican president could not maintain order and protect U.S. private and public interests—including the strategically important production of oil and rubber; and second, Huerta was a dictator who had imposed himself on the Mexican republic after murdering his democratically elected predecessor, Francisco Madero.

The U.S. attack on Veracruz turned into a tragedy when the Mexican civilian populace decided to resist. The recently upgraded guns of the U.S. warships took a terrible toll on the city. The Mexican casualty estimates vary so widely between the official U.S. figure and that of the *cronista de la ciudad de Veracruz* that accurate figures cannot be determined; but the U.S. forces lost nineteen dead and forty-seven wounded. American troops stayed on after the

fall of Huerta. During the summer of 1914, U.S. military officers worked with the constitutionalist faction among the Mexican revolutionary forces in Veracruz, establishing a joint administration of the customhouse and warehouse area. Between 19 and 23 November, as the first U.S. troops were leaving, U.S. officers supervised the unloading from five ships of military materials, which filled the warehouses and piers. In their last act the U.S. officers turned over the keys to the warehouses to the constitutionalist leaders two months later, the forces of Venustiano Carranza marched out of Veracruz to defeat the other revolutionary factions; they carried a wide array of U.S.-supplied arms.

In 1916, President Wilson reacted to the attack of a defeated and embittered Mexican presidential Francisco Villa, on the hopeful border town of Columbus by launching a major punitive expedition to Mexico under the command of General Pershing. The U.S. president hoped to strengthen his position in acrimonious negotiations with Acting President Carranza and to eliminate the threat Villa's forces posed along the border. The Mexican government was increasingly nationalistic, and U.S. public and press opinion demanded security. The U.S. forces, 12,000 strong, brought a full complement of cavalry trucks and even observation aircraft with them. They marched as far as Parral, 419 miles inside Mexico, incurring serious resistance only a few times. The most notable battle was fought at El Carrizal between the U.S. detachment and Carranza's federal forces. The Mexicans surprised the U.S. commander by their resolve to fight and justified their claims of a tactical victory.

One of Pershing's contingency plans included the establishment of his headquarters at Parral just north of a line extending from Mazatlán to Tampico. That possibility must have occurred to the Mexican government because of the inordinate size of the U.S. force. At the onset of the U.S. invasion, Villa had lost popularity and could concentrate only slightly more than 500 combatants. Instead of being eliminated by the Punitive Expedition, Villa's forces grew until they reached 5,000, and Carranza found his government threatened by a loss of public support for its failure to halt the U.S. invasion. The Mexican public and government expressed deepening resentment toward the invading U.S. troops.

U.S. interventions affected the welfare of the approximately 50,000 North Americans living in Mexico even more than those at home. In the wake of the Veracruz invasion, anti-North American riots broke out in diverse parts of Mexico. The U.S. government set up stations at New Orleans, Texas City, and San Diego for the handling of North American refugees, many of whom lost virtually everything they owned in Mexico.

The U.S. government grew less belligerent toward Mexico as tensions with Germany deepened and the Carranza government, demonstrating increasing stability, prepared to promulgate a new constitution. On 27 January 1917, President Wilson ordered the U.S. troops withdrawn from Mexico. A new Mexican Constitution was proclaimed on 5 February 1917; Carranza was elected president on 11 March for a regular term, and the Wilson administration formally recognized the new Mexican government.

MEXICAN WAR (1846-48). After weeks of fruitless diplomacy, the United States and the republic of Mexico declared war on each other in the spring of 1846. By the 1840s, many Americans held the view that the United States should reach from the Atlantic all the way to the Pacific Ocean. In 1844, Democrat James K. "Polk of Tennessee ran for the presidency and won on a platform of "expansionism, embracing the popular concept of "manifest destiny"—that God approved U.S. expansion throughout the continent. Polk opened diplomacy designed to redeem his campaign pledges to purchase California and other Mexican lands as well as to obtain the Oregon country from Britain. Considered in grand strategic terms, Polk intended to make the United States the undisputed national power on the North American continent and to obtain West Coast ports. The British agreed to an equitable treaty dividing Oregon, but no self-respecting patriotic Mexican leader would be satisfied with any amount of money for California.

U.S. annexation of Texas sparked the war. The Texas Revolution of 1836 had won independence for the republic of Texas, but Mexico never officially recognized the loss of the province. Polk's predecessor, John Tyler, arranged the annexation of Texas into the United States in 1845 by a joint resolution of both Houses of Congress before Polk was sworn in. According to Mexico, the United States had torn away one of its provinces. The Mexican government rejected Polk's final offer of \$35 million for California and other lands and dispatched military forces to the Rio Grande. It also rejected Texas and U.S. claims that the border extended south to the Rio Grande instead of the Nueces River.

On 23 April 1846, President Mariano Paredes announced that a state of "defensive" war existed between Mexico and the United States, in response to the violation of the Texas border by U.S. soldiers under Gen. Zachary "Taylor, who marched under Polk's orders from Louisiana through Texas up to the Nueces River. On 25 April, Mexican and U.S. forces fought a skirmish between the Nueces and the Rio Grande. Eleven U.S. dragons were killed, five wounded and forty-seven captured. It took several days for word of the skirmish to reach President Polk, who had previously decided on war even before Paredes's announcement. On 11 May, he asked Congress to acknowledge the state of war that Mexico had already announced, but did so with a resounding and controversial call: "American blood has been shed on American soil." On 13 May, Congress strongly endorsed Polk's request, 174-14 in the House of Representatives and 40-2 in the Senate. Critics, mostly northern Whigs, condemned the president's action, asserting that he sought war to acquire more slave territory and denying that the disputed border area belonged to the United States.

Northern Mexico included two commercial centers, Santa Fe, New Mexico, and San Francisco, California. Lightly populated and distant from Mexico City, both provinces were difficult to defend. Polk met with his cabinet and formulated a remarkably ambitious strategy. He ordered U.S. soldiers to invade New Mexico, capture Santa Fe, then proceed to conquer California, where a naval squadron would assist them in securing the province.

Meanwhile, General Taylor with less than 3,000 regulars would drive Mexican forces south of the Rio Grande, which the United States claimed as the international boundary. Polk assumed that if U.S. forces occupied the Rio Grande as well as key spots in New Mexico and California, Mexico would have no choice but to concede the fait accompli, and the United States would have won the war.

For their part, however, the Mexicans stood ready to fight, both for the defense of their territory and the future of their fledgling nation, which only twenty-four years earlier had won its independence from Spain. Mexico possessed a tiny naval coast guard and on paper had a national army of more than 30,000 soldiers, over three times the U.S. Army's size at 8,500 officers and men. Numbers masked contrasts between the two armies, however. The Mexican Army was indifferently trained and unevenly equipped. Some units had enthusiastic officers, good weapons, and adequate supplies; others were deficient in all respects. Many Mexican officers held honorific commissions but knew little about military matters. The army had been involved with intrigues in the national capital, where commanders went in and out of favor with the political winds. Thus, the Mexican Army had more weaknesses than strengths. In contrast, the United States possessed an excellent navy, which could dominate the Gulf of Mexico and the California coast. The U.S. Army had competent officers, excellent weapons, good training, and the advantage of a uniform supply system. Many of its company officers (captains and lieutenants) were graduates of the U.S. Military Academy at West Point, where they received training and education in weaponry and engineering. Many Mexican officers lacked these fundamentals and had no common base of education. U.S. "artillery units were particularly noted for their high quality. Although it was smaller, the U.S. Army was superior to the Mexican Army.

But the regular U.S. Army would have to be supplemented by state volunteer units. President Polk asked Congress to approve a call for thousands of volunteers, prompting an initial positive response across the country. Dozens of state volunteer regiments were recruited for federal service, giving the United States the minimum manpower it needed to fight a war over a broad expanse of territory. Approximately 73,500 volunteers served in 1846-48.

While Congress considered the issue of war, soldiers fought the first major battle above the Rio Grande at a spot called Palo Alto (near Brownsville, Texas). Leading the U.S. forces, Zachary Taylor, a professional soldier since 1808, was an intuitive commander who had seen combat against Indian tribes. Taylor's force encountered the Mexican Army of the North, with about 6,000 soldiers, under Gen. Mariano Arista on 8 May 1846. The four-hour combat was intense and indicated the bravery and dedication of the men on both sides, with each fielding some of the best regular units of their respective armies. Several times the Mexicans delivered strong charges into well-directed U.S. artillery fire. The Americans repulsed the attacks and Arista elected to retreat. The next day, Taylor advanced his force to locate and fight the Mexicans, who had chosen defensive positions along an old path of the Rio Grande, the Resaca de la Palma. Taylor directed an assault that broke the Mexican line. Panic gripped some Mexican units and Arista and his officers could not prevent a rout. The U.S. victory inflicted serious casualties on some of the most well-equipped Mexican Army units, which threw away

arms and supplies in their hasty withdrawal. During the two days of combat, Taylor's army suffered less than 200 killed and wounded, but the Mexicans suffered more than 600 casualties. Arista retreated again, this time south of the Rio Grande.

In the weeks to come Taylor moved his army southward, occupying Matamoros, Mexico, on 17 May and Camargo on 14 July. Pressing deeper into Mexico, he fought a battle at Monterrey in late September, captured the city, then marched on to occupy Saltillo in November. The initial phase of the war had gone just as President Polk wanted. It had also made a national hero of General Taylor, who became a likely presidential nominee for the Whig Party.

Occurring simultaneously with part of Taylor's northern Mexico campaign was the U.S. invasion of New Mexico and California. The movement of multiple U.S. units threatened the Mexicans with a cordon offensive; that is, the U.S. forces put more than one offensive action into motion at almost the same time, not allowing the Mexicans to focus only on a single campaign.

Under orders from President Polk, Col. Stephen Watts *Kearny mounted the campaign against Santa Fe from a training base at Fort Leavenworth (Kansas). Kearny led a mixed force of 1,600 soldiers (including 500 regulars), departing Leavenworth on 5 June and arriving at Santa Fe on 18 August after a grueling overland march. The Mexican authorities could neither raise nor send adequate military forces to resist Kearny, who entered the city unopposed. In only a few weeks, 1,000 more volunteers were expected to arrive, allowing Kearny to take the regulars in another overland march from Santa Fe to California, while 1,200 volunteers under Alexander *Doniphan, a colonel of the Missouri volunteers, moved on El Paso del Norte (modern Juarez, Mexico).

The U.S. forces completed Polk's initial plan for the war without losing a battle. Kearny arrived in California in early December 1846. By that time U.S. sympathizers had declared the "Bear Flag Republic" on 4 July. U.S. naval forces under Commodore John D. Sloat had disembarked at Monterey 7 July, and another force under Commodore Robert Stockton had occupied Los Angeles 12 August. Meeting scattered resistance, the U.S. military forces appeared to have plucked California from Mexico like a bunch of grapes. Refusing to go down without a fight, Mexicans rose against the U.S. occupation in September and fought several skirmishes, the most important of which were at San Pasqual (northeast of San Diego) on 6 December 1846, and at San Gabriel on 8 January 1847. Following that U.S. victory, however, the province was effectively in North American hands.

In the meantime, on 25 December 1846, Doniphan's men defeated a Mexican force twice their size north of El Paso. Occupying El Paso, Doniphan waited for reinforcing artillery and then marched across inhospitably dry terrain toward Chihuahua. Outside the city, a hastily trained, inadequately equipped army opposed him. Deep in enemy territory with little prospect of support, Doniphan decided to attack the Mexican Army, although his men were again outnumbered more than two to one. The battle of 28 February 1847 sent the Mexicans into headlong retreat and allowed Doniphan to occupy Chihuahua.

North Americans had invaded Mexican territory in several places and been victorious in all of the war's opening campaigns. Yet the Mexican government refused to ac-

knowledge defeat. Until a treaty confirmed Mexico's loss of California and New Mexico, the United States could not officially claim those vast territories.

Even before word of all the North American successes in California and the Southwest had reached Washington, President Polk and Winfield *Scott, general in chief of the U.S. Army, had decided to open a new phase of the war. This would require another invasion of Mexico, intended to capture Mexico City itself. If Mexico's government would not concede defeat, then Polk intended to demand concessions at bayonet point in the enemy capital. Polk ordered Scott to assemble a strong expeditionary force by taking most of Taylor's regulars and supplementing them with several thousand volunteers and a few hundred U.S. Marines. The transfer of Taylor's regulars began 3 January 1847. Eased out of the war's climactic campaign, Taylor's temper flared at Polk as well as Scott. Brilliant, and something of a perfectionist, Scott plunged into plans for the expedition, including having special wooden landing boats built to carry his soldiers from ships offshore to the Mexican beaches. The Mexican port city of Veracruz on the Gulf of Mexico was selected as the U.S. base of operations, which meant that the port would have to be taken as the first step of the campaign. Scott prepared to launch his invasion in early March.

The Mexicans were not standing idle during the U.S. preparations. Their new and controversial president, Gen. Antonio Lopez de *Santa Anna, envisioned a daring gamble that might yet turn the tide of the war. Demonstrating his inspirational leadership, Santa Anna created a new field army of 25,000 soldiers though the Mexican treasury was all but empty. Several of the units were brand-new. A number had inadequate equipment and supplies, but there was a remarkable patriotic fervor as recruits and veterans marched north to carry out their president's risky design. A captured letter informed Santa Anna of Scott's campaign plan. Therefore, Santa Anna intended to defeat Taylor's reduced army (numbering less than 5,000), encamped near Buena Vista ranch, not far from Saltillo, then return to his capital and blunt the new American threat to the heart of Mexico. To reach Buena Vista, Santa Anna sent his men over 400 miles of rough terrain in the winter. This audacious plan missed succeeding by only a narrow margin.

On 22 February 1847, Santa Anna's army attacked Taylor's near Buena Vista in a series of piecemeal assaults turned back by blistering U.S. artillery fire. The next day, the Mexicans seemed on the verge of breaking through the U.S. line when they were met by a sharp counterattack led by Col. Jefferson *Davis and his Mississippi volunteers. Relying on personal inspiration, Santa Anna persuaded his men to attack again, but again the North Americans repulsed them. The two armies glared at each other on the 23rd, and that night Santa Anna decided to retreat. The road south to Mexico City was littered with discarded weapons and wounded men. Santa Anna had lost almost 40 percent of his army killed, wounded, and missing. Taylor suffered around 700 killed and wounded some 15 percent of his army.

Upon his return to Mexico City, Santa Anna appealed to patriotism and used conscription. Drawing upon new taxes and extraordinary funds taken from the Catholic Church, he formed and began training another army. Meanwhile, Scott's expedition had landed below Veracruz on 9 March, laid siege to the city, and forced its garrison to

surrender twenty days later. The North Americans organized the port as their base of operations and on 8 April Scott set out on the National Road to the capital.

Santa Anna hoped to bleed Scott's army (only about 14,000 at its strongest point) as it marched inland, forcing it to fight at roadblocks and weakening it to such an extent that it would either retreat or be vulnerable to a showdown battle. On 12 April at Cerro Gordo, about fifty miles from Veracruz, Santa Anna deployed 11,000 soldiers on a natural defensive position. Scott, however, had no intention of playing to Santa Anna's strengths. Using information brought by skilled staff officers—including Robert E. "Lee, R. G. T. "Beauregard, and George B. "McClellan—Scott maneuvered his units in such a way as to outflank the Mexican defenses, dislodging Santa Anna and pushing him back on 18 April. U.S. "Casualties were about 425 killed and wounded; Mexican losses were 1,000 killed and wounded and 3,000 taken prisoner.

Although he won the first encounter with Santa Anna, Scott had numerous problems. Diseases wracked his army. One thousand North Americans lay ill in hospitals in Veracruz, and another 1,000 were ill in Jalapa, a few miles west of Cerro Gordo. Moreover, the enlistment of thousands of volunteers expired in June. Scott held up his advance at Puebla on 15 May, sending the veterans home, awaiting the arrival of reinforcements, and buying provisions for his men. His army's enrollment stood at only around 7,000. The general determined that he could not garrison a string of depots or forts along the National Road and decided to cut himself off from his supply base (Veracruz) and live off the land, rendering his army even more vulnerable than before. However, using generous terms with local mayors and townsfolk, Scott maintained unusually good relations with the Mexican populace. Some guerrillas picked at the edges of his camps and line of march, but did not weaken him appreciably.

Commanding about 10,000 soldiers, Scott proceeded to the outskirts of Mexico City. Arriving near the capital in mid-August 1847, the general again relied on his staff officers for reliable information about terrain and enemy strengths and weaknesses. Santa Anna had mustered nearly 25,000 men, mostly new recruits and national militia leavened with only a few thousand regulars, spread all around the city. Scott chose to approach from the south, crossing terrain that Santa Anna and his subordinates considered impassable, thus creating a measure of tactical surprise that gave him an advantage. The U.S. forces launched attacks against selected Mexican strongpoints, knowing that if they suffered serious losses they might yet be overwhelmed, just as Santa Anna envisioned. In a series of major battles between mid-August and mid-September, Scott's soldiers fought admirably, outflanking or breaking through well-placed and often determined Mexican defenses, such as that conducted at the Battle of "Chapultepec by regulars and cadets of the Mexican military academy. Scott's army suffered more than 3,000 killed, wounded, and lost to disease during the battles for the capital. On 14 September, the victorious U.S. forces entered the plaza of downtown Mexico City, ending a remarkable military campaign. Great Britain's duke of Wellington, who had declared the expedition lost when it cut loose from its supply line, now landed Scott's achievement.

Reinforced during the weeks to come, Scott's army occupied the capital for several months, employing an effec-

tive military government while diplomatic negotiations brought the war to an official end. Other army officers also provided governmental leadership for the territory of California from 1848 to 1850. No Mexican politicians wanted to affix their names to the treaty that would give up half of their country's territory to the United States. Finally, on 2 February 1848, the diplomats agreed to the terms of the Treaty of "Guadalupe-Hidalgo. The U.S. Senate ratified the treaty on 17 March. Both sides confirmed the agreement 30 May. The United States gained all of the vast lands Polk had sought at the beginning of the war—later to become the states of California, New Mexico, Arizona, Nevada, Colorado, and Utah—taking about half of the land of Mexico but only about 1 percent of its population. The Rio Grande would form part of the boundary between Texas and Mexico. In return, the United States agreed to pay Mexico \$15 million and assume all claims of American citizens against the Mexican government, about another \$3 million.

In addition to the territories lost by Mexico and gained by the United States, the war produced several other important results. After expending \$100 million and losing more than 10,000 military personnel (killed or died of disease), the United States became a truly continental power, stretching from the Atlantic to the Pacific, and had a vast potential for the future. Only a few months after the war, gold was discovered in California, prompting a frantic rush of settlers from all parts of the world and making California eligible for statehood in 1850, ahead of expectations. Most of the West Point graduates had acquitted themselves with distinction during the war, confirming the place of the academy in American life. The U.S. Army had fought its first overseas war and its services of supply and recruitment had worked satisfactorily enough to give the nation a victory. Scott's campaign to capture Mexico City provided notable operations for U.S. military officers to study in the future. Although only a few U.S. Marines participated in that campaign their role received favorable publicity, helping to gain continued congressional support for the Marine Corps.

Moreover, the war produced notable political consequences. By his audacious decisions and detailed direction of the war, James K. Polk broadened the powers of the president as "commander in chief. The Whigs nominated Zachary Taylor and he won the presidential election of 1848. In 1852, the Whigs nominated Winfield Scott, but he lost to his former subordinate, volunteer general and New Hampshire politician Franklin Pierce, the Democratic nominee. Debates intensified over the status of slavery in the new territories, leading most immediately to the Compromise of 1850. That measure admitted California as a free state but allowed slaveowners to bring slaves into the western territories captured from Mexico. Other provisions ended the slave trade in Washington, D.C., and provided a new Fugitive Slave Law. Thus, the successful war that expanded the United States to the Pacific also further intensified the debate over issues relating to slavery and led toward the sectional crisis of 1860, secession, and the U.S. Civil War.

MIDDLE EAST, U.S. MILITARY INVOLVEMENT IN THE. The Middle East—defined here as the area stretching from the Persian Gulf to North Africa—has witnessed sporadic U.S. military intervention since 1801, when Thomas "Jefferson dispatched a flotilla of warships to the shores of Tripoli to protect American commerce from raids by the Barbary pirates. The U.S. Navy periodically patrolled the Mediterranean during the nineteenth century from bases in Minorca and Sicily, and American troops fought their first major engagement of World War II—Operation Torch—in Algeria.

America's sustained military involvement in the Middle East, however, dates from the late 1940s, a time of growing Cold War rivalry with the Kremlin, deepening Western dependence on Persian Gulf oil, and mounting tensions between Arabs and Israelis. After an impromptu naval show of force helped reduce Soviet diplomatic pressure on Turkey in 1946, the Truman administration projected American power into the eastern Mediterranean on a permanent basis by establishing the U.S. Sixth Fleet, based in Naples. Some in Washington worried that the partition of Palestine in November 1947 and U.S. recognition of the state of Israel six months later might necessitate armed intervention to prevent Soviet meddling and to protect the Jewish state.

By early 1949, however, the Israelis had won a stunning victory, and the United States spent the next two decades seeking to preserve a fragile military balance between Israel and its Arab neighbors. To this end, the Truman administration took the lead in drafting the Tripartite Declaration of May 1950, which placed strict limits on the flow of American, British, and French arms into the Middle East. And when the Israelis, supported by British and French, attacked Egypt during the 1956 Suez Crisis, the Eisenhower administration used diplomatic and economic leverage to force them to withdraw. After the Arabs began to receive large amounts of Soviet arms during the late 1950s, America moved to ensure Israeli security by providing Tel Aviv with recoilless rifles in 1958, antiaircraft "missiles in 1962, battle "tanks in 1965, and jet fighters in 1966.

In May 1967, Egypt's Gamal Abdel Nasser closed the Strait of Tiran at the mouth of the Gulf of Agaba to Israeli shipping and expelled "United Nations "peacekeeping forces from the Sinai Desert, moves that Israel regarded as acts of war. The Johnson administration hoped to ease tensions and prevent the outbreak of hostilities by attempting to organize a multinational naval force to patrol the disputed waters. On 5 June 1967, however, Israel in a preemptive strike attacked Egypt and Jordan, which had allied itself with the Nasser regime, and occupied the Sinai and the West Bank. Five days later, Israel invaded Syria and seized the Golan Heights. When Moscow threatened to intervene during the final hours of the Six-Day War to prevent the defeat of its Arab clients, Washington sent the U.S. Sixth Fleet into the eastern Mediterranean to discourage Soviet adventurism.

Anwar Sadat, who had become president of Egypt after Nasser's death in September 1970, and Syria's Hafaz al-Assad decided to use force to recapture the territory lost to Israel in 1967. In October 1973, they launched a surprise attack on Israel during the Yom Kippur holiday. In the first days of the fighting, Egyptian troops recaptured part of the Sinai, and Syrian tanks nearly overran Israeli positions in the Golan* Heights. The tide began to turn rapidly in Israel's favor, however, as the Nixon administration agreed to airlift badly needed war material to Tel Aviv. With the Israeli troops within striking distance of Cairo and Damascus, the Soviet Union, as it had done six years earlier, threatened to intervene militarily. After deterring the Kremlin by briefly placing U.S. strategic forces at the highest level of readiness, the White House brokered a ceasefire in late October and Henry "Kissinger undertook a lengthy process of shuttle diplomacy that brought about military disengagement between Israel and Egypt in 1974 and between Israel and Syria a year later. As part of the September 1978 "Camp David Accords that led to the signing of a comprehensive Egyptian-Israeli peace treaty in March 1979, the United States agreed to station several hundred U.S. troops in the Sinai Desert, where they served as peacekeepers throughout the 1980s.

Although the United States managed for the most part to avoid becoming militarily involved in the Arab-Israeli conflict during the half century after World War II, persistent political instability in the Muslim world triggered armed American intervention in the Middle East with increasing frequency after the late 1950s. On 15 July 1958, Dwight D. "Eisenhower dispatched 15,000 American Marines to Lebanon following a bloody left-wing coup d'état in Iraq that threatened Lebanese president Camille Chamoun and raised fears in Washington that events in Beirut were about to parallel those in Baghdad. During their four-month tour of duty in Lebanon, U.S. troops helped restore order, enabling American diplomats to arrange a truce between warring Christian and Muslim factions. The Marines pulled out of Beirut on 25 October 1958 without having suffered any casualties.

During the mid-1960s, the United States intervened briefly in Saudi Arabia, where the "Pentagon had obtained rights to a small air base at Dhahran at the end of World War II. In October 1962, radical Arab nationalists staged a coup against the house of Saud's royalist neighbors next door in Yemen, prompting Nasser to send 70,000 troops to assist the Yemeni revolutionaries. Eager to reassure the jittery Saudis, who feared that Egypt would use Yemen as a springboard for further adventures in the Arabian peninsula, John F. "Kennedy agreed in March 1963 to station a squadron of U.S. jet fighters in Dhahran. There they played a high-altitude game of "cat and mouse" with Egyptians MiGs along the Saudi-Yemeni frontier until Lyndon B. "Johnson terminated "Operation Hard Surface" in early 1964.

American military involvement in the Middle East increased during the 1970s following a series of sudden shifts in the regional balance of power. In 1971, Great Britain pulled its armed forces out of the Persian Gulf. In early 1979, Islamic revolutionaries inspired by the Ayatollah Rouhallah Khomeini toppled the shah of Iran, then took fifty-three U.S. diplomats hostage in November. One month later, Russian troops invaded Afghanistan to prop up the pro-Soviet government in Kabul.

President Jimmy *Carter responded by promulgating the *Carter Doctrine in January 1980, promising to protect American interests in the Persian Gulf. He moved quickly to acquire a string of strategic bases stretching from Kenya to Diego Garcia, and announced plans for a new "rapid deployment force" of 85,000 U.S. troops. In April 1980, however, a U.S. military attempt to free the Americans held hostage in Iran failed spectacularly when two American *helicopters collided at a secret desert airstrip just outside Teheran, killing eight crewmen.

Although the hostages were released at the outset of his presidency, Carter's successor, Ronald *Reagan, fared little better. Determined to combat state-sponsored terrorism in the Middle East, the Reagan administration did succeed in reining in Libya's Muammar Gaddafi by staging two U.S. air raids against Libyan targets, first in August 1981 and again in April 1986. But when Reagan agreed to send 800 American troops to Beirut as part of a multinational peacekeeping force in the aftermath of Israel's invasion of Lebanon in June 1982, disaster ensued. In October 1983, Iranian-backed terrorists detonated a huge truck bomb at the Beirut airport housing the Manne ground-force headquarters, killing 241 U.S. Marines. Four years later, there was more trouble after the Reagan administration moved to contain the Iran-Iraq War, which had been raging since September 1980. Hoping to prevent the conflict from disrupting the flow of Middle East oil to Western consumers, Washington reflagged Kuwaiti tankers in early 1987 and then sent the U.S. Navy into the Persian Gulf to escort them through the war zone. In April, an Iraqi jet hit an American frigate, the USS *Stark*, with an Exocet missile, killing thirty-seven sailors. Fifteen months later, in July 1988, an American guided missile cruiser, the USS *Vincennes*, accidentally downed an Iranian Airbus, killing all 290 aboard.

The Iraqi invasion of Kuwait on 2 August 1990 triggered a dramatic escalation of the U.S. military presence in the Persian Gulf. Fearful that Saddam *Hussein might attack Saudi Arabia next, President George *Bush sent 200,000 American troops to the Persian Gulf as part of Operation Desert Shield in late August. Determined to force Saddam to pull out of Kuwait, Bush increased the number of U.S. soldiers and sailors in the gulf to 541,000 by the end of the year and put together a broad anti-Iraqi military coalition that included America's *NATO allies and several Arab states, among them Egypt, Syria, and Saudi Arabia. On 16 January 1991, Bush unleashed Operation Desert Storm, which saw a monthlong U.S. aerial bombardment of Iraq followed by a swift flanking attack on Saddam's troops, who fled Kuwait in disarray in late February. American *casualties during the *Persian Gulf War totaled 146 dead, while estimates for Iraqi troops killed in action range from as few as 6,000 to as many as 100,000. In the aftermath of Operation Desert Storm, the United States stationed 24,000 troops and 26 warships in the Persian Gulf on a long-term basis to ensure continued access to Middle East oil and to promote regional security and stability—objectives first articulated by the Truman administration a half century earlier. In 1998-99, Saddam Hussein hampered UN weapons inspectors and challenged U.S. air surveillance. Consequently, President Bill *Clinton in Operation Desert Fox increased American military presence in the Persian Gulf to 33,000 service people and American and British aircraft began sporadic air attacks on Iraqi military

targets. In October 1998, President Clinton brokered the so-called Wye Accord between the Palestinians and the Israelis in which the Palestinians received more land on the West Bank and security control over it and in turn accepted monitoring by the U.S. *Central Intelligence Agency to ensure active efforts to control terrorists.

MIDWAY, BATTLE OF (1942). Within a month of the Imperial Japanese Navy's surprise attack on the U.S. Pacific Fleet in Pearl Harbor on 7 December 1941, Adm. Isoroku *Yamamoto, commander in chief of Japan's Combined Fleet, realized that the Hawaii attack had not achieved its main purpose, the complete destruction of the U.S. Pacific Fleet, including * aircraft carriers. On 14 January 1942, Yamamoto's staff recommended an attack on Midway, a defended American atoll 1,100 miles northwest of Pearl Harbor. Japanese planners assumed the U.S. Pacific Fleet would rush to the outpost's aid, whereupon the more powerful Combined Fleet would engage and destroy it. Such a victory could open the prospect of invading Hawaii, thus extending the Japanese defensive perimeter eastward. With the loss of their fleet and the bare essentials to their success against Japan, the Americans might accept a negotiated end to war.

Fearful that Hawaii was unobtainable and that, without it, possession of Midway would become a liability, the Naval General Staff in Tokyo fought the plan, presented on 2 April 1942; but by the 5th, Yamamoto had triumphed. Later, Yamamoto added a diversionary air raid on the small American air base at Dutch Harbor, Unalaska, and seizure of Attu and Kiska at the western end of the Aleutian chain. The main assault would be against Midway far south, with a naval air attack on 4 June and invasion 6 June. Late in May the Combined Fleet headed east.

In the meantime Adm. Chester *Nimitz, commander in chief of the U.S. Pacific Fleet, heeded warnings of an imminent assault upon Midway from Lt. Comm. Joseph J. Rochefort, whose cryptanalysts, using *MAGIC, had entered the Japanese Navy's radio communication system. Knowing the Aleutians were a feint, Nimitz concentrated his three carriers where needed, misinformed the Japanese as to their location, and until the last minute denied the enemy accurate information about them. At the same time, first his cryptanalysts and then his patrol planes from Midway kept Nimitz and his tactical commanders at sea—Rear Admirals Frank Jack Fletcher and Raymond A. *Spruance—informed of the progress of the enemy fleet.

Early on 4 June, Vice Adm. Chuichi Nagumo, commanding four of Japan's most powerful carriers, launched his attack upon Midway. Simultaneously, Midway-based U.S. aircraft attacked his ships, but none gained a hit and most were shot down. Then, in quick succession, a Japanese scout plane reported the presence of an American carrier; U.S. carrier-based torpedo planes began to attack Nagumo's carriers (almost all were shot down without getting a single hit); the Japanese aircraft that had attacked Midway returned, needing to land on deck; and three U.S. dive-bomber squadrons, one from the *Yorktown* and two from the *Enterprise*, arrived over the Japanese Fleet. The dive-bombers destroyed three of Nagumo's carriers: the *Kaga*, *Akagi*, and *Soryu*. The *Hiryu* survived long enough for her planes to hit the *Yorktown*, then she too sank under air attack from *Yorktown* and *Enterprise*. Defeated, Yamamoto turned his fleet homeward. On 6 June, aircraft from the *Enterprise* and *Hornet* sank a Japanese cruiser, while the Japanese submarine *I-168* finished off the damaged *Yorktown*.

Japan had gained possession of two barren islands in the Aleutians. It had lost four irreplaceable carriers and many equally irreplaceable aviators. The United States had also lost aviators, but only one carrier. The Japanese Combined Fleet no longer had an appreciable edge over the U.S. Pacific Fleet. The United States had saved Midway and perhaps Hawaii, gaining the opportunity to go on the offensive two months hence at Guadalcanal. In Admiral Spruance, it had found one of the Pacific War's most effective tactical naval commanders. And in retrospect, Midway proved to be the turning point of the naval war in the Pacific. The United States now seized the offensive.

MILITARISM AND ANTIMILITARISM. The term *militarism* describes a society in which war, or preparation for war, dominates politics and foreign policy. Soldiers and military-minded civilians become a governing elite dedicated to expanding the military establishment and inculcating martial values. *Antimilitarism*—militarism's opposite—is not the same as a pacifist resistance to all war. But, like pacifists, antimilitarists are hostile to the military and believe that, in the words of Alexis de Tocqueville, "a large army in the midst of a democratic people will always be a source of great danger."

Beginning with the colonists' aggression against the native Indians, Americans have frequently gone to war. But, if not historically a peace-loving people, they have traditionally distrusted militarism. In accord with the English radical Whig tradition, they preferred an informal militia to a standing army. Thus, the Declaration of Independence asserted that "George III 'has kept among us, in times of peace, Standing Armies without the Consent of our legisla-

tures. He has affected to render the Military independent of and superior to the Civil Power.'"

The "Revolutionary War did not diminish American aversion to militarism. George Washington gracefully relinquished his command, while the new state and federal constitutions affirmed the supremacy of civil over military authority. Military power was divided between Congress, which had, the sole power to declare war, and the civilian president as "commander in chief of the armed forces. In the "Civil War, although Abraham Lincoln assumed some aspects of military rule, the Union was preserved without a military dictatorship. Isolated from the strife of Europe, the United States during the nineteenth century enjoyed free, or near-free national security, with a minuscule regular army and a small navy. Through the early twentieth century, America was celebrated as a haven of refuge for young men fleeing the wars and military "conscription of the Old World.

The first major break in the liberal antimilitarist tradition of the American republic followed the "Spanish-American War. Under the new imperialistically minded leadership of Theodore Roosevelt as president, and Secretary of War Elihu Root, the army, with a General Staff and National Guard, was reorganized along the lines of the major military powers of Europe. Selective Service in World Wars I and II completed federal control; but conscription, though democratic in its rough equality of obligatory service, was opposed in peacetime as a bulwark of militarism.

By the second half of the twentieth century, the "Cold War's Pax Americana, along with the enormous technological achievements of modern "nuclear weapons, made possible a new type of militarism unrecognizable to those who looked for its historic characteristics. Militarism might now be clothed in a civilian uniform and imposed upon a people who accepted a permanent warfare economy as no more than a way to full employment and a welfare state.

Historically, Americans have preferred that the soldiers they have chosen as presidents exemplify civilian virtues. Thus, Dwight D. Eisenhower, a career army officer for most of his life, nevertheless in his farewell presidential address in January 1961 warned that America could be menaced by the rise of a "military-industrial complex. "We must never," he declared, "let the weight of this combination endanger our liberties or democratic processes—Only an alert and knowledgeable citizenry can compel the proper meshing of the huge industrial and military machinery of defense with our peaceful methods and goals so that security and liberty may prosper together."

MILITARY HISTORY. See Disciplinary Views of War: Military History.

The term **MILITARY-INDUSTRIAL COMPLEX** has a clearly defined history. It was first used by President Dwight D. Eisenhower in his farewell address in January

1961, when he warned that "In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. The potential for the disastrous rise of misplaced power exists and will persist."

The term soon came into widespread use because it seemed to fit and explain some of the new military realities of the time: the persistent high military spending in peacetime, which was unprecedented in American history; the persistent and costly "arms race between the United States and the Soviet Union; and the persistent and seemingly pointless U.S. military involvement in Vietnam. The 1960s-1970s saw a flood of writings about the military-industrial complex, a flood that crested during the last years of the "Vietnam War. By the mid-1980s, however, the term had largely fallen out of public discussion.

Whatever the ebb and flow of language, the concept reflects an enduring reality. Since the beginning of the Industrial Revolution in the late eighteenth century, every great power has demonstrated a close connection between its military and its industry. Industrial development led to military advantage (e.g., the British steel industry and the Royal Navy) and military needs led to industrial development (e.g., the German Army and the German steel industry).

This military-industrial connection existed even in the commercial United States. Eli "Whitney developed the mass-production process in 1798 while seeking a better way to manufacture U.S. Army muskets. For a century and a half thereafter, the U.S. government arsenal system was a military-industrial complex of the clearest and simplest sort.

The arsenal system was not the most common pattern of military-industrial relations in the United States, however. Normally, commercial demands first called an industry into being, and then the U.S. military, following the lead of the militaries of other great powers, applied the products of the new industry to military purposes. The expanding American steel industry after the "Civil War soon found a market in the new steel-hulled U.S. Navy, but its major markets remained civilian. The next waves of American industry—successively the chemical, electrical, and automobile industries—also developed because of civilian, not military, demand.

Beginning in the 1930s and continuing through World War II and the "Cold War, this pattern of civilian production leading military production was reversed. The next waves of American industry—aviation (later aerospace), computers, and semiconductors—were brought into being by military demand, and their products only later found civilian applications.

Two world wars reinforced the connection between the military and industry. In both wars, the largest defense contractors were the largest industrial corporations (in World War II, these included U.S. Steel, Bethlehem Steel, Dupont, General Electric, Westinghouse, General Motors, and Ford). However, when these wars were over (as after all previous U.S. wars), these American corporations quickly converted from production for military purposes back to production for commercial markets. With the minor exceptions of the U.S. government arsenals and shipyards, the military-industrial complex in the United States was a reality only in wartime.

A new kind of military-industrial complex came into

being in the 1950s. The comprehensive national strategy presented in "National Security Council memorandum No. 68, a call for Cold War, rearmament, seemed to legitimate, and the experience of the "Korean War seemed to necessitate, a permanent military-industrial establishment, in peacetime as well as in wartime or at least in cold as well as hot war. After the Korean War, the Eisenhower administration did not undertake drastic reductions in military spending like the reductions after previous wars but rather maintained military spending at the level of about 10 percent of GNP. Much of this spending went for the procurement of weapons systems, especially aircraft and "missiles. Moreover, several large corporations, particularly those in the aerospace industry, became completely dependent upon military contracts (e.g., Lockheed, General Dynamics, North American, McDonnell, and Grumman). Eisenhower himself presided over the institutionalization of the military-industrial complex that he would later warn against.

Many of the major military contractors were clustered in California and Texas. This concentration within particular states and congressional districts meant that their representatives in Congress became representatives of the contractors and of the military-industrial complex more generally. These representatives often became members of the House and Senate armed services committees, where they heavily influenced military procurement. The military-industrial complex thus developed into the "iron triangle," composed of congressional committees, military services, and military contractors.

During the two decades of the greatest public discussion about the military-industrial complex in 1960-80, several arguments were put forward about its consequences for public policy:

Military Keynesianism. Some analysts argued that the military-industrial complex promoted military spending as the way to use fiscal policy to manage the national economy, a military version of the macroeconomic prescriptions of John Maynard Keynes. This led to persistent and massive federal budget deficits.

The Depleted Society. A related argument was that the military-industrial complex diverted resources from investment in long-run economic and social development into spending on nonproductive military weapons, depleting society instead of developing it. In particular, there were too many engineers devoted to developing military products and not enough developing commercial ones. This seemed to explain why Japan and Germany, which had much lower military spending per capita than the United States, were more successful in international commercial markets. This led to persistent and massive U.S. trade deficits.

The Follow-on System. It was also argued that, in order to preserve particular military contractors and their production facilities, the military-industrial complex promoted weapons systems that were merely new variations or "follow-ons" of previous systems from a particular production line. This led to a sort of technological stagnation.

The Gold-plating Syndrome. A related argument was that, in order to maintain the profits of military contractors, the military-industrial complex promoted excessive spending on superfluous features of weapons systems, often referred to as "waste, fraud, and abuse." This led to fewer numbers of more expensive weapons.

Each of these arguments was highly controversial when first made. This is not surprising, given the high stakes in military expenditures that were involved. By now, however, most analysts of military procurement agree that there is substantial evidence supporting each as they apply to much of the period from the 1960s to the 1980s.

It was also argued, especially at the height of the Vietnam War, that the military-industrial complex put strong and persistent pressure on U.S. leaders to undertake military interventions and an adventurous foreign policy. Yet the evidence is largely against this argument. The U.S. military services, at least the army and the Marines, have consistently been reluctant to undertake military interventions. The military services generally have been in favor of the procurement of new weapons, but not the employment of them.

Whatever the power of arguments about the influence of the military-industrial complex on weapons procurement during the Cold War, they are much less relevant to the current era. The end of the Cold War and the fiscal constraints imposed by federal budget deficits brought an end to military Keynesianism. American society is certainly depleted in many ways, but its current problems do not include too little investment and too few engineers for commercial products. The follow-on system is less evident, since a major defense contractor (Grumman) was allowed to go out of business, and other production lines have shrunk greatly. There is still ample gold-plating—waste, fraud, and abuse—but it can now be seen as a sort of welfare system (like public works during the Great Depression) for a limited number of distressed localities.

A military-industrial complex still exists, but it is now a much smaller part of the U.S. economy than it was during most of the Cold War (military spending in the late 1990s is less than 3% of GNP). Because of this relatively small size, the military-industrial complex no longer seems to have consequences that are really damaging to American interests. The major problems now seem to arise from other complexes—perhaps the financial, medical, educational, or entertainment complexes—and from the complexity of America itself.

MILITARY POLICE. See Justice, Military; Military Police.

MILITIA ACTS. From 1792 through 1916, Congress struggled to devise a policy to make the state citizen soldiery an effective reserve to augment the U.S. Army in national emergencies and yet preserve the militia's prerogatives as guaranteed in the Constitution. The Militia Act of 1792 left

the militia, all able-bodied men between eighteen and forty-five, wholly under the control of the states. Although Congress approved a law in 1808 providing \$200,000 worth of weapons to be shared among the states, and doubled the amount in 1887, the act left the nation with no reserve and dependent on untrained wartime volunteers.

The Militia Act of 1903, as amended in 1906 and 1908, increased federal aid to \$4 million annually and recognized the National Guard as the "Organized Militia." The amended 1903 act deemed state units the first reserve to be called in any war. It limited federal control, however, and in the "National Defense Act of 1916, Congress gave the army extensive control over National Guard officers and units, made state forces available for service overseas, and greatly increased financial support. As amended in 1920, provisions of the 1916 law essentially have governed federal-state military relations to the present.

—Jerry Cooper

MILITIA AND NATIONAL GUARD. Colonial and subsequently state militia systems have played a central role in military affairs for much of America's history. From the first Indian wars of the seventeenth century through the "Spanish-American War in 1898, colonial and state militias raised the majority of soldiers who fought these conflicts. Colonies largely waged war as individual efforts until the 1690s. Thereafter, the colonies provided troops to assist the crown and the states did the same for the United States. Provincial and state units serving with the British army, the "Continental army, or the U.S. Army resisted regular military discipline and earned in return the contempt of professional officers. The combination of militia troops and regular forces from America's earliest history engendered what Russell F. Weigley identifies as an American "dual army tradition."

The militia took root in the British colonies when most European nations abandoned the feudal levy and organized standing armies. Because the private groups that founded the early settlements received no military assistance from the crown, they adopted the fading English militia practice to defend themselves. Virginia, Plymouth Colony, and Massachusetts approved laws that in their general provisions came to prevail throughout the colonies, except Pennsylvania. (There the "pacifism of the elite "Quakers prevented the organization of a militia until the 1750s.)

Colonial laws levied a military obligation on all able-bodied white men, the ages of obligation varying from colony to colony. The laws exempted some men due to their occupations or religious beliefs, and usually excluded indentured servants and slaves. However, in times of crisis colonies ignored race or condition of servitude. Obligated militiamen were required to arm and equip themselves, and take part in occasional musters and training sessions. Training in the colonial era was usually perfunctory. Officers inspected weapons and equipment, led their men in close order drill, and sometimes permitted volley firing or individual marksmanship contests.

Informality and inefficiency marked the colonial militia. By nature the institution was intensely local. Militiamen

often elected their own officers, defied the decisions of courts-martial, and ignored orders from colonial capitals. A geographically dispersed farming population produced few men with the time, money, or inclination to make themselves efficient soldiers. Even the ardent were not likely to become skilled with only a few days' annual training. As the colonies matured and immediate Indian threats disappeared, the militia lost much of the military effectiveness it initially developed; yet it persisted because it served important social, political, and community functions.

The very fact that the colonies succeeded illustrates that for all its weaknesses the militia ensured colonial survival and expansion. After the early struggles, however, the militia rarely functioned as a community-in-arms. Conquest of Indian territory required offensive operations—a function to which the obligated militia was unsuited. From the late seventeenth century, therefore, the colonies used the system to mobilize provincial soldiers to man expeditionary forces, to maintain frontier garrisons, and to support slave patrols. Colonies used various methods to recruit men: appeals for volunteers, offers of cash or land bounties, and if necessary, "conscription. Men normally excluded from the militia, including slaves and Indians, often served in provincial forces.

The * Revolutionary War tested the militia as no previous conflict had done. Americans confronted a great imperial power with neither a central government nor a standing army of their own. Although leaders extolled the militiaman as an idealized republican * citizen-soldier whose virtue and zeal could beat the British army, after 1775 state militias generally failed to fight effectively, or to recruit enough men to meet the demands of the Continental army. Militia units called to temporary duty to assist the Continentals often performed poorly, earning the condemnation of Gen. George "Washington and his fellow officers, and providing the basis for an antimilitia prejudice that persisted within the army into the twentieth century. Even so, the revolutionary militias served the country well. The Continental Congress lacked the money, bureaucracy, and political legitimacy to raise troops on its own. Without militias to organize men and supplies within the states, there would have been no Continental army.

The militia remained the source of troops for Congress after the Peace of Paris (1783). The ratification of the U.S. Constitution in 1788 gave the federal government the authority to raise an army, while the Second Amendment (1791) guaranteed the states the right to keep their militias. The Federalist administration of President George Washington established a regular army in the early 1790s, but failed to assert federal control over the militia. Congress perpetuated colonial militia practice when it approved the Militia Act of 1792.

Although new states entering the Union enshrined the militia in their constitutions and statutes, over the next three decades the obligated militia faded into insignificance. Few men enrolled in militia formations and few states made efforts to organize the system. Reform groups pressured state legislatures to repeal militia fines and abolish compulsory musters and training; ultimately state adjutants general merely estimated the size of the obligated population. Although Congress approved an innocuous law in 1808 providing \$200,000 worth of weapons to be distributed annually to states and territories, it made no effort to reform the state forces after 1792.

Despite the disintegration of the obligated militia, the state soldiery remained central to military affairs. President James "Madison's administration called on the militia repeatedly during the *War of 1812, when its woeful performance added to its miserable reputation within the regular army. After the War of 1812, the army assumed the central role in protecting the frontier and forming the core around which war armies were built. The regulars, however, could fight neither extended Indian wars nor conventional conflicts without reinforcement by citizen-soldiers.

With the obligated militia moribund, states called for volunteers when assigned manpower quotas by the federal government—a practice with colonial precedents that survived to the end of the nineteenth century. Colonial practice persisted as well when Congress permitted the states to select officers according to local preference, which usually meant by election. Although adjutants general and other part-time staff officers assumed important "mobilization responsibilities, states generally turned to regimental and company officers at the county and municipal level to organize volunteer troops. The call for volunteers thus invariably animated a system that seemed otherwise defunct and perpetuated the militia as a mobilization system.

State soldiers assisted the army in the "Black Hawk War (1832) and the second of the "Seminole Wars (1836-42). States organized 40,000 volunteers for the "Mexican War and approximately 175,000 for the "Spanish-American War. Though both the Union and the Confederacy utilized conscription during the "Civil War, 96 percent of the "Union army and 80 percent of "Confederate army troops entered service as state volunteers. Volunteer soldiers came to military duty no better armed, equipped, or trained than had their earlier militia counterparts. Yet as the Mexican and Civil Wars demonstrated, time and training made them creditable soldiers. Nonetheless, army officers lambasted the volunteers for their lack of discipline and military effectiveness. Deep dismay with the inefficiency he saw in the Civil War led Emory "Upton to write *Military Policy of the United States* (1904), a polemic against reliance on state militia and volunteers that became a favorite text among army officers in ensuing decades.

State mobilization explains in part why the militia persisted, but it served other functions as well. Until the obligated militia disappeared, states called on it to meet local Indian uprisings; militia also served to suppress urban disorders and real, or threatened, slave insurrections. More important, even as the old obligatory system shriveled, one element—the uniformed militia—expanded.

Uniformed militia could be found as elite *artillery, cavalry, and "cadet" units in colonial America and the early republic, but did not become widespread until after the War of 1812. Men with avocational interests in military affairs organized uniformed militia units, voluntarily meeting to train and purchasing their own *uniforms. Many voluntary units lasted only a short time, but some became permanent elements of their state militias. A few voluntary companies reflected an elite tinge with their expensive uniforms, high company dues, and costly armory expenses. They sponsored dinners, theatricals, and balls that attracted the socially active in their communities.

The years from 1830 to 1860 were the heyday of the uniformed militia, as middle-class men—especially, after the 1840s, in towns and cities with an Irish or German ethnic element—became active in forming units. There was

much to mock in the activities of these part-time citizen-soldiers. Their self-designed uniforms featured a good deal of gold braid, bearskin hats, and bright colors. They spent most of their money and time on social activities rather than training. Military activities centered on close order drill competitions and marksmanship contests, with an occasional foray into camp to hold sham battles.

On the other hand, by the late 1850s, some 75,000 men demonstrated enough interest in military matters to join a company, support it financially, and gain limited military training. The uniformed militia aided municipalities and states when public disorders or natural disasters required a show of public force. Except for Connecticut, Massachusetts, and New York, states neither aided these organizations financially nor supervised their activities. Answerable only to themselves, the uniformed militia nonetheless provided the only martial experience for thousands of otherwise untutored citizen-soldiers who would volunteer for the next war.

The Civil War swallowed up the uniformed militia. In the decade following the war, however, state voluntary units revived to become the National Guard. Guard units differed from uniformed militia in that state governments gave them financial support. Governors and legislatures also imposed centralized control over local companies and established minimum standards to qualify for state subsidies. Money was forthcoming in part because Guardsmen lobbied for it, but more so because states sought a constabulary force to control urban and industrial disorders. Although a state military revival was underway before 1877, the destructive railroad disorders of that year spurred new interest in the Guard.

In training, arms, equipment, and numbers, the National Guard represented a vast improvement over the uniformed militia. By the 1890s, over 100,000 men in Guard regiments regularly attended summer training camps. Most states made their adjutants general full-time employees to supervise and administer their citizen-soldiers. The Guard, however, continued to resemble the uniformed militia in many ways. It still elected its officers, sponsored social and athletic events, and except in some northeastern states, remained largely self-supporting. The Guard's military efficiency left much to be desired, even in suppressing civil disorder.

Many Guardsmen disliked the constabulary role and presented themselves as an organized volunteer reserve. The National Guard Association, founded in 1879, initiated a campaign to win increased federal aid in recognition of that reserve function. Congress remained unmoved until the calamities of the Spanish-American War fostered wide-ranging military reform. Although the Guard had volunteered willingly in 1898, the war demonstrated that it was poorly prepared to fight. Over the next five years, Congress increased federal aid to the states and granted the National Guard a limited reserve role in the Militia Act of 1903.

Although the act gave the state soldiery a legal recognition never granted before, during the ensuing fifteen years it lost its centrality in military affairs. Military reform also created a general staff manned by professional soldiers intent on creating a military policy fully under their control. Army reformers failed to replace the Guard with a federal volunteer reserve but nonetheless gained significant control in the National Defense Act of 1916. Although the

National Guard survived the army challenge, use of conscription to meet the manpower demands of World War I drastically reduced the percentage of state-recruited soldiers serving in the war army. Of these nearly 4 million men, only 10 percent were Guardsmen. The 400,000 called in 1917, however, represent the largest state effort in the twentieth century. For the next fifty years national draftees, not state soldiers, would represent the nation's citizen-soldiers.

Despite another regular army effort to eliminate it, the Guard survived under the National Defense Act of 1920. The law continued the state reserve role, but placed the Guard under close federal control and limited its forces to 400,000 men. In fact, the Guard never exceeded 200,000 during the interwar years, and poor funding prevented implementation of policy outlined in 1920. A shortage of equipment and an understrength regular force limited National Guard training, and the army displayed little enthusiasm for instructing the state troops. Consequently, when the Guard was mobilized in 1940, it fell well short of combat readiness. Just under 300,000 Guardsmen served in World War II, but their service was vital to the effort. Guard divisions provided the cadre and units that trained millions of draftees, and represented seven of the eleven combat divisions sent overseas in 1942.

In the fifty years since the end of World War II, the National Guard has remained a reserve component to the army and gained a similar function with the air force as well. Federal funding came to total 95 percent of support for the Army and Air National Guard. Despite that support, however, the Guard's part in war has diminished since 1945. The demands of the "Cold War led to a much larger regular army that drew its manpower from the Selective Service, men who then met their reserve obligation in the Army Reserve. In the four significant mobilizations since 1945—the "Korean War, the 1961 Berlin call-up, the "Vietnam War, and the "Persian Gulf War—the "Department of Defense mobilized more reservists than Guardsmen except in the very limited Vietnam activation of Air National Guard units.

The army struggled to develop a rational reserve policy after 1945. It had none for the Korean War and out of desperation called thousands of individual reservists rather than mobilize understrength Guard units that were poorly trained and equipped. Reserve policy began to make sense only in the early 1960s. Policies adopted since then have followed a logical trend: reduce the number of reservists and provide sufficient funding to create fully manned, fully equipped, properly trained units that were genuinely combat ready. During the Vietnam War, the army relied on draftees rather than reservists, but the decision not to call the Guard and Army Reserve represented a political, not a military, choice.

Even as the National Guard assumed a more rigorous combat training program in the 1960s, its state constabulary function engulfed it with demands for which it was unprepared. Armed, equipped, and trained for combat, Guardsmen called to suppress urban ghetto riots and campus protests displayed limited knowledge of the legal requirements in aiding civil authorities, and relied too often on firepower. More than once, as during the 1967 Detroit riot, the failure of the Guard to suppress violence led state officials to request federal military aid. Riots following the assassination of Martin Luther "King, Jr., in April 1968

brought out 40,000 Guardsmen in 14 states. That year the army directed to the Guard to conduct thirty-two hours of riot control training each year. Use of the National Guard to control war protests engendered irony for many young men who joined reserve components to avoid combat duty in Vietnam.

In the aftermath of Vietnam, the army adopted a Total Force policy that allowed it to maintain a large number of combat units by assigning key combat and service support roles to the National Guard and Army Reserve. The end of Selective Service and budget cuts that seriously reduced the active army led to the policy. Under Total Force, the army could not fight a war without mobilizing reserve components. The Gulf War tested that assumption and it seemed to work. One aspect of Total Force, however, apparently failed in 1990-91: three Guard combat brigades were mobilized but not deployed because they fell short of combat readiness.

The decision not to deploy the Guard brigades initiated a dispute that echoed the complaints of George Washington, Emory Upton, and early twentieth-century General Staff reformers. Army leaders did not want to commit poorly prepared state forces to battle led by improperly trained officers. The army complaint implied that no unit not fully under its control could be ready for combat. This recapitulation of an argument as old as the republic raises the question of why the ancient institution of the militia endures in the guise of the National Guard. The state soldiery persisted because it exemplified strains in the American experience that honored the self-taught amateur, the citizen-soldier, and localism, enshrined in the Constitution through federalism. Militiamen were citizens first but effective soldiers as well who, unlike regulars, did not threaten community freedom. A significant gap often existed between the theoretical martial qualities of the militiaman and the realities of his wartime performance. Nonetheless, the state citizen-soldiery with its historically established combat record has endured.

questions regarding military authority over civilians. In 1864, a military commission in Indiana during the *Civil War convicted Lambdin P. Milligan on charges of conspiracy for his part in an alleged plot to release and arm Confederate prisoners in Northern prison camps and sentenced him to death. Milligan appealed to the civil courts, challenging the military tribunal's jurisdiction over his case. When the case reached the Supreme Court in 1866, the justices unanimously ordered Milligan's release. In the majority opinion for the Court, Justice David Davis held that the Constitution prohibited military trials of civilians where civil courts remained open. Martial law was only permissible, he insisted, in "the theater of active military operations," where civil courts could no longer function. In a concurring opinion joined by three other justices, Chief Justice Salmon P. Chase argued that Congress intended to ensure civil trials to civilians when it adopted the *Habeas Corpus Act of 1863, and therefore Milligan had been wrongly tried. However, unlike Davis, Chase insisted that Congress under its war powers had the authority to enact *martial law, even in areas removed from the theater of war.

Milligan promptly provoked criticism from those who feared that it compromised Republican *Reconstruction plans for the South by restricting military authority over civilians. Although in the twentieth century the Supreme Court has been reluctant to endorse *Milligan's* wholesale ban on martial law outside the theater of war, the case has never been reversed and scholars continue to hail it as a landmark constitutional protection of civil rights.

MINES, LAND. Originally mine warfare consisted of tunneling beneath enemy positions and destroying them with explosives. In the *Civil War, Union troops successfully detonated a mine containing 4 tons of gunpowder under a Confederate position near Petersburg, Virginia, on 30 July 1864. Modern land mines may be an encased charge of explosive or may contain a chemical agent or incendiary device. They can be detonated in numerous ways: pressure (stepping or driving over it), pull (using a trip-wire), tension release (cutting a trip wire), pressure release (removing a weight), or by electrical means (command detonation). More exotic ways are through magnetic induction (driving near the mine in a vehicle), frequency induction (using a radio nearby), audio frequency (any loud noise), and infrared (large heat sources). Mines can come in different sizes and shapes and can weigh as much as 20 pounds, with the capacity of destroying a tank, down to 4 ounces, enough to mangle a foot.

The purpose of mines is to deny ground to the enemy, forcing him either to breach or to circumvent the mine barrier. In either case, the enemy's movement is restricted and he is forced to concentrate in areas that can be covered by direct or indirect fire. Mines are normally emplaced by burial in the ground or scattered upon the surface, where they pose a two-edged weapon against both enemy and friendly forces. Modern mines can be controlled

MILLIGAN, EX PARTE (1866). The case, *Milligan* 71 U.S. 2 (1866), brought to the U.S. Supreme Court fundamental

electronically and can turn themselves on and off at the whim of the dispenser. Though the most common type requires direct pressure to activate, command-detonated mines are frequently employed in prepared defensive positions or ambushes. This type is also called a *directional* mine because 80 percent of the fragments are propelled outward in a 60-degree arc. The effect is lethal up to 50 meters and can cause wounds out to 100 meters.

Another antipersonnel mine is the *bounding* type. Upon activation, a small expelling charge in the base of the mine propels the main charge about 1 meter into the air, where it explodes. Antitank mines can attack armored vehicles through shaped charges aimed at the underside of the vehicle, blast effects to blow off a tire or track, or using advanced technology with *off-route* types. Off-route methods involve using acoustic, seismic, and passive infrared sensors to identify a target and then firing a missile down the weapon's line of sight.

Future development of mines will be closely tied to the development of electronic sensors in such areas as identification friend or foe (IFF) technology and methods of deploying mines either mechanically or by remote delivery by aircraft, gun, or rocket systems. Mine warfare is a complicated and wasteful form of engineer combat. Unfortunately, as the size of military units shrink, its appeal will increase as armies seek ways to offset their numerical weaknesses. The widespread use of relatively inexpensive land mines in Third World countries led to numerous civilian casualties long after the end of the conflicts for which the mines were originally placed. So far the United States has not signed an international treaty banning the use of mines because of its obligations to defend large land areas in such far-flung places as Korea and Guantanamo, Cuba.

MINES, NAVAL. Underwater explosive devices are designed to sink ships, submarines, or other seaborne craft or by such threat to prevent them from using an area. Their firing mechanisms are either the traditional pressure points which detonate the explosive on contact or the modern influence devices which are triggered through magnetic or electronic sensors merely by the approach of a vessel. Most mines are automatic, but some harbor mines, controlled electrically by cable from shore, can be turned off to allow transit of friendly vessels. Moored mines are tethered to sinkers, and they float at predetermined depths generally to cut off particular areas. Traditionally they have been contact mines floating just below the water to damage surface ships that touch them, but more recently moored mines can serve as influence mines at depths of 3,000 feet or more against submarines. Ground or bottom mines are settled on the bottom in shallow waters such as rivers, harbors, and tidal areas to block their use, especially against amphibious invasion. In contrast to these stationary mines, a broad group of moving mines includes drifting and homing mines and deep-water mobile and rising mines. Mines are small, relatively inexpensive, easily laid down, and require little maintenance. Yet they have the explosive ability to sink or badly damage even large vessels by blowing open their hull below the waterline. Conse-

quently, smaller naval powers have often used them to impede the larger fleets of major powers.

Naval "mines originated in the sixteenth century, but their use in naval combat began in the American "Revolutionary War by David Bushnell, who placed such devices under the hulls of British ships in New York harbor using a small one-man, wooden "submarine he invented. During the "Civil War, the "Confederate Navy protected its harbors and sank a number of "Union Navy ships using moored and mobile contact or electrically controlled mines (misabeled "torpedoes"). Major use of underwater mines began in World War I with the British and later Americans planting tens of thousands of mines to contain the German surface and submarine fleets, and the Germans laying mines in British coastal waters. The Allies lost 586 ships and the Germans lost 150 warships and 40 submarines. In World War II, nearly 700,000 naval mines were laid, accounting for more ships sunk or damaged than any other weapon (the Allies lost 650 ships to mines, the Axis lost around 1,100).

Mining operations and countermining operations have been part of America's wars since World War II. Although the North Koreans did not use mines to try to prevent the "Inchon Landing (1950), in the "Korean War, they subsequently planted 3,500 Soviet magnetic mines at Wonsan, which took U.S. minesweepers a week to clear before the landing of "United Nations forces there. In the "Vietnam War, the U.S. Navy cleared mines so it could operate off the coast of North Vietnam, and in 1972 it mined Haiphong harbor, thereby blocking the influx of Soviet supplies. In the "Persian Gulf War (1991), Iraq laid mines to block oil shipments and impede seaborne assault by the forces of the U.S.-led coalition, but helicopter air sweeps, surface minesweeper ships, and underwater demolition teams cleared the sea lanes and access routes. Development of detection and countermeasures are becoming increasingly important since terrorists, such as those who planted mines in the Red Sea and the Persian Gulf in the 1980s, have begun to use this inexpensive stealthful weapon for its military, economic and considerable psychological effect.

MINUTE MEN. See Militia and National Guard; Citizen-Soldier; Lexington and Concord, Battles of (1775).

MIRV (MULTIPLE INDEPENDENTLY TARGETED RE-ENTRY VEHICLE). See SALT Treaties (1972, 1979).

MISSILES. Airborne missiles were experimented with in World War I and used extensively in World War II. Since then a wide variety of airborne missiles have been tested in combat many times. Their performance has continuously improved because of technological advances in aerodynamics, guidance, propulsion, and warheads.

Air-to-Air Missiles. The very first air-to-air missile was an aircraft rocket designed primarily for antiballoon or anti-Zeppelin work. Invented by Lt. Y. P. G. Le Prieur of the

French Naval Air Service, the rocket came into use in 1916 by both the French and British air forces. Four or five projectiles, each with a Congreve rocket-like stick for stability, were connected to interplane struts on either side of bi-plane fighters. Salvaged by electric ignition, the unguided rockets were most effective against larger targets such as observation balloons, but successes were also scored against other aircraft.

World War II brought about the widespread use of aerial rockets, primarily as an air-to-ground weapon against armor. Early in the war, the Germans used fighters to lob a rather primitive conversion of their 21cm mortar shells to break up bomber formations. Later, twenty-four to forty-eight R4M rockets were carried under the wings of a Messerschmitt Me 262 jet fighter. Salvo-fired, they dispersed to cover an area about the size of a football field; a single hit was deadly.

During World War II, the Germans developed radio-controlled and wire-guided versions of the Henschel Hs 298, and the supersonic wire-guided X-4, designed by Dr. Max Kramer in 1943. Both missiles were intended to have proximity fuses, with the X-4 testing an acoustic version. Their most important legacy was probably in proving the feasibility of wire guidance, which has been so widely used on antiarmor rocket weapons.

The "Cold War requirement to shoot down incoming nuclear bomb-laden enemy "bomber aircraft created a demand within the U.S. Air Force for air-to-air missiles for its interceptors. The Lockheed F-94 Starfighter and Northrop F-89 Scorpion were initially armed with 2.75-inch-diameter unguided aerial rockets. These were supplemented by the Hughes GAR (later AIM) Falcon and the McDonnell-Douglas MB-1 (AIR-2A) Genie. The latter was an unguided rocket with a speed of Mach 3, a range of 6 miles, and a 1.5-kiloton warhead intended to break up formations of incoming bombers. Aircraft carrying the Genie were routinely parked at civil airports during the years of the Air Defense Command dispersal program, a practice that might have disturbed modern environmentalist sensibilities.

The long-lived Hughes Falcon was a short- to medium-range missile capable of Mach 4 speed and a range of about 7 miles. Guidance was by a Hughes-developed semi-active "radar homing system.

Missile design improved rapidly as better propellants, miniaturized circuitry, and improved systems came into being. A series of American missiles appeared that would continue in service for decades and be used in air forces around the world. Foreign industries arrived at similar solutions, and their designs were similarly long-lived and widely used.

The heat-seeking AIM-9 Sidewinder first flew in September 1953, and continues in use today, after more than 110,000 have been produced. The successful and widely used Soviet AA-2A Atoll was developed directly from captured Sidewinders. Missiles similar in principle and performance to the Sidewinder have also been built in China, France, Germany, Italy, Israel, and South Africa.

The 186-pound AIM-9 has been produced in many variants, but may be described in general as a solid fuel rocket with a Mach 2 speed and a range of 10 miles. The infrared homing device detects a target's heat source (e.g., a jet aircraft's tailpipe) and homes in on it. Raytheon and Loral are the primary contractors.

A second long-lived air-to-air missile is the AIM-7 Sparrow, a semiactive Doppler radar-guided medium-range missile that was first flown in 1952 and came into operational use in 1958. It has a maximum speed of Mach 3.5 and a range of 25 miles. More than 40,000 had been built when production ended in 1990. Principal contractors include Raytheon and Hughes Missile Systems. The Sparrow was effective during the "Persian Gulf War in Operation Desert Storm, shooting down twenty-three aircraft.

The 510-pound Sparrow carries an 86-pound warhead. The target is first acquired by the carrier's radar; after launch, a radar in the missile's nose, tuned to the fighter's radar signals, picks up the radiation reflected from the target and steers the missile to it.

Intended for use against bombers, air-to-air missiles were disappointing in combat against fighter "aircraft. In the "Vietnam War, the Sparrow had a probability of kill (PK) of only about 9 percent, while the Sidewinder had a PK of about 15 percent, both exceedingly low figures when one considers the time and money expended on them and the expectations they had evoked. Later variants offered more discriminating seekers and better reliability.

For many years the most sophisticated air-to-air missile in the world, the U.S. Navy's long-range AIM-54 Phoenix is used by the Northrop/Grumman F-14 Tomcat and incorporates the Hughes AWG-9 or AWG-17 radar/fire control system. A large weapon weighing about 1,000 pounds, the Phoenix carries a 135-pound warhead, and can reach a speed of Mach 5. The F-14's Phoenix missile weapon system permits the tracking of up to twenty-four targets and a choice of up to six simultaneous interceptions, over a range in excess of 125 miles.

Designed to replace the AIM-7, the AIM-120A Advanced Medium-Range Air-to-Air Missile (AMRAAM) was developed jointly by the U.S. Air Force and the U.S. Navy, and entered service in 1992. Like the Phoenix, a "beyond visual range" (BVR) missile, it is intended for use on the F-15, F-16, F/A F-18, and Tornado aircraft. The AIM-120A is slightly smaller than the Sparrow, weighing only 345 pounds, and has a speed of about Mach 4, a range of 30 miles, with a 48-pound warhead. The AIM-120A has a high kill probability stemming from its being able to launch at any aircraft speed or target angle and from its "look-down, shoot-down" capability, meaning its ability to discern and hit a target against any background. Hughes Missile Systems and Raytheon are the principal contractors.

The Soviet Union, and its principal successor state, Russia, maintained a missile development program that closely matched that of the United States. The latest versions of the AA-10 Alamo missile and the AA-12 Adder have many of the characteristics of the AMRAAM. Other nations tend to create niche market air-to-air missiles tailored to their industrial capability and particular defense needs.

Air-to-Surface Missiles. World War II saw the development of several air-to-surface tactical missiles, which ranged from the relatively simple 2.75-inch-diameter high-velocity aerial rockets (HVAR) to forerunners of today's cruise missiles such as the Japanese Ohka kamikaze aircraft launched from Mitsubishi G4M "Betty" bombers.

The first major U.S. air-to-surface missile was the AGM-12B Bullpup, developed for the U.S. Navy during the "Korean War, but later adopted by the U.S. Air Force and many foreign air forces. The Bullpup was essentially a

rocket-propelled bomb guided by radio from the launch aircraft. Very inexpensive (at one point having a unit cost of only \$5,000), the Bullpup was built by the tens of thousands and used by aircraft of many countries. It was continually improved over time, and a laser-guided version was built for the U.S. Marine Corps.

First produced in 1971, the Hughes AGM-65 Maverick represented a giant step forward technologically. The "launch and leave" Maverick depicts a target on a cockpit television screen; when launched, it homes automatically to its target. Later Mavericks had improved optics or an imaging-infrared seeker. In the Gulf War, about 100 Mavericks a day were fired, about 90 percent by Fairchild A-10 close air support aircraft.

The development of powerful Soviet defenses against air attack made air-launched missiles attractive to the U.S. Air Force. The 30-foot-long, 13,000-pound Bell XB-63 Rascal was a supersonic missile attached like an enormous goiter to the side of Boeing DB-47E carrier aircraft. After a troubled development, it entered service in October 1957. It was followed by the GAM-72 Quail, a decoy missile intended to confuse enemy radar as to the strength and direction of attacking Boeing B-52s.

Missiles soon acquired a strategic capability. The North American AGM-28A Hound Dog was an impressive Mach 2.1 delta-wing aircraft that would today be termed a cruise missile. It could fly at any altitude from tree-top level to more than 50,000 feet, with a maximum range of 710 miles; later models carried terrain avoidance and electronic warfare equipment. The Hound Dog carried a thermonuclear warhead of up to 4 megatons, and would have been used to blast a way for the carrier aircraft to reach its targets. B-52 G and H models could carry two Hound Dogs whose 7,500-pound-thrust Pratt & Whitney J52 engines could be used to augment takeoff power. Over 590 Hound Dogs were delivered to the Strategic Air Command, serving from 1961 to 1976.

Advances in computers and microcircuitry led to the development of the Boeing AGM-69A SRAM (short-range attack missile), only 14 feet long and weighing but 2,320 pounds. Eight SRAMs could be fitted into each of the rotary launchers installed in a B-52 bomb bay. Additional SRAMs could be carried on the wing pylons formerly used for Hound Dog missiles, so that a B-52 might carry as many as twenty missiles to cover a wide array of targets. The FB-111 and B-1 were also designed to accommodate SRAMs. The SRAM had a range of 35 to 105 miles, depending upon its launch altitude, at speeds up to Mach 3.5. The 170-kiloton nuclear warhead made the SRAM a true force multiplier; but unexpected difficulties with propellant storage led to an earlier than planned removal from the fleet.

The SRAM was followed by a political football, the Air-Launched Cruise Missile (ALCM). Originally designed as the AGM-86 SCAD (Subsonic Cruise Armed Decoy) and intended as a more potent version of the Quail decoy, the missile was upgraded to ALCM status to be used as a bargaining chip in disarmament talks. President Jimmy Carter presented the ALCM as an inexpensive new idea that justified canceling the Rockwell B-1 bomber.

The AGM-86B ALCM is a small, unmanned, winged subsonic vehicle with an approximate speed of 500 mph and a range of 1,555 miles. The ALCM uses a terrain contour matching system (TERCOM) to update its inertial

guidance system to achieve pinpoint navigational accuracy. B-52s typically carry twelve ALCMs externally and eight more in the bomb bay. The longest combat mission in history took place when seven B-52Gs took off from Barksdale Air Force Base, Louisiana, and opened the 17 January 1991 Desert Storm air offensive with a barrage of thirty-five AGM-86Cs with conventional high-explosive warheads.

The most modern cruise missile in service is the AGM-129 Advanced Cruise Missile, manufactured in the early 1990s by General Dynamics. The AGM-129 has stealth characteristics coupled with a 2,000-mile range and Mach .9 speed. A total procurement of 2,000 missiles was planned, but the breakup of the Soviet Union and some program delays resulted in termination of the program after 461 missiles were delivered.

The AGM-84E-1 standoff land-attack missile (SLAM) is a derivative of the Harpoon (described below) and has similar physical characteristics and performance. It was created by combining the basic Harpoon with components of other systems, including the Maverick infrared seeker, a Global Positioning System, and a Walleye data link.

The former Soviet Union developed a parallel series of cruise and attack missiles, the most important of which was the AS-15 "Kent." The Kent corresponds to the ALCM and could be launched by air, land, or sea. It has an estimated range of 1,800 miles.

Antiradar Missiles. The appearance of Soviet surface-to-air missiles forced the development of the first antiradar missile, the AGM-45 Shrike. A development of the AIM-7 Sparrow, the Shrike was first used in combat in 1966. With a Mach 2 speed and a range of up to 25 nautical miles, the Shrike weighs about 390 pounds, with a 145-pound warhead. The Shrike is a joint product of Texas Instruments, Sperry-Rand, and Univac.

The Shrike was succeeded first by the General Dynamics "Standard Arm," the AGM-78 Standard Antiradar Missile, which could continue homing in on the radar even after it had shut down. Like the Shrike, it was used in Vietnam and by the Israeli Air Force. Weighing 1,799 pounds, with a 215-pound warhead, the AGM-78 has a speed of Mach 2.5 and a maximum range of 30 nautical miles.

The current antiradar missile is the AGM-88 High Speed Anti-radiation Missile (HARM), developed jointly by the Naval Weapons Center at China Lake, California, and Texas Instruments. The Mach 2+ HARM has a much greater capability to lock on to enemy radar than its predecessors. It can be fired as a long-range standoff missile, or its all-aspect passive radar homing seeker can be used to detect and attack targets of opportunity. It demonstrated its prowess in the 1986 U.S. naval air strikes against Libya, and in the Gulf War, where more than 1,000 HARMs were fired. The AGM-78 weighs about 800 pounds; its 145-pound high-explosive warhead is designed specifically for damaging radar antenna. The sophisticated British ALARM antiradar weapon also did well in the Gulf War.

Antiship Missiles. The vulnerability of ships to missiles was first demonstrated in World War II, when a Luftwaffe Dornier Do 217 sank the Italian battleship *Roma* with two Fritz-X missiles. In the 1982 Falklands War, Argentine Naval Air Force Super Entendard fighters launched Aerospatiale MM 38 Exocet missiles to sink the Royal Navy destroyer HMS *Sheffield* and the aviation supply ship HMS *Atlantic Conveyor*.

The principal U.S. antiship missile is the McDonnell-Douglas AGM-84 Harpoon, a long-range, sea-skimming "fire-and-forget" weapon manufactured in a variety of models. Its wings and control surfaces fold for storage, popping out after launch. About 13 feet long and weighing 1,170 pounds, the Harpoon is powered by a 600-pound static-thrust Teledyne Continental turbojet engine and cruises at Mach .85.

The Chinese have been especially active in building and selling antiship missiles like the HY-4, designated "Silk-worm" by *NATO. While derivative of the early Soviet SS-N-2 "Styx," the Silkworm's Mach 1.2 speed and 20-mile range make it a formidable weapon. Other nations, including the former Soviet Union, France, Germany, Italy, Norway, and Sweden, have all developed specialized antishipping missiles, which have in turn led to the development of extraordinarily expensive defensive systems.

Airborne Antitank Guided Missiles. Beginning with the World War II American "Bazooka" and the German *Panzerfaust*, antiarmor missiles became common, for they provide infantry with an inexpensive, flexible, and effective means to defeat opposing armor. The improvements in the guidance, propulsion, and warheads of *antitank weapons have exceeded the ability of tank designers to defend against them.

The proliferation of antitank missiles can be traced to the French Nord SS-10 guided missiles. Used by French helicopters in Algeria (the first combat role for helicopters), the SS-10 has been called the "smallest, cheapest and most significant" missile since 1945 in that it expanded on German World War II practice and was exported to many foreign countries. A host of wire-guided missiles followed, most line-of-sight missiles with manual control systems and an effective range of just over 1 mile. The second generation of weapons used computer technology to allow the gunner to "fly" the missile to the target by keeping it centered in his sights. The subsequent generation will be almost fully automatic, making full use of computers, television, fiber optics, guidance by *lasers, and other technological advances.

The most important U.S. airborne antitank guided missile is the Rockwell International AGM-114 Hellfire (the name deriving from "helicopter fire and forget"). Initially fielded as a laser-guided weapon, the Hellfire accepts other guidance packages, including imaging-infrared, radio frequency, and millimeter wavelength seekers.

The Hellfire is deployed on a wide variety of U.S. Army and Marine and Israeli Air Force helicopters. U.S. Army Bell "Apache" helicopters used it with effect in Operation Just Cause in Panama and in the Persian Gulf War. There it opened the war with a long-distance raid on Iraqi early warning radar sites, scoring fifteen hits in two minutes. The Hellfire is a small, 100-pound weapon with a wingspan of just over 1 foot, a speed of Mach 2.2, and a range of about 4 miles.

The first and most widely used U.S. antitank guided missile is the Hughes BGM-71 TOW (tube-launched, optically tracked, wired-guided) weapon, which is fired from helicopters as well from a variety of ground installations. First used in Vietnam in May, 1972, the TOW had a sensational 80 percent hit record. With tens of thousands of TOWs in the field in armies around the world, the weapon has been used with effect in wars in Israel, Lebanon, Morocco, Iran, Pakistan, and Iraq. Weighing about 42 pounds,

with a shaped, charged, high-explosive armor-piercing warhead, the TOW is effective at ranges up to about 3 miles. The TOW has been complemented by the formidable FIM-92A Stinger, used by rebels with such devastating effect against the Soviet Union in Afghanistan, and adapted for current American *helicopters. Hughes is the principal contractor but the vast quantities required called for a second source, Raytheon.

The Stinger is a "fire-and-forget" missile, weighing 22 pounds and with a speed of Mach 1. Designed for close-in fighting, over ranges of less than 3 miles, the Stinger uses an all-aspect automatic passive infrared homing device.

Helicopter warfare also requires an antiradar missile. The Motorola AGM-122 Sidarm is essentially an AIM-9C Sidewinder modified to have a broad band passive radar homing sensor. The missile is used primarily by the U.S. Marine Corps on both helicopters and fixed-wing aircraft.

The role of the airborne missile can be expected to grow in the future; it waits in the wings as an antisatellite device, and will undoubtedly be employed in the next century by unmanned remote-piloted vehicles in futuristic dogfights.

MISSIONARY RIDGE, BATTLE OF (1863). After the Battle of *Chickamauga (September 1863), the defeated *Union army retreated into Chattanooga, Tennessee. The victorious *Confederate army virtually besieged it there by occupying high ground west, south, and east of the city, practically cutting off Union supplies.

The federal government reacted by sending reinforcements—Gen. Joseph *Hooker and 10,000 men from Virginia, and William Tecumseh *Sherman and 20,000 men from Mississippi. More important, it sent a new commander: Ulysses S. *Grant. Grant opened an adequate supply line and prepared his combined armies for battle. Meanwhile, Confederate commander Braxton *Bragg was plagued by backbiting and noncooperation from his subordinates.

By late November, Grant was ready. His plan was that Hooker should threaten the Confederate left on Lookout Mountain to the southwest of the city and George H. *Thomas the Confederate center along Missionary Ridge to the east, while Sherman broke the Confederate right on Tunnel Hill. On 24 November, Hooker actually drove the Confederates off Lookout Mountain; but the terrain around Tunnel Hill proved deceptively difficult, the Confederate defense skillful and stubborn. Sherman's 25 November attacks got nowhere. To ease pressure on Sherman, Grant ordered Thomas to take a line of Confederate rifle pits at the base of Missionary Ridge. Confusion regarding orders and the impossibility of remaining at the base of the ridge under fire from the Confederates on the crest led Thomas's troops to continue their charge and—

astoundingly—take the ridge. Why? First, ravines on the slope covered the attackers. Second, the confederate defensive line was poorly sited. Third, the Confederate troops' "morale was low since they had lost confidence in Bragg. And fourth, Thomas's Fédéraux were unusually aggressive, determined to blot out the shame of their recent debacle at Chickamauga. In all, 56,000 Fédéraux engaged 46,000 Confederates on Missionary Ridge. "Casualties were 5,824 Union men to 6,667 Confederates.

As a result of the battle, Bragg was removed from command. His army retreated to Dalton, Georgia, and the stage was set for the start of Sherman's Atlanta campaign the following spring.

MITCHELL, BILLY [WILLIAM] (1879-1936), army officer, airpower theorist. Scion of a Wisconsin railroad and banking family, Mitchell was born in Nice, France, where his parents were vacationing. Enlisting as a private in the "Spanish-American War, nineteen-year-old Billy was promoted to lieutenant as a result of an appeal by his father, John Mitchell, a U.S. senator. In 1901, he became a regular army lieutenant in the Signal Corps. Promoted to major, he was appointed chief of the Signal Corps' new aviation section in 1916.

In World War I, as a brigadier general, Mitchell organized and ably led the U.S. Army's fledgling Air Service in France. In addition to aerial pursuit, reconnaissance, and ground support, he experimented with mass bombing of enemy military formations and installations in the war zone. From this experience and his discussions with Sir Hugh Trenchard, head of the Royal Flying Corps, Mitchell became a champion of airpower.

In the early 1920s, as a war hero and assistant chief of the army's Air Service with headquarters in Washington, D.C., Mitchell campaigned for a large, independent air force. He used the new mass media, including motion pictures, to advance his program against the opposition of senior army and navy officers as well as cost-cutting Republican administrations and Congress. Mitchell's planes dramatically sank captured naval warships in prearranged tests off the Virginia Capes in 1921-22, but his constant criticism led to his reassignment to Texas.

Even more outspoken in 1925, Mitchell was tried by a court-martial for calling army and navy leaders criminally negligent and responsible for the deaths of aviators in outmoded aircraft. His trial, portrayed by the media as the martyrdom of a prophet standing alone against entrenched bureaucracy, was one of the most sensational of the decade. Found guilty, Mitchell was suspended from active duty for five years; instead, he resigned from the army in 1926.

As a civilian, Mitchell became even more strident in interviews, articles, and books. Much like Trenchard and the Italian airpower theorist Giulio "Douhet, Mitchell claimed that strategic bombing would be decisive in future wars, and as a deterrent to war, because it could bypass enemy fleets and armies to strike directly at the industrial and population centers of hostile nations. Mitchell died of a heart attack in 1936, but since the adoption of many

of his ideas in World War II, he has been eulogized by the air force.

MOBILE BAY, BATTLE OF (1864). Confederate Mobile, Alabama, was a major port, ranking second to New Orleans on the gulf. After New Orleans and the mouth of the Mississippi fell to the Union in 1862, Adm. David "Farragut" moved into Mobile Bay early in August 1864, countering the most serious threat from that quarter, the formidable Confederate ironclad *Tennessee*.

Three wooden gunboats completed the Confederate squadron, which patrolled more than twenty miles from Mobile south to Fort Gaines on the eastern tip of Dauphin Island and Fort Morgan on the western end of Mobile Point. They guarded a three-mile passage into the bay, which had been narrowed with pilings and a minefield to force approaching ships toward Fort Morgan.

Farragut sent 1,500 soldiers to engage Fort Gaines on the night of 4/5 August. At 5:30 a.m., a floodtide helped propel eighteen Union ships along a west-east course toward Fort Morgan. The first rank of four turreted monitors could fire head-on; then seven warships could fire broadside at the fort as they steered sharply to port into the bay. Lashed to the port side of each warship was a smaller gunboat with guns trained west on Fort Gaines.

Tecumseh, the lead U.S. monitor, hit a mine and sank while steaming toward the *Tennessee*. The lead ship *Brooklyn* deployed nets to sweep for floating mines (then called "torpedoes"), but her commander hesitated, prompting Farragut to order his flagship *Hartford* forward with his legendary "Damn the torpedoes! Full speed ahead!"

By 10. a.m., the Union force had captured the *Tennessee* and routed the wooden defenders. Farragut's effort sealed off the port, and the naval victory, together with Gen. William Tecumseh "Sherman's capturing of Atlanta a week later, contributed to the reelection of President Abraham "Lincoln.

—Maxine T. Turner

MOBILIZATION is the process of assembling and organizing troops, materiel, and equipment for active military service in time of war or national emergency. As such, it brings together the military and civilian sectors of society to harness the total power of the nation. It is the mechanism that facilitates the successful prosecution of any conflict.

The modern process of preparing armies for war originated in the mid-nineteenth century. Inherent in the modern usage of the term is the concept of a large national force, as opposed to the smaller professional forces of earlier times—armies that depended upon a warrior class maintained in almost perpetual readiness. As they devel-

oped generally, and in response to the Napoleonic Wars, European nations shifted to marshaling the entire nation-state for war, and building large national armies. The term *mobilization* was first used in the 1850s to describe the preparation of the Prussian Army for deployment. Since then, it has become commonplace for governments, or states, to raise *volunteers and employ *conscription to create mass forces. Mobilization of the state harnesses the national economy to the military machine in order to conduct war.

For the United States, the *Civil War brought the draft, mass armies, and massive economic changes. With full public support, both Northern and Southern governments raised volunteers, and within a year or two turned to conscription to help field national armies. Both governments tied their militaries to their respective economic bases to sustain the war effort for a prolonged period.

In the years following, America industrialized, expanding markets and interests beyond its own borders. International presence and wartime experience in Cuba and the Philippines kept military issues at the forefront of American policy. Although the armed forces were maintained at a relatively low level, reorganization in 1903 brought a General Staff to oversee the U.S. *Army; planning and mobilization became regular missions.

In May 1917, President Woodrow *Wilson approved the Selective Service System, which remained an instrument for raising armies in war and the *Cold War until 1973. That solved the problem of recruiting and maintaining large national armies, but did not address the other half of the mobilization process. Producing equipment, supplies, and facilities turned out to be a far greater challenge. By sheer economic strength, at the end of World War I, the United States had built an army over 3.5 million strong with equally huge equipment surpluses.

The United States took some lessons from the staging and conducting of World War I. The warmaking had been so massive that an effort was made to standardize at least some of the procedures. The National Defense Act of June 1920 gave the assistant secretary of war responsibility for planning for industrial mobilization and for procurement through the War Department. Planning was done in the War Plans Division of the General Staff. Two initiatives were significant. One was the establishment of the Joint Army and Navy Munitions Board in 1922, which brought the two services together to formulate joint *strategy. The second was the creation of the Army Industrial College, which gave officers the opportunity to examine mobilization. Plans and studies followed. In these, availability of supplies and equipment determined the rate at which troops could be absorbed. However, they assumed that production would adjust to strategic plans—expanding and contracting as necessary—and that only one mobilization plan would cover a variety of possible contingencies. Gradual changes in preparedness or a measured transition to a mobilized state did not exist. Manpower and materiel were considered separately.

By the end of the 1930s, plans went beyond the role of the army to examine how the nation should organize the control of industry in war. In 1936, the War Resources Administration was designated responsible for control of wartime finance, trade, labor, and price control. By 1939, industrial mobilization plans stipulated that the War Resources Administration be established as soon as it became

practical to do so. Economic mobilization was no longer tied to the outbreak of hostilities.

The army began developing defensive plans in the mid-1930s, addressing the size and composition of an initial defense force and its support. They sought to mesh production schedules and to bring together rates of troop and materiel mobilization. They also provided for a small, well-equipped emergency force to ensure security during general mobilization. That was sound enough to become the permanent basis for mobilization. The plans provided for detailed unit and individual training programs, as well as manuals and associated training materials. They established a system for mobilizing men and equipment already available.

The United States began mobilizing for World War II by the end of 1939, despite the American public's alienation from military participation in world affairs. The depression had produced much idle and obsolete industrial capacity. The Roosevelt administration encouraged private expansion of facilities for war production through accelerated depreciation and government financing. Lend-Lease also helped stimulate production. Mobilization sped up in 1941, expanded dramatically in 1942, and peaked in 1943.

Although the United States has historically relied on mobilization to meet its wartime needs, with the start of the Cold War it began to maintain higher levels of military forces in peacetime and to deploy them in close proximity to potential enemies. American strategy assumed a short warning time to respond to its major threat, the Soviet Union. The ebb and flow of the Cold War was such that public consensus allowed the military to maintain a large active force in high state of readiness, with sizable stocks of supplies for "logistics support.

The *National Security Act of 1947 instituted governmentwide planning by establishing the organizational machinery to implement mobilization and deployment strategy. Management structures include the Department of *Defense (DoD), the Office of the Secretary of Defense, the Office of the *Joint Chiefs of Staff (JCS), and the Federal Emergency Management Agency. The nation's commitment to readiness, in great part, was enabled by the Defense Production Act of 1950, which has since been extended or amended over forty times.

Success in mobilization depends upon the health of the national industrial base, the availability of manpower, the state of international trade, and the condition of the nation's foreign relations. In time of war or urgent national need, it is assumed that the marketplace will provide adequate industrial capacity.

Historically, the National Guard and Organized reserves have been the assets that supported national defense. Currently, America's reserve forces consist of two National Guard components, the army and air guard; and five reserve components, the army, navy, air force, Marine Corps, and Coast Guard Reserves. The Guard and organized reserves form the basis for expanding the active component in a military emergency. The National Guard and reserves are similar in that during wartime both are federal forces serving under the president. During peacetime, however, while the reserve is a federal force subordinate to the president, the Guard remains subordinate to the governor of each state, unless federalized by the president.

Mobilization levels depend upon the existence of

forward bases, the level of industrial infrastructure, prepositioned equipment, industrial preparedness, preparedness planning, and public and congressional support. Ideally, high levels of any or all of those factors ease the entire process. Naturally, all are influenced by perceived threat. Generally, the higher the level of perceived threat, the higher the corresponding levels of support.

There are currently five levels of mobilization, governed by Title 10 of the U.S. code: selective, presidential selected reserve call-up, partial, full, and total. These levels are not necessarily sequential. One level may precede another, but may not; they need not build upon one another. Certain policies and programs that immediately increase unit resources and readiness are available only when the president and Congress mobilize the reserve components of the armed forces. Conscription supports the expanding force structure, as determined by Congress and the president, but is not tied to any level of mobilization.

Selective mobilization is the expansion of the active forces by activating units and individuals of the selected reserve to protect life, federal property, and functions, or to prevent disruption of federal activities. This includes the call-up of the National Guard, which can be done only for a specific purpose, such as the suppression of insurrection or conspiracy, prevention of unlawful obstructions or rebellions or abridgments of civil rights, to repel an invasion, or to execute the laws under legal authorities.

Presidential selected reserve call-up gives the president authority to augment the active force with up to 200,000 members of the reserve component for up to 90 days, with an extension of a further 90 days. It does not require a declaration of national emergency, but does require a report to Congress within twenty-four hours.

Partial mobilization requires presidential or congressional declaration of national emergency. The total force level could be as high as 1 million members of all services for up to twenty-four months or less by presidential authority. If the presidential selected reserve call-up already is in effect, the levels are cumulative; the ceiling is 1 million. A partial mobilization allows all selected reserve units and individuals (individual ready reserve, standby, and retired reserve) to be ordered to active duty.

Full mobilization is the state that exists when all units in the current force structure are called to active duty, fully equipped, fully manned, and sustained. Assumptions are that presidential selected reserve call-up and partial mobilization have been completed and Congress has declared war or a state of national emergency. All reserve components are ordered to active duty for the duration of the war or emergency plus six months; industrial mobilization is initiated; allies are called on for support according to their treaty commitments.

Total mobilization is the expansion of the active armed force and the activation of additional units beyond the approved force structure. All additional resources, including production facilities, may be mobilized to support and sustain the active forces.

Overall, mobilization reflects American national and military history. As the nation has grown, physically and economically, so has its standing in the international community. Given the size of the armed forces today, their technological level and equipment requirements, and the diversity of threat and mission, the process of mobilization has become both more complex and more significant to the eventual success of the military force.

MOFFETT, WILLIAM A. (1869-1933), U.S. naval officer, aviation pioneer. An 1890 graduate of the U.S. Naval Academy, Moffett saw action in the *Spanish-American War and the Veracruz expedition of 1914. He became director of naval aviation in March 1921 after successfully using small aircraft to spot the gunfire of the battleship *Mississippi*, which he commanded.

In July 1921 Moffett was appointed chief of the navy's newly created Bureau of Aeronautics, and served three successive terms in this position with the rank of rear admiral. He lobbied effectively for acceptance of aviation with the navy, in the halls of Congress, and in the public arena. Moffett's skills at low-keyed political maneuvering helped to counter naval aviation's most flamboyant critic, Gen. Billy *Mitchell of the Army Air Service. Moffett participated in the Washington and London naval arms limitation conferences (leading to their respective treaties); in 1922 he also qualified as a naval aviation observer.

Within the bureau and the fleet, Moffett concentrated on the development of patrol and scouting seaplanes and dirigibles, airplane technology and *logistics, * aircraft carriers, and naval air stations. His genius as manager and advocate led to success in virtually all categories—except airships. In 1933, he was aboard the navy dirigible *Akron* and died when it crashed into the sea during a storm, virtually ending the airship program. Moffett nevertheless had skillfully laid the foundations for the aviation-dominated navy that would emerge in World War II.

MONMOUTH, BATTLE OF (1778). By the spring of 1778, George *Washington's ambition to make the *Continental army a force proficient in linear European tactics seemed—thanks largely to the efforts of Friedrich Wilhelm von *Steuben—to be near realization. When Henry *Clinton, the British commander in chief, abandoned Philadelphia and marched for New York City, Washington decided to force a battle in the open field. On 28 June 1778, he ordered a 5,000-man advance force under his second in command, Charles *Lee, to attack the British rear guard.

Lee found Clinton's force near Monmouth in the hills of northern New Jersey, about twenty miles from Sandy Hook where the Royal Navy waited to transport the army to New York. Clinton's 2,000-man rear guard initiated a piecemeal engagement into which he eventually fed 6,000 men of his 10,000-man army. As the clear summer day wore on in heat that may have reached 100 degrees Fahrenheit, the Americans proved their mettle in open battle. Yet, it was easier to train the soldiers how to fight than to find

competent general officers to lead them. In blazing heat and broken terrain, Lee lost touch with the flow of the battle. When Washington arrived with the 6,000-man main army and found many American soldiers retreating, he severely reprimanded Lee, who was later court-martialed and removed from the army.

Washington's frustration was understandable. For the first—and what would turn out to be the only—time during the war, he thought he had the enemy at a disadvantage in a fight his army stood a chance of winning. He stabilized the American position, but Clinton won the larger contest. On the night of the 28th, the British army slipped away from the battlefield, and guarding its 1,500-wagon supply train, reached Sandy Hook on the 30th. Monmouth, the longest continuous battle of the war, settled nothing, but displayed the growing ability and professionalism of the Continental army.

MONROE, JAMES (1758-1831), senator, diplomat, secretary of state, secretary of war, and fifth president of the United States. While at William and Mary in 1776, Monroe was commissioned an infantry lieutenant in the 3rd Virginia Regiment. He subsequently rose to lieutenant colonel, serving with the "Continental army in the battles of Long Island, New York; Trenton (where he was severely wounded); Brandywine; and the Battle of "Monmouth.

In 1782, Monroe entered the Virginia House of Delegates; later he held positions in the Continental Congress (1783-86) and U.S. Senate (1790-93), and as governor of Virginia (1799-1802 and 1811). In 1793-96, he was U.S. minister to France, returning there in 1803 to help negotiate the Louisiana Purchase. Thereafter he served as minister in London and Madrid until 1807.

Monroe became secretary of state and a leading advocate for the diplomatic and military policies of James "Madison's administration in 1811. As acting secretary of war during the winter of 1812-13 and secretary of war, October 1814-March 1815, he shaped U.S. manpower policies during the "War of 1812.

Monroe's presidency (1817-25) contributed significantly to national defense and security. The 1819 "Adams-Onis Treaty (or Transcontinental Treaty) acquired the Floridas, established clear boundaries for the Louisiana Purchase, and extended U.S. territory to the Pacific. His annual message of 1823, subsequently known as the "Monroe Doctrine, laid the foundation for U.S. diplomatic hegemony in the Americas. His administrations improved the efficiency of the army and began the professionalization of its officer corps. In 1825, Monroe retired to New York City; he died on 4 July 1831.

—J. C. A. Stagg

MONROE DOCTRINE. In his message of 2 December 1823, President James "Monroe articulated two principles that by the 1850s were regarded as the basis for the so-

called Monroe Doctrine. The first stipulated that the "American Continents, by the free and independent condition which they have assumed and maintain, are henceforth not to be considered as subjects for future colonization by any European Power." The second embodied Monroe's support for the newly independent Latin American republics by stating that the American and European political systems were "essentially different," and that the United States would consider efforts by European nations "to extend their system to any portion of this hemisphere as dangerous to our peace and safety."

James K. "Polk, in the 1840s, was the first president to invoke Monroe's message as a form of policy justification, but his conduct did not immediately set a precedent. For much of the nineteenth century the Monroe Doctrine was ignored or violated far more than it was observed. U.S. acquiescence in such developments as the British occupation of the Falkland Islands (1833), British activities in the Central American isthmus throughout the 1850s, Spain's reannexation of Santo Domingo in 1861, and France's installation of a Bourbon monarch in Mexico in the 1860s were hardly in accord with the principles of 1823.

In the last quarter of the nineteenth century, in response to rising concerns about European "imperialism coupled with a more assertive sense of American "nationalism, the United States began to invoke the Monroe Doctrine more consistently. This was particularly so in 1895, when the Cleveland administration insisted, successfully, that Great Britain submit to arbitration a long-standing boundary dispute between Venezuela and British Guiana. On that occasion Secretary of State Richard Olney formulated the first major corollary to the 1823 message by asserting that "the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition."

After the turn of the century, the United States redefined the Monroe Doctrine in ways that were also intended to justify greater U.S. activity in the Americas. In 1904, President Theodore "Roosevelt, anxious that financial malfeasance in the nations of Central America and the Caribbean might provoke intervention by European creditor nations, announced a second major corollary to the Monroe Doctrine to the effect that no American nation could use the doctrine "as a shield to protect it from the consequences of its own misdeeds against foreign nations." In effect, this required the United States to intervene in the affairs of other American nations. Acting on this basis, the United States took over the management of the finances of the Dominican Republic (in 1907) and of Nicaragua (in 1911), and in 1915 it actually occupied the republic of Haiti.

The assumptions behind the "Roosevelt corollary," although repudiated in the 1930s in favor of Franklin D. "Roosevelt's "Good Neighbor" policy, continued to influence U.S. policy in the Americas through the 1980s. Beginning with Woodrow "Wilson, U.S. presidents have sought to reconcile the regional principles of the doctrine with the increasingly global reach of their foreign policies. Worried about aggression from Nazi Germany, Franklin Roosevelt even expanded the doctrine to include both Canada and Greenland.

In the early years of the "Cold War after 1945, the United States internationalized the democratic and noninterventionist principles of the Monroe Doctrine in the "Truman Doctrine of 1947, while at the same time it

preserved its regional hegemony in the Americas through the framework of the Rio Pact (1947) and the Organization of American States (1948). The concern to keep communism out of the Americas subsequently led to U.S. intervention in various forms in Guatemala (1954), Cuba (1961), the Dominican Republic (1965), Chile (1973), and Grenada (1983), as well as to active involvement in the insurgencies in El Salvador and Nicaragua in the 1980s. In each case the United States either overthrew, or attempted to overthrow, left-wing regimes in order to replace them with dictatorial governments whose members supported U.S. priorities. Critics argued that these repressive governments violated the principles that Monroe had proclaimed in 1823.

The most serious crisis of the Monroe Doctrine occurred in Communist Cuba in 1962. As early as 1960, Soviet premier Nikita Khrushchev openly proclaimed that the Monroe Doctrine was dead. Two years later, Khrushchev installed intermediate-range * missiles on the island to protect Fidel Castro's regime. Throughout the ensuing * Cuban Missile Crisis, which was eventually resolved by the removal of the missiles, President John F. * Kennedy did not invoke the Monroe Doctrine in defense of his actions, but concern for its traditions was never far from his mind.

With the end of the Cold War in 1991 and the disappearance of any regional threats to the security of the United States in the western hemisphere, the Monroe Doctrine might be fairly regarded as moribund, if not entirely dead. The doctrine was never accepted as valid international law by any European nation, and it would be inaccurate to say that it saved Latin America from any form of recolonization. Nor did the doctrine ever receive much support in Latin America; indeed, to the extent that the United States invoked it in the twentieth century, it became increasingly unpopular there as a symbol of an overbearing Yankee supremacy. The true significance of the Monroe Doctrine, however, has always depended on circumstances.

• Dexter Perkins, *A History of the Monroe Doctrine*, 1941; rev. ed. 1955. Gaddis Smith, *The Last Years of the Monroe Doctrine 1945-1993*, 1994. -J.C.A. Stagg

MONTGOMERY, BERNARD LAW (1887-1976). British field marshal. One of the best-known and controversial commanders of World War II, Montgomery—or Monty as he was better known—commanded Allied armies in two of the decisive battles of the war, El Alamein and Normandy. A Sandhurst graduate, he entered the British army in 1908, and served with distinction in World War I. Between the wars Montgomery was among the few army officers who grasped the need for new ideas, new equipment and new techniques. He was an unorthodox individualist.

In August 1942, with the legendary Gen. Erwin * Rommel almost at the gates of Cairo and the oil fields of the Middle East, the almost unknown Montgomery took command of the British Eighth Army and defeated the Axis forces at the Battle of El Alamein, the foundation of Monty's fame, October 23-November 4, 1942.

A small, wiry man with hawk-like features, a neatly-

trimmed moustache, and a jaunty black beret, he was boastful and blunt. Critics have called him an egomaniac, overrated, and worse. His "finest hour" came both before and during the invasion of * Normandy in which he commanded all Allied ground forces from June to August 1944. He became the lightning rod for criticism when temporary stalemate followed * D-Day. Relations with Supreme Allied Commander Gen. Dwight D. * Eisenhower soured; exuding infallibility, Montgomery was his own worst enemy, and the myth took root that he had failed in Normandy. In practice, his generalship displayed far greater flexibility than he ever acknowledged. Original intention or not, Montgomery succeeded in keeping German armored divisions tied down on the British and Canadian front, thus assisting the American breakout on the right flank in July.

Differences continued to mar Monty's relationship with Ike following the Allied victory in Normandy, with the newly created field marshal advocating a single, concentrated blow to end the war in 1944, and the Supreme Commander's decision to adopt a broad-broad strategy. In September 1944, Montgomery launched Operation *Market-Garden*, the largest airborne and glider operation in history. The attempt to seize a bridgehead over the Rhine at Arnhem failed.

In the Battle of the * Bulge, Eisenhower placed all American troops north of the German thrust under Montgomery's command, a courageous decision that was contrary to the advice of Gen. Omar N. * Bradley. Fighting desperately to stop the German counteroffensive, subordinate American commanders welcomed Montgomery's arrival. At a press conference after the battle, Monty praised the fighting qualities of the American soldier, but left the impression he had saved the American high command from disaster. He noted in his *Memoirs*, "I should have held my tongue." Britain hailed Montgomery as another Wellington and he was made viscount of Alamein in 1946. He served as deputy commander of * NATO forces, 1951-58.

MOORER, THOMAS (1912-), * Cold War U.S. naval leader; chairman of the * Joint Chiefs of Staff (JCS), 1970-74. A blunt but affable Alabaman, Moorer was a graduate of the U.S. Naval Academy and saw combat as a naval aviator early in World War II and participated in the postwar Strategic Bombing Survey. Later he commanded the Pacific Fleet (during the Tonkin Gulf incident and the air campaign over Vietnam), and the Atlantic Fleet (during the Dominican Republic intervention). Moorer served as * NATO's Atlantic commander (during France's pullout from NATO commands) and commander in chief of the U.S. unified Atlantic Command. Chief of Naval Operations in 1967, his term saw intensive operations in the * Vietnam War, the * Pueblo incident in Korea (1968), increased public antipathy toward the military, Soviet challenges to U.S. naval dominance, and decline of U.S. naval strength.

As chairman of the JCS (1970-74), Moorer served President Nixon and defense secretaries Laird, Richardson, and

Schlesinger. Bombing and mining campaigns against North Vietnam (which he championed), "Vietnamization," strategic arms limitation talks, conventional force cuts, the end of *Conscription, and two Middle East crises highlighted his term.

Following retirement, Moorer remained active in research and industry, notably as senior adviser at the Center for Strategic and International Studies.

MORALE, TROOP. *Morale*, generally defined, is a state of mind that either encourages or impedes action. The greatest combat commanders have always understood that morale reflects the mental, moral, and physical condition of their troops. These conditions, in turn, directly relate to the troops' courage, confidence, discipline, enthusiasm, and willingness to endure the sacrifices and hardships of military duty. Troops with high morale can operate, even succeed against high odds, in all kinds of conditions. Poor morale can lead to failure, even when odds favor victory. At a basic level, good morale allows soldiers to overcome fear.

Troop morale has been studied since ancient times, and early modern military leaders like Frederick the Great understood such notions thoroughly; defeat, he observed, resulted more from discouragement than *casualties. Napoleon's famous aphorism, "in war the moral is to the physical as three is to one," brings into focus the pivotal importance of troop morale, and he frequently tried to motivate his troops by rewards, medals, or promotion. His views, along with those of the other "great captains," underscore the complex relationship between morale and success in combat.

Prior to the twentieth century, commanders attentive to their soldiers' morale mainly attended to their physical well-being. As long as an army was reasonably well fed, had adequate clothing and shelter, and could expect to be paid more or less regularly, its morale might be considered adequate to the task at hand. Belief in a "cause" was thought less important than strong affection for a leader, or the promise of glory or loot. During eras when armies faced each other across open fields, the outcome of battles often hung on the state of morale. An intuitive desire for safety or instinct for survival could lead soldiers to abandon their duty and dissolve into rabble, while those suddenly inspired might snatch victory from defeat.

Modern notions of troop morale arose out of the horrific casualties generated by the *trench warfare of World War I. Some military historians suggest that stress-related casualties were almost unknown earlier. Evolution of

* weapons technology, mass armies, and General Staff leadership increased the scale and magnified the intensity of warfare, levying terrific burdens on a soldier's mental fitness. Accordingly, troop morale attracted the detailed attention of military and medical authorities. In general terms, researchers understood that men subjected to severe combat conditions for prolonged periods would have to be

relieved at regular intervals. Men unable to continue in combat were either deemed cowards or thought to be victims of a debilitating physical condition, "shell shock."

Lord Charles Moran, a former World War I medical officer, wrote the first systematic explanation of troop morale. *Anatomy of Courage*, first published in 1945, postulated an explanation for troop morale and explained how it might be managed. Moran argued that courage had measurable limits and could be expended as easily as water can be poured from a beaker. Commanders had to determine how much bravery soldiers possessed and not allow them to exceed those limits without replenishment. Moran also believed courage was largely a function of a man's character. Cowards simply lacked moral strength.

Events of World War II only partially supported Moran's notions. By then, psychiatrists and psychologists had more fully investigated the components of morale, and come to recognize that all troops, not just the weak or morally flawed, were subject to the effects of unrelenting fear and anxiety. Only a sense of duty allowed men to overcome their fears; thus duty—devotion to a cause or to comrades—joined the traditional factors—food, clothing, training, discipline, and leadership—as a defining component of morale. Research conducted during the war, especially that of S. L. A. *Marshall, argued that troop morale rose and fell principally as a result of a shared sense of danger. According to Marshall's book, *Men Against Fire*, (1947), small group dynamics were more important to success in battle than any other factor.

Despite critics' charges of sloppiness and lack of genuine support data, Marshall's main point is hard to ignore. Subsequent research, carried out by experts like Samuel Stouffer, E. A. Shils, and Morris Janowitz, clearly demonstrated the connection between small unit cohesion, morale, and combat capability. By investigating the German army of the Nazi era, Shils and Janowitz showed that the Wehrmacht's ability to fight so effectively, and survive for so long, resulted partly from the German focus on group leadership, human dynamics, and troop morale. Later research by Trevor Dupuy and Martin van Creveld underscored these conclusions. Moreover, Dupuy argued that German effectiveness at the tactical and operational level exceeded that of its opponents. Even when in retreat or significantly outnumbered, the Wehrmacht managed more tactical victories and inflicted more casualties man-for-man than did its enemies.

It seems clear that troop morale in the post-*Cold War era will remain no less important than before in influencing the outcome of combat. Small professional armies, even when extraordinarily well led, trained, and disciplined, will nevertheless be subject to the same rigors as their ancestors; indeed, the exponential advances in military weapons technology, the increasing impact of artificial intelligence, and the exploitation of the electromagnetic spectrum will only increase the scope and lethality of battle, and magnify the pressure on combatants to survive and function effectively. It will also mandate the continued efforts of senior leadership and medical officers to understand and sustain morale, which is sure to remain crucial to measuring the critical interval between victory and defeat.

MORGAN, DANIEL (c. 1735-1802), Revolutionary War general and Federalist Party leader. The son of Welsh farmers, Morgan grew up along the Pennsylvania-New Jersey border before settling in the Virginia backcountry in the 1750s. A teamster with the Braddock expedition, he then became a provincial ranger. Later he fought the Shawnee in Lord Dunmore's War. Given to brawling and drinking, he settled down, taking a common-law wife and fathering two daughters.

At the outbreak of the Revolutionary War, Morgan received command of a rifle company raised by the Continental Congress and performed heroically in Benedict "Arnold's ill-fated Québec expedition. An authority on guerrilla tactics, Morgan commanded a ranger regiment that helped defeat Gen. John "Burgoyne in the Battles of "Saratoga (1777). After serving under George "Washington in the Middle States in 1778-79, Morgan transferred to the American Southern Army. In January 1781, at the Battle of "Cowpens in South Carolina, his forces destroyed Banastre Tarleton's Tory Legion; Morgan's double envelopment was the tactical masterpiece of the war. Becoming ill, he returned home, but not before providing Gen. Nathanael "Greene with a useful battle plan against Cornwallis at the Battle of "Guilford Courthouse (1781).

After the war, Morgan headed part of the militia army that put down the "Whiskey Rebellion in 1794-95; he served a single term (1797-99) as a Federalist in the House of Representatives.

MORGENTHAU, HENRY, JR. (1891-1967), secretary of the treasury, 1934-45. This former Dutchess County gentleman farmer and member of a prominent New York German Jewish family was a close personal friend and political confidant of President Franklin D. "Roosevelt. Morgenthau was an important figure in the Roosevelt administration.

Responsible for U.S. financing of World War II, Morgenthau, as head of the Treasury Department, advocated relying on increases in the income tax to dampen inflationary pressures while raising revenue. Although he prevented a regressive national sales tax advocated by conservatives, Morgenthau faced a series of defeats in Congress over fiscal policies, especially on the income tax. He did, however, organize several highly publicized bond drives.

When the Roosevelt administration, especially the State

Department, proved unresponsive to reports of systematic extermination of European Jewry by the Nazi regime of Adolf "Hitler in 1940-43, Morgenthau and the Treasury Department proved to be one of the few federal agencies pressing for the United States to take decisive action against the Holocaust. On 16 January 1944, Morgenthau directly confronted Roosevelt with evidence of the Holocaust as well as the reluctance of the State Department to provide visas to Jewish refugees or facilitate rescue efforts by Jewish organizations in Europe. Shortly after this meeting, Roosevelt established the U.S. War Refugee Board by executive order. This body, with Morgenthau an active member, undertook a series of relief efforts, albeit limited, to aid Jewish refugees.

In 1944, Morgenthau—over the objections of the State and War Departments—forcefully advocated a harsh peace settlement. His plan called for stripping Germany of all heavy industry and partitioning the country into a series of demilitarized agricultural states. Attending the Quebec Conference in September 1944, Morgenthau prodded Roosevelt and Prime Minister Winston S. "Churchill to initial a memorandum of agreement supporting his plan. This was later reversed by Roosevelt and his successor, Harry S. "Truman, after intense lobbying by the State and War Departments, which denounced the plan as both unrealistic and detrimental to U.S. interests, given the need for a European counterweight to the expanded power of the Soviet Union.

Morgenthau proved more successful in shaping the postwar international monetary system. Relying heavily on expertise of Assistant Secretary of the Treasury Harry Dexter White, Morgenthau organized the Bretton Woods Conference of June-July 1944, which established the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development.

Shortly after Truman assumed the presidency in April 1945, Morgenthau resigned as Treasury secretary. In retirement, he became an ardent supporter of the state of Israel and active in a number of Jewish philanthropic causes.

MORMON "WAR" (1857-58). Federal administrators assigned in the 1850s to Utah Territory, after it had been acquired from Mexico in 1848, frequently complained of harassment and abuse at the hands of the Latter-day Saints (Mormons). Some contended the Mormons were essentially in a state of rebellion against the United States. By 1857, the cry for a settlement of the "Mormon Question" reached critical proportions. President James Buchanan appointed Alfred Cumming of Georgia, a non-Mormon, to replace Mormon leader Brigham Young as governor of Utah. Expecting the Mormons to resist, Buchanan ordered an expeditionary force of 2,500 soldiers to the territory. Under the command of Gen. William S. Harney, the 5th Infantry Regiment, elements of the 10th Regiment, the 2nd Dragoons, and two "artillery batteries marched from Fort Leavenworth, Kansas, on 18 July 1857, hoping to occupy

Utah by fall. Gen. Albert Sidney Johnston succeeded Harney as commander of the expedition, 11 September.

Viewing the army as a hostile invasion force, Governor Young mobilized the Utah Militia and began preparations for a guerrilla war. Although the campaign—the so-called Mormon War—was bloodless, Mormon militiamen were successful in impeding the progress of U.S. forces, which were forced into winter encampment near Fort Bridger in the fall of 1857.

Peace commissioners authorized by President Buchanan arrived in Utah in June 1858, and a settlement was reached. Young resigned as governor; the Mormons were pardoned for acts of rebellion; and U.S. forces established Camp Floyd (later Fort Crittenden) forty miles southwest of Salt Lake City. The camp was abandoned in 1861 with the outbreak of the *Civil War.

MORRIS, ROBERT (1734-1806), signer of the Declaration of Independence, Articles of Confederation, and U.S. Constitution; “financier of the Revolution.” Born in Liverpool, Morris came to America in 1747. As active partner of the trading firm of Willing, Morris & Co. of Philadelphia, Morris integrated his European and West Indian commercial network into the *Revolutionary War effort in 1775.

A shrewd entrepreneur and energetic administrator, Morris became vice president of Pennsylvania’s revolutionary governing body, the Council of Safety, in 1775, and organized the state’s defenses. After election to the Second Continental Congress in November 1775, he became chairman of the Secret Committee of Trade and managed international procurement and naval affairs. He also participated in supply contracts and often disguised public ventures as private ones to facilitate secrecy and economy. The potential conflict of interest produced much controversy.

Morris retired from Congress in 1778, becoming an agent for supplying French forces in the United States and greatly augmenting his wealth and credit. When Congress was faced with financial and military collapse in 1781, it turned to Morris, by now the most prominent merchant in America, for help. As superintendent of finance, from February 1781 to November 1784, he raised money and supplies for the Yorktown campaign, then struggled to reestablish public credit by measures that included controlling the budget, founding the nation’s first bank, settling the public debt, advocating a funding plan and mint, administering foreign loans, and replacing staff departments with military contracts. His administrative and financial skills are considered to have been indispensable to military success in the Revolutionary War.

MORTARS. The mortar is a very simple piece of *artillery, essentially a firing tube, that fires a high arc and imparts its main recoil force directly into the ground through a base plate. The lack of a recoil system distinguishes this weapon

from other pieces of artillery. Dating back to at least the fifteenth century, mortars became most common in World War I. With opposing forces dug in at close ranges, a simple weapon capable of high-angle fire was needed to drop rounds in the enemies’ trenches. In Britain in 1915, Sir Wilfred Stokes produced the prototype that has become the world’s standard, consisting of a tube with a fixed firing pin at the breech attached to a base plate and supported at the muzzle end by a bipod. It can be adjusted in both azimuth and elevation by a screw mechanism. To fire the weapon a projectile containing the propellant and explosive is dropped into the muzzle.

After World War I, mortars passed into the hands of infantry units, while very heavy pieces remained with the artillery. The U.S. Army classifies mortars as light (60mm), medium (81mm), and heavy (120mm and above). All light and medium mortars are carried by infantrymen. They are inexpensive and easy to maintain, and can achieve a very high rate of fire. An 81mm mortar platoon can fire 196 rounds in a minute—a far greater weight of ammunition on a target than can be achieved by a field artillery battery, but one that can only be sustained over a short period of time. Concealment is easy and fire control is straightforward. With the advent of global satellite positioning systems, accuracy has been improved. The high-angle fire associated with this weapon allows it to engage targets concealed behind cover.

MOURNING WARS. See Native American Wars: Warfare in Native-American Societies; Native American Wars: Wars among Native Americans.

MURPHY, AUDIE (1924-1971), World War II war hero. Audie Murphy was the most highly decorated American soldier of World War II. Diminutive, self-reliant, and ambitious to escape his hardscrabble Texas origins, Murphy joined the army in 1942 at the age of seventeen. He soon proved himself more than equal to the demands of combat soldiering, fighting his way unwounded through Sicily and Italy. By 1944, Murphy had won several medals and the offer of a battlefield commission, which at first he refused.

During the invasion of southern France in June 1944, Sergeant Murphy won the Distinguished Service Cross for destroying several enemy *machine guns in the course of a few minutes’ action. Wounded a few weeks later, Murphy returned to combat as a lieutenant and resumed his near-suicidal habits. These habits were in evidence in January 1945, when virtually alone he wrecked a German counter-attack by 6 *tanks and 250 infantrymen in the Colmar Pocket. For this action he won the Congressional Medal of Honor.

Murphy returned to America and genuine celebrity in the summer of 1945, when his photo appeared on the cover of *Life* magazine. A successful postwar acting career in films kept him in the public eye. With a friend’s help, Murphy wrote a best-selling memoir, *To Hell and Back*, and starred in the motion picture version (1955) as well.

Murphy's star faded by the 1960s. He was attempting to retrieve his fortunes when he died in a plane crash in 1971.

MUSEUMS, MILITARY HISTORY. The essential mission of military museums in the United States remains teaching through the study and interpretation of historical artifacts, first exemplified at America's oldest armed forces museum, the Musée d'Artillerie (1843) at West Point. Unlike centralized war museums found in many European capitals, American military museums and sites are located throughout the nation, frequently at battlefields, seaports, forts, or *military bases that provide added ambiance. Scores of specialized facilities in the U.S. Army, Navy, Air Force, Marine Corps, and Coast Guard museum systems serve primarily for the instruction and inspiration of military personnel. Yet, like many nonservice museums—including those of the National Park Service, Smithsonian Institution, state governments, and private associations—service museums possess a widespread public constituency, at whose care is the *veterans' community.

Reflecting broader historical perspective, American military museums currently build collections documenting both military material and the experience of all ranks in the services, envisioned in relation to national social, political, and economic development. Exhibit policies are founded upon major collections of militaria that emerged during the nineteenth century, beginning with ranks of British field guns, surrendered at the Battles of *Saratoga in 1777, that provided the initial artifactual core at West Point. Under Congressional authorization (1814), trophy flags taken during the *War of 1812, *Mexican War, and *Civil War were deposited at West Point and the Naval Academy Lyceum (1845) at Annapolis, Maryland. Construction of the nation's first system of coastal *fortifications (1815-53), the founding of armories at Springfield (1794) and Harpers Ferry (1796), and establishment of arsenals at Watervliet (1813) and Rock Island (1862) provided an enduring material heritage, presently evoked in museums at Springfield, Harpers Ferry, Rock Island, Fort McHenry, Fort Monroe, Fort Adams, and Fort Point. The Quartermaster Corps Collection, begun in 1832 at Schuylkill Arsenal, Philadelphia, provided the basis for the army's extensive collections of *uniforms, transferred in 1919 to the Smithsonian Institution. That congressionally mandated institution, whose first scientific collections were provided by the U.S. Exploring (Wilkes) Expedition of (1838-42), would emerge after World War I as a major repository of American army *weaponry and biographical militaria, ultimately exhibited in the National Museum of American History (1961).

The Centennial of the American Revolution (1876) provided powerful impetus for establishment of national battlefield parks from that war and the *Civil War, many eventually including museums with particularly evocative appeal—notably at Saratoga, Yorktown, Gettysburg, Chickamauga, and Vicksburg. The advent of the modern

steel navy, heralded at the Columbian Exposition in 1893, launched the navy's renowned warship model program, whose technical apogee was attained in the detailed models of *battleship models constructed during World War II. Consisting of some 1,900 models, this collection is generously represented at the Naval Academy Museum at Annapolis, Maryland, the Navy Museum at Washington Navy Yard in Washington, D.C., and the Smithsonian's National Museum of American History. Notwithstanding congressional proposals (1889) to establish a "national military and naval museum" in Washington, D.C., major efforts after two world wars for a national armed forces museum proved fruitless, most recently falling victim to antimilitary sentiment during the *Vietnam War. In an era of rogue terrorism, the wide dispersal of military museums curiously bodes well for survival of the nation's military heritage.

The Army Museum System, including forty-three accredited facilities in 1998, is located at West Point, New York, and at numerous training establishments in the South and Southwest, all of whose artifacts are recorded in the Center of Military History in Washington, D. C. Structured, like the maturely conceived West Point Museum, to serve an educational mission, the army's branch and service corps museums preserve and interpret specialized military collections. Notable branch museums range from the Ordnance Museum in Aberdeen, Maryland; the Medical Museum in Washington D.C.; the Infantry Museum at Fort Benning, Georgia; to the Special Warfare Museum at Fort Bragg North Carolina; the Cavalry Museum at Fort Riley, Kansas; and the Field Artillery Museum at Fort Sill, Oklahoma. Army service corps establishments include the Transportation Corps Museum at Fort Eustis, Army Women's Museum at Fort Lee, Virginia and the Signal Corps Museum at Fort Gordon, Georgia. Among historic army posts, Fort Snelling at Minneapolis, Minnesota, and the Frontier Army Museum at Fort Leavenworth, Kansas, interpret the regular army's role in settlement of the West.

Similarly troop-oriented are the seven facilities of the Marine Corps Museum System, including the U.S. Marine Corps Museum at Washington Navy Yard, the Marine Air-Ground Museum at Quantico, Virginia, and the Parris Island Museum in South Carolina. The evolution of the oldest sea service is traced at the U.S. Coast Guard Museum at New London, Connecticut, and the Coast Guard Museum of the Northwest in Seattle, Washington. Evocative of America's role in the history of seapower are eleven elements of the Navy Museum System, particularly the Naval War College Museum at Newport, Rhode Island; the U.S. Navy Museum at Washington Navy Yard; Hampton Roads Museum at Norfolk, Virginia; and the Naval Academy Museum. The evolution of undersea warfare is recounted at the Submarine Force Museum at Groton, Connecticut, and the Naval Undersea Museum at Keyport. Necessarily more modern in orientation are the National Museum of Naval Aviation at Pensacola, Florida, and the Seabee Museum at Port Hueneme, Georgia. Monuments of American naval architecture are preserved in USS *Constitution* (still in commission) at Boston, Dewey's flagship *Olympia* at Philadelphia, and surviving World War II battleships, *aircraft carriers, *cruisers, *destroyers, and *submarines.

According to the Historic Naval Ships Association, in 1998 there were fifty-six historic military vessels from World War II on exhibit in the United States. These included forty-six U.S. warships, four armed merchant ships,

and six Axis submarines (all midget subs except for the *U-505* at Chicago, Illinois). Of the U.S. warships, 15 were submarines. The rest included the battleships *Alabama* at Mobile, Alabama; *Arizona* and *Missouri* at Pearl Harbor, Hawaii; *North Carolina* at Wilmington, North Carolina; and *Texas* at LaPorte, Texas. In 1998, groups were still seeking to acquire and exhibit *Iowa*, *New Jersey*, and *Wisconsin*. Also on display were the aircraft carriers *Hornet* at Alameda, California; *Intrepid* at New York, New York; *Lexington* at Corpus Christi, Texas; and *Yorktown* at Mt. Pleasant, South Carolina (with a group seeking to acquire the *Midway* for San Diego, California). The Association includes World War II era warships on display abroad, notably the cruiser H.M.S. *Belfast* at London.

The development of American military aviation is emphasized in twenty-six installations of the U.S. Air Force Museum System, including the Air Force Armament Museum at Eglin AFB, Pensacola, Florida; the Air Force Space Museum at Cape Canaveral, Florida; and the extensive collection at the U.S. Air Force Museum, operated under the Air Force Logistics Command at Wright-Patterson Air Force Base near Dayton, Ohio. This is the oldest and largest aviation museum in the world, with more than 200 aircraft and large "missiles, as well as over 20,000 aircraft components, personal effects, and photographs. Also technically oriented, the Smithsonian's National Air and Space Museum includes vignettes of naval and military air service during the two world wars.

American military and naval history is explored in numerous private and state-owned museums, reflecting widespread public appreciation of the armed forces' role in national development. Notable examples include the Museum of the Confederacy at Richmond, Virginia; the War Memorial Museum and Mariners' Museum at Newport News, Virginia; the Liberty Memorial Museum in Kansas City; and the Wisconsin Veterans' Museum in Madison. Exceptional insight into World War II strategy is afforded at President Franklin D. "Roosevelt's estate at Hyde Park, New York; the Marshall Library and Museum at Lexington, Virginia; the MacArthur Memorial at Norfolk, Virginia; the Nimitz Historic Park at Fredericksburg, Virginia; and the Eisenhower Library and Museum in Abilene, Kansas.

Often highly popular not just with veterans and their families but with much of the general public, military museums in the United States perform important functions for the military and for the public, reminding them of the significant role the military has played in the nation's heritage.

MUSIC, WAR AND THE MILITARY IN. From the earliest major American wars to the "Persian Gulf War, music has played an active role in wartime activities of both military and civilian populations. Soldiers wrote their own lyrics,

and occasionally even the songs themselves, which they sang and played to pass the time or while marching into war. Civilians at home wrote and sang popular songs to support or oppose the war effort, and composers wrote more involved instrumental or vocal works dealing with the subject of war, often long after a war was over. In this century as well, composers have created music to be part of films and television shows dealing with war. Music and war have clearly had a strong relationship in America since the mid-eighteenth century.

During the "Revolutionary War, several "Continental army regiments had small bands, but it was two decades after the war that Congress authorized a Marine band, in 1798. It consisted of thirty-two members, playing exclusively drums and fifes. Most active during the Revolutionary War were the soldiers who sang ballads and strophic songs, the majority of which were usually set to British tunes since there were few composers in America. For many of those songs the music has been lost; only the lyrics were published in papers at the time. But some of the music is known. The most popular songs during the war were "Yankee Doodle," "The Battle of the Kegs," and "Volunteer Boys." William Billings, the most significant American composer of this era, also wrote important songs dealing with the war, such as "Chester," "Lamentation Over Boston," "Retrospect," and "Victory."

Other genres appeared somewhat later, specifically battle pieces, which were popular in Europe and America in the late eighteenth and early nineteenth centuries. These battle pieces were sectionalized, programmatic keyboard works that attempted musically to reenact battle situations, and often incorporated national airs or military songs. One of the earliest American examples was James Hewitt's *Battle of Trenton*, written in 1792. Hewitt dedicated the piece to George Washington, composed a detailed program indicating how the general's army marched, crossed the Delaware, and defeated the Hessians, and included popular tunes such as "Yankee Doodle" and "Roslin Castle."

The relationship of music and war during the early nineteenth-century American wars was similar to that in the Revolution, chiefly patriotic songs and programmatic piano battle pieces. Benjamin Carr wrote one of the most difficult early pieces in his *Siege of Tripoli* (1801), concluding again with "Yankee Doodle." Other works glorified America's victories, such as Denis-Germain Etienne's *Battle of New Orleans* (1816), with a programmatic journey including "Hail Columbia" and "Yankee Doodle." The most important song to be written during the War of 1812 was certainly Francis Scott Key's poem "The Star-Spangled Banner" (1814), set to John Stafford Smith's song, "To Anacreon in Heaven." Not until 1931 did it become America's official national anthem.

Although war-related music in Europe changed during the mid-nineteenth century with more sincere forays into seriousness of purpose (particularly in the music of Franz Liszt, Giuseppe Verdi, and Pyotr Tchaikovsky), American music devoted to war remained limited in its focus and quality. However, these pianistic battle pieces and salon works for voice and piano remained popular during the Mexican War. In 1846 and 1847, Charles Grobe composed two piano works, *The Battle of Buena Vista* and *The Battle of Palo Alto and Resaca de la Palma*, dedicated respectively to Gen. Zachary "Taylor, "who never lost a battle," and to

the men of the U.S. Army. In 1847, William Cumming composed a simple piano work, *Santa Annas Retreat from Cerro Cordo*, in which the composer indicates at specific moments in the score how Antonio López de *Santa Anna lost his wooden leg and later his Mexican hat. The most popular war songs during this time were T. A. Durriague's "Remember the Alamo," sung to the tune of "Bruce's Address," and Park Benjamin's "To Arms."

The *Civil War was a turning point in song writing. America was sufficiently established to have composers writing both the lyrics and the tunes, unlike the popular songs of the earlier wars that were chiefly set to preexisting tunes. George F. Root was the most gifted of the Union song writers and his "Tramp, Tramp, Tramp, the Boys are Marching," "The Battle-Cry of Freedom," and "Just Before the Batde, Mother," were among the most popular songs. Other particularly noteworthy songs of the North were Julia Ward Howe's "Batde Hymn of the Republic" and Henry C. Work's "Marching Through Georgia." Some of the most famous songs sung in the South were Daniel Emmett's "Dixie," Harry Macarthy's "The Bonnie Blue Flag," James R. Randall's "Maryland, My Maryland," and "Marie Rave-nal de la Coste" and John Hill Hewitt's "Somebody's Darling." Many songs, however, crossed battle lines with different texts to the same tunes often parodying the originals. Emmett composed "Dixie," the most famous song of the war, in 1859 as a minstrel song, but it soon was adopted by both the Union and Confederate states. For the Confederacy, it became an unofficial national anthem; President Lincoln liked it and had a White House band perform it as well.

Pianistic battle pieces continued, as seen in the blind slave Thomas Bethune's *Battle of Manassas* (1866), which quotes "Dixie," "The Star-Spangled Banner," and "Yankee Doodle," and uses clusters to imitate cannon shots in the lower part of the keyboard. The most serious composer of keyboard music in America during the mid-nineteenth century, however, was Louis Moreau Gottschalk. He wrote several piano works that significantly elevated both the virtuosity and the quality of battle-like pieces for the instrument. His *L'Union* (1862), for which Samuel Adler made an arrangement for piano and orchestra in 1972, is a brilliant showpiece for the pianist, with interlocking offices, rapid figurations, and cannon imitations. By the Civil War period, military brass bands were prevalent, having significantly replaced the drum and fife bands by 1834. During the war, several of these bands—chiefly the Stonewall Brigade Band, the Spring Garden Band, and the Fencible Band—became well-known, playing concerts and assisting with recruitment.

The Civil War has remained vivid in the American consciousness to the present day, as is evident in the large number of works composed about it in this century—an inspiration due in part to the excellent poetry and prose that emerged about the war from Abraham Lincoln, Stephen Crane, Herman Melville, and Walt Whitman.

The most important setting of Crane's "War Is Kind" is Ulysses Kay's *Stephen Crane Set* (1967) and the best settings of Melville include Joseph Baber's *Shiloh and Other Songs from Herman Melville's "Battle Pieces"* (1991) and Gordon Binkerd's *Requiem for Soldiers Lost in Ocean Transports* (1984). David Diamond composed his *Epitaph (On the Grave of a Young Cavalry Officer Killed in the Valley of Virginia)* in 1945.

The poet most frequently set to music is Walt Whitman. Paul Hindemith (1946) and Roger Sessions (1964-70) both wrote outstanding large-scale works on "When Lilacs Last in the Dooryard Bloom'd." Other noteworthy Whitman settings include Howard Hanson's *Drum Taps* (1935), Norman Dello Joio's *Songs of Walt Whitman* (1966), Thomas Pasatieri's *Dirge for Two Veterans* (1973), Ned Rorem's *Whitman Cantata* (1983), and John Adams's *The Wound Dresser* (1989).

Numerous composers have also set Lincoln's Gettysburg Address to music. Other works, such as Rubin Goldmark's *Requiem* (1919) and Ernest Bloch's *America* (1926), include portions of the address or are based on Lincoln's life. Perhaps the most famous and most frequently performed work about Lincoln is Aaron Copland's *A Lincoln Portrait* (1942), which uses a portion of the Gettysburg Address. Roy Harris based his four-movement Symphony No. 6 ("Gettysburg") (1943-44) on the address and composed his Symphony No. 10 ("Abraham Lincoln") (1965) in honor of Lincoln. Warner Hutchison wrote an experimental *Mass: For Abraham Lincoln* (1974), and Vincent Persichetti set Lincoln's second inaugural address in *A Lincoln Address* (1973).

Very few works emerged from the *Spanish-American War, although some popular songs such as Charles K. Harris's "Just Break the News to Mother," "Good-bye, Dolly Gray," and Joe Hayden and Theodore Mertz's popular "There'll be a Hot Time in the Old Town Tonight"—which became the official song of Theodore *Roosevelt's Rough Riders—were well established. It was finally during the Spanish-American War that piano battle pieces reached their demise after having dominated American war music during the nineteenth century. In their place, for the first time in America, composers created serious large-scale compositions dealing with war for chorus and orchestra, such as Walter Damrosch's *Manila Te Deum* (1898).

In the last quarter of the nineteenth century and the first quarter of the twentieth, John Philip Sousa composed about 140 marches for military band that represented the glorification of the martial, patriotic, and expansionistic spirit of the turn of the century. His most significant marches include "Stars and Stripes Forever!" (1896), "Washington Post March" (1889), "King Cotton" (1895), and "U.S. Field Artillery" (1917). Many other patriotic tunes related to the military emerged from this era as well, including Alfred Miles and Charles Zimmerman's "Anchors Aweigh" (1906) and Edmund Gruber's "The Caissons Go Rolling Along" (1907).

Charles Ives was the composer most interested in writing serious music for *World War I. He composed two songs in 1917—"He is There!," later expanded to *They Are There: A War Song March*, and "In Flanders Fields." Ives dedicated the *Second Orchestral Set "From Hanover Square North at the End of a Tragic Day the People Again Arose"* (1915) to the victims of the sinking of the *Lusitania*. Few American works were written during the war; however, a number of pieces appeared after the war, such as Frederick Converse's *The Answer of the Stars* (1919) and Ernest Schelling's *A Victory Ball* (1922). American composers also wrote pieces lamenting those lost in the war, as did their European counterparts during this time. Arthur Foote composed *Three Songs 1914-1918* (1919), and Horatio Parker *A.D. 1919* for chorus and piano (1919) in memory of the Yale graduates who lost their lives in the war. The

American G.I.s enthusiastically adopted British songs, chiefly Harry Williams's or Jack Judge's "It's a Long Way to Tipperary," and Ivor Novello's "Keep the Home Fires Burning." George M. Cohan's "Over There" and "Johnny, Get Your Gun" were two of the most famous popular war songs in the United States.

*World War II witnessed the greatest outpouring of war music ever in America. By the midpoint in the war, the American government and other civic organizations were commissioning music for war bonds, films, education, recruitment, and patriotic fanfares. The government supplied 12-inch, 78 rpm V-Discs to servicemen abroad (chiefly popular and light classical music), and the Department of Public Instruction in Indiana published a book, *Music and Morale in Wartime*, for civilians to sing in support of the war effort. The War Production Drive Headquarters even produced a study of the effect of music in armament factories. Wheeler Beckett's *Music in War Plants* (1943). Otto M. Helbig focused on the therapeutic importance of music in his *History of Music in the U.S. Armed Forces During World War II* (1966). Eugene Goossens and the Cincinnati Symphony Orchestra invited composers to create short fanfares that opened their concerts, and the League of Composers commissioned short pieces, based on a war-associated theme, which the New York Philharmonic premiered between 1943 and 1945. Aaron Copland's *A Fanfare for the Common Man* was the most important of these, and Copland later incorporated the work into his optimistic postwar Symphony No. 3 (1946).

Many composers dedicated these works to the war effort. Morton Gould dedicated his Symphony No. 1 (1943) to his three brothers in the service and to their fellow fighters; Marc Blitzstein wrote *Freedom Morning* (1943) for the black troops of the U.S. Army; Paul Hindemith dedicated his *When Lilacs Last in the Door-yard Bloom'd: A Requiem for Those We Love* (1946) to the memory of President Franklin D. *Roosevelt and to the American soldiers killed during World War II; Dai Keong Lee offered his *Pacific Prayer* (1943) to the fighting men in the Pacific; and Roy Harris originally dedicated his Fifth Symphony (1942) to the USSR before later removing the dedication.

Other composers wrote laments for the soldiers who had died: Bernard Herrmann's *For the Fallen* (1943); Douglas Moore's *In Memoriam* (1943); and William Grant Still's *In Memoriam: The Colored Soldiers Who Died for Democracy* (1943). A large number of popular songs, such as "Cornin' in on a Wing and a Prayer," "Der Fuehrer's Face," and Frank Loesser's "Praise the Lord and Pass the Ammunition" placed high on the popular charts of the era. Among the most popular of all the music composed about World War II was Richard Rodgers's incidental music to *Victory at Sea* in 1952.

Some of the most intense works deal with the Holocaust. Both Part III: "Night" of Morton Subotnick's *Jacob's Room* (1985-86) and the second movement of Steve Reich's *Different Trains* (1988) tragically depict a train journey to the concentration camps. Lukas Foss wrote an *Elegy for Anne Frank* (1989), which he later incorporated into his Symphony No. 3 ("Symphony of Sorrows") (1991). Morton Gould extracted a *Holocaust Suite* (1978) from his music for a television docudrama about the Holocaust.

The *Korean War produced very few compositions. Only two Americans composed serious works dealing with

the war and only one during the actual conflict—Lowndes Maury wrote his *Sonata in Memory of the Korean War Dead* for violin and piano in 1952, and Donald Erb composed his *God Love You Now* in 1971.

The Vietnam War, however, marked a significant change. Its art and popular music mirrored youthful perceptions of the war. Early on, Sgt. Barry Sadler's "Ballad of the Green Beret" paid tribute to these extraordinary new special forces. Later, as young men and women vocalized forceful opposition to the war, their music reflected that protest. Compositions such as William Mayer's *Letters Home* (1968), Gail Kubik's *A Record of Our Time* (1970), or Lou Harrison's *Peace Pieces* (1968) were clearly antiwar works, as were many songs by the popular songwriters, such as Joan Baez, Bob Dylan ("Blowin' in the Wind," "A hard rain's a-gonna fall," and "Masters of War"), and Phil Ochs ("Talking Vietnam" and "Draft Dodger Rag"). Dylan, following in the protest tradition of Woody Guthrie, became the spokesman for the Vietnam era and many musicians sang his songs, including Baez and Peter, Paul, and Mary. Joe MacDonald's "I-Feel-Like-I'm-Fixin'-to-Die" makes fun of the soldiers and their willingness to die at any cost.

Furthermore, the cynicism found in the novels and films of the early sixties is active in war-related compositions of the time. Donald Martirano's *VsGA* (1968) includes a speaker who cites the Gettysburg Address while inhaling helium gas. Arnold Rosner's *A Mylai Elegy* (1971), Dai-Keong Lee's *Canticle of the Pacific* (1968), and Donald Lyberty's *Lines for the Fallen* (1971) were all laments for those who died in the war; there were few optimistic compositions. But perhaps the most significant work related to the Vietnam War is George Crumb's *Black Angels* (1970) for electrified string quartet. The soldiers in the war continued their output of lyrics to preexisting melodies. Joseph F. Tusso's *Singing the Vietnam Blues: Songs of the Air Force in Southeast Asia* (1990) contains 148 songs written solely by U.S. Air Force combat flyers during the Vietnam War.

The *Persian Gulf War, in contrast, was a popular war and the majority of songs supported the war effort. A new outpouring of patriotism could be seen in Whitney Houston's performance of "The Star-Spangled Banner" and Lee Greenwood's "God Bless the U.S.A." which were regularly heard during the conflict. Most recently, Aaron Jay Kernis premiered *Colored Fields* (1996), a three-movement concerto for English horn that deals with the fighting in Bosnia.

Combat: A Century of Liberty and War Songs, 1865-1865, 1987. Ben Arnold, *Music and War: A Research and Information Guide*, 1993. Les Cleveland, *Dark Laughter: War in Song and Popular Culture*, 1st ed. — Ben Arnold

The rifled MUSKET, adopted by the U.S. Army in 1858, represented a significant departure from previous weapons technology. In contrast to the notoriously inaccurate and short-ranged smoothbore musket, the rifled musket featured helical grooves running the length of the barrel that caused a bullet to spin as it left the muzzle. The spinning projectile was less susceptible to air resistance and drop, and hence had a longer, flatter trajectory. Integral to the rifled musket's design was a conoidal-cylindrical bullet, invented by French infantry captain Claude Minié (hence the Americanized name, *minie ball*). When fired, the exploding powder in the rifle's breech caused a shallow concavity in the bullet's butt end to expand, grip the rifling, and create spin.

During the "Civil War, both sides used rifles with close order infantry tactics designed around smoothbores, which emphasized volume of fire rather than accuracy or distance. Rifles, however, greatly increased the range at which an opponent could be brought under effective fire, and magnified the length of time spent under that fire. Consequently, "casualties—and the natural power of the defense—increased dramatically. Some Civil War generals recognized the problem and began experimenting with disordered attack formations that spread soldiers out in a more open, less vulnerable configuration. Most commanders, however, persisted in traditional tactics, and disordered attacks were not accepted as official army doctrine until after the war. The rifled musket itself was the last evolutionary step in muzzle-loaded small arms, and was quickly superseded by breech-loading rifles that fired jacketed, metal cartridge bullets.

MUSTE, ABRAHAM J. (1885-1967), minister, labor organizer, antiwar activist. Born in the Netherlands, Muste studied at theological seminaries in the United States and became a minister in the Dutch Reformed Church (1909-14), the Congregational Church (1914-18), and the Society of Friends (1918-26).

Muste opposed World War I through the "Fellowship of Reconciliation (FOR). During the 1920s and 1930s, he worked in support of industrial unionism through FOR and more radical secular groups. In the early 1930s, his labor activities led him to become a full-fledged Marxist revolutionary, but by 1936 he became once again a Christian pacifist, urging workers to use "nonviolence.

During World War II, as executive secretary of FOR, Muste maintained that military action against fascism only encouraged the forces of hatred and brutality that had created it. He supported "conscientious objection and "draft resistance and evasion. He also urged U.S. assistance to Jewish and other victims of Nazi persecution in Europe. To avert future wars, he recommended more equitable distribution of the world's resources.

In the "Cold War, a more radical Muste opposed the nuclear "arms race through the "War Resisters League and

the Committee for Nonviolent Action. He also encouraged nonviolent direct action in civil rights and the "Vietnam Antiwar movement. Muste's activism made him one of the intellectual leaders of the American movement for peace and social justice.

MUTINY. Despite its emotional connotation, *mutiny* is simply defined as collective military insubordination; it is the antithesis of discipline, which is itself the basis of military behavior. As a phenomenon, it is probably as old as armies and navies; in the case of the American armed forces, it dates back to the "Revolutionary War. In the American services, as elsewhere, mutiny is nowadays a relatively rare occurrence.

Mutiny can be active or passive; conducted with or without arms, with or without violence. It can take place in peace or war, on ship or on shore, at the front or in the rear. It is the collective aspect of mutiny that presents such a challenge to the stability of the particular military organization, or, when it exists on a very large scale, to the state itself. That, and the disgrace to the affected unit, accounts for the secrecy and lack of candor that is usually associated with mutinous incidents. Thus, actions that are, in fact, mutinies, are often cloaked in euphemisms: during the "Vietnam War, the U.S. Army referred to its mutinies as "battlefield refusals," a rhetorical invention without any basis in military law.

Historically, the main sources of mutiny have been rooted in a perception of unfairness on the part of the troops, of burdens inequitably shared vis-à-vis their military colleagues or their parent society. In the American military, this sense of relative deprivation has most often occurred as the result of perceived or actual racial discrimination. World War II saw several major mutinies by black soldiers and sailors in which the issues were discriminatory treatment: Bamber Bridge, England (1943); Port Chicago, California (1945); Guam (1944); Port Hueneme, California (1945). During the Vietnam War, in addition to some small unit incidents in the war zone, a major racially motivated mutiny involving over 100 sailors took place on board the USS *Constellation* (1972).

The notion of unfairness has also resulted from the demands of the military for service beyond an agreed or implied enlistment period. The mutiny of the Pennsylvania Line in June 1783 had as its central grievance the extension of duty beyond the original enlistment term; there were similar cases in the Civil War. In January 1946, in the immediate aftermath of World War II, mutinous outbreaks took place in several overseas garrisons—notably at Manila in the Philippines—in which the troops protested their retention in service following the termination of actual hostilities.

The twentieth century has seen another fundamental source of discontent take root in American and foreign military organizations: the reluctance to serve for ethical, political, or moral reasons. U.S. Army troops questioned the legitimacy of their service in North Russia in 1919; in Vietnam there were many small unit mutinies in which the essential issue centered on the why rather than the how of service.

The process of most American mutinies has followed the pattern of mutinies in general: they tend to be passive refusals to participate rather than acts of violence; of short duration, usually measured in hours rather than days; and spontaneous rather than premeditated.

In spite of the gravity of the offense, the penalties for mutiny in the American military have been minimal. Reluctance even to use the term *mutiny* has resulted in troops being court-martialed, if at all, for lesser offenses. The acceptance of the industrial strike as a legitimate expression of collective protest in twentieth-century civil society has fostered a more lenient view of what was classically considered the most serious of military crimes.

MUTUAL DEFENSE ASSISTANCE ACT (1949). Signed by President Harry S. "Truman on 6 October 1949, the Mutual Defense Assistance Act (MDAA) was the first global U.S. military assistance legislation of the 'Cold War. Military officials began calling for the introduction of such legislation two years earlier, arguing that depleted inventories of surplus armaments, piecemeal planning, and restrictions on presidential authority threatened current and future efforts to arm foreign nations. New legislation became a necessity by mid-1948 because of plans to negotiate a North Atlantic defense treaty and furnish arms aid to strengthen the connective defenses and the will to resist Communist expansion of the signatories.

Truman sent the bill to Congress on 25 July 1949, the day he ratified the North Atlantic Treaty. Opposition from Senator Arthur H. Vandenberg (R-Mich.) to the bill's broad executive powers forced submission of new legislation, which specified the recipients and the amounts of assistance. Controversy also arose over the omission of China, resulting in an unvouchered fund for the "general area" of China. Overall, the MDAA authorized \$1.314 billion: \$1 billion for 'NATO countries; \$211.4 for Greece and Turkey; \$27.6 million for Iran, the Philippines, and South Korea; and \$75 million for the "general area" of China. Administration planners believed the MDAA's immediate effects were to raise the morale of friendly nations and prove U.S. reliability and resolve to meet Communist threats. The MDAA also institutionalized the military aid program, a result ensured by enactment of similar legislation in 1950 and an increase in annual spending on military aid to \$5.222 billion after the outbreak of the

• Korean War.

• Lawrence S. Kaplan, *A Community of Interests: NATO and the Military Assistance Program, 1948-1951*, 1980. Chester J. Pach, Jr., *Arming the Free World: The Origins of the United States Military Assistance Program, 1945-1950*, 1991. — Chester J. Pach, Jr.

MUTUAL SECURITY ACT (1951). Successor to the 'Mutual Defense Assistance Act and the Economic Cooperation Act, the Mutual Security Act became law on 10 October 1951. It created a new, independent agency, the Mutual Security Administration, to supervise all foreign aid programs including military assistance and economic programs that bolstered the defense capability of U.S. allies.

Submitted on 24 May 1951, President Harry S. "Truman's omnibus foreign aid bill got a hostile reception on Capitol Hill. Rapid expansion of national security expenditures during the 'Korean War had produced alarm over high taxes, large deficits, government controls, and a possible "garrison state" among such prominent conservatives as Senator Robert 'Taft (R-Ohio). Truman's decision to send U.S. troops to Europe as part of a standing 'NATO force further antagonized congressional conservatives and exacerbated their fears that European nations were not doing enough for their own defense. Congress thus reduced the administration's request for Mutual Security funds by 15 percent and authorized \$5.998 billion and \$1.486 billion, respectively, for military and economic assistance. The deepest cuts were in economic aid, thus ensuring its subordination to military assistance as "defense support." Renewed each year until 1961 (on the reorganization of the program under new legislation), the Mutual Security Act produced annual struggles over the size of the foreign aid budget and the balance between military and economic aid.

MY LAI MASSACRE (1968). In South Vietnam on 16 March 1968, American soldiers of Company C (Charlie) of Task Force Barker, Americal Division, assaulted the hamlet of My Lai (4), part of the village of Son My in Quang Ngai province. The entire Son My area was a stronghold of the Viet Cong and American units there had taken repeated 'casualties from snipers, land 'mines, and booby traps, without making any significant contact with the enemy. During a briefing prior to the assault, the commander of Charlie Company, Capt. Ernest L. Medina, had ordered his men to burn and destroy the hamlet of My Lai (4), which was said to be fortified and held by the 48th Viet Cong Battalion.

Contrary to expectations, no enemy forces were encountered during the assault on My Lai (4), yet the men of Charlie Company swept through the hamlet and systematically killed all the inhabitants—almost exclusively old men, women, and children. There were several rape killings and at least one gang rape. The total number of Vietnamese civilians killed could not be determined: it was at least 175 and may have exceeded 400.

The massacre at My Lai was successfully concealed within all command levels of the Americal Division for more than a year. In 1969, a letter sent by a serviceman not connected with the division, who had heard stories of a massacre, brought the incident to the attention of the secretary of defense and other government officials. A commission of inquiry, appointed by the secretary of the army and headed by Lt. Gen. W. R. Peers, eventually listed thirty individuals as implicated in various "commissions and omissions" related to the Son My operation. Criminal charges were proffered against sixteen of these. Five were tried by court-martial, but only one individual, 1st Lt. William L. Calley, was found guilty.

On 29, March 1971, after a court-martial of over four months, Calley was convicted of three counts of

premeditated murder of not less than twenty-two Vietnamese; he was sentenced to life imprisonment at hard labor. During several stages of review, Calley's life sentence was reduced to ten years' imprisonment; he was granted parole effective 19 November 1974. Captain Medina, Calley's company commander, was charged with involuntary manslaughter—failure to exercise proper control over his men engaged in unlawful homicide of at least 100 unidentified Vietnamese. He was acquitted because of the military judge's faulty instructions on the issue of command responsibility. Altogether, the legal consequences of the My Lai incident left much to be desired. General Peers on 2 December 1974 called it a "horrible thing, and we find we have only one man finally convicted and he's set free after doing a relatively small part of his sentence."

Many Americans disagreed with this conclusion. President Nixon had been deluged with letters protesting Calley's conviction. The young lieutenant and his men, it was argued, had acted out of frustration and hatred of the Vietnamese who had killed and wounded their comrades. Calley's supporters on the right wing of the American political spectrum were sometimes joined by those in the "Vietnam antiwar movement who regarded My Lai as merely a particularly horrible example of everyday American military tactics.

The environment of *guerrilla warfare, a war without fronts, undoubtedly created a setting conducive to * atrocities. Some apparent civilians were actually combatants who tossed grenades or planted booby traps. Yet these facts cannot provide legal exculpation for the cold-blooded slaughter of old men, women, and children. Despite pressure for a high enemy casualty toll, most U.S. sol-

diers in Vietnam did not intentionally shoot unarmed villagers. Indeed, some U.S. soldiers tried to stop the slaughter at My Lai, notably the helicopter pilot Hugh Thompson. The My Lai massacre was not a typical occurrence. The openness of the fighting in Vietnam to journalistic coverage and the encouragement which the My Lai affair gave to other service people to come forward with reports of atrocities made it quite unlikely that any other massacre could escape attention. True, villagers were regularly killed in combat assaults on defended hamlets; but the rounding up and shooting of civilians was an unusual event, and the men involved in the massacre at My Lai knew it.

The final report of the Peers Commission listed perfunctory instruction in the laws of war in U.S. Army training as a contributory cause of the My Lai massacre. Since then, this aspect of training has been thoroughly revised. Servicepeople are instructed that acting under superior orders is no defense to a charge of murder or other *war crimes. New channels have been set up for the reporting of violations of the laws of war. It is to be hoped that these changes will prevent a recurrence of a dark chapter in the history of the U.S. Army.

NAPOLÉONIC WARFARE. For most of the years from 1799 to 1815, Napoleon Bonaparte led the armies of France to victory over successive hostile coalitions. Despite his ultimate defeat and his mobile and offensive way of war, his personal leadership and strategic approach were widely admired in his day and are still studied.

Napoleon's achievements did not rest on superior armament or totally new "tactics. His army's "weapons differed little from those of his opponents, and his tactics were adapted from those practiced by the mass conscript forces of the French Revolution. What made Napoleon so formidable was the combination of his genius and a large, offensive-minded army led by young and ambitious officers. A charismatic leader, he inspired his troops, Frenchmen and foreigners, with fierce loyalty and devotion. His greatest shortcoming was his refusal to train his senior subordinates for independent command; consequently, their performance often was faulty.

Between 1801 and 1805, Napoleon reorganized the French forces, creating what was called the *Grande Armée*. The permanent institution of the corps system perhaps was most important. Normally commanded by a marshal, a corps consisted of two to four infantry divisions, some cavalry, "artillery, and support troops, strong enough to defeat equal numbers and hold against superior forces until reinforced. Some formations Napoleon kept under his own control: the Army Artillery Reserve, the Army Cavalry Reserve, and the Imperial Guard.

Napoleon always preferred to fight on the offensive, and acting as his own operations officer, made all major decisions. He had the unique talent to conceive a campaign as a complete sequence leading to his main objective: the destruction of the enemy's army or will to fight in one great decisive battle, followed by vigorous pursuit. Careful planning, combining deception and rapid movement, was designed to compel the enemy to fight this battle at a disadvantage. In the Italian campaign of 1796, Napoleon's small army of 35,000 men won victories over the stronger Austrians and Piedmontese by bringing superior strength to bear against each individual enemy force, defeating them in succession. Greater numbers and the corps system enabled Napoleon to develop new strategic sequences. Normally a campaign started with the corps marching widely dispersed along separate routes. Once the enemy's main force was located, the corps pulled closer together, advancing in a diamond-shaped formation. The first corps to contact the enemy engaged him at once while the other corps came into action along the flanks and the rearmost corps remained reserve. A variant of this strategic movement was Napoleon's famous maneuver in the rear. The enemy would be pinned by what he believed was

Napoleon's main force, while the bulk of the French Army swept around to cut his communications and compel him to turn and fight at a disadvantage or to surrender. The 1805 Ulm campaign and the Battle of Austerlitz are the most successful examples.

In battle, Napoleon favored the offensive and stood on the defensive only three times, at Leipzig (1813) and at La Rothière and Arcis (1814). Each time he assumed the defensive only after his initial attack had failed. Basically, his battle tactics stressed offensive movement supported by massive fire, though he tried to retain an element of surprise. He usually sought to direct his main blow against an enemy flank while occupying his front with simultaneous attacks, often infantry combined with cavalry. A second variant was the frontal attack while a flanking maneuver was launched. In both cases, the enemy was gradually weakened, and then, with a superb sense of timing, Napoleon would release his reserve for the smashing blow. Infantry attack columns supported by cavalry and horse artillery moved to breach the enemy's front or flank, while light cavalry would be launched to turn retreat into rout. From Marengo (1800) to Wagram (1809), Napoleon's talent to seize the right moment, together with the overall superior quality of his army, assured victory. But as time passed, he no longer was at his peak, and the quality of his troops declined, while his enemies had learned their lessons.

Besides improving their forces, Napoleon's opponents adopted the corps system that made it impossible to destroy an entire army in one battle. Ultimately, Napoleon's attempt to exploit the central position failed because of British-Prussian strategic cooperation at Waterloo (1815).

Nonetheless, the pattern of Napoleonic warfare continued to be studied and many of his innovations, especially the corps system, were retained. His strategic concepts—in particular, the central position and the maneuver on the rear—remained models for future commanders and were studied even in the fledgling U.S. "Army. Napoleonic warfare as expounded in the writings of Baron Antoine Henri "Jomini was transmitted to American officers by the teaching at the recently founded Military Academy at West Point and came to influence the generals of the Civil War.

Jomini's writings provided a schematic and prescriptive interpretation of Napoleonic operations, an approach well suited to West Point's engineering emphasis. They provided the basis for the teachings of Dennis Hart Mahan, professor of civil engineering and the science of war from 1832 to 1871. Over time, Mahan came to stress the more offensive aspects of Jomini, while Mahan's most brilliant student, Henry W. Halleck, published his *Elements of Military Art and Science* in 1846—an influential work presenting a more defensive-minded view of Jomini's principles.

American operations in Mexico in 1846, offensive though hardly Napoleonic, provided additional impetus for strategic studies, and in 1848 officers at West Point founded a Napoleonic Club, chaired by Mahan, to discuss Napoleonic campaigns. Participants included Robert E. *Lee and George B. *McClellan.

If a clear consensus on the thrust of Jomini's work did not emerge, his influence on the commanders in the Civil War was great. It has been said that they went to war with the sword in one hand and a copy of Jomini in the other. But the results were unclear. Jomini's influence may have made McClellan and Halleck too cautious, while Lee's use of the central position and his turning maneuver at the Second Battle of *Bull Run (1862) and at the Battle of *Chancellorsville (1863) showed a Napoleonic touch. In the end, of course, the new rifled weapons, extended frontages, and rapid rail movements, which negated much of the advantage of the central position, required a quite different approach. The Civil War victory was devised by Ulysses S. *Grant, who claimed that he had never paid much attention to Jomini, and echoing a statement attributed also to Napoleon, declared that the art of war was simple enough: find your enemy and hit him as hard as you can.

NASHVILLE, BATTLE OF (1864). After losing the Battle of * Atlanta, John B. *Hood in November 1864 took the Confederacy's chief western army into Tennessee in a quixotic campaign to reverse the situation. Opposing him was George H. *Thomas, who would have a very substantial force once he gathered the various Union garrisons in Tennessee.

Hood started well, nearly catching a Federal delaying force under John M. Schofield at Spring Hill, Tennessee. When a *Confederate army command error allowed Schofield to escape, Hood became enraged, and the next day recklessly sacrificed much of his army against Schofield's entrenchments at Franklin, Tennessee. After Schofield retired at his leisure to join Thomas at Nashville, Hood followed.

Though he was now outnumbered two to one, Hood took a position outside Nashville and waited for something to turn up. Both Abraham * Lincoln, in Washington, and Ulysses S. *Grant, near Petersburg, were very anxious for Thomas to get on with the business of smashing Hood; but Thomas was not to be hurried. Sleet, snow, and ice made conditions difficult. On 15 December 1864, Thomas attacked, with 55,000 men to perhaps 28,000 for Hood. The Confederates were driven back to a line of hills about a mile to the rear, but still maintained their cohesion. The next day, Thomas renewed the assault, and that afternoon Hood's army collapsed. Federal cavalry pursued the remnants southward toward Alabama. *Union army *casualties were 3,061; Confederate were about 6,000, of whom three-fourths were captured.

One of the most complete victories of the Civil War, the Battle of Nashville was also the last major battle west of the Appalachians.

NATIONAL COMMITTEE FOR A SANE NUCLEAR POLICY. In June 1957, twenty-seven prominent citizens concerned with the direct and indirect hazards of nuclear fallout (e.g., strontium 90 found in cow's milk) met in New York City and formed the Provisional Committee to Stop Nuclear Tests. In the fall, they adopted the name National Committee for a Sane Nuclear Policy, commonly known as SANE, and placed a full-page advertisement in the *New York Times* that read: "We Are Facing a Danger Unlike Any Danger That Has Ever Existed." SANE quickly became the largest and most influential nuclear disarmament organization in the United States. By the summer of 1958, it had about 130 chapters representing approximately 25,000 Americans.

For over three decades, men and women prominently associated with SANE, such as Norman Cousins, Clarence Pickett, Lenore Marshall, Norman Thomas, Dr. Benjamin Spock, H. Stuart Hughes, Sanford Gottlieb, and Rev. William Sloane Coffin, Jr., published full-page advertisements, wrote letters, signed petitions, staged impressive rallies, and took to the streets to pressure U.S. leaders to stop testing, to lessen the risk of nuclear war, and to move toward peace with justice. From the first large American antinuclear rallies of the late 1950s and early 1960s, through the organizing of the largest yet demonstration of the * Vietnam antiwar movement in November 1965, to helping bring about the massive June 1982 disarmament march and rally in New York City, SANE was at the forefront of liberal *nuclear protest movements. The organization's greatest achievement was the *Limited Test Ban Treaty of 1963, halting atmospheric nuclear tests.

In the 1980s, SANE activists played a leading role in the campaign to "freeze" *nuclear weapons (to prevent proposed escalation of the *arms race). In 1987, the two largest peace organizations in the country merged into SANE/FREEZE: Campaign for Global Security, an organization of over 240 local groups, 24 state affiliates, and 170,000 members. The goals of SANE/FREEZE remained a comprehensive ban on nuclear testing as the first step toward complete disarmament and a redirection of military spending to social programs. Reverend Coffin served as president until the end of the *Cold War in 1989. In 1993, SANE/FREEZE adopted a new name, Peace Action.

NATIONAL DEFENSE ACTS (1916, 1920). These statutes provided major restructuring of the U.S. Army. The 1916 act resulted from the "Preparedness" movement to ready the United States for modern war. It authorized nearly

doubling the regular army, to 175,000 (and 286,000 in war), but failed to eliminate state militias as nationalists and regulars desired. Instead, Congress designated the National Guard the primary trained reserve, increased its funding and regulation, and authorized its expansion to 450,000. The law required Guard members to take a dual oath to the nation and their state, enabling the president to "federalize" them and even send them overseas. To prepare reserve army and National Guard officers, Congress established a campus-based Reserve Officers Training Corps (*ROTC) and provided federal funds for summer-time officers' training camps for business and professional men. It also authorized steps toward industrial *mobilization that led to a Council of National Defense. When the United States entered World War I in 1917, the regular army expanded, the president federalized the National Guard, and Congress authorized temporary wartime selective *conscription.

The National Defense Act of 1920 expanded the 1916 legislation and provided for postwar reorganization of the army. The 1920 law governed organization and regulation for three decades—until the *Army Reorganization Act (1950)—codifying the three-component army: regular, National Guard, and Army Reserve. Rejecting peacetime conscription, the lawmakers relied on voluntarism; denying the General Staff's proposal for a 500,000-man standing army, Congress authorized a regular army of 280,000, a National Guard of 430,000, a skeletal Army Reserve, to be filled with veterans, and expanded programs for commissioning reserve officers. The legislators made permanent some wartime organizational additions: the Financial Department, the Chemical Warfare Service, and the Air Service, which was separated from the Signal Corps. It also rescinded some changes: the Tank Corps was put back in the infantry. Furthering the Elihu *Root reforms, the legislation enlarged the General Staff, giving it responsibility for overall military planning. It also authorized an assistant secretary of war for planning business and industrial mobilization. The General Staff's importance in planning and combined operations would become evident in World War II.

NATIONAL GUARD. See Militia and National Guard; Army Reserves and National Guard.

NATIONALISM is a loyalty to an "imagined community." It creates a sense of common identity even among people who have never met one another and probably never will. In large part, that is its function. We speak of American or German nationalism, but not the national identity of Luxembourg or Liechtenstein, where a far higher percentage of the people do in fact know one another. Even in large nations, the issues of who is imagined to be part of the community and who is entitled to do the imagining have often been fiercely contested. Beginning with the 'Revolutionary

War, African Americans have tried to use their participation in major wars to win acceptance of their membership in the national community, while those who founded and sustained that community have tried to exclude them or restrict their participation. By contrast, some white reformers were trying to turn Indians into American citizens at a time when most Indians preferred to be left alone as distinct peoples on enough land to sustain their ancestral ways. The American quest for national identity has shown a pattern toward greater inclusiveness over time, but the stages of that struggle have been marked by some of the most violent confrontations in the history of the country.

In the great age of European nationalism from the French Revolution to World War II, peoples who spoke the same language or shared a common ethnicity fought to build their own nation-states. The unification of Germany and Italy, and later the achievement of independence by Poland and other East European states, also meant the weakening and eventual destruction of the polyglot Habsburg and Ottoman empires. German nationalism took shape in sharp reaction against Napoleonic France, while Italian unity required the repudiation of rule from Vienna. Most historians—always with a nervous glance at Germany from the 1860s to 1945—have assumed that the stronger the nationalism, the greater its ability to prevail.

These nineteenth-century European models do not help much in trying to understand nationalism in the Americas. The thirteen colonies won independence from Britain without claiming a preexisting common identity distinct from that of the mother country. They certainly had no quarrel with the English language. That pattern recurred a generation later in the Latin American struggles for independence. The Latin revolutionaries, like those in North America, accepted most of the geographical boundaries that had been laid out by the imperial states of Spain and Portugal and continued to use the old imperial languages after independence. In North America in the nineteenth century, only one major nationalist movement failed: the attempt to establish the Confederate States of America. Ironically, at least by European norms, the Confederacy was the most militantly nationalist movement to appear in the Americas. In North America, unlike Europe, the gentler and weaker nationalisms of the United States and Canada have survived, but the Confederacy was crushed.

The United States of America emerged as a separate nation before its citizens had any firm sense of a distinct national identity. In England's mainland colonies in the seventeenth century, most settlers assumed that they belonged to the English "nation," the first European society to define itself in these terms. An Englishman's identity involved a strong commitment to liberty, property, and "no popery," although the English quarreled fiercely and sometimes violently over how Protestant, or Puritan, England should be. These quarrels crossed the ocean, but the rival positions tended to take hold in different colonies, which were also founded for different purposes. Moderate Anglicans always controlled Virginia, and over time these values took hold throughout the southern colonies, where the pursuit of wealth energized the settlers far more than the demands of piety. By contrast, Puritanism largely defined what was most distinctive about the New England colonies. In the middle colonies, the competition among denominations in New York and New Jersey, and the

"Quakers' idealism in Pennsylvania, together guaranteed a regional victory for religious liberty by about 1720. But in this region ethnic and religious pluralism made even a sense of English identity problematic.

Many seventeenth-century colonists believed that they could create overseas a better society than England was ever likely to become. Then England's Glorious Revolution of 1688 guaranteed a Protestant succession to the throne, annual meetings of Parliament, and toleration for Protestant dissenters. Over the next twenty-five years, England (which united with Scotland to form the kingdom of Great Britain in 1707) emerged quite unexpectedly as one of Europe's great powers, the one usually best positioned to prevent France, or any other power, from establishing hegemony over the rest. Britons began to celebrate their "mixed and balanced constitution" of king, Lords, and Commons as the great wonder of the age, the foundation for the liberty, property, and Protestantism that made the nation distinct. Colonists joined in this celebration, and in the process of embracing a British national identity also seemed quietly to abandon any ambitions of creating a more just society than Britain's. This trend became most visible during Britain's mid-eighteenth-century wars with Catholic Spain and France. Colonial spokesmen proudly proclaimed their loyalty to the world's most successful empire, which by 1763 had expelled France from Canada and Spain from Florida and had taken control of everything east of the Mississippi River except New Orleans.

In one of history's most astonishing reversals, triumphant Britain then alienated the colonists so totally over the next twelve years that war broke out between the two sides in April 1775. Britain's policies included two major attempts to tax the settlers without their consent—the Sugar and Stamp Acts of 1764-65, and the Townshend Revenue Act of 1767. At first the revenue was to be used only to pay part of the costs of North America's military establishment; but by 1767, some of it was designed to make royal governors and judges independent of the financial support of the colonies' elective assemblies. To North American settlers, the insistence on "no taxation without representation" marked a demand for traditional English property rights, not a quest for something distinctively "American."

For decades British spokesmen had predicted that eventually the American colonies would be strong enough to throw off all subjection to Britain. The reforms of 1763-67 were designed, at least in part, to postpone that terrible day. Colonists found this fear misconceived and even dangerous. Acutely aware of how different the colonies were from one another, they repeatedly affirmed their loyalty to Britain and their admiration for the British constitution. They denied that they harbored any desire for independence, and many of them doubted that any viable union of such disparate colonies was even possible. In short, "America" began as Britain's idea. Into the 1770s, almost nobody on either side of the Atlantic actively favored the creation of a separate American nation.

Fifteen months of terrible warfare, beginning at Lexington in April 1775, changed these sensibilities. The Second Continental Congress long insisted that it was fighting only to restore English rights to the settlers under the traditional government of the empire. But when "George III refused even to receive Congress's very moderate Olive Branch Petition and instead proclaimed the colonists

rebels in August 1775, sentiment began to shift, more obviously at first in private correspondence than in public statements. In January 1776, Thomas Paine published *Common Sense*, a call for both independence and American union. An English immigrant who had been in Philadelphia for only fourteen months, Paine saw an "American" nation around him, where other settlers were able to perceive only separate colonies. His eloquence was infectious, however, and *Common Sense* persuaded many colonists that both independence and union were attainable. In July 1776 Congress concluded that independence was necessary, but union remained another matter.

Many things seemed self-evident to the patriots of 1776, but the benefits of a unified nation-state were not among them. John Dickinson of Pennsylvania believed that the colonies were strong enough to resist even Britain's military might, but the prospect of success terrified him. Where "shall we find another Britain, to supply our loss?" he asked. "Torn from the body to which we are united by religion, liberty, laws, affections, relation, language, and commerce, we must bleed at every vein." Even though he refused to sign the Declaration of Independence, he did become the principal draftsman of the Articles of Confederation, which Congress did not send to the states until late 1777, and which failed to win ratification by all thirteen states until March 1781. Charles Thomson, secretary to Congress from 1774 until 1789, doubted that the American Union could long outlast the war. Even though Congress prevailed in the long struggle for independence, scored two diplomatic triumphs in the French alliance of 1778 and the Peace of Paris in 1783, and designed an imaginative and expansionist western policy culminating in the Northwest Ordinance of 1787, it provided little focus for popular loyalty and won little respect, even among its own members. By 1786-87, with Daniel Shays's Rebellion disrupting rural Massachusetts and with Congress itself ominously divided over the proposed Jay-Gardoqui Treaty, which would have surrendered the navigation of the Mississippi for twenty-five years in exchange for commercial privileges within the Spanish empire, talk of disunion became serious and even erupted into the newspapers. Southern states blocked the treaty because it would have privileged northeastern merchants at the expense of southern planters.

In May 1787, the Constitutional Convention met in Philadelphia and, by September, produced a charter for a radically new form of federal government, one that lodged sovereignty in the people themselves while permitting them to delegate sovereign powers to both their state and national governments. One of the most thoughtful delegates, James Wilson of Pennsylvania, declared that the United States was not yet a nation, but that the Constitution would create a framework to make that transition possible. "As we shall become a nation, I trust that we shall also form a national character; and that this character will be adapted to the principles and genius of our system of government." He based that expectation, not upon the shared memories of a largely mythical past (the kind of thing that shaped English nationalism), but upon popular expectations for a glorious and prosperous future in a vast continent with enormous resources.

Without the Constitution, the Union would probably not have survived the tumultuous years of the French Revolution and the Napoleonic wars. American national

identity would have died in infancy. But the Constitution by itself could not guarantee the success of the Union, or even define the form that American political culture would assume.

The struggles between the Federalists and the Democratic-Republicans after 1790 reshaped American political culture and, indeed, American identity. "A nation without a national government is, in my view, an awful spectacle," proclaimed Alexander *Hamilton in the last of *The Federalist Papers*. He and other Federalists believed that creating a national government capable of holding its own against the great powers of the Atlantic world required funding the Revolutionary War debt at par, collecting sufficient revenue to meet other national objectives, empowering a vigorous executive, creating an efficient army and navy, and establishing an activist federal court system—measures that made the United States resemble a transplanted Britain, lacking only a royal court and an hereditary aristocracy. His opponents insisted that Americans had fought Britain to become something quite different. Once they captured power in 1801, they began to define what such a nation could become.

Jeffersonians set out to pay off the national debt as soon as possible, reduced the army and navy to token forces, repealed all internal taxes, and did their best to tame the federal judiciary. Especially after the Louisiana Purchase of 1803, they began to seek a combination of goals that no other movement or nation, anywhere else in the world, had yet put together. Under their leadership, the United States would repudiate the balance-of-power politics that prevailed in Europe. Within the Atlantic world, Jeffersonians favored trade with all of Europe's maritime powers but alliances with none. They believed that American commerce was so important that a mere threat of withholding it could force the great powers to respect American rights without resort to war, a policy that revealed its limitations when the United States finally declared war on Britain in the *War of 1812. But on this side of the ocean, the new republic would achieve hegemony within the western hemisphere—that is, it would be stronger than any combination of enemies that could be aligned against it—without the need to create standing armies or impose heavy taxes. The energy of the people, especially their determination to settle ever more western lands, would achieve this hegemonic goal with little more than mild supervision from Washington, while avoiding the class conflicts of Europe. The Jacksonian era saw this process become the ideology of "manifest destiny," whose apologists saw almost no limit to how large the United States might become (some even favored the annexation of Ireland!), provided that most governmental activities remained decentralized to the state level.

Liberty and empire remained compatible so long as the free and slave states could agree on how to share the spoils of western lands. By the 1830s, the Jeffersonian formula for hemispheric hegemony had won wide acceptance. As Abraham *Lincoln argued in one of his earliest speeches, "All the armies of Europe, Asia and Africa combined ... could not by force, take a drink from the Ohio, or make a track on the Blue Ridge, in a trial of a thousand years." Any threat to the Union, he insisted in 1838, "cannot come from abroad. If destruction be our lot, we must ourselves be its author and finisher. As a nation of freemen, we must live through all time, or die by suicide."

When Lincoln wrote, the "imagined community" of the

United States was still restricted to white men. Its success depended on the republic's ability to deprive Indians of nearly all of their land, usually without significant compensation or any willingness to incorporate Indians into the polity. Enslaved African Americans were not part of the polity either. During the Revolution, most blacks south of New England in a position to choose sided with the British, not the American republic. Partly because Federalists pushed harder for abolition in northern states than did their opponents, the Jeffersonian triumph magnified these trends. In 1807, when the Democratic-Republicans took control of New Jersey (the only state that permitted some women to vote), they righteously disfranchised women, Indians, and free blacks, thus announcing to the world that their brand of democracy applied to white men only.

The early 1830s largely defined the extremes that would shape American politics and national identity for the next three decades. Northern evangelical Protestants launched a vigorous abolitionist movement that increasingly alarmed the South. South Carolina nullified the tariff in 1832 and threatened secession if President Andrew *Jackson resorted to force. Jackson pushed a "Force Act" through Congress but also agreed with Congress's decision to lower the tariff by stages over the next decade. Disillusioned nullifiers began to envision an independent southern nation taking shape, united in the defense of slavery. Jackson's supporters, for the first time in the history of the republic, insisted that the Constitution had created a "perpetual union," one that could not be destroyed. Many of Jackson's northern opponents agreed. As Daniel Webster put it in 1830, "Liberty and Union, now and forever, one and inseparable." But after the *Mexican War, North and South could not agree on how to digest America's enormous conquest, nor even on how to divide between them the remaining unsettled portion of the Louisiana Purchase. *Expansionism, instead of solving the nation's problems, was tearing it apart. The two ideas, of a southern nation and an indestructible union, finally clashed when the *Civil War erupted in April 1861.

Both sides did their best to appropriate the principles of 1776. Confederate apologists insisted that they were the true heirs of the Revolution, much as the patriots of that era had claimed to be defending English liberty against a government bent on destroying it. Lincoln insisted well into 1862 that he was fighting only to preserve the Union that the founding fathers had created.

Despite these similarities between the Revolution and the Civil War, the differences are even more compelling. In 1775-76, the colonists went to war and fought for fifteen months before Congress finally proclaimed American independence. In 1860-61, seven Southern states seceded from the Union, created the Confederate States of America and then began a war against the United States by firing upon *Fort Sumter. When President Lincoln responded with a summons to arms, four more states seceded and joined the Confederacy. In other words, the Revolutionary War preceded the creation of an American nation, but the Confederate nation preceded the Civil War. Some "fire-eaters" had been agitating for a southern nation for nearly three decades by then, a movement without parallel in the colonies before 1776. The Confederacy was, in short, very much the product of an active and aggressive nationalism in a way that the original American Union had not been.

At first, both sides tried not to interfere with the constricted sense of American identity that Jeffersonians had bequeathed to them. But the 'Emancipation Proclamation, followed by the Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution, boldly offered freedom, citizenship, the duty to bear arms, and suffrage to black males while ignoring the demands of the early women's suffrage movement. This mobilization of blacks contributed immensely to Union victory by 1865. But the failure of Radical 'Reconstruction and the imposition of Jim Crow legislation throughout the former Confederate and border states deprived nearly all black men of the ability to vote by the early twentieth century. Blacks were free but not equal. The warring sections of the republic achieved reconciliation around principles of liberty, union—and and white supremacy. While disfranchising blacks, they enfranchised white women, beginning in several western states near the end of the nineteenth century and culminating in the Nineteenth Amendment to the Constitution during World War I.

World War II marked the next watershed. The Pacific War became a merciless contest between two racial ideologies—Japan's determination to make the divine Yamato race prevail throughout Asia and the Pacific versus the white supremacy of the Western powers, led by the United States. By contrast, the United States fought to destroy Nazi racism in the European theater; and in the aftermath of the war and during the onset of the 'Cold War, the attack on racism became a major force in domestic politics as well. President Harry S. Truman began the desegregation of American armed forces on the eve of the 'Korean War. Over the next two decades, the American defense establishment (along with the world of professional and intercollegiate sports) led all other sectors of American society in the quest for equal opportunity regardless of race. Ironically, while the rest of the world largely condemned American intervention in Vietnam as a ruthless manifestation of arrogant racial supremacy, the United States fought the 'Vietnam War with the most completely integrated military establishment the nation had ever possessed. Colin 'Powell, an African American who fought in Vietnam as a junior officer, would become by the 1990s the most powerful military officer in the land, chairman of the 'Joint Chiefs of Staff. By then, women had also won far broader opportunities for military careers than had ever been available to them before.

What it means to belong to the American nation is still hotly contested, but at the end of the twentieth century that identity has become far more inclusive than ever before.

NATIONAL LABORATORIES. Since the mid-twentieth century, the U.S. government has supported hundreds of science and technology laboratories, many for military purposes. Those designated *national* laboratories combine wide-ranging research and development programs with administration by the Department of Energy (1977) as government-owned, contractor-operated facilities. Although the national laboratory system traces its roots to World War II's atomic bomb project, only three have maintained significant roles in designing, developing, and engineering 'nuclear weapons: Los Alamos (1943), Sandia (1948), and Lawrence Livermore (1952). The two other major wartime laboratories, Oak Ridge National Laboratory and Argonne National Laboratory, abandoned military-related work. An additional three national laboratories created subsequently—Brookhaven National Laboratory, Fermi National Accelerator Laboratory, and Idaho National Engineering Laboratory—rarely performed any.

Until the early twentieth century, new military technology normally originated outside the military establishment. Although individual soldiers might have a hand in invention, manufacturing rather than innovation tended to characterize the century-old network of army arsenals and navy shipyards. In 1915, however, the creation of the National Advisory Committee for Aeronautics (NACA) inaugurated a new era.

Advisory to be sure, NACA (1915-58) also directed a premier research facility, Langley Aeronautical Laboratory in Virginia. Not only did NACA become an interwar byword for cutting-edge military (and civilian) aeronautical research, it also provided the Office of Scientific Research and Development with a model for organizing American science in World War II. Government contracts with well-established academic and industrial organizations became the normal route for military research and development during the war and after.

Ultimately, the most renowned instance of this new partnership was the 'Manhattan Project. To produce a totally new weapon, the atomic bomb, the army's wartime Manhattan Engineer District contracted with universities and corporations for the necessary applied scientific research, engineering development, proof testing, and manufacturing. Facilities created to further the project included what would become the national laboratories, all inherited by the Atomic Energy Commission (1947-75) when it succeeded the army team.

When the war ended, only Los Alamos, the New Mexico laboratory managed by the University of California, remained in the weapons business, though it soon had company. The laboratory's weaponization group (responsible for converting designs to functional weapons) moved to Albuquerque, changed its name to Sandia, and became an

independent engineering laboratory in 1948. The following year, its management passed from the university to Bell Telephone, succeeded in its turn by Martin Marietta in 1995.

Concerns about the development of thermonuclear weapons underlay the 1952 establishment of the third nuclear weapons laboratory at Livermore, California. Originally a branch of the University of California Radiation Laboratory (now Lawrence Berkeley Laboratory), Lawrence Livermore became independent in 1971, though still under university management. To provide weaponization support for the new laboratory, Sandia in 1956 opened its own branch laboratory in Livermore.

Los Alamos, Lawrence Livermore, and Sandia were responsible for designing and developing every warhead in America's entire nuclear arsenal. And although the research, development, and testing of nuclear weapons remains their core concern, they expanded their scope far beyond any narrow military requirements into such areas as computers, "lasers, and biomedical technology.

NATIONAL SECURITY ACT (1947). The conditions leading to the entry of the United States into World War II in 1941 revealed a number of deficiencies in how its national security apparatus was organized. There were inadequacies in civil-military policy coordination, in interservice coordination, and in intelligence. During the latter part of the war, debate arose over the possibility of merging the U.S. Army (and its subordinate air force) and the U.S. Navy into a single department. The army largely favored the concept; the air force saw it as the means to its independence; the navy was opposed.

It became apparent to Navy Secretary James V. Forrestal in 1945 that, given congressional interest, outright opposition was doomed. He decided it was best to come up with an alternative that he could support. He asked his former business colleague Ferdinand Eberstadt to review the issue.

Once immersed, Eberstadt realized that military coordination and unification was far from the entire problem. Indeed, in a very logical order, Eberstadt saw that each proposed solution led to the need for further change. If there was going to be a unified military, civil-military coordination also had to be improved. Further, improved policy coordination also required more coherent intelligence support.

The idea of improved civil-military coordination was not new. Various types of structures had been tried since at least Woodrow "Wilson's administration, all with little effect. But the combination of evident problems at the outset of World War II, coupled with the growing demands of the postwar world and nascent "Cold War, created a political consensus for some kind of action hitherto lacking. Even so, the unification struggle was in a long congressional debate (1945-47) that required the intervention of President Harry S. "Truman for its completion.

The National Security Act signed into law on 26 July 1947 created a number of enduring structures: a "National

Security Council (NSC) to coordinate policy, consisting of the president, vice president, secretary of state, and the newly created secretary of defense (which went to Forrestal); a Department of "Defense (actually created in a 1949 amendment, initially called a National Military Establishment), including a statutory "Joint Chiefs of Staff (JCS); and a "Central Intelligence Agency (CIA). The U.S. "Air Force was recognized as an independent service from the army, but the navy retained its own aviation force and prevented the marines from being absorbed by the army.

The controversies in the prolonged congressional debate over the act centered on four main areas. The new defense structure raised concerns about the distinct roles and missions of the services, a vital issue in terms of doctrine, force structure, and budgets. It is also a continuing issue. Some in Congress worried about the role and powers of the JCS, fearing that it might become a "Prussian General Staff," threatening the concept of civilian control. Limits were placed, therefore, on the size of the JCS's joint staff and the powers of the chairman. A disproportionate amount of time was spent on the propriety of allowing the director of Central Intelligence to be an active duty military officer. Finally, there were concerns about the CIA becoming a "Gestapo." Therefore, provisions were included denying the CIA police or subpoena powers or any internal security role.

Of equal interest are the issues that did not arise. The NSC, which proved to be a crucial policy vehicle for successive presidents (through the unforeseen and still not statutory position of national security adviser), raised little interest. Nor did the clause tasking the CIA with "other functions and duties related to intelligence," which became the legal basis for "covert operations.

The National Security Act was a central document in U.S. Cold War policy and in the acceptance by the nation of its position as world leader. Although the act did not actually unify the armed services, it did increase the coordination of the national security establishment. This went from a very ramshackle ad hoc structure to a much more coherent and more centralized one—via the president through the NSC, the increasing power of the secretary of defense, and the role of the CIA in intelligence.

One of the most striking features of the act has been its relative stability. Although all have been strengthened, the NSC, Defense Department, and CIA continue on in basic roles not very far from those envisioned by Eberstadt. There have been necessary adjustments to the act: the 1949 amendments creating a stronger central control in the office of the secretary of defense; improved congressional oversight of the CIA; and the "Goldwater-Nichols Act (1946) increasing the JCS structure and role. But the essentials remain largely the same.

The NATIONAL SECURITY AGENCY (NSA) is the lineal successor to a number of U.S. code-breaking organizations and projects before and during World War II—Herbert Yardley's "Black Chamber," "MAGIC, and "ULTRA.

Created by President Harry S. "Truman in a secret directive in 1952, NSA is responsible for the protection of U.S. coded communications and for intercepting and breaking foreign communications—customarily referred

to as *signals intelligence* (SIGINT). SIGINT is one of four major intelligence collection branches; it is highly prized by intelligence analysts and policy customers as SIGINT often reveals plans and intentions.

A three-star flag officer heads NSA, rotating among the services. Budget and personnel figures are classified, although NSA is widely acknowledged to be the largest of the intelligence agencies. James Bamford in 1982 estimated a budget of over \$1 billion and 80,000-120,000 employees. NSA's major components are regional operational groups: the former Soviet Union and allies; communist Asian nations; Third World and others.

Like all other intelligence agencies, NSA came under post-*Cold War pressure to reduce size and costs while maintaining production and modernizing its workforce skills. A longtime leader in computer technology, NSA in the 1990s has been involved in a debate over a data encryption standard, which would allow enciphering nongovernmental data and which NSA opposed. It is assumed that NSA will play a role in "information warfare" (computer attacks on * communications, financial, and other nodes) as this becomes both a new capability and a growing defensive concern.

NATIONAL SECURITY COUNCIL. Since its origins in 1947, the interagency, cabinet-level National Security Council (NSC) has played major roles, ranging from advising the president and coordinating various strands of policy to formulating and ratifying policy decisions. Because it is primarily an instrument of presidential power, each president has employed the NSC as he has seen fit. Since the 1960s, however, presidents have made sporadic use of the council itself but have assigned its White House-based staff important roles in policymaking not anticipated by the NSC's inventors. Moreover, the president's national security adviser, a position unforeseen in 1947, has become central to national policymaking.

The NSC was part of a compromise, fashioned in 1947, in postwar decisions over armed services unification. The council as a mechanism to coordinate foreign and military policy was first proposed in the Eberstadt Report (1946), sponsored by Navy Secretary James V. *Forrestal. Seeking an American version of the British Committee of Imperial Defence, Forrestal saw an NSC as a way to ensure timely and unified action in time of crisis, avoid the organizational confusion of World War II, and check the authority of a president—Harry S. *Truman—in whom he had little confidence. In particular, Forrestal and the navy saw the council as an alternative to the strong secretary of defense favored by proponents of unification because it would provide a decentralized military structure and preserve the navy's autonomy. Though the navy could not stop the plan for a secretary of defense, its proposal for an NSC endured, if in watered-down form; Truman's advisers altered early proposals granting the council statutory authority and ensured that the legislative language provided for advisory functions.

In the 1947 *National Security Act, Congress declared that the NSC's purpose would be to "advise the President

with respect to the integration of domestic, foreign, and military policies" so as to ensure more effective cooperation in national security policy. Moreover, the council would supervise the *Central Intelligence Agency (CIA). The council's members would be the president, the secretary of defense, the secretary of state, the three service secretaries, the chairman of the National Security Resources Board, and other such officials as the president chose to designate*. The director of Central Intelligence would be an adviser, not a member. In a 1949 amendment, Congress removed the service secretaries and the National Security Resources Board, added the vice president, and designated the director of Central Intelligence and the chairman of the

* Joint Chiefs of Staff as statutory advisers. The amendment also provided for a small staff with an executive secretary.

During the first few years of the council's existence, in order to preserve his freedom of action and avoid pressure to make decisions on the spot, Truman seldom attended meetings. Nevertheless, he approved a number of policy papers that the council had generated to provide guidance to the agencies. After the *Korean War broke out, Truman raised the council's status by routinely presiding over its meetings. In 1950, he also designated an NSC senior staff, under the direction of the council's executive secretary, and enhanced the council by integrating it into the executive office of the president. The senior staff met frequently for policy coordination purposes but had little impact on NSC policy papers, which were generated primarily by the State Department and the Department of *Defense. Although Truman had resisted suggestions that he appoint a national security assistant to help him coordinate policy, in 1950 he partially conceded by designating W. Averell Harriman as a special assistant, charged with monitoring the implementation of national security policy.

Of all Cold War presidents, Dwight D. *Eisenhower made the fullest use of the NSC, often meeting with its members on a weekly basis throughout his eight years in office. Those meetings provided agency chiefs with a forum to debate the issues and a means for them to ascertain presidential thinking. Significantly, Eisenhower tapped Robert Cutler, Dillon Anderson, and Gordon Gray to serve, at various times, as special assistant to the president for national security affairs, a position not specified in the National Security Act. He made great use of the assistant to keep abreast of current problems, to plan meetings, and to follow up decisions. He also authorized auxiliary NSC planning and coordinating boards, based upon agency representation, for policy coordination and for developing the position papers that provided guidelines for official policy on many issues. Although some Democratic critics charged Eisenhower with constructing a cumbersome decision-making process, he seldom relied on the NSC structure for decisions during crises; those he reserved for the flexibility of smaller meetings in his private office.

After Eisenhower, the council fell into relative eclipse as a means for policy guidance. Under President John F. *Kennedy, Eisenhower's elaborate NSC structure was torn down and the council met infrequently. Moreover, Kennedy's national security assistant, McGeorge *Bundy, became an adviser as well as a policy coordinator. Dissatisfied with advice from the State Department, Kennedy encouraged Bundy to turn the NSC staff into an instrument that could work quickly and secretly at the president's command and develop a "White House" perspective

that was not restricted by the bureaucracy's recommendations. Lyndon B. Johnson followed suit; he virtually did away with council meetings, developing his own mechanisms, primarily the "Tuesday lunch," for policy discussion and coordination.

The council as a forum for policy discussion and advice continued its decline during the Nixon-Ford period, while the council's staff and the national security adviser acquired an unprecedented level of prestige and prominence. Richard M. Nixon declared that he was restoring the Eisenhower system, but his deep suspicion of the State Department and his desire to centralize command over policy worked against that purpose. To strengthen presidential control, Nixon and his ambitious national security adviser, Henry Kissinger, created new advisory and decision-making mechanisms such as the Washington Special Action Group. Moreover, circumventing the State Department, Nixon and Kissinger established secret communications ("backchannels") with key allies and adversaries, e.g., with the Soviet Union, for arms control talks, and with the People's Republic of China, for normalizing relations. The unparalleled secret bombing of Cambodia during the Vietnam War symbolized the extent to which Kissinger and the NSC staff had developed operational control over national security policy in this period.

Kissinger's use of "backchannels" and secret missions had mixed results—by leaving agency heads out of the picture and by confusing negotiators working in regular channels, an outcome that Jimmy Carter criticized during his 1976 campaign. But like Nixon and Ford, President Carter established specific structures for policy advice and coordination as well as for crisis management. Moreover, Carter's national security adviser, Zbigniew Brzezinski, and the NSC staff played central roles in offering policy advice, sometimes to the discomfort of agency heads, especially Secretary of State Cyrus Vance. Although Brzezinski operated in a less Byzantine fashion than his predecessor, Carter sustained the trend toward a strong national security adviser and prominent NSC staff. This development led to an inconclusive debate over whether the president's choice for national security adviser should require the Senate's consent.

When Ronald Reagan came to power, he pledged that cabinet members, not national security advisers, would have a dominant role in policymaking, a procedure that was consistent with his lack of interest in the details of foreign policy. Though the council met more frequently, Reagan followed his predecessors by approving new structures for discussion and decision making. No powerful national security adviser emerged, but activism in policymaking and implementation at the NSC staff level reached its apogee in the "Iran-Contra" activities of national security advisers Robert McFarlane and John Poindexter and their assistant, Lt. Col. Oliver North. Ignoring congressional restrictions, they secretly provided aid to the anti-Sandinista Contras with funds raised through arms sales to Iran and other sources. When the scandal broke in late 1986, Reagan claimed that his management style had precluded tight control over the NSC staff. But declassified documents and his own public statements suggest that Reagan provided overall direction, and that several of the covert operations had his approval, if not the wholehearted support of some cabinet members.

Since the Iran-Contra Affair, presidents have avoided

the excesses of the Reagan system but have continued to supplant the council with other advisory and decision-making mechanisms. For example, President George Bush made modest use of the council, relying instead on regular meetings of deputies' committees for policy development. The national security adviser and NSC staff have remained central for coordinating the strands of diplomatic, military, economic, and intelligence policy; for serving as sources of policy advice; and for managing important initiatives.

NATIONAL SECURITY COUNCIL MEMORANDA.

Soon after President Harry S. Truman established the National Security Council (NSC), its participants developed an extended series of memoranda recording basic policy on diplomatic, intelligence, and military issues. Most comprehensive and ambitious was NSC 68, 14 April 1950, "United States Objectives and Programs for National Security," which called for massive increases in military spending to support the U.S. position in Europe and East Asia. Besides the policy papers, Truman's NSC institutionalized National Security Intelligence Directives (NSIDs) that specified tasks for the intelligence establishment. For the most part, NSC memoranda had high security classifications—often top secret—a practice that Truman's successors carefully followed.

President Dwight D. Eisenhower's NSC apparatus continued Truman's precedent. Among important papers issued were annual statements on basic national security policy that delineated foreign and military policy objectives, strategic concepts, and requirements for foreign aid and military capabilities. Like Truman's policy papers, Eisenhower's documents created a framework for policymaking, seldom recording particular decisions.

When President John F. Kennedy came to power, he abolished the NSC policy paper and institutionalized more informal arrangements through National Security Action Memoranda (NSAMs). Kennedy and his national security adviser McGeorge Bundy used NSAMs for a variety of purposes—to communicate a policy decision, request specific information, or ask for studies on a particular issue. President Lyndon B. Johnson continued this format, although less frequently than his predecessor.

After President Richard M. Nixon appointed Henry Kissinger as his national security adviser, a more formal system of National Security Study Memoranda (NSSMs) and National Security Decision Memoranda (NSDMs) appeared. NSSMs were White House requests for studies by the agencies, while NSDMs represented a presidential decision made after an NSC Senior Review Group, NSC members, and the president had completed the study and

review process. Some have claimed that Kissinger used this process to distract the bureaucracy, but others have argued that it gave White House decision makers a better sense of the available options. For example, NSC agencies produced important studies on strategic arms control that led to NSDMs on negotiating positions for the "SALT Treaties. Nevertheless, the NSDMs only reflected part of the diplomatic process; Nixon and Kissinger never incorporated positions discussed in secret "backchannel" negotiations.

President Gerald "Ford continued the NSSM/NSDM process, and subsequent presidents adopted the same routine although using different terminology. Under President Jimmy "Carter, there were Presidential Directives (PDs) and Presidential Review Memoranda (PRMs), while under President Ronald "Reagan the national security system produced National Security Study Directives (NSSDs) and National Security Decision Directives (NSDDs). During the Reagan and Bush administrations, congressional investigators tried to get information about the scope and Content of presidential directives; however, both administrations refused to cooperate because they considered them too important and too sensitive to divulge. Although giving new nomenclature to his NSC memoranda, the first post-Cold War president, Bill "Clinton, continued the practice of shrouding most of them in secrecy.

—William Burr

NATIONAL SECURITY IN THE NUCLEAR AGE. The concept of national security in the nuclear age is a product of the World War II experience that found intellectual and organizational expression during the "Cold War. Before 1942, the Departments of State, War, and Treasury—the three departments with foreign responsibilities—consulted with one another but developed compartmentalized approaches to diplomatic, military, and economic problems. National security was intended to provide organizing principles for a more coherent and integrated response to the problems of the postwar world. The "National Security Act (1947) created the "National Security Council and gave it overall responsibility for guidance and coordination of foreign and defense policies. The same act established the "Central Intelligence Agency (CIA) and the Department of "Defense, and made the three military services subservient to the latter.

For most of the Cold War, national security policy rested on the twin pillars of containment and "deterrence. Containment, the theme of George F. "Kennan's famous "X" article in *Foreign Affairs* (1947), looked forward to a time when the Soviet Union might become a less aggressive and more "normal" state. In the interim, the United States could protect itself, and hasten the transformation of the Soviet Union, by helping to rebuild the economies of key industrial regions (i.e., Western Europe and Japan) along the Soviet periphery and by strengthening the political will of their peoples to maintain their independence.

Deterrence is a strategy of conflict management that relies on threats of punishment to prevent a specified behavior. Successful threats need to be sufficient and credible.

They must hold out the prospect of enough loss to convince their target that restraint is in its self-interest. Implementation must also appear certain, or at least very probable, in the absence of compliance. The United States employed deterrence to restrain the Soviet Union and China militarily, and more specifically, to prevent an invasion of Western Europe or Japan. Washington threatened both countries with nuclear annihilation.

Deterrence became the military arm of containment. Kennan had conceived of containment as primarily a political-economic strategy, but NSC 68 and the "Korean War encouraged greater emphasis on military means of opposing communism. By the mid-1950s, the Communist threat was also regarded as largely military. Successive State and Defense Department annual reports described deterrence as the "foundation" of national security policy.

Deterrence was attractive to the American national security establishment for military, political, and economic reasons. Wars between nuclear powers were too costly to fight, and the strategy of deterrence was specifically designed to prevent them. Deterrence, and the related strategy of compellence, also appeared to provide a mechanism by which the United States could exploit its strategic superiority for political ends. Nuclear retaliation was also much cheaper than any attempt to match Soviet conventional capabilities. President Dwight D. "Eisenhower—and Premier Nikita Khrushchev—invoked the security conferred by nuclear deterrence to justify cuts in conventional force levels.

The implementation of threats usually involves costs for threat makers, too, and credibility is difficult to establish in proportion to these costs. In the opinion of many strategists, within and without the government, the credibility of the American commitment to attack the Soviet Union with "nuclear weapons in response to an invasion of Western Europe became increasingly problematic once the Soviet Union developed the capability to attack the United States with its own nuclear weapons. From the early 1960s on, successive American administrations grappled with this dilemma. Through a combination of arms buildups and deployments, nuclear doctrines and targeting, and rhetorical commitment, they sought to convey resolve to the Soviet Union and reassure the European allies without unduly frightening them.

Controversies. The role of nuclear weapons in Soviet-American relations was and remains controversial. The debate centers on four questions. First and foremost is the contribution nuclear deterrence made to the prevention of World War III. The conventional wisdom regards deterrence as the principal pillar of the postwar peace between the superpowers. Critics charge that deterrence was beside the point or a threat to the peace.

The second question, of interest to those who believe that deterrence worked, is why and how it works. Some insist that it forestalled Soviet aggression; in its absence, Moscow would have attacked Western Europe and possibly sent forces to the Middle East. More reserved supporters credit the reality of nuclear deterrence with moderating the foreign policies of both superpowers.

The third question concerns the military requirements of deterrence. In the 1960s, Defense Secretary Robert S. "McNamara adopted Mutual Assured Destruction (MAD) as the official American strategic doctrine. McNamara contended that the Soviet Union could be deterred by the

American capability to destroy 50 percent of its population and industry in a retaliatory strike. He welcomed the effort by the Soviet Union to develop a similar capability in the expectation that secure retaliatory capabilities on both sides would foster stability.

Many military officers and civilian strategists rejected MAD on the grounds that it was not credible to Moscow. To deter the Soviet Union, the United States needed to be able to prevail at any level of conflict. This required a much larger nuclear arsenal and highly accurate * missiles necessary to destroy Soviet missiles in their silos and the underground bunkers where the political and military elite would take refuge in any conflict. Nuclear "war fighting" supplanted MAD as the official strategic doctrine during the presidency of Jimmy *Carter. The Reagan administration spent vast sums of money to augment conventional forces and to buy the strategic weapons and command and control networks that *Pentagon planners considered essential to nuclear war fighting.

An alternate approach to nuclear weapons, "finite deterrence," maintained that Soviet leaders were as cautious as their Western counterparts and just as frightened by the prospects of nuclear war. Nuclear deterrence was far more robust than proponents of either MAD or war fighting acknowledged and required only limited capabilities—several hundred nuclear weapons would probably suffice. The doctrine of finite deterrence never had visible support within the American government.

The fourth question concerns the broader political value of nuclear weapons. War fighters maintained that strategic superiority was politically useful and conferred bargaining leverage on a wide range of issues. Most supporters of MAD contended that strategic advantages could only be translated into political influence in confrontations like the *Cuban Missile Crisis (1962-63), where vital interests were at stake. Other supporters of MAD, and all advocates of finite deterrence, denied that nuclear weapons could serve any purpose beyond deterrence.

Nuclear Deterrence in Retrospect. Evidence in the 1990s from recently declassified Soviet and American documents, memoirs, and interviews with former policymakers of both superpowers has allowed scholars to reconstruct some of the critical events of the Cold War. These histories, and the evidence on which they are based, permit some answers to the four questions that have been posed, although such answers must remain tentative until additional evidence becomes available about the role of nuclear weapons in other critical Soviet-American confrontations, and in Sino-American and Sino-Soviet relations.

1. *Leaders who try to exploit real or imagined nuclear advantages for political gain are not likely to succeed.* Khrushchev and Kennedy tried and failed to intimidate one another with claims of strategic superiority in the late 1950s and early 1960s. Khrushchev's threats and boasts strengthened Western resolve not to yield in Berlin and provoked Kennedy to order a major strategic buildup. Kennedy's threats against Cuba, his administration's assertions of strategic superiority, and the deployment of Jupiter missiles in Turkey—all intended to dissuade Khrushchev from challenging the West in Berlin—led directly to the Soviet decision to send missiles to Cuba. Both leaders were willing to assume the risks of a serious confrontation to avoid creating the impression of weakness or irresolution.

2. *Credible nuclear threats are very difficult to make.* The destructiveness of nuclear weapons makes nuclear threats more frightening but less credible. It is especially difficult to make nuclear threats credible when they are directed against nuclear adversaries who have the capability to retaliate in kind. Many Soviets worried about nuclear war during the Cuban Missile Crisis, but Khrushchev judged correctly that Kennedy would not initiate a nuclear war in response to the deployment of Soviet missiles. Khrushchev's principal concerns were that the president would be pushed into attacking Cuba, and that armed clashes between the invading Americans and the Soviet forces on the island committed to Cuba's defense would escalate into a wider and perhaps uncontrollable war.

In 1973 during the Yom Kippur War, the American alert had even less influence on the Soviet leadership. It was inconceivable to Leonid Brezhnev and his colleagues that the United States would attack the Soviet Union with nuclear weapons. They did not believe that the interests at stake for either the United States or the Soviet Union justified war. The American nuclear threat was therefore incredible. The Politburo assumed that it was directed against President Nixon's domestic opponents.

3. *Nuclear threats are fraught with risk.* In both 1962 and 1973, American leaders were uninformed about the consequences and implications of strategic alerts. In 1973, they did not understand the technical meaning or the operational consequences of the DEFCON III alert (U.S. forces were normally kept at DEFCON IV) and chose the alert in full confidence that it entailed no risks. During the 1962 missile crisis, when conventional and nuclear forces were moved to an even higher level of alert (DEFCON II), it was very difficult to control alerted forces. Military routines and insubordination posed a serious threat to the resolution of the crisis.

Evidence from these two cases suggests that there are stark trade-offs between the political leverage that military preparations are expected to confer and the risks of inadvertent escalation they entail. American leaders had a poor understanding of these trade-offs: they significantly overvalued the political value of nuclear alerts and were relatively insensitive to their risks.

4. *Strategic buildups are more likely to provoke than to restrain adversaries because of their impact on the domestic balance of political power in the target state.* Josef *Stalin, Khrushchev, and Brezhnev all believed that strategic advantage would restrain adversaries. Khrushchev believed that the West behaved cautiously in the 1950s because of a growing respect for the economic as well as the military power of the socialist camp. He was convinced that the visible demonstration of Soviet power—through nuclear threats and the deployment of missiles in Cuba—would strengthen the hands of "sober realists" in Washington who favored accommodation with the Soviet Union. Khrushchev's actions had the opposite impact: they strengthened anti-Soviet militants by intensifying American fears of Soviet intentions and capabilities. Kennedy's warnings to Khrushchev not to deploy missiles in Cuba, and his subsequent blockade, were in large part a response to the growing domestic political pressures to act decisively against the Soviet Union and its Cuban ally.

Brezhnev's strategic buildup was a continuation of Khrushchev's program. American officials considered that the Soviet buildup continued after parity had been

achieved. Soviet strategic spending appeared to confirm the predictions of militants in Washington that Moscow's goal was strategic superiority, even a first-strike capability. Brezhnev, on the other hand, expected Soviet nuclear capabilities to prevent the United States from engaging in "nuclear blackmail." Instead, it gave Republicans ammunition to use against President Carter and the SALT II agreement. The Soviet arms buildup and invasion of Afghanistan contributed to Ronald *Reagan's landslide victory in 1980 and provided the justification for his administration's massive arms spending. American attempts to put pressure on the Soviet Union through arms buildups were equally counterproductive.

5. *Nuclear deterrence is robust when leaders on both sides fear war and are aware of each other's fears.* War fighting, MAD, and finite deterrence all mistakenly equate stability with specific arms configurations. More important than the distribution of nuclear capabilities, or leaders' estimates of relative nuclear advantage, is their judgment of an adversary's intentions. The Cuban Missile Crisis was a critical turning point in Soviet-American relations because it convinced Kennedy and Khrushchev, and some of their most important advisers as well, that their adversary was as committed as they were to avoiding nuclear war. This mutually acknowledged fear of war made the other side's nuclear capabilities less threatening and paved the way for the first arms control agreements.

Not all American and Soviet leaders shared this interpretation. Large segments of the national security elites of both superpowers continued to regard their adversary as implacably hostile and willing to use nuclear weapons. Even when Brezhnev and Nixon acknowledged the other's fear of war, they used the umbrella of nuclear *deterrence to compete vigorously for unilateral gain. Western militants did not begin to change their estimate of Soviet intentions until Mikhail Gorbachev made clear his commitment to ending the arms race and the Cold War.

Deterrence and the Cold War. The Cold War was the result of Soviet-American competition in Central Europe in the aftermath of Germany's defeat. Once recognized spheres of influence were established, confrontations between the superpowers in the heart of Europe diminished. Only Berlin continued to be a flashpoint until the superpowers reached an understanding about the two Germanies.

The conventional and nuclear arms buildup that followed in the wake of the crises of the early Cold War was a reaction to the mutual insecurities they generated. By the 1970s, the growing arsenal and increasingly accurate weapons of mass destruction that each superpower aimed at the other had become the primary source of mutual insecurity and tension. Moscow and Washington no longer argued about the status quo in Europe but about the new weapons systems each deployed to threaten the other. Each thought that deterrence was far less robust than it was. Their search for deterrence reversed cause and effect and prolonged the Cold War.

The history of the Cold War provides compelling evidence of the pernicious effects of the open-ended quest for nuclear deterrence. But nuclear weapons also moderated superpower behavior, once leaders in Moscow and Washington recognized and acknowledged to the other that a nuclear war between them would almost certainly lead to their mutual destruction.

After the late 1960s, when the Soviet Union developed an effective retaliatory capability, both superpowers had to live with nuclear vulnerability. There were always advocates of preemption, ballistic missile defense, or other illusory visions of security in a nuclear world. But nuclear vulnerability could not be eliminated. Mutual Assured Destruction was a reality from which there was no escape short of the most far-reaching arms control. Even after the dissolution of the Soviet Union in 1991 and the proposed deep cuts in nuclear weapons, Russia and the United States still possess enough nuclear weapons to destroy each other several times over.

Nuclear vulnerability distinguished the Soviet-American conflict from conventional conflicts of the past or present. In conventional conflicts, leaders could believe that war might benefit their country. Leaders have often gone to war with this expectation, although more often than not they have been proven wrong. The consequences of war turned out very differently than leaders in Iraq in 1980, Argentina in 1982, and Israel in 1982 expected.

Fear of the consequences of nuclear war not only made it exceedingly improbable that either superpower would deliberately seek a military confrontation with the other; it made their leaders extremely reluctant to take any action that they considered would seriously raise the risk of war. Over the years they developed a much better appreciation of each other's interests. In the last years of the Soviet-American conflict, leaders on both sides acknowledged and refrained from any challenge of the other's vital interests.

The ultimate irony of nuclear deterrence may be the way in which the strategy of deterrence undercut much of the political stability the reality of deterrence should have created. The arms buildups, threatened military deployments, and confrontational rhetoric that characterized the strategy of deterrence effectively obscured deep-seated, mutual fears of war. Fear of nuclear war made leaders inwardly cautious, but their public posturing convinced their adversaries that they were aggressive, risk-prone, and even irrational.

This kind of behavior was consistent with the strategy of deterrence. Leaders on both sides recognized that only a madman would use nuclear weapons against a nuclear adversary. To reinforce deterrence, they therefore tried, and to a disturbing degree succeeded, in convincing the other that they might be irrational enough or sufficiently out of control to implement their threats. Each consequently became less secure, more threatened, and less confident of the robust reality of deterrence. The strategy of deterrence was self-defeating: it provoked the kind of behavior it was designed to prevent.

The history of the Cold War suggests that nuclear deterrence should be viewed as a powerful but very dangerous medicine. Arsenic, formerly used to treat syphilis and schistosomiasis, or chemotherapy, routinely used to treat cancer, can kill or cure a patient. The outcome depends on the virulence of the disease, how early the disease is detected, the amount of drugs administered, and the resistance of the patient to both the disease and the cure. So it is with nuclear deterrence. Finite deterrence can be stabilizing when it prompts mutual caution. Too much deterrence, or deterrence applied inappropriately to a frightened and vulnerable adversary, can fuel an arms race that makes both sides less rather than more secure and pro-

vokes the very aggression it is designed to prevent. As with any medicine, the key to successful deterrence is to administer correctly the proper dosage.

NATIONAL SERVICE in the United States conventionally refers to the performance of full-time civilian service on the part of youth. The concept is usually traced back to William James's essay, "The Moral Equivalent of War" (1910). James coined the concept to contrast the noble human qualities evoked by war with the destructive purposes they served. Ever since James there has been a marked tendency to think of military and civilian service as alternate, if not opposing, ideals.

The Great Depression of the 1930s placed national service on center stage. Two of the most successful initiatives of the New Deal were national programs for youth: the Civilian Conservation Corps (CCC) and the National Youth Administration (NYA), President Franklin D. "Roosevelt gave some thought to putting national service on a more permanent footing after World War II, but his death intervened.

The 1950s were the doldrums for the idea of civilian national service, but the climate changed when President John F. "Kennedy in 1961 set up the Peace Corps, an overseas youth corps to serve primarily in Third World countries. Participants received a subsistence allowance plus free health insurance. Despite changes of fortune, the Peace Corps has proved remarkably durable. Some 150,000 volunteers have served in 92 countries.

The early success of the Peace Corps made a domestic equivalent seem a natural sequel. In 1964, VISTA (Volunteers in Service to America) was established as part of President Lyndon B. "Johnson's Great Society program. Though it never gained the popularity of the Peace Corps, VISTA has shown durability as well.

In 1988, the Democratic Leadership Council (DLC), an organization of centrist Democrats, proposed its own national service program. Senator Sam "Nunn of Georgia and Congressman Dave McCurdy of Oklahoma introduced a bill in 1989 that called for the establishment of a Citizen Corps for two years service in a civilian or military capacity. The conceptual breakthrough was the linkage of military and civilian service under the broader heading of national service. The policy breakthrough was the broadening of postservice educational benefits, e.g., the

"G.I. Bill principle, to include civilian as well as military service to the nation.

Although the Nunn-McCurdy bill did not move far in Congress, it set the stage for a public debate on national service. During the 1992 presidential campaign, candidate Bill "Clinton made national service one of his key campaign planks, part of his "New Democrat" image. In September 1993, President Clinton signed the National and Community Service Trust Act setting up a corporation to oversee the management and funding of an AmeriCorps program. Enrollees would work in nonprofit agencies, community centers, parks, government agencies, and public hospitals.

Since 1994, the annual budget of AmeriCorps has been around \$300 million annually. Enrollment averaged between thirty and forty thousand a year. A major threshold was crossed in 1997 when AmeriCorps members could also perform service in faith-based organizations. In October 1998, a milestone was reached when the 100,000th member of AmeriCorps was enrolled.

The basic term of service in AmeriCorps was one or two years of full-time duty. Enrollees were paid 85 percent of the minimum wage, about \$7,500 a year. In addition, for each year of service, a participant would receive an educational voucher worth \$4,725 to be used for vocational education, college, graduate school, or to pay off a college loan. AmeriCorps set a notable precedent: a recognizable civilian variant of the G.I. Bill was codified into law.

The contemporary debate on national service reflects certain ongoing realities. One is that federally run programs have much more national visibility than decentralized programs. Even though AmeriCorps's first-year membership of 20,000 members was greater than that of the Peace Corps at any time, AmeriCorps's did not achieve the name recognition of the Peace Corps. Even more striking, the aura of the highly centralized and army-run CCC remains strong in the national consciousness, even though it expired a half century ago, while its larger decentralized and fully civilian counterpart, the NYA, is all but forgotten. A second reality was the continuing tension between proponents of national service who variously emphasized the good done for the server or the value of the work being delivered.

When the Republicans became the new Congressional majority in 1994, it appeared that national service would be placed on the budgetary chopping block. By 1998, however, AmeriCorps had gained more bipartisan support and its future seemed somewhat secure. Indeed, national service for youth was becoming increasingly popular in the United States as the century came to a close. In the late 1990s, AmeriCorps had four applicants for each available opening.

NATIVE AMERICANS, U.S. MILITARY RELATIONS WITH. American military history twists around and through Native American lives like a corkscrew. Of all the direct relationships that developed between Native Ameri-

cans and the various offices, agencies, and branches of the federal government, none has been more ambiguous than that which evolved between the tribes and the U.S. * Army. As an agent of conquest, the army undeniably used violence and terror to subjugate the tribes. But the violence was arbitrary and sporadic rather than methodical and unrelenting. The army also performed numerous administrative tasks connected with Indian affairs, played an important diplomatic and ceremonial role in treaty negotiations, served as a constabulary on the reservations, sometimes provided tribes with rudimentary health care, distributed rations and annuities, and often acted as an intermediary between different tribes as well as between local whites and tribal leaders. The army recruited native males for military service, and numerous Indians developed strong bonds with the U.S. military as allies, auxiliaries, or scouts in conflicts with other tribal groups or foreign enemies. In short, the Native American-military relationship was a strange mixture of extreme emotions and behaviors: violence and compassion, hatred and comradeship, deceit and sincerity, moderation and excess.

The post-Revolutionary War United States made a national policy of expansion, despite the fact that the government lacked the military and financial strength to wage large-scale wars of conquest against the tribes. Tribal land cessions and peace and friendship treaties between the tribes and Congress failed to halt white encroachments on Indian lands. Warfare erupted along the frontier. When Congress established the War Department in 1789, it allocated Indian affairs to the secretary of war, defining the "Indian problem" as one to be solved by military means.

Secretary of War Henry *Knox, however, recognized that a military solution to the problem on the frontier would cost far too much blood and treasure. Several tribes, especially the Cherokees and Creeks in the South and the Shawnees, Kickapoos, Miamis, and others north of the Ohio River, held substantial military power. Knox's misgivings proved well founded in 1790 and again in 1791, when two military expeditions into the country north of the Ohio met with disaster at the hands of an Indian confederacy under the Miami war leader Little Turtle.

Knox and George *Washington therefore designed an Indian policy to carry forward expansion in a more orderly fashion. This policy provided for an impartial dispensation of justice, a method of purchasing (rather than simply taking) Indian lands, the regulation of commerce with a view to ending the liquor trade, the punishment of those who infringed on tribal rights, and the promotion of "civilization," or the propagation of economic techniques that would enable tribes to survive on greatly diminished landholdings. These ideas were incorporated into the Trade and Intercourse Acts between 1790 and 1834, and the army was authorized to police the frontier and implement the new policy. The War Department retained administrative control over Indian affairs until 1849, when the Indian Office was transferred to the new Department of the Interior.

From the 1790s on, the army functioned in the dichotomous role of trained fighting force and diplomatic representative. As Americans extended their frontiers, the army erected forts on the boundaries of Indian lands. These *fortifications could be sallying points for punitive expeditions against the tribes, but were also trading posts, meeting places for treaty negotiations, depots for issuing rations, and temporary jails for rounded-up whites who violated Indian territorial rights. Indians often came to the

forts to complain of maltreatment or encroaching white settlers. A few treaties required army surgeons to provide health care for the tribes. A number of officers served as Indian agents and often used the forts as their administrative headquarters.

In the 1830s, the army acquired the onerous task of removal. The Indian Removal Act (1830) decreed that the eastern tribes were to be relocated west of the Mississippi. The army was assigned to round up tribal members, place them in stockades, and transport them to the Indian Territory (Oklahoma), which Congress created in 1834. Removal was neither war nor an effort to protect human rights, and officers not infrequently questioned the ultimate goals of their missions. Cherokee removal particularly galled the officer corps. Major W. G. Davis, who assessed the Cherokee improvements on their lands, protested to the secretary of war that the Cherokee removal treaty was fraudulent and that the removal itself stained the army's reputation. Both Brig. Gen. R. G. Dunlap and the overall federal commander Gen. John Ellis Wool looked upon the whites waiting to move onto Cherokee property with disdain and asked to be relieved of their commands.

Until the *Civil War, the army was primarily a small frontier force that mapped new regions, built roads, and implemented Indian policies. Except during major wars, such as the *War of 1812, the second of the *Seminole Wars, and the *Mexican War, regular army strength never exceeded 10,000 soldiers and officers. The Civil War's phenomenal increase of regular and volunteer regiments helped to militarize public attitudes and produced a series of ruthless and sanguinary wars against the western Indians. The long Apache Wars, the bloody Santee Sioux War in Minnesota, and the massacres of the Navajos at Canyon de Chelly, the Cheyennes at Sand Creek, and the Aravaipa Apaches at Camp Grant can all be traced directly to the actions of volunteer militia, overzealous and inexperienced junior officers, and armed citizens' groups.

After the Civil War, the army was reduced in size and once more became basically a frontier force. Between 1867 and 1876, army manpower fell from 57,000 to about 25,000, where it remained until the outbreak of the *Spanish-American War. It was not, however, the same kind of army as it had been prior to the great conflict of 1861 to 1865. The warfare between the tribes of the Far West and the whites was a nightmare of violence, and the army seemed a potential agency to control the situation; there was even a movement to transfer the Indian Office back to the War Department. It was thought that regular army officers were better educated, had no local political axes to grind, and could look upon Indian affairs from a purely professional standpoint.

Christian missionary influences prevented the transfer of the Indian Office, but William Tecumseh *Sherman, Philip H. *Sheridan, Nelson A. Miles, George Crook, and other veterans of Civil War service made efficient and merciless war on the tribes, regardless of the army's subordination to civilian Indian agencies. The army destroyed tribal horse herds, burned homes and food caches, chased Indians who had left their reservations, quelled internal disturbances, and generally made total war on recalcitrant native people until the 1890s. The outbreaks of warfare were unceasing, and the ruthlessness of these campaigns left a legacy of animosity toward the army that has lasted among some native people to this day.

Although the army made relentless war on Native Americans, the tribes did not break easily. On several occasions they foiled and defeated army units by better tactics and greater mobility. Badly needing personnel knowledgeable of Indian tactics and of western terrain, in 1866 the army formed the Indian Scouting Service. Thereafter, Native American men were recruited and paid regular army wages to track down and fight their traditional tribal enemies or, most notably in the Apache outbreaks, their own people. The Indian Scouting Service was disbanded in 1943, after achieving a record of bravery in action unequalled in American military history.

By the time the Scouting Service had been formed, many whites had already formed the opinion that Indians were naturally adept at making war and would make excellent soldiers. In 1890, Secretary of War Redfield Proctor authorized raising several all-Indian infantry and cavalry units in order to capitalize on the presumed Indian proclivity for war and to legitimize Indians as American citizens. For a variety of reasons, these units were disbanded after seven years; but the active recruitment of Native Americans for military service has continued. Native Americans have served in every American war of the twentieth century in numbers greatly exceeding their proportional population. This, too, is a legacy of the long, stormy relationship between Indians and the U.S. military.

NATIVE AMERICANS IN THE MILITARY. From the

* Revolutionary War to the present, American Indians have served in the U.S. military in a variety of roles. During the Revolutionary War, Native Americans sought initially to remain neutral, but eventually most sided with the British, who seemed less expansionist. Nevertheless, Indians in south and central New England ultimately rallied to the American cause against the British and their Tory allies. Primarily these were alliances, but sometimes Indians, particularly religiously converted Indians, served as individuals in the American forces. Indians also fought on both sides in the "War of 1812; in the South, the Choctaw and Cherokee fought alongside Andrew "Jackson, while the Creek divided their allegiance.

During the "Civil War, Indians were first recruited by the Confederacy, which in 1861 raised four regiments from among the Cherokee, Chickasaw, Choctaw, Creek, and Seminole in the Indian Territory (Oklahoma) to drive neutrals across the border into Kansas. The most famous Confederate Indian, Col. Stand Watie, led his Cherokee Mounted Rifles in capturing "Union army "artillery batteries in the Battle of "Pea Ridge, Arkansas, in 1862. However, hundreds of these Indians eventually went over to the Union side, and an all-Indian brigade was organized in the Indian Territory. Aside from these Indian units with their

Indian officers, the most famous Indian to serve in the war was the Seneca Ely S. Parker, who rose to the rank of general and served as secretary to Gen. Ulysses S. "Grant.

In the thirty years of "Plains Indians Wars across the Great Plains from 1860 to 1890, members of certain tribes, especially the Crow and Pawnee, fought alongside regular army soldiers, black and white, against their traditional tribal enemies, especially the Lakota Sioux, helping the army wipe out tribal resistance to the encroaching settlement. During the postwar reorganization of the U.S. Army in 1866, Congress authorized the enlistment of up to 1,000 Indians as "scouts," making permanent a previously informal policy. The Indian Scouts, who may have reached as many as 1,500 in some decades, won high praise from generals like George Crook and Nelson A. Miles for their horsemanship, tracking, and fighting ability. An experiment begun in 1890 by Secretary of War Redfield Proctor and Gen. John Schofield to add all-Indian companies, under white officers, in each of the western regiments, was abandoned by 1897.

In the twentieth century, Indians, who participated in all the major U.S. military conflicts, would serve as individuals, not in Native American units. In World War I, perhaps as many of one-half of the Native American population were not U.S. citizens and were not eligible for the draft. Volunteer service was rewarded with U.S. citizenship. Including draftees and volunteers, some 10,000 Indians served in World War I. The service of these Indians contributed to the decision of Congress in 1924 to grant U.S. citizenship to all Native Americans.

In World War II, some 25,000 Indians served in the military, up from the 4,000 who had been in the military in 1940 before wartime "mobilization. Their participation marked a turning point in the relations of Indians with the larger American society. It produced the largest single exodus of Indian males from the reservations and allowed them to compete in an arena where the fighting ability of those from tribes with strong warrior traditions inspired respect among the whites with whom they served. (Indians did not usually serve in racially segregated units as did African Americans.)

Though the number of Indians in the Marine Corps never exceeded 800, their experience certainly obtained the most publicity but in many ways also reflected Indian experiences in other services. One exception to integration was the Navajo Code Talkers communication units, which worked behind enemy lines in the Pacific Theater and sent radio messages on enemy troop maneuvers in Navajo language, thus avoiding the need for mechanical decoding equipment while baffling the Japanese. From these units came several postwar tribal and national Indian leaders such as chairman of the Navajo Tribal Council Peter MacDonald.

It was an Indian Marine, Ira Hayes, a full-blooded member of the small Pima tribe in Arizona, who emerged as the most famous Indian of the war. One of the six Marines and Navy Corpsmen who were photographed raising the flag atop Mt. Suribachi after the Battle of Iwo Jima, Hayes became a special celebrity used to demonstrate wartime unity. He struggled for the rest of his life with that notoriety, and finally died, destitute and suffering from alcoholism, at the age of thirty-three in 1955.

Military service during World War II did more than provide an arena where Indians could perform as equals. For the first time, thousands of young Indian men and women

earned a decent wage. The average Indian's income increased two and a half times, to \$2,500, between 1940 and 1944. Thousands married non-Indians, converted to Christianity, and relocated off the reservations after the war.

In the immediate postwar years, many of the Indian veterans benefitted from the "G.I. Bill. Some took a lead in battling for full civil rights and a better life. In 1947, they led a successful campaign for the vote in Arizona and New Mexico. Joseph Garry, an ex-Marine, chair of the Coeur d'Alene Tribal Council in Idaho and of the National Congress of American Indians, headed a fight in the early 1950s against assimilationist federal efforts to liquidate reservations and divide tribal assets.

Although no firm figures exist, estimates are that between 10,000 and 15,000 Native Americans served in the "Korean War and more than 42,000 served in the "Vietnam War. The conflict in Southeast Asia led many Indian Vietnam "veterans to begin to reexamine their situation in American society. Consequently, many joined with the most traditional tribal elders in attempts to revitalize indigenous warrior societies. Moreover, a number of disillusioned veterans became leaders of militant Indian rights organizations, such as the American Indian Movement (AIM) in the mid-1970s.

In the 1990s, about 10,000 Indians were serving in the "All-Volunteer Army, which revised many of its policies to accommodate Indian traditions and religious customs. Estimates from the "Veterans Administration and the Census Bureau suggest that in the 1990s there were 160,000 living Indian veterans. This represented nearly 10 percent of all living Indians—a proportion triple that of the non-Indian population—and confirms once again that Native Americans play an important role in the U.S. military.

NATIVE AMERICAN WARS. *This essay consists of three articles that examine different aspects of Native American wars and warfare. Warfare in Native American Societies discusses the changing nature of organized armed conflict in disparate Native American societies. Wars Among Native Americans examines warfare between different Indian nations before and after contact with Euro-Americans. Wars Between Native Americans and Europeans and Euro-Americans traces the history of warfare between Indians and European nations, American colonies and states, and the United States.*

NATIVE AMERICAN WARS: WARFARE IN NATIVE AMERICAN SOCIETIES

The significance of warfare varied tremendously among the hundreds of pre-Columbian Native American societies, and its meanings and implications changed dramatically for all of them after European contact. Among the

more densely populated Eastern Woodland cultures, warfare often served as a means of coping with grief and depopulation. Such conflict, commonly known as a "mourning war," usually began at the behest of women who had lost a son or husband and desired the group's male warriors to capture individuals from other groups who could replace those they had lost. Captives might help maintain a stable population or appease the grief of bereaved relatives: if the women of the tribe so demanded, captives would be ritually tortured, sometimes to death if the captive was deemed unfit for adoption into the tribe. Because the aim in warfare was to acquire captives, quick raids, as opposed to pitched battles, predominated. Warfare in Eastern Woodland cultures also allowed young males to acquire prestige or status through the demonstration of martial skill and courage. Conflicts among these groups thus stemmed as much from internal social reasons as from external relations with neighbors. Territory and commerce provided little impetus to fight.

Trade contacts with Europeans changed this situation by creating economic motives to fight, as Indians sought European goods. The arrival of Europeans also dramatically intensified mourning warfare as it ushered in an era of depopulation stemming from colonization, intertribal warfare, and epidemic disease. In the seventeenth century, Algonquian and Iroquoian groups fought a series of "beaver wars" to control access to pelts, which could be traded for iron tools and firearms from Europe. Casualties and losses from disease ignited more mourning wars in a vicious cycle that threatened the viability of many Eastern Woodland cultures.

On the Western Plains, pre-Columbian warfare—before the introduction of horses and guns—pitted tribes against one another for control of territory and its resources, as well as for captives and honor. Indian forces marched on foot to attack rival tribes who sometimes resided in palisaded villages. Before the arrival of the horse and gun, battles could last days, and casualties could number in the hundreds; thereafter, both Plains Indian culture and the character and meaning of war changed dramatically. The horse facilitated quick, long-distance raids to acquire goods. Warfare became more individualistic and less bloody: an opportunity for adolescent males to acquire prestige through demonstrations of courage. It became more honorable for a warrior to touch his enemy (to count "coup") or steal his horse than to kill him.

Although the arrival of the horse may have moderated Plains warfare, its stakes remained high. Bands of Lakota Sioux moved westward from the Eastern Woodlands and waged war against Plains residents to secure access to buffalo for subsistence and trade with Euro-Americans. Lakota Sioux populations, unlike most Indian groups, increased in the eighteenth and early nineteenth centuries; this expansion required greater access to buffalo and thus more territory.

Unlike the Plains and the Eastern Woodlands, pre-Columbian warfare was almost negligible west of the Rockies. Northwest Coast, Columbia Plateau, and Arctic peoples tended to express violence at a personal level rather than between more elaborate political entities. Ceremonies often resolved conflicts between groups; rituals such as ceremonial gaming and the potlatch—a gathering at which the host acquired honor and privilege through the distribution of goods—allowed individuals peaceably

to acquire prestige and leaders to compete for the allegiance of followers, and minimized warfare in the northwestern quadrant before the arrival of Europeans.

As always, European contact ushered in an era of greater warfare by intensifying competition for resources. Mounted Lakota Sioux warriors pushed such Plains nations as the Blackfeet and the Crow westward, into contact with Plateau Indians, precipitating violence between groups that shared little common cultural ground by which to mediate disputes. Some Plateau groups, such as the Nez Percé, adapted culturally, closely approximating Plains horse culture, including its martial components. Similarly, European traders, who approached trade as a competitive endeavor instead of one of reciprocity that created ties of mutual obligation, provoked disputes and sporadic violence in the eighteenth and nineteenth centuries. The European settlement that followed more distant trade relationships led to many wars for the control of land, some of which promoted united, pan-Indian resistance.

Despite the diversity of Indian cultures in North America, patterns of resistance to Euro-American conquest followed certain rules: sedentary groups tended to capitulate more quickly than their nomadic counterparts, because nomads faced more drastic changes in lifestyle if they surrendered to European domination, and because they could capitalize on their mobility to resist Euro-Americans militarily. Semisedentary and sedentary groups, lacking the means to carry out guerrilla warfare, found it more feasible to accept reservation life and European-style agriculture.

NATIVE AMERICAN WARS: WARS AMONG NATIVE AMERICANS

Among most Indian groups east of Mississippi River on the eve of European contact—including the Iroquois and Cherokee—warfare served both social-psychological and demographic functions. Indians waged war against one another to help members of their group cope with the grief experienced at the loss of a loved one or to avenge the death of a relative. Known as "mourning wars," these conflicts were intended to acquire captives who would in turn either be ceremonially tortured to death or adopted into the group. Although men had responsibility for waging war and conducting the raids for captives, women often decided to initiate wars and typically chose between killing and adopting captives. Because taking captives rather than acquiring territory or economic goods was the primary impetus to fight, most wars before the arrival of Europeans were sporadic and consisted of relatively quick raids with little bloodshed.

Contact with Europeans spread trade goods and new diseases throughout the Eastern Woodlands, changing and intensifying wars between Indian groups. In the Northeast,

for example, Iroquoian peoples dependent on European firearms and iron tools expanded militarily to acquire the beaver pelts Europeans sought in exchange for their goods. The result, a protracted series of "beaver wars" between Iroquoian and Algonquian groups near the Great Lakes from the 1640s to 1680s, had both economic and demographic motives. Having lost many members to European diseases, the Iroquois waged mourning wars in a desperate effort to maintain their populations; meanwhile, having hunted out the local beaver supply, they expanded their hunting grounds, creating conflict with neighboring groups. The attendant warfare led to further depopulation, and, in a dangerous cycle, escalated mourning wars.

Beginning in the 1680s, wars among the Eastern Woodland Indians became entangled with the European wars for control of the continent and the Atlantic trade. King William's War (1689-97), Queen Anne's War (1702-13), King George's War (1744-48), and the *French and Indian War (1754-63), all pitted Indians against one another as allies of European powers. Incentives for Indians in these wars were both economic and demographic. Indians used European allies to further their interests in wars for captives and control of economic resources.

Indian rebellions against colonial domination also tended to become wars among Indian groups. In *King Philip's War (1675-76), for example, Indian groups including the Mohawks helped the New England colonies put down a great Wampanoag-Narragansett-Abenaki uprising. These actions reflected old rivalries among New England's Indians, as well as the view of some who preferred a strategy of accommodation toward the English over violent resistance. Similarly, in the Yamasee War (1715), Cherokees seeking English trade goods helped white Carolinians suppress the Yamasee and Creek Indians who resisted European military encroachments.

Wars on the Plains and in the Southwest differed from those in the Eastern Woodlands in that these primarily broke out between peoples pursuing two distinct lifestyles—nomadic and horticulturist. While such groups often forged symbiotic relationships, e.g., exchanging crops for buffalo meat, these contacts sometimes degenerated into nomadic raids on villages. The arrival of Europeans and the spread of the horse heightened distinctions between nomads and villagers. Most horticulturists, like the Pueblos, Pawnees, Navajos, Omahas, and Arikaras, remained sedentary once they acquired the horse; but others, such as the Cheyennes and Crows, abandoned horticulture for nomadism. Yet other groups, such as the Lakota Sioux and Blackfeet, moved onto the Plains from the east to take advantage of the buffalo supply and became nomads in the process. Those Plains and southwestern groups that had practiced nomadism before European contact usually continued after the arrival of the horse. The horse enabled nomads to hunt more efficiently, but did not end their reliance on agricultural peoples for many goods; trade between nomads and villagers became rarer, however, as raids largely supplanted trading as a means of procuring agricultural products.

The development of horse culture shifted the military balance of power on the Plains in favor of nomads. The Comanches came to dominate the southern Plains in the first half of the eighteenth century at the expense of Pueblos, Plains Apaches, and Navajos. Early in the eighteenth century, for example, the Navajos lived north of Santa Fe;

pressures from northern raiders gradually drove them westward, until by 1750 they inhabited what is now Arizona and western New Mexico.

In the second half of the eighteenth century, the Lakota Sioux did to northern and central Plains Indians what the Comanches had done to the Navajos. Originally residents of the Eastern Woodlands, the Sioux became the dominant power of the northern and central Plains through their willingness to use the horse as a tool of conquest against the horticulturalists of the upper Missouri River. From Minnesota, they ranged westward to the Rocky Mountains and southward to the Platte River, finding allies in the Arapahos and Cheyennes, who helped devastate the Pawnees, Arikaras, and other groups by the mid-nineteenth century. The rise of the Lakota Sioux at the expense of sedentary tribes explains why the latter behaved as they did after the arrival of the United States on the Plains in the 1840s. Horticultural groups saw a greater threat in the expanding Lakota Sioux than the United States. They felt that a military alliance with the United States against the Lakota Sioux offered their best hope for survival.

NATIVE AMERICAN WARS: WARS BETWEEN NATIVE AMERICANS AND EUROPEANS AND EURO-AMERICANS

Despite the diversity of Euro-American and American Indian societies, wars between the two have shared certain features. In most eras of conflict, Euro-Americans had Indian allies; Euro-American citizen soldiers tended toward greater brutality and less military discipline than professional soldiers; nomadic groups of Indians usually waged war more tenaciously than the more sedentary ones; and the eruption and expansion of war usually stemmed from a Euro-American drive to acquire Indian land.

During the sixteenth and seventeenth centuries, European powers established military presences in North America from which they could make and defend claims—by right of discovery, settlement, or conquest—to vast portions of a continent already inhabited by Indians. In response, many Native Americans waged wars to resist European colonial domination. In the seventeenth century, the Powhatan Confederacy threatened the existence of the Virginia Colony with attacks in 1622 and 1644. Four decades after their devastation of the Pequots in the Pequot War (1636-37); New England colonists faced a massive uprising among the Algonquians living within their borders in *King Philips War (1675-76). The Pueblo Revolt (1680) drove the Spanish out of New Mexico for thirteen years. In the eighteenth century, colonists in Virginia and the Carolinas forcibly acquired land from Tuscaroras, Yamasees, and Cherokees, while the French put down the armed resistance of the Natchez, Chickasaw, and Fox.

In these wars and others, many groups of Indians flirted

with a united pan-Indian alliance against colonists, but such alliances usually failed to reach fruition. With the French defeat in the *French and Indian War (1754-63), Indians west of the Appalachians found their survival threatened because they could no longer play off the French against the English. Aware that the presence of only one European power in their vicinity meant that the old trade system had broken down, in 1763 the Ottawa Chief *Pontiac rallied many groups formerly allied with the French in an effort to oust the English from the Ohio Valley. *Pontiac's Rebellion (1763-66), although relatively successful in cementing a pan-Indian alliance, ultimately failed. The English government tried to achieve peace in 1763 by a royal proclamation separating Indians and English settlers at the crest of the Appalachian Mountains. While the proclamation's promise that all land west of the Appalachians would be reserved for the Indians weakened Pontiac's alliance, it did nothing to lessen Euro-American pressures on Indian land, as American traders, squatters, and speculators flowed unchecked into the Ohio Valley.

Throughout the colonial era, European imperial rivalries overlaid warfare between Europeans and Native Americans. For example, during King William's (1689-97), Queen Anne's (1702-13), and King George's (1744-48) Wars, the French supported Algonquian raids against the English colonies, while New England's domesticated Indians and certain Iroquoian allies aided the English. In the French and Indian War, the French and their mostly Algonquian allies initially made impressive strides toward controlling the Ohio Valley, beginning with *Braddock's Defeat (1755), only to be overcome by the more numerous English and their Iroquoian supporters. Indians fought as European allies in these wars to advance their own perceived interests in acquiring weapons and other trade goods and captives for adoption, status, or revenge. Until the end of the French and Indian War, Indians succeeded in using these imperial contests to preserve their freedom of action.

The *Revolutionary War, however, forced the Indians of the Eastern Woodlands to deal with a United States that by the Treaty of *Paris (1783) had acquired all British claims south of the Great Lakes and east of the Mississippi. The United States encouraged settlement in its newly acquired lands, and the resulting Euro-American pressures for Indian land generated sporadic fighting in the Old Northwest. In the late 1780s, Shawnees and other Indians launched attacks that swept across Indiana, Ohio, and western Pennsylvania, and soundly defeated contingents of the U.S. *Army in 1790 ("Harmar's Defeat") and 1791 ("St. Clair's Defeat," which inflicted 900 *casualties on the 1,400 Americans under Arthur St. Clair). It took until 1794 for U.S. troops to quell the Indian warriors in the Battle of Fallen Timbers, in which Gen. Anthony *Wayne decisively defeated the Indians, securing the Old Northwest—for the time being—to Euro-American control.

Following their defeat in 1794 and the Treaty of Greenville (1795), the Indian land base continued to shrink until 1809, when the Shawnee brothers *Tecumseh and Tenskwatawa fostered a message of Indian unity and nativism among the tribes of the Old Northwest. Tensions in the region climaxed when Indians capitalized on the *War of 1812 between the United States and England to wage their own war. Despite several initial battlefield victo-

ries, these Indian efforts failed to do more than briefly delay the completion of American dominion in the Old Northwest. A final Indian attempt failed in the "Black Hawk War (1832).

To the south, diverse Creek leaders united to challenge white encroachment. Although some Creeks advocated accommodation, their voices went unheard as whites from Georgia, Alabama, Kentucky, and Tennessee, the last under the leadership of Andrew "Jackson, sought land and retribution for alleged Creek atrocities. The resulting Creek War (1811-14) ended with the Battle of Horseshoe Bend, in Alabama, in which 800 Indians died, the greatest Indian battle loss in U.S. history. The Cherokees were driven west in the "Trail of Tears (1838-39). Most of the Florida Indians were conquered and forced west in the "Seminole Wars (1818; 1835-42; 1855-58). Like the Indians in the Old Northwest, the Indians of the South had succumbed to U.S. expansion.

Peace, interrupted by only periodic armed resistance to removal policies, lasted until the end of the "Mexican War in 1848. After that conflict, the U.S. government and Indians west of the Mississippi River confronted a new burst of westward migration propelled by gold discoveries in California. The populous yet atomized Indians of California faced local posses and militias rather than federal troops. The result was devastating; if Euro-Americans committed genocide anywhere on the continent against Native Americans, it was in California. Between 1850 and 1860, war, disease, and starvation reduced the population of California Indians from 150,000 to 35,000. When prospectors found gold in the Pacific Northwest, warfare erupted in that region. The U.S. "Army engaged in the Rogue River (1855-56), Yakima (1855-56), and Spokane (1858) Wars to force a number of tribes onto reservations in the eastern portions of Oregon and Washington.

The Modocs and Nez Percé mounted the most determined resistance in the Pacific Northwest. The former, under the leadership of Keintpoos, holed up in a ten-square-mile area of lava deposits rife with caves and trenches. From this advantageous position, 60 Modoc warriors held off 1,000 federal troops for seven months in 1873. When the Modoc finally surrendered, the United States executed four of their leaders and sent the remainder to the Indian Territory. The Nez Percé, under the leadership of Chief "Joseph, led the army through more than 1,500 miles of rugged territory in Idaho, Wyoming, and Montana, until most were captured shortly before attempting to cross the Canadian border in 1877.

Initially, the United States sought to protect the overland trails leading to the West Coast from possible Indian attacks. While these attacks were minimal in the 1840s, Indians felt the presence of the migrants early as they brought disease and depleted game along the routes. Such repercussions escalated tensions. The Treaty of Fort Laramie, sponsored by the United States in 1851, sought to preserve peace on the plains by restricting tribes to designated lands. Yet fighting erupted as the parties largely ignored the treaty's terms and American migration continued to have detrimental effects on the buffalo herds on which Plains Indians relied for subsistence. Although Americans' westward migration temporarily abated during the "Civil War, tensions between Indians and settlers remained high. In Minnesota, groups of Eastern Sioux raided American settlements in 1862, only to face retaliation

from American troops who pushed many of them onto the plains. These Sioux faced relatively disciplined American troops and fared much better than the Cheyennes and Arapahos did at the hands of a volunteer Colorado militia. Sporadic Indian raids on Santa Fe Trail travelers led to fears in Colorado of a widespread Indian war. Hoping to make a preemptive strike, John Chivington led volunteers from Denver in the slaughter of most of Black Kettle's Cheyenne band, together with some southern Arapahos near Sand Creek—a location in southeastern Colorado where the U.S. government had promised them safety. The "Sand Creek Massacre (1864) precipitated Cheyenne and Arapaho revenge as they joined the Sioux in what would be a sporadic twenty-year war against the United States. In the "Plains Indians Wars (1854-90), U.S. soldiers waged war to open the plains to safe travel and settlement by confining Indians to reservations; Plains Indian warriors sought increased individual status through wartime acts of bravery and preservation of their way of life. Plains Indians now faced vast numbers of Euro-Americans, because the development of the railroad provided white soldiers and settlers efficient and economical "transportation to the contested territory. In the end, U.S. destruction of the Indians' main food source—the buffalo—combined with persistent attacks on Indian villages subdued the Indians on the plains.

Nevertheless, Plains Indians mounted a spirited resistance. In the north, the Oglala Chief Red Cloud's warriors stopped the building of the Bozeman Trail between Fort Laramie and western Montana (1866-67). In 1868, the Sioux received U.S. treaty guarantees to their territory, including the Black Hills of South Dakota. Yet in the northern plains, these victories proved short-lived. The discovery of gold in the Black Hills in the 1870s led to new white pressures for Sioux land, as the United States failed to live up to the terms of the 1868 Fort Laramie Treaty. Crow and Shoshone warriors assisted American soldiers in their effort to conquer and pacify Sioux country. Determined to avenge the annihilation of George Armstrong "Custer and much of the Seventh Cavalry in the Battle of the "Little Bighorn in 1876, the army persisted until the last of the northern Plains Indians surrendered. By 1877, Sioux armed resistance came to a virtual end when Chief "Sitting Bull fled to Canada and "Crazy Horse surrendered.

On the southern plains, Kiowas, Comanches, and southern Cheyennes faced a similar fate. Hemmed in by Texans to the south and settlers along the Platte River to the north, at the Treaty of Medicine Lodge in 1867, these Indians agreed to live on reservations in exchange for the protection and supplies of the federal government. When the federal government failed to provide the promised supplies, Indian men left the reservations to hunt and conduct raids. Gen. Philip H. "Sheridan and other officers retaliated with winter campaigns against Indian villages in the region beginning in 1868. Warfare lasted until 1875, by which time nearly all southern Plains Indians had submitted to life on reservations. The final denouement came in the tragedy known as the Battle of "Wounded Knee (1890).

In the American Southwest, the last region of the United States to face intense Euro-American pressure for land, various bands of Apaches under such prominent leaders as Cochise, Victorio, and "Geronimo mounted perhaps the most protracted military resistance of Indians to Euro-American expansion. Unlike the nearby Navajo,

whose more sedentary existence had helped compel them to surrender in the 1860s, the prospect of surrender to American troops confronted the Apache with a catastrophic lifestyle change. Moreover, the Apache resided on more rugged territory than the Navajo, and their more nomadic existence facilitated their crossing and recrossing the Mexican border as they fled U.S. troops. Apache resistance came to an end in 1886 only after the army committed thousands of troops to the region and allowed them to cross the Mexican border in pursuit of the Apache.

NATO—the North Atlantic Treaty Organization—was originally created by representatives of twelve Western powers: Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, the United Kingdom, and the United States, in 1949, as a military security alliance to deter the Union of Soviet Socialist Republics' (USSR) expansion on the European Continent. From 1945 to 1949, to widen the Communist sphere of influence, the USSR had annexed Czechoslovakia, East Prussia, Estonia, Latvia, Lithuania, Poland, Romania, and sections of Finland, and had penetrated into the governments of Albania, Bulgaria, and Hungary.

The foundation for NATO had been set in Brussels, Belgium, in March 1948, when representatives of Belgium, France, Luxembourg, the Netherlands, and the United Kingdom met to forge a mutual assistance treaty to provide a common defense system. The Brussels Treaty stipulated that should any of the five signatories be the target of "armed aggression in Europe," the other treaty parties would provide the party attacked "all the military aid and assistance in their power." In June 1948, after a losing battle by isolationists, the U.S. Congress adopted a resolution recommending that the United States join in a defensive pact for the North Atlantic area. President Harry S. Truman urged U.S. participation in NATO as a critical part of his policy of containment of Soviet expansion. Containment had begun with the *Truman Doctrine of 1947 with military assistance to Greece and Turkey to resist Communist subversion. The North Atlantic Treaty was signed on 4 April 1949 in Washington, D.C. It formally committed the European signatories and the United States and Canada to the defense of Western Europe. The U.S. Senate ratified the treaty, 82 to 13. This treaty marked a fundamental departure with tradition of the United States because it was Washington's first peacetime military alliance since the Franco-American Alliance of 1778. In October 1949, in the *Mutual Defense Assistance Act, Congress authorized \$1.3 billion in military aid for NATO. Greece and Turkey joined NATO in 1952. The Federal Republic of Germany joined in 1955 following an agreement on the termination of the Allies' postwar occupation of West Germany and an understanding that the country would maintain foreign forces

on its soil. A rearmed Germany became a major component of NATO.

The USSR strongly opposed the NATO alliance. The Berlin Blockade in 1947-48 and the threat of war had in fact given impetus to the creation of NATO. Following the outbreak of the *Korean War in June 1950, fearing the possibility of a Soviet invasion of Western Europe as a result of a miscalculation by Moscow, NATO countries expanded their military forces in Europe. Allied forces in Western Europe numbered twelve divisions to deter a Soviet threat of eighty divisions. The sending of several U.S. divisions to Europe was strongly debated in the U.S. Congress. Proponents of *isolationism, including former President Herbert *Hoover and Senator Robert *Taft, opposed the assignment of ground troops to Europe. Others, including retired Gen. Dwight D. *Eisenhower, supported an increase in the U.S. commitment to the *Cold War and urged expansion of NATO forces. The isolationists lost, and Truman in 1951 added four more to the two divisions already in Germany to bring the Seventh U.S. Army to six divisions. Truman also brought Eisenhower out of retirement to become Supreme Allied Commander in Europe (SACEUR), following the creation of Supreme Headquarters Allied Powers Europe (SHAPE) in 1951. NATO ministers, in the * Lisbon Agreement on NATO Force Levels of February 1952, set new force goals for 1954 consisting of 10,000 aircraft and 89 divisions, half of them combat-ready. These were unrealistic; but by 1953, NATO had fielded 25 active divisions, 15 in Central Europe, and 5,200 aircraft, making it at least equal to Soviet forces in East Germany. In 1955, Moscow created the * Warsaw Pact, a military alliance composed of Albania, Bulgaria, Czechoslovakia, the German Democratic Republic (GDR), Hungary, Poland, and Romania.

East-West relations were further strained by Nikita Khrushchev, who emerged as the Soviet leader after Josef *Stalin's death in 1953. Although he had criticized Stalin's dictatorship and had accused his predecessor of escalating international tensions, Khrushchev ordered a Soviet force into Hungary to suppress a rebellion and maintain Communist rule in 1956. In 1957, the USSR's launching of Sputnik, the first of the space * satellites, indicated that the Soviet Union was developing long-range nuclear *missiles. NATO had planned in 1954 to use *nuclear weapons in case of a massive Soviet invasion. In 1957, it planned to make the thirty NATO divisions and its tactical aircraft nuclear-capable. By 1960, NATO's commander, SACEUR, probably had some 7,000 nuclear weapons; but two SACEURs, Gen. Alfred Gruenther and Gen. Lauris Norstad, warned of NATO's declining conventional capabilities as a result of reductions or redeployments in British and French forces.

During the 1960s, French president Charles de Gaulle rejected the lead of the United States and Britain in Europe and pushed for a larger diplomatic role for France. The French developed their own nuclear capacity; then, in 1966, while still remaining a part of the NATO community, France withdrew its troops from the alliance and requested that NATO's headquarters and all allied units and installations not under the control of French authorities be removed from French soil. NATO headquarters officially opened in October 1967, in Brussels, where it has remained. East and West efforts to achieve peaceful coexistence decreased a year later when the Soviet Union and four of its satellite nations invaded Czechoslovakia.

In an effort to reach an era of detente, a relaxation of tensions reached through reciprocal beneficial relations between East and West, the Nixon administration took the lead with the Leonid Brezhnev government in Moscow, and NATO members and Warsaw Pact members opened the Strategic Arms Limitation Talks (SALT) in November 1969. In May 1972, the first series of "SALT Treaties was signed. The following year a SALT II agreement was reached, although it was never ratified by the United States. Further efforts during the 1970s for East-West balanced force reductions proved unsuccessful. The Arab-Israeli War did little to ease world tensions when it erupted on 6 October 1973, after which the Soviets implied that they might intervene in the crisis due to the strategic importance of oil reserves in that part of the world. A year later, Brezhnev accused NATO of creating a multinational nuclear force and called for cancellation of the alliance as a first step toward world peace. In 1979, the USSR invaded Afghanistan and that ongoing conflict caused the suspension of negotiations between the United States and the USSR on reductions in intermediate-range nuclear forces (INF) that had opened in 1981. Talks resumed in 1984 primarily to prevent the militarization of outer space and then led to negotiations on arms control and disarmament. Reformer Mikhail Gorbachev came to power in the USSR in March 1985, and that October he met President Ronald Reagan in Reykjavik, Iceland, to discuss ceilings of 100 nuclear missile warheads for each side (none of which would remain in Europe) and 100 residual warheads to remain in Soviet Asia and on U.S. territories in the Pacific. Verification arrangements were also agreed upon for the first time.

By the end of the 1980s, dramatic changes had occurred in the Warsaw Pact countries. In November 1989, the Berlin Wall was opened, which led the way to a unified Germany ten months later. Bulgaria, Czechoslovakia, and Romania took steps toward breaking from Soviet domination. When Russian troops were withdrawn from Eastern Europe in 1990, the Warsaw Pact was dissolved. In response to these events, NATO members at a summit conference in London in July 1990 declared that they no longer considered the Soviets to be an adversary and laid plans for a new strategic concept that was adopted in 1991 in Rome. The concept reaffirmed the significance of collective defense to meet evolving security threats—particularly from civil wars and massive refugee problems—and established the basis for peacekeeping operations, as well as coalition crisis management both inside and outside the NATO area. It also stressed cooperation and partnership with the emerging democracies of the former Warsaw Pact.

The North Atlantic Cooperation Council (NACC) was created in 1991 to draw former Soviet republics, as well as the Baltic states and Albania, into a closer relationship with NATO countries. The same year, the Soviet Union established diplomatic links with NATO and joined the NACC on a foreign ministerial level. Hungary and Romania entered a twenty-five-nation Partnership for Peace (PFP), an arm of NATO created in 1994. The PFP administers exercises, exchanges, and other military contacts to encourage military reform. The partnership also provides for peacekeeping, humanitarian, and rescue operations. Hungary, Romania, Slovakia, Poland, and the Czech Republic aspired to become full members of NATO, and debate opened on a second-tier Russian NATO membership al-

lowing for political, but not military, integration for the former Soviet Union. In June 1994, Russian leader Boris Yeltsin announced that the Russians would join the PFP, but Russian fears of an eastward expansion of NATO remained a contentious issue.

In 1992, due to the escalation of the Bosnian Crisis, and Serbia's armed support of the Bosnian Serbs against Muslims and Croats, NATO's mission was expanded to include peacekeeping operations in support of United Nations (UN) efforts to restrain the fighting and find a solution to the conflict. In July 1992, NATO ships and aircraft commenced monitoring operations in support of the UN arms embargoes on Serbia and Bosnia from the former Yugoslavia. In April 1993, NATO aircraft began patrolling the skies over Bosnia to monitor and enforce the UN ban on Serbian military aircraft. In November 1995, following U.S.-sponsored peace talks in Dayton, Ohio, a peace agreement was signed in Paris in December calling for a Muslim-Croat federation and a Serb entity in Bosnia. During 1996, fourteen non-NATO countries (Austria, Czech Republic, Estonia, Finland, Hungary, Latvia, Lithuania, Pakistan, Poland, Romania, Russia, Slovakia, Sweden, and Ukraine) were invited to contribute to the NATO-led Implementation Force (IFOR). All the NATO countries with armed forces (Belgium, Canada, Denmark, France, Germany, Greece, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Turkey, United Kingdom, and the United States) pledged to contribute military forces to the operation, and Iceland provided medical personnel. With 60,000 troops, 20,000 of them from the U.S. forces, IFOR was the largest military operation ever undertaken by NATO. It was the first ground force operation, the first deployment "out of area," and the first joint operation with NATO's PFP partners and other non-NATO countries. NATO's IFOR halted the pitched battles and urban sieges that ravaged Bosnia during the four-year war. National elections were held in September 1996, and plans were made for a reduced IFOR force.

The collapse of Communism in Europe led NATO to search for new roles beyond that of a mutual defense pact. One was to bolster democracy and national security in former Warsaw bloc nations; consequently in March 1999, the Czech Republic, Hungary, and Poland were made members of NATO. The other new role for NATO was as a regional policeman seeking to restrict ethnic wars, terrorism, and the generation of massive flows of refugees through genocidal violence. Consequently, as a result of military and paramilitary actions by Serbian president Slobodan Milosevic against hundreds of thousands of ethnic Albanians in the Serbian province of Kosovo, NATO in late March 1999 began a military offensive against Serbian forces and installations. By April 1999, when the 50th anniversary of the establishment of NATO was observed, NATO forces in the Kosovo Crisis were engaged in the largest military assault in Europe since World War II. The NATO air offensive ended successfully with the Serbian forces withdrawal from Kosovo in June and the establishment of a UN administered and NATO implemented peacekeeping force there. With the end of the Cold War (and NATO's first war), a new era for NATO had clearly emerged.

NAVAL GUNS. Large-caliber tube weapons firing projectiles propelled by chemical explosives, naval guns dominated the conduct of war at sea from the seventeenth to the early twentieth century.

Even in their earliest applications, naval guns were part of what would today be termed a *weapons system*, and their use was closely connected with other elements of ship design. The first guns were smoothbore cannon mounted in a ship's "castles," where they could be fired down at the enemy deck. As improved metallurgy made heavier guns possible, however, it became necessary for balance to carry them closer to the waterline, a development that led to the cutting of gun ports into the sides of ships. Wheeled gun carriages followed, allowing the muzzle to be drawn back for reloading. Lowering the gun mountings to, and then below, the weather deck in turn made the ships themselves, rather than their crews, the immediate targets of gunfire—though experience soon showed it was not easy to sink a heavily timbered ship by fire with solid shot.

Throughout the age of "sailing warships, naval guns did their work primarily by killing enemy sailors in a hail of splinters, and by disabling the opposing ship's rigging. More combats ended by boarding than by sinking, a process made easier because all guns of this era were so inaccurate that effective fire was impossible beyond a few hundred yards. Gun laying (aiming the guns) was a matter of ship handling. Tactics evolved accordingly, most fruitfully in the practice of sailing in "line ahead," to allow multiple ships to concentrate their broadside fire against a single target.

The history of naval guns in the preindustrial era is thus a tale of evolving consensus, driven by the well-understood characteristics of weapons whose superiority was unquestioned, and which changed only very slowly over several centuries. From the middle decades of the nineteenth century onward, this consensus—embodied in the long careers of ships like the USS *Constitution*, a forty-four-gun frigate laid down in 1797, and still a plausible choice as flagship of the Pacific Squadron in 1839—would be shattered by rapid technological innovation.

The Industrial Revolution introduced two basic changes in the character of naval guns. Improved gun founding (casting) and precision machining allowed the production of ever larger guns, strong enough to stand rifling, breechloading, and vast increases in tube pressures. At the same time, advances in chemistry and industrial design made it possible to replace solid shot with exploding shells. These developments necessitated fundamental changes in ship design. Rifled weapons were more accurate at longer distances than their smoothbore predecessors, characteristics that combined with the superior maneuverability of ships afforded by steam propulsion to increase the range of effective fire from a few hundred to a few thousand yards. The practice of mounting a ship's main batteries of guns in

turrets on the center line by the end of the century was also linked to the characteristics of steam propulsion: the advantages of tactical movement in any direction could only be realized by ships that could also fire in any direction. Center-line turrets also allowed much larger guns to be mounted safely.

The rifled shell gun placed a great premium upon the protective qualities of armor plate. The inconclusive four-hour duel in the "Civil War between the USS *Monitor* and the CSS *Virginia* (formerly the USS *Merrimack*) off Hampton Roads, Virginia, in March 1862 introduced the world to the spectacle of ironclad warships in action; but it was scarcely typical of what the future would hold, because both ships fired only solid shot. Their encounter confirmed initial impressions that the use of armor would increase a ship's defensive staying power. Early steam-powered ironclads were routinely fitted with rams to make up for any possible deficiency in offensive capability. Once large-caliber explosive shells became the norm in the 1880s and 1890s, however, it was rare for the resistive power of a ship's armor to equal the penetrative power of its biggest guns. At the same time, it became increasingly clear that against heavily armored ships, it was only the biggest guns that mattered, a principle that culminated in the all-big-gun design of the HMS *Dreadnought* (1905), the type for all subsequent battleships.

The aggregate effect of all these changes from the 1880s onward brought an almost unmanageable increase in naval firepower, which in the nineteenth century was calculated in terms of "broadside muzzle energy": the total kinetic energy generated by the maximum number of guns on a ship capable of firing in a single direction. In 1860, the best ironclad warships disposed of just under 30,000 foot-tons of muzzle energy. For capital ships laid down on the eve of World War I, the figure was about 600,000 foot-tons—a comparison that does not take account of the fact that it took at least four or five minutes (often much longer) to reload a large naval gun in 1860, and less than one minute fifty years later.

Neither, however, does this comparison take account of the difficulty of actually hitting anything with these formidable weapons. At the start of the twentieth century, naval guns were still direct-fire weapons in the strictest sense: they could be fired only at targets the operators could see, and effectively only at distances close enough to allow the gun to be laid horizontally (without regard to range). Even then, results could be disheartening: in the "Spanish-American War, the American squadron that sank four Spanish cruisers off Santiago, Cuba, in 1898, fired its guns at ranges closing to 1,000 yards, and still managed a hit rate of only 4 percent—with no hits at all by the main 13-inch batteries. It was not until World War I that improved range keeping and fire control equipment permitted ships to employ indirect plunging fire at longer distances; and not until World War II that "radar allowed guns to acquire targets beyond visual range.

By the 1940s, however, naval guns were losing their preeminence as the arbiters of combat at sea, first to airplanes, and most recently and more decisively, to guided missiles. Naval guns survive today only in vestigial form, as weapons for close-in defense and as instruments of communication: despite far-reaching technological change, there remains no substitute in naval communication for a shot fired across the bow.

NAVAL MILITIA. A late nineteenth-century offspring of the National Guard and "New Navy" movements, the naval militia championed a place for the citizen-sailor in national defense. The resurgence of the National Guard ensured a positive reception in coastal and Great Lake state legislatures to the idea of training a citizen-based naval reserve. Massachusetts formed the first state Naval Battalion in 1890. By the 'Spanish-American War, fifteen states had naval militia to quell waterfront strikes and defend coastal areas. Interest in developing a world-class New Navy also contributed to the popularity of the naval militia concept. Accordingly, the navy, beginning in 1891, provided funds and equipment for training and did not hesitate to call upon these forces when war came with Spain in 1898. Four thousand militiamen served on auxiliary *cruisers performing scouting and blockade missions—which included providing cover for the Marine landing at Guantanamo Bay, Cuba—or manned stateside coastal signal stations.

In 1914, the naval militia received federal recognition as an official reserve force comparable in status to the National Guard. During World War I, however, naval militia units lost their state designation when members were assigned indiscriminately to U.S. Navy ships. The Naval Reserve Act of 1938 permanently federalized the naval militia as a training unit for the U.S. *Naval Reserves. Unlike National Guardsmen, naval militiamen now volunteered to serve first in the reserves, then the militia. Reflecting the trend toward federal supervision and the emphasis on billet over unit training, only three states continued their naval militia units by 1960.

The U.S. NAVAL RESERVE was created by several statutes enacted in the period 1915-18 as the successor to the • "naval militia"—naval versions of the National Guard—of several states. The naval militia, as was the case with their army counterparts, was established in the late nineteenth century as part of a general attempt by state military forces to seek higher status and readiness and obtain more federal recognition.

The Naval Reserve did not become a force of federally controlled "citizen-sailors," who underwent periodic peacetime training, until the 1920s and 1930s. During those decades, the reserve provided core crews for ships not in commission and personnel to augment crews of both active U.S. Navy ships and the navy shore establishment upon "mobilization for war. (In addition to these organized reserves, many people who served on active duty in World Wars I and II, the * Korean War, and the * Vietnam War, or the peacetime navy, were designated naval re-

servists, although they were not members of an organized reserve unit called to active duty in time of crisis.) Between the end of the Korean War in mid-1953 and March 1995, Naval Reserve strength has fluctuated from a low of 82,800 in 1978 to a high of 152,800 in 1990. Planned strength for the post-*Cold War era is about 94,000.

Most Naval Reserve units have not mobilized and deployed to a theater of war as units. Rather, individuals and small groups have been used to augment units of the active navy. Reasons for this include the requirements of highly complicated vessels and aircraft for full-time manpower, which limits the extent to which a reserve ship or aircraft squadron can be manned by reservists (a Naval Reserve frigate, for example, actually has a crew of 72 percent active navy and 28 percent reserve sailors). In addition, the need for a large overseas naval presence in peacetime requires the navy and Marine Corps to maintain more of their total force structure—active and reserve—in the active component than do the other services.

Until recently, the "service culture" of the U.S. Navy has probably reflected somewhat more disdain in its attitude toward its reserve component than have the other services' active components. Some of this probably results from the factors noted above, which do limit the extent to which the active navy can rely on reserves. It may also be driven by what was, until recently, a much more inbred hierarchy and socially conservative milieu than the other services (Naval Academy graduates, for example, form a much greater proportion of admirals than do service academy graduates in the army and air force).

This attitude has changed considerably in the late 1990s—out of necessity. Austere defense budgets have forced the navy to rely increasingly on the Naval Reserve to meet its peacetime commitments as well as to provide mobilization assets. Naval Reserve ships, aircraft, and shore units operate with active navy units around the world; individual naval reservists spend tours of duty varying from a few days to many months as integral parts of active navy or joint operations. Finally, the activation of over 21,000 naval reservists (out of a total of about 250,000 reservists from all five military services) for the victorious * Persian Gulf War has given immense legitimacy to this military institution.

Since 1946

NAVY, U.S.: OVERVIEW

In the summer of 1775, the Continental Congress authorized the first ships of what became the U.S. Navy. Through the course of the 'Revolutionary War, each ship and each commission was made to fit an ad hoc need: to defend ports, to interrupt the flow of British personnel and

goods, or to fight the enemy's warships at sea. Each of these—along with admirable cooperation from privateers and from the French and Spanish fleets—contributed to Britain's defeat. These operations and John Paul Jones's raids on British coastal communities gave the fledgling service a reputation for valor.

Like the Continental Army, the Continental Navy was all but dissolved after the war. The global wars of the French Revolution and British empire quickly showed the United States the importance of maintaining a navy, if only to protect a neutral's rights at sea. In 1794, Congress recognized this need, authorizing the first heavily armed frigates designed to deter depredations by European nations as well as those of the Barbary pirates. In 1798, it established a Navy Department to administer, procure, train, and direct the new fleet. President Thomas Jefferson had hoped that small coastal defense gunboats would take the place of a blue water navy, but these lacked sufficient deterrence value. By 1812, deterrence failed and war with Britain brought humiliating military defeats in Canada and the United States. Nonetheless, the navy's heroic deeds—particularly those of Oliver Hazard Perry and James Lawrence—ensured its survival for another generation.

Organized by bureaus and rapidly supplemented from the huge merchant marine community and unprecedented expenditures, the U.S. Navy thrived during the Civil War. It developed new gun and steam propulsion technology that made it one of the most modern and effective forces in the world. Critical to the Union strategy, a naval blockade cut off the rebellious states from life-sustaining trade. Control of the littoral also provided the necessary platform for amphibious assaults of Confederate harbors and eventually for the riverine operations that split the Confederacy. Like the Mexican War, the Civil War saw extensive joint army-navy operations.

After Appomattox, the navy reduced its vessels from over 700 to 200 mostly hybrid steam/sail frigates that aged quickly in an era of rapid technological change. With an aging, pre-Civil War officer class, relatively unskilled sailors, and increasingly decrepit ships, the navy barely performed its peacetime functions of policing American interests on far-flung stations and undertaking occasional diplomatic or scientific missions. Between 1882 and 1916, navalists (such as Alfred T. Mahan and Theodore Roosevelt) revolutionized the service, constructing many first-class steel battleships, training competent sailors, and educating first-class officers. Against the decrepit Spanish fleet in 1898, the "New Navy" appeared to vindicate itself, winning dramatic victories at Manila and Santiago Bays.

In 1917, the U.S. Navy entered a war for which its battleship-heavy fleet was ludicrously ill-suited. Fortunately, in the process of building a large navy, the nation had also created the bureaucracy, education and training systems, and industrial capacity sufficient to adapt successfully to the challenges of convoys, troop transport, and antisubmarine warfare systems. Before it was over, the nation had joined with the Royal Navy to escort over 2 million men and supplies that aided the Allies to victory.

Following World War I, the Republican Party, blaming international naval competition, financial obligations, and Woodrow Wilson's idealism for America's participation in the war, managed a global political and military withdrawal now called isolationism. Successive administrations negotiated arms limitations treaties while Congress

consistently kept the fleet below even permitted strength. This pruning proved healthy, as the smaller navy learned to adapt new technologies to enhance capabilities. While the U.S. Marine Corps developed a forward base concept and amphibious warfare capabilities, the navy concentrated on improving gunfire, submarine warfare, and—increasingly—carrier-based aviation.

In the Depression of the 1930s, President Franklin D. Roosevelt and Congress began building ships to restart the economy as well as to counter the growing militaristic menaces in Germany and Japan. Most critically, Washington started the fast attack carriers that fortuitously avoided the December 1941 raid on the battle fleet at Pearl Harbor. From America's entry into World War II, the armed forces recognized the need for combined and joint operations. Adm. Chester Nimitz divided responsibility for the Pacific with Gen. Douglas MacArthur. Admiral Ernest J. King and Adm. Royal E. Ingersoll shared the Atlantic with the Royal Navy, combatting the U-boat threat and securing the astonishing flow of goods, personnel, and supplies to Britain and the Soviet Union. The amphibious operations in North Africa, Italy, Normandy, and across the Pacific offered the navy and its sister services some of their most daunting military challenges. American submarines established a deadly blockade of Japan. Again, battleships only supported the critical action. Two of the greatest naval battles ever—at Midway and the Philippine Sea—were fought by naval aviation, between commanders who could not see one another.

After World War II, U.S. blue water naval supremacy would remain virtually unchallenged, although the Soviet bloc did pose considerable threats across the globe. During the Cold War, the navy's role in national defense waned and waxed, vacillating with the intensity of operations and the current state of technology. An early bid for nuclear capabilities—the atomic-bomb-launching supercarrier—was canceled in 1949. Only with the advent of the Polaris missile-launching submarine in 1960 did naval ships join the bombers and intercontinental ballistic missiles as one leg of a nuclear triad. The surface navy remained centered on the aircraft carriers. During the Vietnam War, carrier task forces were supplemented by river gunboats for some of the most dangerous operations of the war.

In the decades following the fall of Saigon, the navy continued to move to a high-low mix. Still, the carrier groups dominated the fleet, particularly after the 1985 introduction of a "maritime strategy"—a forward-oriented, carrier-based plan to bring a nonnuclear war to the Soviets. The collapse of the Soviet Union left the U.S. Navy without a credible strategic rival. Nonetheless, the carriers and amphibious capabilities developed in the late eighties were refocused for the expeditions and police actions the United States faced as the only superpower and the only sea power.

NAVY, U.S.: 1783-1865

At the end of the "Revolutionary War Americans had yet to form a political consensus for a strong nation and saw little need for an expensive and unnecessary navy. In 1785 the Confederation Congress sold off the frigate *Alliance*, the last ship of the "Continental navy.

In the late 1780s, when Barbary corsairs preyed upon Yankee ships, Americans discovered that their vision of a new world order dominated by concepts of limited government and free trade was not universally shared. The Confederation Congress, without the power to tax, lacked the money to pay the tribute demanded by the Barbary states and lacked the ships to respond to force with force. This powerlessness contributed to a movement for a stronger national government and the ratification of the federal constitution in 1789.

When new Barbary troubles arose in the 1790s, the new U.S. government possessed options, and Congress and President George Washington responded in classic fashion, following the Roman maxim "if you wish peace, prepare for war." Congress negotiated, but simultaneously passed the Naval Act of March 1794 calling for the construction of six large frigates. The Algerians signed a treaty in 1796.

American determination failed to deter the new French Republic, which angered by the Anglo-American Jay Treaty of 1795, unleashed a war against U.S. commerce in 1797. When the French rebuffed the negotiators sent to Paris, the Federalist-dominated Congress, with a core of six frigates built or being built (including the USS *Constitution*, completed in 1797), voted to expand the navy to a force of over thirty ships. To oversee the expansion, Congress established a separate Department of the Navy on 30 April 1798.

Between the spring of 1798 and 1801 the navy waged an undeclared naval war with "France—the so-called Quasi-War. Benjamin Stoddert, the navy's first secretary, headed a minuscule administration that oversaw operations centered in the West Indies. Stoddert adopted an aggressive, offensive strategy, successfully carrying the war to the French bases in the Caribbean. The new American navy mostly patrolled the shipping lanes and escorted hundreds of merchantmen clear of danger, although there were a few battles of note. In February 1799 Captain Thomas Truxtun, commanding the thirty-eight-gun frigate *Constellation*, captured the French forty-gun frigate *Vulturne* near Nevis.

For the navy, the Quasi-War was a formative experience. The disappointments of the Continental navy were forgotten. The new American marine force emerged from the war with an excellent reputation, a core of powerful frigates, and a cadre of young officers including Edward Preble and Stephen Decatur.

Despite the efforts of Stoddert and other navalists, the United States did not emerge from the war with a big-ship navy. Construction of a squadron of seventy-four-gun "battleships began in 1799, but none was completed. The

nation possessed the means to build such ships, and could have made good use of them in 1812. But for a navy that was usually 10 to 15 percent understrength, manning might have been a practical and political impossibility in a nation unwilling to resort to the press gang.

The electoral victor of President Thomas Jefferson's Democratic-Republicans in 1800 terminated the building of the program. In Jefferson's scheme, army fortifications and an army and navy militia bore primary responsibility for national defense. The navy played a subsidiary role, protecting commerce and supporting coastal defense efforts with a fleet of small harbor gunboats. Jefferson's was in many ways a sensible policy, though he could have spared the nation the cost of the gunboat fleet.

Jefferson considered economic sanctions the chief weapon in his arsenal, a weapon he and his successors employed against Britain between 1807 and 1812 to no avail. Republican embargoes sent the American economy into a depression from which the commercial sector did not fully recover until the 1830s. James Madison and a frustrated Republican Congress declared war in 1812.

In the "War of 1812, the nation's small navy achieved some notable successes, capturing three Royal Navy frigates in the first months of the war. But the navy could not prevent the British from blockading and raiding the coast. At Baltimore and New Orleans, Republican defense policies succeeded; but the British marched into Washington and burned the "President's Mansion." Along the frontier with Canada, the navy achieved mixed success, winning significant battles on Lakes Erie and Champlain, but not on the most important of the lakes—Ontario. For the navy, war ended none too soon.

After 1815, the Democratic-Republicans (soon to be simply Democrats) embraced many Federalist naval policies. They built more and larger ships, just in time for the "era of free security." Many of the big ships were soon laid up, while the smaller vessels operated globally in support of American commerce, suppressing piracy in the Caribbean and conducting anti-slavery patrols off the African coast. In 1854, Commodore Matthew Perry opened Japan to American trade. The navy also undertook scientific and geographic missions. Matthew Fontaine Maury broke ground in ocean science; William Lynch explored the Dead Sea, and Charles Wilkes the Pacific.

The post-1815 era was also one of administrative reform and technological advance. Congress established the Board of Navy Commissioners (1815), the Navy Bureau system (1842), and the U.S. Naval Academy at Annapolis (1845). Other reforms included the prohibition of dueling (1857) and flogging (1850), and (unsuccessful) attempts to limit the spirit ration. The navy experimented with and embraced myriad new technologies—shell-firing cannon, heavy guns, armor plating, steam power, and screw propulsion.

During the "Mexican War (1846-48) the navy played a subsidiary, but important, role. The few American warships executed a big-navy strategy—blockading the Mexican coasts, helping defeat the Mexicans in California, and transporting Gen. Winfield Scott's army to Vera Cruz in an amphibious operation that ultimately brought the war to a successful conclusion.

At the start of the "Civil War, the U.S. Navy's officer corps suffered fewer defections than that of the U.S. Army. Employing many new technologies, the Union navy

performed well, blockading the Confederate coast, supporting amphibious operations around the Confederate periphery, and conducting critically important riverine operations in the west. The navy did have a difficult time tracking down the handful of Confederate naval commerce raiders, although the Union cruiser *Kearsarge* destroyed the *Alabama* off Cherbourg, France, in 1864.

By 1865 the navy had reached a peak of efficiency and was one of the largest in the world. But many of its ships were hastily built or poorly suited for service beyond American coastal waters. Moreover, the immediate post-war decades were years of national reconstruction and introspection during which American naval policy atrophied.

The years 1783-1865 marked a formative period for the U.S. navy. The service's roles and missions were limited, in that the government assigned the navy the roles of safeguarding overseas commercial and diplomatic interests, and not the defending the nation itself. Nevertheless, the navy performed well and earned a reputation for excellence, despite its diminutive size. Over the decades American naval officers gained experience in all the corners of the globe and through their efforts, and those of a handful of competent civilian secretaries, laid the foundation for the establishment of a larger, more powerful, truly national navy in the 1880s and 1890s.

NAVY, U.S.: 1866-1898

Following the 'Civil War, the U.S. Navy suffered a sharp decline for over a decade. American commerce was in a shrunken state, and the country, with little foreign menace, was preoccupied with domestic matters. But in the 1880s a resurgence of "manifest destiny," increased involvement in foreign affairs, and heightened professionalism within the service brought a naval renaissance that culminated in the navy's overwhelming victories during the 'Spanish-American War of 1898.

In 1865, the U.S. Navy, with 471 warships on its roster, ranked as one of the world's largest in numbers, but it was strongly oriented toward coastal and riverine operations. With peace, Congress quickly ended funding for new construction and laid up or sold off the bulk of the Civil War fleet. The principal remaining mission for the navy was to show the flag on foreign stations; its active 'sailing warships, mostly wooden vessels, were prized more for their economy and cruising radius than for their military qualities. The few ironclad monitors retained were overhauled for lengthy periods at great expense, essentially with an eye to keeping the dockyards in existence rather than to strengthening the force. In personnel, the service grew top-heavy with officers (one for every four enlisted men in 1882), and promotion, based entirely on seniority, came to a virtual standstill. As late as 1896, some lieutenants dated their ranks to the Civil War. Enlisted life was so unattrac-

tive that in the late 1870s, the navy averaged 1,000 desertions yearly out its authorized strength of 8,000 men. At the top, the navy was run by a series of political secretaries, some of whom were incompetent or corrupt. Abroad, its reputation so declined that an Oscar Wilde character who lamented that the United States had neither ruins nor curiosities was contradicted by reference to its navy.

Behind this facade of stagnation, the navy made some important advances. The quasi-official U.S. Naval Institute, organized in 1873, initiated the next year the publication of a journal of professional opinion, the *Proceedings*. The pace of reform accelerated in the next decade. In 1882, the Office of Naval Intelligence was established. Two years later, the Naval War College at Newport, Rhode Island, began instruction under its first president, Rear Adm. Stephen B. Luce. One of its early luminaries was Alfred T. Mahan, president in 1886-89 and 1892-93, whose stress on 'war games highlighted for the navy the importance of such disparate items as oil fuel, an isthmian canal, and bases in Hawaii. Mahan's cardinal book, *The Influence of Sea Power Upon History, 1660-1783*, published in 1890 and soon translated into six major languages, established him as the world's foremost naval thinker.

In force structure, the navy began in 1883 to match these quickening steps toward modernization when Congress provided funds for three new steel 'cruisers. This modest program was augmented later in the decade with the authorization of twelve more cruisers and the navy's first big-gun ships, the *Maine* and *Texas*. Early in the 1890s, four 'battleships and three large cruisers followed. The military characteristics of these new steam-powered ships reflected the essentially defensive mission of the service. The battleships were of low freeboard and thus best suited for coastal defense; the cruisers, such as the *Columbia*, possessed high speed and were designed as commerce raiders to hunt down fast passenger liners. The navy also experimented with smaller craft, such as 'torpedo boats and the ram *Katahdin*.

This expansion was stoked in part by a war scare with Chile in 1891, by the resurrection of the American merchant marine, and by rising imperial ambitions. Also, Mahan argued forcefully for the construction of a battle fleet and influenced civilian policymakers such as Secretaries of the Navy Benjamin F. Tracy (1869-93) and Hilary A. Herbert (1893-97). Congress in 1895 and 1896 funded five additional battleships.

Before these could be completed, the steel navy was tested in war with Spain in 1898. Competent prewar preparations by Secretary of the Navy John Davis Long and his assistant Theodore Roosevelt paid dividends at the outset, when Commodore George Dewey moved quickly to defeat the Spanish fleet at the Battle of Manila Bay. Off Cuba, the fleet of Rear Adm. William Sampson won an easy naval victory at Santiago Bay. Materially, the new ships of the navy performed well, with the battleship *Oregon* steaming from the West Coast around Cape Horn to the Caribbean in seventy-one days, arriving in time to play a key role during the Santiago engagement. The Marines impressed observers with their élan and professionalism at Guantanamo Bay, earning the sobriquet from reporters of "first to fight."

The navy's victories in 1898 helped lead to far-flung bases and vast new commitments; the successes also garnered public acclaim, which translated into congressional

support for ambitious construction programs that moved the navy rapidly into the first ranks of the world's powers. The contrast with the demoralized and decrepit service of only two decades earlier was marked indeed.

NAVY, U.S.: 1899-1945

The U.S. Navy matured from a respectable and growing fleet in 1899 to a navy that was incontestably the greatest in the world by the end of World War II. Built initially around the big-gun ship, the navy during World War II shifted its primary focus to aerial warfare and also waged a submarine campaign of unparalleled effectiveness.

Emerging triumphant from the *Spanish-American War (1898), the navy enjoyed generous support early in the century from presidents and the Congress, which yearly funded battleship construction. By 1902, the U.S. Navy ranked third in the world in battle line strength. Its new ships were tested and America's naval might flexed with the cruise of the Great White Fleet of 1907-09. The navy's personnel expanded correspondingly, from 16,000 in 1899 to 60,000 by 1916. With its emphasis on battleships, the navy paid less attention to smaller craft, arguing that those could be built quickly in an emergency. Nonetheless, the service did commission its first submarine in 1900 and led the world in experiments with naval aviation, conducting the first flight from a ship in 1910.

To provide leadership for the growing force, the Naval Academy was completely rebuilt, and the system of officer promotion by seniority was replaced by merit. At the top, the Naval General Board was established in 1900 as an advisory planning body to link the navy's strategy with its force structure. In 1915, Congress established the office of the chief of naval operations to oversee fleet readiness and employment. The next year, Congress authorized the construction of sixteen warships of unprecedented size to give the nation a "navy second to none."

Work on this ambitious program was hardly under way when the United States entered *World War I. Because German U-boats posed the principal menace, the navy, needing *destroyers desperately, suspended the 1916 construction program. During the war, American warships sank few "submarines, but the navy did make significant contributions to the Allied victory by advocating the adoption of the convoy system and by escorting over 2 million army and Marine troops to France without the loss of a single sailor.

Following the armistice, the navy reverted to its emphasis on the big gun, but soon found its building plans stymied when the *Washington Naval Arms Limitation Treaty of 1922 mandated a ten-year moratorium on battleship construction. Despite this setback, the navy worked hard on its long-range gunnery in planning to fight in the Pacific. To that end, it placed great emphasis on aviation, which could provide the necessary spotting and air control. In 1921, the navy created a separate Bureau of Aeronautics, and in 1927 commissioned powerful "aircraft car-

riers of the *Lexington* class. With almost 100 planes each, these ships possessed great striking power, and under the leadership of such air-minded officers as Joseph M. Reeves, William A. *Moffett, John H. Towers, and Ernest J. *King, they became a potent force in their own right. Conversely, the threat of hostile aircraft caused such concern that navy planners made determined efforts to develop efficient anti-aircraft defenses during the 1930s. The navy also experimented with *radar for early warning and aircraft control, with dirigibles and seaplanes for long-range scouting, and with at-sea refueling and replenishment. Given its Pacific focus, the navy built fast long-range submarines armed with an advanced torpedo, although lack of funding prevented adequate testing of this weapon. The Marines, studying the problem of seizing forward bases, focused on "amphibious warfare, a mission that many military analysts deemed impossible.

Increasing tensions of the late 1930s and the outbreak of *World War II in 1939 led to renewed warship construction; following Germany's defeat of France in 1940, the U.S. Navy won funds for essentially unlimited expansion. Before the new vessels entered the fleet, active belligerency brought crises in both the Atlantic and Pacific oceans. The destruction of the battleships at the attack on *Pearl Harbor forced the navy to scrap its plans for an advance with the battle line across the central Pacific; a German submarine offensive along the eastern coast of the United States caught the navy unprepared. But the emergency moved to the fore officers who would guide the fleet to "victory: Ernest J. *King as chief of naval operations, Chester *Nimitz to head the Pacific Fleet, and William F. *Halsey and Raymond A. *Spruance as commanders of fast carrier task forces.

After a slow start, the navy helped win the Battle of the Atlantic against the U-boats with long-range aircraft and blimps, large numbers of specialized antisubmarine ships such as escort carriers and destroyer escorts, "radar in both ships and planes, and code-breaking successes. The navy's victory in this vitally important campaign enabled the U.S. Army and air forces to bring their weight to bear in the European theater with the strategic bombing campaign against Germany and the landings in North Africa, Italy, and France.

In the Pacific theater, the navy recovered rapidly from the Pearl Harbor defeat. Relying of necessity on "aircraft carriers, the navy struck back with raids on Japanese-held territories and on the home islands themselves. Then, in the first carrier battles of the war, the navy fought the Japanese to a draw at the Battle of the *Coral Sea and won a stunning victory at the Battle of *Midway. Quickly going over to the offensive, the navy with its Marine component began at Guadalcanal in August 1942 a series of amphibious operations against a skillful and dedicated enemy defending terrain from jungle to atoll and from the Aleutians to New Guinea. Despite some heavy "casualties, not a single American landing over the next three years was repulsed. Simultaneously, U.S. "submarines were cutting Japanese lifelines. Once their formerly faulty "torpedoes became effective, the submarines inflicted lethal damage on the Japanese war machine by sinking 56 percent of its merchant marine and numerous imperial warships.

In 1944, the navy crushed the Japanese Imperial Fleet in two of the greatest naval battles in history: Philippine Sea and Leyte Gulf. Closing in on Japan, the navy and Marines

secured bases in the Marianas and at Iwo Jima and Okinawa, thereby making possible the B-29 aerial offensive. Despite grievous losses in men and ships to kamikaze aircraft late in the war, the U.S. Navy's triumph was complete. By the end of the conflict, its foes in both oceans had been utterly crushed, and it was bigger than all the rest of the navies in the world combined.

NAVY, U.S.: SINCE 1946

On V-J Day, 1945, the U.S. Navy—the world's largest—had 105 aircraft carriers, 5,000 ships and submarines, and 82,000 vessels and landing craft deployed around the world, manned by experienced citizen-sailors and led by aggressive and seasoned admirals. Arguably the most glamorous, tradition-bound, and elitist of the American armed services, the navy had been given pride of place by President Franklin D. "Roosevelt. Now with no potentially threatening navy in existence, a new president, Harry S. "Truman, who disliked the navy, endorsed the War Department's recommendation for centralization and reduction of the armed forces and ordered the process begun. Thus commenced the most bitter internal political struggle experienced by the U.S. government since the Civil War. On one side were the navy and Marine Corps and their congressional allies, and on the other the Truman White House, the army and the army air force, and their congressional allies. The army wanted the navy under the War Department and the marines integrated into the army. The air force wanted independence from the army and naval aviation put under the air force.

The battle for complete independence was lost by the Navy Department, which was moved under a new Defense Department. The air force gained independence from the army, but failed to obtain control of naval aviation, and the army failed to get the Marines. Largely through the leadership of Navy Secretary James V. "Forrestal, the navy retained much autonomy and most of its roles and missions. To obtain the compromise, Forrestal was named the first Secretary of Defense. After Forrestal's suicide, he was succeeded by Louis "Johnson, who set about reducing the navy with a vengeance. The triumphant 5,000-ship fleet was retired wholesale, the 105 carriers were reduced to six, and the first supercarrier, the USS *United States* under construction at Newport News, was scrapped. That triggered the immediate resignation of Navy Secretary John Sullivan and the public protest in 1949 known as the "Revolt of the Admirals." The lead role in the new nuclear strategy was taken from the navy and its carriers and given to the new air force and its B-36 bomber.

The "Korean War reversed the decline of the navy. Its re-activated carriers provided the bulk of allied air power after all land bases were captured or destroyed in the initial Communist attack. The dramatically successful amphibious

flanking attack at "Inchon renewed the important navy-marine mission of "amphibious assault."

Naval planning and procurement were centered for the next twenty years on the mission of projecting power ashore. Supercarriers were built and new aircraft procured to strike deep into the Soviet heartland from the sea around its periphery. The surge of the "Cold War and adoption of the "containment strategy" launched the navy into a new (and classic) naval mission of "presence."

By the mid-1950s "battleships and carriers were being kept permanently on station in the Mediterranean and were being deployed to trouble spots around the world. A small naval force was now kept permanently in the Persian Gulf in recognition of the new strategic value of oil in a region of volatile politics. Between 1946 and 1996, the navy was deployed in crises short of war 270 times. Crisis deterrence and crisis management have proved to be the most consistent and enduring naval mission throughout the last fifty years.

In pursuit of containment the direct U.S. combat involvement in the "Vietnam War in 1964 began an intense decade of naval combat using virtually every dimension of naval warfare. SEAL team commandos and riverine gunboats engaged in bloody counter-insurgent operations; "destroyers, "cruisers, and for a short time the battleship USS *New Jersey* provided massive naval gunfire supporting land forces; patrol aircraft and surface ships tried to prevent supply of the Communists by sea.

The overwhelming naval task, however, was the use of carrier aircraft to provide air support to land operations in South Vietnam, interdict supply routes to the south, and engage in strategic bombing in North Vietnam. The air war had an enormous impact on the naval service. All other naval missions were subordinated worldwide. Because the U.S. government wished to avoid "wartime" budgets, the navy consumed its capital, forgoing necessary maintenance of ships and equipment, much research and development, and quality-of-life expenditures. When combat operations ended in 1973, the navy was in very poor condition. Morale was corrosive, with mutinies breaking out on three capital ships, and the officer corps cynical about the constraints under which they had fought. Ships and aircraft were in disastrous condition after deferred repairs.

Chief of Naval Operations (CNO) Elmo "Zumwalt and his successor James Holloway carried out a program of dramatic reforms to rebuild the navy for the post-Vietnam War era. Planning focus was shifted away from projecting power ashore to dealing with the enormous new Soviet blue water fleet that had taken shape during the 1960s under the forceful Soviet Adm. Sergei Gorskikh, who was intent on achieving maritime superiority over the United States and "NATO. The post-Vietnam, post-Watergate defense cuts made rebuilding the U.S. Navy a difficult challenge. Zumwalt decided to retire some 500 ships to save the huge deferred cost of maintaining them, and directed funding instead to new ships and weapons to regain sea-control credibility. Zumwalt later expressed the considered judgment that had war with the Soviets broken out during this period, the United States would have been defeated at sea. The arrival of the administration of President Jimmy "Carter further slowed the renewal effort, with adoption of a security policy, PRM 10, that relegated the navy to a secondary role.

Modernization was cut back, pay frozen, and in 1979

the president vetoed the defense bill because Congress had authorized a new nuclear aircraft carrier. There was very nearly a repeat of the "Revolt of the Admirals," when the CNO, Adm. James Holloway, refused to testify that the navy could continue to do its mission.

President Ronald *Reagan had campaigned on a promise to build a "600-ship navy," to restore "maritime supremacy." Immediately after his inauguration naval shipbuilding and aircraft procurement were nearly doubled, pay was substantially increased, and weapons modernization was intensified. Navy Secretary John Lehman and CNO James Watkins led the development of an assertive new forward naval strategy to put the Soviet navy on the defensive and convince the Soviets they would lose a naval war decisively. Massive annual naval exercises were held annually in sea areas close to the Soviet Union. By 1987 the U.S. Navy had ordered more than 200 new combatants including 5 nuclear carriers and had 592 ships in commission, including 4 recommissioned battleships. During this period the navy was engaged in sustained operations in the Persian Gulf, the Mediterranean, Lebanon, and Grenada. Three confrontations off Libya including the shooting down of four Libyan aircraft, and air strikes against Tripoli and Benghazi and the dramatic air intercept of the "Achille Lauro" terrorists. The culmination of this naval renaissance was reached with the unexpected collapse of Soviet communism, and the disintegration of the 1700-ship Soviet fleet.

The aftermath of the Cold War victory once again brought difficult times for the navy. The disruptions of integrating women into combat roles, sharply reduced budgets, and leadership turmoil (from 1987 to 1995, five new secretaries of the navy were named and fourteen admirals were fired) made the navy a whipping boy for the media and Congress. Despite the political trauma, the navy played a vital role in shielding Saudi Arabia after Iraq invaded Kuwait, transporting the massive Desert Shield buildup and then conducting surface, submarine, and air operations during Desert Storm in the *Persian Gulf War.

A new post-Cold War strategy was also developed that focused planning once again on projecting power ashore. The innovations were applied in peacekeeping operations in Somalia in 1993, Haiti in 1994, Bosnia in 1995, and Yugoslavia in 1999.

NAVY COMBAT BRANCHES

Surface Forces
Submarine Forces
Naval Air Forces

NAVY COMBAT BRANCHES: SURFACE FORCES

Until the twentieth century, surface warfare was naturally the focus of the U.S. Navy. The navy's force structure was built around major surface warships: the frigates of the 1794 program, the ships of the line after the *War of 1812,

the monitors of the *Civil War era, and, beginning in the 1880s, the *cruisers and the *battleships. Missions for these naval vessels included commerce raiding, trade protection, coast defense, and sea control. In the 1890s, a smaller type, the destroyer, emerged to shield larger vessels from enemy *torpedo boats; it soon undertook myriad other tasks.

Following the turn of the century, radical technological advances embodied in the aircraft and *submarine began to challenge the primacy of the surface combatant. Although the navy incorporated both innovations into its fleet structure by the end of *World War I, the battleship remained the "backbone of the fleet." For able officers, the swiftest path to advancement remained duty aboard large surface warships. Top midshipmen at the U.S. Naval Academy took seriously the aphorism, "Get behind the big guns and stay there."

*World War II overturned this long-standing system. The successes of submarine forces, while serious enough, paled in comparison with the rising challenge of the aircraft, whether sea- or land-based. The navy's building programs, initially centered around the battleship and cruiser, were redirected in mid-course to emphasize *aircraft carriers. Although surface warships still proved quite useful, both in sea control and in a variety of subsidiary roles, the carrier by 1944 was unquestionably the single most important type of combatant. Many ambitious junior officers of the surface line put in for flight training.

The drawdown following V-J Day reflected these changing priorities, with most of the battleships and cruisers going to the breakers or into "mothball" storage; destroyers remained operational in substantial numbers, principally for their utility in the antisubmarine mission. For the next decades, the carrier ruled supreme within the navy, although the Korean War showed again the indispensability of surface warships for shore bombardment and blockade work. Surface warriors also found a champion in Arleigh *Burke, Chief of Naval Operations (CNO) from 1955 to 1961. Burke, a former destroyer officer, advanced an ambitious program to update the surface navy by a large building program of new ships equipped variously with anti-aircraft *missiles for the defense of carriers, with *helicopters for anti-submarine work, and with nuclear powerplants for propulsion.

Despite these gains, the 1960s dealt harshly with the surface navy. Early troubles with this costly new technology rendered the new combatants of questionable worth; at the same time, Vietnam deployments wore out older warships and deprived the fleet of funding for replacements. More ominous, the lethality of Soviet antiship missile, as demonstrated by proxy in the 1967 six-day Arab-Israeli conflict, threatened—as had *torpedoes and the aircraft in earlier decades—the very survival of surface warships.

In 1970, another surface warfare officer, Elmo *Zumwalt, Jr., became CNO. Zumwalt began or accelerated a number of initiatives: innovative warships propelled by gas turbine engines; the Harpoon and Tomahawk missiles to give cruisers and destroyers extended reach against sea and shore targets; and advanced air defense capabilities (such as the Standard air defense missile, the Phalanx point-defense gun, and the computerized Aegis weapons control system).

Mirroring the renaissance of surface warfare in the 1970s was the creation of a distinctive branch insignia and

an organizational restructuring within the Navy Department to give surface forces an institutional voice equal to those of the aviation and submarine branches. Additionally, the navy's mine, amphibious, and service elements were fused with the cruiser/destroyer/frigate forces; the establishment of the Surface Warfare Officer School at Newport, Rhode Island, enhanced professionalism.

The surface navy continued to prosper during the Reagan and Bush years. Returned to active duty were the four Iowa-class battleships armed with cruise missiles. New cruisers and destroyers of the Yorktown- and Arleigh Burke-classes went to sea equipped with the Aegis system. During the Persian Gulf War, surface warships demonstrated their versatility by conducting long-range missile strikes, shore bombardment, and blockade duties. In 1999, the surface navy launched missiles from the Adriatic Sea as part of 'NATO measures against Yugoslavia during the 'Kosovo Crisis.

At the close of the century, surface warfare, lost for much of the century in the shadows of the air and subsurface specialties, had been rejuvenated. With the navy's new emphasis on littoral warfare, surface warships promise to remain an essential and viable component for the foreseeable future. Thus, the oldest branch of the navy has learned to cope with a host of threats; its motto, "Up, Out, and Down," succinctly describes the capabilities that surface forces continue to offer the nation.

NAVY COMBAT BRANCHES: SUBMARINE FORCES

The modern U.S. Navy's first submarine, named in honor of its designer, the Irish-American inventor John P. Holland, was commissioned on 12 October 1900. The 54-foot *Holland* and the succeeding thirty-one submarines completed through early 1915 were capable of carrying only a handful of 'torpedoes, had limited endurance on the surface (and even less when running submerged on their batteries), and were considered fit only for harbor defense duties. They played little part in the doctrine or strategy of a U.S. Navy focused on the great power theories of Alfred T. Mahan. Most of the tiny, dangerous submarines, under the command of junior officers, were exiled to the Philippines and Panama.

Of the twenty-three U.S. Navy submarines sent to European waters during World War I, none had the opportunity to attack an enemy vessel. The war ended with a large number of still primitive submarines under construction, and their sheer numbers meant that few new submarines would be built in the 1920s—an era of treaty-mandated force reductions and in a climate where submarine attacks, especially against merchant ships, were unpalatable. Nonetheless, the U.S. Navy studied German submarine designs and attempted to adapt the superior German diesel engines to a series of unsuccessful large experimental "boats" that were intended to act in concert with the battle fleet.

Unreliable diesel engines remained a problem until the late 1930s, when railroad diesel engine designs were adapted to submarine propulsion, providing the reliability

and endurance that later allowed submarines operating from Hawaii, Australia, and the Aleutians to stay for extended periods in Japanese home waters. Problems with torpedo exploders, however, took longer to be recognized and corrected, and it was not until well into 1943 that submariners could expect their weapons to detonate reliably.

The trial-and-error experiences of the first four decades of submarine operations nonetheless paid off handsomely in the war against Japan: for a loss of 52 submarines (and 3,506 personnel), U.S. Navy submarines sank a confirmed 1,314 Japanese ships totaling some 5.3 million tons; among these were 1 battleship, 8 'aircraft carriers, and 11 'cruisers. In the Atlantic, however, only 113 war patrols were made, and no enemy ships were sunk or damaged.

The Cold War era initially saw innovative attempts to adapt German concepts such as the snorkel (which permitted submerged operations on the diesels while charging the batteries); improved hull forms; and better batteries, sensors, and homing torpedoes to the large numbers of "fleet boat" submarines left over from wartime construction. The growing Soviet submarine force became the prime prospective target of its U.S. counterpart, and operations against surface targets gradually became secondary.

Diesel-electric submarines, however, were still limited in submerged endurance, and when running on their diesels were subject to detection by increasingly sophisticated anti-submarine sensors. The solution, forcefully advocated by Hyman 'Rickover, was the development of nuclear power for submarines, giving endurance limited only by the submarine's food supplies (oxygen could be regenerated by the electrical power available from the nuclear reactors) and sustained speeds rivaling those of the fastest surface ships. Rickover's creation, the USS *Nautilus* (SSBN 571) was commissioned on 30 September 1954, and some 195 additional nuclear-powered submarines have since been ordered. The last diesel combatant submarine was retired in 1990.

Experiments with adaptations of the German V-1 cruise missile led to the deployment of a limited number of Regulus-I strategic 'missiles on navy submarines in the late 1950s, but it was the synthesis of the nuclear-powered submarine and the submerged-launched Polaris ballistic missile that gave the submarine force an entirely new strategic mission as one leg of the nation's nuclear 'deterrence triad; USS *George Washington* (SSBN 598) completed the first Polaris missile patrol on 21 January 1961. Later, the longer-ranged Poseidon replaced Polaris, and USS *Ohio* (SSBN 726) completed the first multiwarhead Trident missile patrol on 10 December 1982.

The submarine force at the turn of the century faces fiscal constraints and a crisis of vision. The vastly increased costs of building, operating, and maintaining nuclear-powered submarines, balanced against the drastic reduction in the Russian submarine fleet, have inspired the U.S. submarine "community" to investigate new missions and capabilities for its smaller fleet of the future.

NAVY COMBAT BRANCHES: NAVAL AIR FORCES

Naval aviation has been an integral component of the U.S. Navy's administrative and operational structure because the fleet's aircraft have been long-range extensions of the traditional naval gun and scouting ship. Eventually, the navy's air forces dominated policy, strategy, and force structures as they extended their direct influence throughout the service—personnel, training, ordnance, "logistics, shipbuilding and maintenance, medicine, navigation, "submarine warfare, and the "Marine Corps. This ascendancy generated stresses within the U.S. Navy—and controversy with the army's air forces and later the U.S. Air Force—over strategic roles and missions and the competition for funding.

Initially, in 1910-16, a director of aviation activities, a captain, supervised the few dozen navy planes and pilots until America's entry into World War I. The need to patrol the coastal waters of Europe and North America against Germany's U-boats and to bomb their bases led to a strengthened directorship in 1917. The director wielded immense authority over naval aviation's wartime expansion to 2,107 aircraft; 15 dirigibles; 205 kite and free balloons; 6,998 officers, mostly pilots; 32,882 enlisted men, some pilots; 31 air stations in Europe and 24 in the United States. The navy's aviation proved so essential to victory that postwar personnel strength was set at 500 officers and 5,000 enlisted men. Patrol seaplanes and dirigibles were employed in reconnaissance roles; land-based planes assigned to "battleships to scout and spot gunfire; and an experimental aircraft carrier commissioned. Major recognition came with the creation of the Bureau of Aeronautics, headed by a rear admiral, in 1921.

Under the inspired leadership of the first chief of the Bureau of Aeronautics, Adm. William A. "Moffett (1921-33), the navy's air forces were integrated into fleet operations in anticipation of war with Japan. The two major aviation components became the carriers and land-based and amphibian patrol-bombers. Depression-era budgetary constraints did not deter Moffett and his successors from forging a qualitatively advanced naval air force centered on seven aircraft "carriers and five patrol wings during the interwar period. A civilian assistant secretary of the navy for aeronautics facilitated progress in 1926-32, and again after 1941.

The immense expansion of fleet aviation for World War II was brilliantly managed by Adm. John H. Towers (chief of bureau, 1939-42). It attained an eventual strength of over 36 attack carriers, 84 escort carriers, dozens of seaplane tenders, numerous training bases and air stations; 40,912 aircraft, 139 blimps, and 27 "helicopters; 60,095 pilots (navy and Marine), 33,044 nonflying officers, and 337,718 nonflying enlisted sailors. Such growth led in 1943 to the new post of deputy chief of naval operations (Air), held by a vice admiral. The primary role of naval aviation in the destruction of Japan's Imperial Fleet and Germany's U-boats established it at the center of the postwar navy.

During and after the "Cold War, aviators occupied the post of chief of naval operations (CNO) and were commanders or deputy commanders of the Atlantic and Pacific Fleets. The deputy CNO (Air Warfare, after 1971) remained the highest aviation billet. At the technical and logistical level, the Bureau of Aeronautics merged with the Bureau of Ordnance to become the Bureau of Weapons in 1959; its chief was a naval aviator. Simultaneously, the of-

fice of assistant secretary (Air) was discontinued. In the Navy Department reorganization of 1966, the Naval Air Systems Command superseded the Bureau of Weapons. With the aircraft carrier as the focus of its strategy, the Cold War navy countered the Soviet navy and projected its power over land and sea during limited wars and confrontations in Korea, Vietnam, and the Middle East. Attack carrier strength varied between twelve and fifteen, augmented by land-based patrol planes and antisubmarine and helicopter carriers. The 1980 overall naval-Marine aviation personnel strength was typical for the post-Vietnam period: 160,675, of whom 12,774 were pilots. The navy's air forces have remained a major component of the nation's global "peacekeeping forces since the end of the Cold War.

NAVY SEALS. See Special Operations Forces: U.S. Navy Seals.

NEUMANN, JOHN VON (1903-1957), pioneer of computation; founder of "game theory. Von Neumann's wide-ranging genius shaped more scientific and technological fields than probably anyone of the century. Born in Budapest, he made basic discoveries in set theory, algebra, and quantum mechanics. In 1930, he moved to Princeton University and, as war loomed, turned to "weaponry, studying the mechanics of shock waves for the optimal height of explosion attacking a structure. For the "Manhattan Project, he researched the implosion trigger for an atomic bomb.

Von Neumann's pervading contribution was promoting computers for military and scientific research. As the United States entered World War II, computers were primitive. Typically used to calculate mathematical tables, they required operators manually to plug in connector cables for each task. Von Neumann's group put the commands controlling the computer's action sequence into its electronic memory, making it fast and flexible. In 1951, a computer simulated the triggering of the first thermonuclear explosion. Von Neumann pioneered the abstract study of computation, with his British student Alan Turing, and founded game theory, used to analyze "deterrence and escalation.

His postwar military work was driven by an abhorrence of communism, but he avoided the excesses of McCarthyism, testifying in support of J. Robert "Oppenheimer. Under President Dwight D. "Eisenhower, he oversaw the development of the first U.S. intercontinental "missiles. Von Neumann preferred behind-the-scenes influence to the popular celebrity of an Albert Einstein or an Edward "Teller, and his wide grasp of science and technology made him adept in that role.

NEUTRALITY was among the predominant principles of U.S. foreign policy from the Revolutionary War until 1941, reflecting a national determination to avoid involvement in other nations' wars. In the twentieth century, and particularly since U.S. entry into World War II, rigid neutrality has been seen as bad, even "immoral," as the United States has sought to exercise world leadership. The definitions of neutrality have varied as the United States has sought to integrate it with other policies.

The first English settlers in North America found themselves constantly at war under the doctrine of "no peace beyond the line," a diplomatic principle that allowed European states to remain at peace to the east of a north-south line 370 leagues west of the Cape Verde Islands, while placing no restrictions on military action to the west of that boundary. Those engaged in Spanish, French, and Dutch "privateering held that the English colonies were fair game even when their nations were officially at peace. When King William's War began in 1689, many colonists were indifferent to whether William III or James II ruled England, but reciprocal raids made neutrality difficult. There were local live-and-let-live agreements, the most successful between New York and Canada during Queen Anne's and King George's Wars. Generally, however, the colonists rallied to king and country as war followed war in Europe from 1689 to 1763.

Benjamin Franklin was among the first to note that the British North American colonies had developed common interests distinct from those of London. The colonists hardly objected to fighting: when the Seven Years War began officially in Europe in 1756 it had been going on for two years in the Ohio Valley. But Americans, who saw every reason to destroy the French empire in America, saw no reason to fight so that Prussia could rule Saxony in Europe.

Thus, a decade before independence, the colonists had developed a concept of neutrality in regard to European wars. This idea had many roots: a realpolitik definition of national interest; a commitment to trade; a notion of American exceptionalism; a legalist view of the rule of law among nations. Yet these emerged from the central idea that Americans, while ready to fight in causes that concerned them, should recognize that most world disputes did not. Instead, America would benefit by detachment from such conflicts while trading under a broad definition of neutral shipping rights.

By 1775, neutrality was a fundamental assumption of revolutionary ideology. The Continental Congress's Model Treaty of 1776 called for commerce and neutral rights without political commitments. Congress abandoned this ideal to sign an alliance with France in 1778, but the goal of isolation from European conflicts remained. When Russia organized an "armed neutrality" in 1780, the United States failed to join only because a belligerent, by definition, would not join a league of neutrals.

International recognition of U.S. independence in 1783 after the Revolutionary War left the new nation with contradictory commitments to neutrality and to France. This contradiction became critical in 1793, when Europe again went to war. On 22 April, President George Washington

proclaimed neutrality, then set out to define it. Secretary of the Treasury Alexander Hamilton favored restricting neutral rights to ease relations with Britain, while Secretary of State Thomas Jefferson favored strict enforcement of neutral rights, which would aid France.

Washington tried to navigate between belligerents, publicly claiming to honor the French alliance while violating its definitions of neutrality by concluding Jay's Treaty in 1795. He insisted that the United States had a right to non-contraband trade despite friction with Britain. In his farewell address of 1796, Washington argued that Europeans had interests distinct from those of the United States: the proper policy of which was to trade widely, have as little political connection to Europe as possible, and grow strong by avoiding Europe's inevitable quarrels.

Washington's advice guided his successors. John Adams fought the Undeclared Naval War with France; Thomas Jefferson conducted economic warfare while warning against "entangling alliances"; and James Madison fought the War of 1812. Each showed tactical flexibility, but upheld the principle of neutrality. Adams allowed British and American warships to cooperate, but rejected high Federalist demands for an Anglo-American alliance to conquer a Caribbean Empire. Jefferson threatened a British alliance, but purchased Louisiana instead. Madison went to war with Britain, but refused alliance with Napoleon. Even when they used force, they did so to defend American neutrality.

James Monroe redefined this policy in 1823 with a doctrine that divided the world into an eastern hemisphere, where European rules would apply, and a western hemisphere, where American rules would prevail. America's rules included an end to European colonization and interference. The United States welcomed trade with the Old World, but not political ties with it. In Europe's conflicts the United States would remain neutral, trading with all according to its broad definition of neutral rights.

The American Civil War caused some rethinking for a United States concerned not with avoiding involvement in the wars of other nations but rather with preventing European intervention in its own internal conflict. President Abraham Lincoln initiated a blockade of the South that disregarded a century of maritime rights precedents. The success of the blockade played a major role in preservation of the Union.

The end of the Civil War left the United States reunited, still committed to neutrality in the abstract, and eager to forget its recent enforcement of broad belligerent rights. The nation maintained its neutrality through Europe's late-nineteenth-century wars, but found itself drawn into great power rivalries in East Asia as its economic interest in China conflicted with its determination to avoid political entanglements. Annexation of Hawaii and the Philippines in 1898 carried the American flag across the Pacific, and Secretary of State John Hay's "open door" notes of 1899 and 1900 reaffirmed U.S. policies of commerce with all, political involvement with none. But with U.S. troops helping Europeans and the Japanese to suppress the Boxer Rebellion in China, the strains between neutrality and reality were obvious.

These strains became even more evident under President Theodore Roosevelt. His definition of U.S. neutrality during the Russo-Japanese War favored Japan. His personal intervention with German Kaiser Wilhelm II helped

to determine the outcome of the 1906 Moroccan crisis in favor of France. Roosevelt talked of neutrality but believed a balance of power in Europe and Asia served the national interest, and he acted on that belief even when it violated traditional policies.

This pattern of neutral rhetoric but unneutral action continued under President Woodrow Wilson. Though he proclaimed U.S. neutrality in August 1914, Wilson's policies favored Britain over Germany in World War I, allowing sales of munitions, credits to belligerents, and travel on belligerent ships, but restricting German submarine warfare. Wilson protested but did not take similar action against British violations of U.S. neutral rights, such as the illegal seizure of food, cotton, and other American exports to the central powers and European neutrals. By recognizing the British blockades but not those of Germany, Wilson placed the United States from 1914 to April 1917 in legal limbo, as a non-neutral nonbelligerent.

World War I left the United States caught between two visions of the world. One was its traditional policy: trade with all but political entanglement with none outside the Americas. Wilson presented another: the United States must lead a new international order in which neutrality would be inconceivable. The heart of this order would be the League of Nations, which Wilson wrote into the Treaty of Versailles in 1919.

The American people received the League's covenant with deep ambivalence. Many were simply confused. The popular groundswell the administration counted on to push the treaty through a partisan Senate never developed. Wilson himself killed any compromise. The Senate defeated the treaty and the people sealed its defeat in the 1920 election.

The Republican administrations of 1921-33 publicly reaffirmed their commitment to neutrality, repudiating the League in favor of a policy of commercial expansion and political nonintervention. Yet they found themselves caught in a web of existing commitments. Commerce and politics were not so easily separated in an increasingly interdependent global economy.

While the difficulties of returning to neutrality were becoming evident to American statesmen, the demand for such a return was growing among the American people. By the 1930s, many Americans believed that participation in World War I had been a mistake. To avoid a repetition, many supported congressional passage of neutrality laws. Wars in Spain, Ethiopia, and the Far East raised moral questions about U.S. neutrality, however, and disagreement between those who favored a return to traditional definitions of neutral rights and those who favored abandonment of neutrality altogether divided the movement, allowing President Franklin D. Roosevelt to eliminate many objectionable provisions. But the "Neutrality Acts of 1935, 1936, and 1937 nevertheless represented a repudiation of Wilsonianism.

Although Roosevelt publicly supported these acts, he complained privately that they limited his authority. In November 1939 he secured passage of a modified Neutrality Act, which allowed him to begin supplying arms to nations fighting Germany and Japan in World War II. Over the next two years he eroded neutrality by trading surplus destroyers to the British, providing massive amounts of equipment under the Lend-Lease "Destroyers-for-Bases Agreement, and using the U.S. Navy to convoy Allied ships

in the North Atlantic. By 1940, U.S. policy was again in a legal limbo, neither belligerent nor neutral.

World War II saw the end of neutrality as a principle of U.S. foreign policy. President Roosevelt forged a bipartisan coalition behind U.S. membership in the "United Nations. Under the UN charter, the major powers have an obligation to maintain or restore peace, by collective force if necessary. In the postwar world, the United States emerged as the major economic and military power. During the "Cold War confrontation with communism, particularly in the Soviet Union and China, the U.S. government abandoned neutrality for an active policy of containment. In pursuit of that policy, it ended the century-old policy of avoiding prewar military alliances by organizing the North Atlantic Treaty Organization ("NATO) and pledging U.S. military forces to defend Western Europe and, through other commitments, numerous regions of the globe in defense of U.S. "national security in the nuclear age.

The NEUTRALITY ACTS were laws passed in 1935, 1936, 1937, and 1939 to limit U.S. involvement in future wars. They were based on the widespread disillusionment with World War I in the early 1930s and the belief that the United States had been drawn into the war through loans and trade with the Allies. "Isolationism was particularly strong in the Midwest.

Congressional proponents of neutrality legislation sought to prevent similar mistakes. The 1935 act banned munitions exports to belligerents and restricted American travel on belligerent ships. The 1936 act banned loans to belligerents. The 1937 act extended these provisions to civil wars and gave the president discretionary authority to restrict nonmunitions sales to a "cash-and-carry" basis (belligerents had to pay in advance then export goods in their own ships). (These bills were signed and publicly applauded by President Franklin D. "Roosevelt, although he complained privately that they limited presidential authority.) The 1939 act, passed with President Roosevelt's active support in November under the shadow of the European war, banned U.S. ships from carrying goods or passengers to belligerent ports but allowed the United States to sell munitions, although on a "cash-and-carry" basis. Roosevelt further eroded neutrality over the next two years, trading surplus U.S. "destroyers to Britain for access to naval and air bases and providing U.S. military equipment to enemies of Germany and Japan under the "Lend-Lease Act. Congress repealed the Neutrality Acts on 13 November 1941.

Although seen as the high tide of interwar isolationism, the neutrality legislation of 1935-37 had minimal impact on U.S. defense planning. The 1939 act encouraged combat testing of U.S. equipment by Allied forces, but also created shortages as U.S. production initially was unable to meet requirements of both Allies and expanding U.S. forces.

NEWBURGH "CONSPIRACY" (1783). Following victory at the Battle of "Yorktown in October 1781, George Washington's army returned to the Hudson Highlands to stand watch over the British garrison at New York City, forty-five miles downriver. The Revolutionary War now entered a new phase in which the army seemed to Congress to absorb scarce money and supplies for no immediate purpose. Moreover, some Americans worried that an idle standing army might overthrow civilian control and sought to keep it under tight supervision. Increasingly marginalized, the army's officers brooded about their lack of pay, food, clothing, pensions, and respect from the public.

The crisis in civil-military relations came in early March 1783 when an anonymous address circulated at army headquarters at Newburgh, eight miles north of West Point, threatening that the army would not disband at the end of the war if its financial demands were not met or that it would refuse to fight if the war continued. The address called for a meeting of officers on 11 March; Washington, who knew the officers' concerns were legitimate but who also understood the need to maintain order and discipline, issued his own call for a meeting for 15 March, transforming an irregular proceeding into an official airing of grievances.

At that meeting, Washington entreated his officers not to "lessen the dignity and sully the glory you have hitherto maintained" and produced a letter from a Virginia congressman that attempted to explain Congress's problems in meeting the army's financial demands. Beginning to read, he stumbled over the tightly written words, and drawing out his eyeglasses, reportedly "begged the indulgence of his audience," observing that "he had grown gray in their service, and now found himself growing blind." No other words could have reminded the officers so effectively that, if anyone had a right to be frustrated with Congress, it was Washington. If he was willing to trust Congress's goodwill, so should they. The so-called conspiracy collapsed immediately.

There is reason to doubt the seriousness of the officers' threat to civilian control of the military. While they had cause to complain about a dilatory and pusillanimous Congress, they were members of the same society, with no real prospects but a return to their homes and former employments when the war ended. There is, however, no reason to doubt the power of Washington's leadership. At Newburgh, he reasserted the principle that Congress controls the army, the cornerstone of the American military tradition.

NEW GUINEA CAMPAIGN (1942-44). Probably few of the 685,407 Americans sent to the Southwest Pacific Area

(SWPA) through 1944 knew much about New Guinea prior to Japan's attack on "Pearl Harbor—initiating the American entrance into World War II. Nevertheless, the New Guinea campaign began in summer 1942 when Japan attempted to isolate Australia through an overland attack from Buna to Port Moresby. This attack resulted in the first American action on that mountainous and jungle-covered island. After the Australians successfully defended Port Moresby along the Kokoda Trail, U.S. forces launched an unsuccessful strike against the Japanese at Buna on the island's northern coast. Impatient with the lack of progress, Gen. Douglas MacArthur, chief of SWPA, replaced the commander, Maj. Gen. Edwin Forrest Harding, with Lt. Gen. Robert L. Eichelberger, who initially fared no better. However, MacArthur pushed Eichelberger onward, and the enemy force was finally defeated on 22 January 1943 through a grueling battle of attrition.

After the Buna campaign, MacArthur created the Sixth U.S. Army under the command of Lt. Gen. Walter Krueger. Although historians have largely overlooked Krueger's overall role in New Guinea, he coordinated the various services and developed operational plans that made MacArthur's strategy a success.

Krueger's first order was an attack on Saidor in January 1944 as part of an effort to seize the Vitiaz Strait. Next, MacArthur wanted Hansa Bay, but intercepted and decrypted Japanese Army messages (through "ULTRA") tipped off SWPA leaders that the Japanese were expecting a landing there. So, he directed Krueger to seize Hollandia in April 1944. Thus began a string of amphibious assaults along the northern coast of New Guinea. Following Hollandia came Wakde and Biak in May 1944, and Noemfoor and Sansapor in July 1944. By the fall of 1944, the Sixth Army had secured New Guinea sufficiently to invade the Philippines.

Both sides invested heavily in the campaign. The Japanese committed 180,000 men, while the Allies employed five Australian divisions and six American divisions. The Americans suffered approximately 16,850 "casualties and the Australians over 17,000. The Japanese lost the most, with 123,000 killed.

The New Guinea campaign was important for several reasons. It protected Australia and provided a stepladder for the liberation of the Philippines; it demonstrated the valuable role of Krueger; it illustrated the American strategy of leapfrogging, one that emphasized bypassing Japanese strongholds while capturing less defended areas; and it reflected MacArthur's obsessive desire to return to the Philippines as quickly as possible.

NEW ORLEANS, BATTLE OF (1815). This encounter concluded the "War of 1812 against the British. Approxi-

mately 5,300 British regulars under Maj. Gen. Sir Edward Pakenham, accompanied by naval forces under Vice Adm. Sir Alexander Cochrane, attacked New Orleans to relieve American military pressure on Canada and improve Great Britain's position in peace negotiations. Major Gen. Andrew *Jackson opposed them with a force of about 4,700 drawn from the U.S. Army, the free colored population of New Orleans, the militias of Kentucky, Louisiana, and Tennessee, and the pirates of Barataria.

Three lesser engagements preceded the battle. On 23 December 1814, Jackson attempted to drive the British off, and on 28 December and New Year's Day, Pakenham probed Jackson's defenses with a reconnaissance in force and an *artillery attack. On 8 January 1815, Pakenham assaulted Jackson's line on the east bank of the Mississippi, making a secondary attack on his position on the west bank. The latter succeeded, but the main attack failed as Jackson's artillery fired grapeshot and canister shot into the advancing British line. British losses amounted to 2,400 *casualties and prisoners; the Americans lost about 70 men.

Since the Treaty of Ghent, ending the war, had been signed on 24 December 1814, the battle's impact was symbolic, but nevertheless significant. It reinforced the legend of the volunteer American *citizen-soldier, made Jackson a national hero, and contributed eventually to his election as president in 1828.

NEW ORLEANS, SIEGE OF (1862). Anxious to control the Mississippi River early in the Civil War, the Lincoln administration sent an expedition to the Gulf of Mexico after efforts to descend that waterway failed. Capt. David *Farragut commanded the Union naval contingent, Maj. Gen. Benjamin F. *Butler the army. Their concentration at Ship Island caused Confederate authorities mistakenly to believe their objective was Mobile or Pensacola. Thousands of troops were withdrawn from New Orleans, leaving less than 5,000 militia when Farragut entered the Mississippi.

On 8 April, Farragut assembled his fleet of 14 wooden vessels, mounting about 200 cannon, and 29 mortar schooners. Blocking Farragut's path were 500 Confederates and 80 cannon in Forts Jackson and St. Philip; a chain barricade across the river; and naval vessels. This fleet consisted of three ironclads (the ram *Manassas*, the underpowered *Louisiana*, and the unfinished *Mississippi*), twelve armed wooden vessels, seven tugs, and some fire rafts.

On 18 April, Union mortars began bombarding the forts. Disregarding orders to wait until the forts were silenced, Farragut got under way at 2:00 A.M. on the 24th. Twenty-one vessels cleared the gauntlet. In a wild melee, they destroyed the Confederate fleet, losing only 1 vessel and 171 sailors killed or wounded. Confederates ashore suffered fewer than 50 *casualties.

After detaching two vessels to support Butler's movement ashore, Farragut proceeded upriver and captured New Orleans on the 25th. Confederate Maj. Gen. Mansfield Lovell evacuated the city to prevent its destruction and civilian authorities formally surrendered the city on the 28th. A mutiny in the forts forced Brig. Gen. Johnson

K. Duncan to surrender them the same day. On 1 May, Butler's troops occupied New Orleans.

Farragut's victory gave the Union control of the lower Mississippi. A court of inquiry cleared Lovell; it blamed the disaster on the Davis administration for reducing the garrison and failing to unite all naval forces under Lovell.

NEWS MEDIA, WAR, AND THE MILITARY. From the earliest days of the republic, American leaders encountered difficulties trying to balance the need for secrecy in diplomatic and military affairs with America's tradition of a free and independent press. As early as 1792, Secretary of State Thomas *Jefferson wrote to President George *Washington that "No government ought to be without censors and where the press is free, no one ever will." Yet, only three years earlier, Congress passed a statute requiring each department to establish regulations for the custody, use, and preservation of official documents. That seemingly innocuous statute implicitly included rules for classification and censorship. The imposition of such rules has been especially important during periods of international crisis and war when citizens have been asked by presidents, who controlled the flow of government information, to surrender their lives and treasure to defend national security. Looking over America's military past, many observers would agree with Senator Hiram Johnson (R-Calif.) who said in 1917 that "The first casualty when war comes is truth."

Obviously, few citizens in any nation approve the publication in wartime of information about troop movements and military strategies that would help their enemies defeat their fighting men and women. Not all citizens agree about the necessity of government suppression or censorship of journalists or those opposed to war who allegedly give aid and comfort to the enemy by criticizing presidents or generals or organizing antiwar groups.

This was the case with the first major assault against free speech and the free press in the United States, the Federalists' controversial Sedition Act of 1798, which made it a crime to write or speak against the president or Congress in a defamatory way during the Undeclared Naval War with *France. However, during that "Quasi-War" and subsequently the *War of 1812, commodores and generals did not have to worry about war correspondents. Military officials controlled the channels of communication in the combat theaters. Whatever appeared in newspapers—sometimes weeks or even months after the events—was little more than the sort of propagandistic official war dispatches that had recently been perfected in France by Napoleon, although Andrew *Jackson did institute censorship for a brief period early in 1815 after he occupied New Orleans. It was not until the *Mexican War that the wartime relationship between journalists and the government began to assume its contemporary shape.

Because of the development of high-speed printing presses in the 1840s, the "penny press" could be produced rapidly and cheaply in large numbers. Newspapers like the *New York Morning News* and the *New York Herald* competed with one another for jingoistic readers and thus

contributed to the spirit of "manifest destiny"—a slogan coined by the *Morning News's* John L. O'Sullivan—that swept over the nation.

The development of the telegraph and other improvements in land and sea transportation soon made it easier to bring news from afar to major urban areas. Nonetheless, because telegraph lines did not reach south of Richmond during the 1840s, it still took as much as three weeks or more for news from Mexico to arrive in Washington and New York, via New Orleans and the sea. All the same, the war in Mexico was the best-covered war to date as journalists like the dashing George V. Kendall did not have to put up with censorship and often fought in battle alongside the men about whom they were writing.

For the emerging profession of war correspondent, the war was just a warmup for the Crimean War and the Civil War, where modern problems of censorship on the battlefield first appeared. At the start of the Civil War, Abraham Lincoln placed the telegraph lines in Washington under federal control, but allowed journalists free rein elsewhere. Because of major divisions in the North, the policy changed in February 1862 when Lincoln took control of all telegraph lines and ordered the U.S. Postmaster General to deny the use of mail service to disloyal newspapers. Operating under that order, Lincoln's agents completely suppressed several Democratic newspapers and imprisoned editors.

Northern newspapers and illustrated magazines sent 500 correspondents and a few illustrators into the field, almost all of whom supported the Union cause. The same could be said for their 100 Southern counterparts, most of whom did double duty in the Confederate army. Due to self-censorship as well as official censorship, reporters underestimated casualties and reported uncritically about strategic and tactical blunders. This was the first American war in which the media played an important role in intelligence. Despite the censorship, both Robert E. Lee and William Tecumseh Sherman, among other generals, claimed to have discovered valuable information about troop movements and future battle plans from newspapers.

The public's demand for war news proved insatiable. The more colorful and breathless the story, the more newspapers were sold. As in later wars, reporters sometimes made up "eyewitness" accounts of battles hundreds of miles from their positions. In 1864, Secretary of War Edwin M. Stanton began issuing daily war bulletins, a practice that made it easier for journalists to write their reports and easier for Washington to control the news.

The press played a more important role prior to the next war, the Spanish-American War, than during it. From the beginning of the Cuban insurrection against Spain in 1895, the new sensationalist "yellow press," exemplified by William Randolph Hearst's *New York Journal* and Joseph Pulitzer's *New York World*, increased circulation exponentially as it called for American intervention against the Spanish, who were accused of committing some real and many imagined crimes against humanity. On the other hand, as the United States prepared to enter the war, President William McKinley masterfully manipulated the news so that skeptics would ultimately support his call to arms.

The U.S. government centralized the release of war information from Washington, took control of telegraph facilities at Key West, Florida, and censored dispatches that arrived in New York City. Nonetheless, embarrassing sto-

ries did manage to leak out concerning gross mismanagement and scandals in the food and supply lines. Two hundred correspondents, including the novelist Stephen Crane and the flamboyant Richard Harding Davis, covered the Caribbean campaign, while fledgling motion picture companies made reenacted newsreels they sold as authentic to a public thrilled with this "splendid little war."

Military censorship in Manila posed greater difficulties for journalists covering the less popular follow-up Philippine War against Filipino insurrectionists. But material did appear in the press that highlighted torture and atrocities committed by American soldiers in a dirty, counterrevolutionary war and encouraged a potent anti-imperialist movement.

After the United States entered World War I in April 1917, the War Department, following the policies of the European nations, established its first formal accrediting procedure for war correspondents. A journalist had to agree in writing to submit dispatches to military censors and to behave "like a gentleman of the press." In addition, back in Washington, Woodrow Wilson established the controversial Committee on Public Information, which was not only in charge of censorship but also ran an elaborate propaganda campaign at home and abroad. For example, the committee employed 75,000 speakers who delivered 750,000 four-minute pep talks, often in movie theaters, in 5,000 cities and towns in support of the war.

The administration also obtained from Congress the Espionage and Sedition Acts of World War I. The former permitted the Postmaster General to refuse to mail magazines or other publications detrimental to the war effort; the latter prohibited speech that did not support that effort. Under such laws, Socialist Party presidential nominee Eugene V. Debs was sent to jail, as was a movie producer for making a film about the Revolutionary War in which the British appeared as villains.

During World War II, military authorities again imposed strict censorship at the source for correspondents who numbered as many as 1,000 in Europe alone. Among other matters deemed threatening to national security were stories and, especially, pictures that portrayed too graphically G.I. injuries and death, or reported incidents of cowardice, as was the case during the Battle of the Bulge, or revealed information embarrassing to the United States and its Allies. And as in previous wars, once they learned the rules, correspondents practiced self-censorship so that they would not have to rewrite their articles completely after censors got through with them.

Back home, the government issued a voluntary code of wartime practices for the media, to which, in most cases, the mainstream press adhered. The *Chicago Tribune* was a notable exception when it revealed mobilization plans on the eve of the attack on Pearl Harbor, and later ran a story about the breaking of Japanese codes. Although the Office of Censorship did intercept and read letters and cablegrams and tap phone calls, most Americans accepted the abridgment of their First Amendment rights during the global crisis.

The Office of War Information (OWI), headed by radio commentator Elmer Davis, coordinated propaganda activities. Somewhat more sophisticated than the Creel Committee of World War I, OWI staffers met regularly with the media, including the heads of Hollywood studios, to suggest political themes they wanted to promote.

No such elaborate activities were needed during the limited "Korean War. From June through December 1950, journalists at the front adhered to a voluntary code of self-censorship. But when South Korean leaders began complaining about articles critical of their repressive actions, Washington imposed full military censorship. Few Americans ever learned the truth about the nature of their ally or of the devastating American "bombing of civilians in North Korea that resulted in hundreds of thousands of deaths.

Such was not the case in the "Vietnam War—the most controversial war in American history in many ways, including the relationship between the media and the military. According to critics of press performance, journalists in the combat theater, not subject to censorship, wrote stories and shot television footage that distorted and hurt the war effort—most controversially, media coverage of the "Tet Offensive of early 1968. That charge dramatically influenced the way the government subsequently limited journalists' access during the 1983 U.S. intervention in "Grenada, the 1989 Panama intervention, and, above all, the 1991 "Persian Gulf War.

But the charge that the media "lost the war" in Vietnam was a myth. Except for a brief period during the Kennedy administration when several young journalists who supported the war criticized military tactics and the venality of the Saigon regime, most of the coverage favored administration policies, at least until 1968. Even during that earlier period, the government in Saigon expelled American journalists, and Washington influenced publishers to alter their coverage. To be sure, in several celebrated cases—notably Morley Safer's 1965 account on CBS of Marines burning hooches, and his later coverage of the Tet Offensive—the media apparently contributed to the growth of antiwar sentiments, but no more so than the American rates of casualties. But the fact that reporters shared the national "Cold War consensus and that the tenets of so-called objective journalism demanded that they report official briefings (the "Five O'clock Follies"), often uncritically, guaranteed a relatively favorable press until almost the end. The Johnson administration did not institute full censorship because it wanted to play down the importance of this undeclared war.

Another view suggests that the Vietnam War was the first televised live or "living-room war." But it was not projected live into viewers' homes. In this era before the development of satellite hookup, the news film for stories emanating either from Saigon or Japan was flown by air to New York, then edited and broadcast. As in World War II, those in charge of deciding what to air generally eliminated pictures of bloodied soldiers and the other worst horrors of war.

The situation was different during the Persian Gulf War in 1991, with strict censorship and "pool" reporting for the more than 1,000 journalists who covered the fighting in real time—primarily from hotels in Saudi Arabia. Military authorities banned several magazines from the combat theater and arrested at least eight American correspondents for violating aspects of the censorship rules. Aside from reports from the Cable News Network's (CNN) Peter Arnett in Baghdad, which were themselves censored by the Iraqis, most of what Americans saw on television was exactly what the military wanted Americans—and anyone else tuning in—to see.

Beginning in the 1980s, worldwide television news ser-

vices, led by CNN, began to play an increasingly important role in crises and wars. Before the Gulf War broke out, Saddam "Hussein, the Iraqi leader, was encouraged by strong congressional opposition to President George "Bush's policies, broadcast by satellite to Iraq. Later, coalition commander Gen. H. Norman Schwarzkopf tailored his televised briefings for those in Baghdad who were watching. In 1991, Haitian dictator Gen. Raoul Cédras's viewing of congressional and other opposition to American policies, brought to him by the ubiquitous CNN, may have contributed to his recalcitrance.

As nations become even more completely electronically connected to one another in years to come, the problems inherent in maintaining a free press during times of international crisis may become even more severe.

NEW YORK, BATTLE OF (1776). When the British evacuated Boston in March 1776 early in the Revolutionary War, no royal government remained between New Hampshire and Georgia. New York, with its central location and superb harbor, was the logical place to reassert British authority. Congress—hoping to prevent such a reassertion and forestall the loss of overland communication between New England and the other colonies—urged Gen. George "Washington to undertake the almost hopeless task of defending New York. Without a navy, Washington hoped that shore batteries would protect his army from defeat. With perhaps 19,000 men, many of them poorly trained militia, he faced the largest force Britain had yet sent overseas, over 40,000 soldiers and sailors under the command of the brothers Gen. William "Howe and Adm. Richard Howe.

The British landed on undefended Staten Island on 2 July, and after seven weeks of careful preparation, launched a campaign based on turning the Americans out of their earthworks, as he had planned to do at the Battle of "Bunker Hill in June 1775. This cautious plan made effective use of British resources and envisioned a negotiated settlement after the American army had been beaten but not martyred.

In retrospect, the Howes were overly cautious in not exploiting their naval strength, but their initial successes on land were spectacular. Crossing the Narrows to Long Island on 22 August, William Howe five days later implemented the plan that had gone awry at Bunker Hill: pin down the Americans' right flank and send a strong force around their left. Brilliantly executed by 10,000 men under Howe's personal command, the attack routed the Americans from advanced positions on the Heights of Guan.

Although many American units fought well, the army retreated several miles to entrenchments on Brooklyn Heights. Expecting a renewed British attack in the morning, Washington on the night of 29-30 August evacuated his exhausted men to Manhattan Island.

Howe waited until 15 September before picking Kip's Bay on the east side of Manhattan as the site of his next turning movement; only Howe's failure to move west to the Hudson River allowed the Americans to escape. Howe pushed Washington north into Westchester County by late October, then retired to consolidate his gains. The last American position on Manhattan, Fort Washington, fell to assault on 16 November. Four days later, Howe began a slow pursuit of the battered remnants of the American army across northern New Jersey.

Washington made serious mistakes at New York, especially by attempting to defend everything rather than deny Howe New York for as long as possible without losing his own army. Although it lost over 5,000 men—killed, wounded, and captured, Washington's army performed creditably in its first campaign of maneuver. Outnumbered, incompletely trained, crippled by inexperienced general officers, and forced to defend an impossible position, it survived because of the determination, courage, and leadership of a core of officers and soldiers, foremost among whom was George Washington. Howe's failure to destroy Washington's army cost the British their best chance of ending the rebellion.

The NEW YORK CITY ANTI-DRAFT RIOTS (1863) constituted the largest domestic uprising in the North during the Civil War. Caused by a newly enacted draft law, which fell heavily upon the poor because of the clause offering an exemption to anyone furnishing a substitute or paying a \$300 fee, the riot started on 13 July 1863, and lasted until 17 July, when newly arrived troops brought it under control.

New York City had long been seething with discontent. A Democratic community in an often Republican state, it contained many immigrants, especially Irish Catholics, who feared black competition and were enraged by the *Emancipation Proclamation. Fueled by the exasperation of the badly exploited poor and the increasingly difficult situation of many workingmen, on Monday, 13 July, a large group of disaffected volunteer firemen and laborers converged upon the district office of the Provost Marshal responsible for implementing * conscription, stormed and wrecked the building, and stopped the draft process. Superintendent of Police John A. Kennedy was badly beaten; trolley tracks and telegraph wires were torn up, and many shops and factories closed.

Soon the rioters began indiscriminate attacks on black residents, many of whom were killed. The crowd also vented its anger upon the Republican press, attempting to storm the building of the *New York Tribune*, from which editor Horace Greeley escaped only with difficulty. In the afternoon, rioters attacked and burned the black orphan

asylum on Fifth Avenue, attempted to secure guns at a gun factory, and gutted a number of police stations. The rioting continued for four more days; Col. Henry O'Brien of the 11th New York Regiment was murdered, and general looting of stores, hotels, and the homes of the rich made the city unsafe.

In the meantime, Gen. Harvey Brown had taken over command of the troops in the city and, cooperating with the police, managed to beat back a number of attacks. Democratic governor Horatio Seymour, vacationing on the New Jersey coast, came back on Tuesday and addressed the crowd at City Hall, allegedly calling them "My Friends" and exhorting them to return to their homes. He also sought a suspension of the draft, of which he thoroughly disapproved. It was not until Thursday, 16 July, that federal troops, some of them summoned from Gettysburg, were able to assist in ending the rioting. On 17 July, the Roman Catholic archbishop John Hughes cooperated with Mayor George Opdyke in pacifying the crowd, and order was restored.

The result of the riot was that the draft in New York was suspended until August, while the city and county raised a fund to help pay exemption fees for those unable to afford them. The national administration did not impose martial law, as had been requested, but it did put conservative Gen. John A. Dix in charge of the Department of the East. Estimates of effects of the riots are usually set at over \$1 million in property damage and perhaps 120 people killed and more than 120 wounded. The Tammany wing of the Democratic Party under William M. Tweed took over the city's affairs and continued in power until 1871. In the long run, recruitment continued undisturbed.

NEW YORK TIMES v. U.S. (1971). See *Pentagon Papers* (1971).

NICARAGUA, U.S. MILITARY INVOLVEMENT IN. The United States has directly intervened militarily in Nicaragua three times, 1909-10, 1912-25, and 1926-33, and once indirectly, 1981-89. The direct interventions were extensions of the 1904 * Roosevelt Corollary to the Monroe Doctrine, in which President Theodore * Roosevelt proclaimed the right of U.S. intervention to preclude European intervention in the Caribbean.

Nicaragua first gained importance to the United States as a potential canal route through Central America. With the construction of the Panama Canal, that importance shifted to economic and security concerns. Instability or a government unfriendly to the United States were seen as threats to the Panama Canal. It was just such conditions that prompted the first intervention and led to the establishment of what was in effect an American protectorate over Nicaragua until 1933.

In 1909, President José Zelaya's government executed two Americans who had joined a revolutionary force opposing his rule. The United States broke relations with the government in Managua, and the U.S. Navy was used to aid

the rebels in a decisive battle against Zelaya's forces. The victorious revolutionaries, under the leadership of Adolfo Diaz, negotiated a treaty establishing U.S. control over Nicaragua's customs—the exporting nation's main source of revenue. American forces were removed in 1910, but over 2,000 U.S. Marines were sent back in 1912 to help protect the Diaz government against a new uprising. After the defeat of the rebellion, most Marines were withdrawn, but 100 remained to ensure stability. This arrangement was ratified in the 1916 Bryan-Chamorro Treaty, which extended American financial aid to Nicaragua and granted the United States sole rights for any future canal built there.

By 1925, the Coolidge administration concluded that Nicaragua was stable enough for U.S. forces to depart. The outbreak of civil war in late 1926, however, brought a third round of American intervention. Secretary of State Frank Kellogg justified military intervention because Communists were fighting the government. Actually, liberal forces were contesting Diaz's taking of the presidency from Gen. Emiliano Chamorro Vargas. Washington quickly recognized Diaz and sent lawyer-diplomat Henry L. *Stimson to Nicaragua to supervise elections and establish a National Guard (*Guardia Nacional*) to be trained by the Marines. All the liberal forces agreed to the settlement imposed by Stimson except for Augusto Sandino, who vowed to fight until U.S. forces were withdrawn.

Stimson, appointed secretary of state by Herbert C. "Hoover, concluded that the *Guardia Nacional* was ready to handle the problem of Sandino and maintain order in Nicaragua. The last of the Marines departed in 1933, and the *Guardia Nacional* under Anastasio Somoza became the most powerful military force in Nicaragua. Sandino ended his fighting as promised, but was killed in 1934 by the *Guardia Nacional*. In 1936, Somoza formally took over all power in Nicaragua. He and his two sons would rule with American support until 1979, when the Somoza dictatorship was overthrown by the Sandinista National Liberation Front.

In the 1980s, tensions developed quickly between the leftist Sandinistas and the U.S. government. When promised U.S. economic aid was delayed by Congress, the new revolutionary government turned to other nations, particularly Cuba, for advisers and technicians, and produced scathing criticisms of American foreign policy in Latin America. As it left office, the Carter administration suspended the belated economic assistance on the grounds that the Sandinistas were aiding leftist rebels in neighboring El Salvador. In 1981, the Reagan administration came to office determined to oust the Sandinistas. To do so, the United States applied a wide range of political and economic pressure to undermine the Nicaraguan government. Most important, Reagan provided \$19 million to the "Central Intelligence Agency in November 1981 to begin training a counterrevolutionary army known as the Contras. Led by former *Guardia Nacional* officers, the Contras by 1986 consisted of over 15,000 soldiers supported by the United States. During the period when a Democratic majority in Congress banned aid to the rebels, the administration used a variety of means to funnel funds to them illegally. In what became known as the *Iran-Contra Affair (1986), one scheme diverted money from secret arms sales to Iran to the Contras. Even with U.S. aid and bases in Honduras, the Contras were unable to unseat the Sandinistas. The war ended after a negotiated settlement spon-

sored by other Latin American nations led to free elections in 1989 and the victory of the anti-Sandinista coalition.

NIMITZ, CHESTER (1885-1966), World War II Commander in Chief of the U.S. Pacific Fleet. Born in Fredericksburg, Texas, on 24 February 1885, Nimitz graduated from the U.S. Naval Academy in 1905, and served in the Pacific successively in a battleship and as commanding officer of a gunboat and of a destroyer. In 1909, transferred to the Atlantic for submarine duty, he made himself an expert in submarine diesel engines. In 1913, sent by the navy to Germany to perfect his knowledge of such engines, he returned and supervised construction of diesels in a new oiler. In *World War I, Nimitz served as engineering aide and chief of staff to the commander of the U.S. Atlantic submarine flotilla.

Nimitz, recognizing his main talent, now shifted the direction of his career from operating machinery to directing people, a new emphasis put severely to the test in 1920 when he oversaw the building of a submarine base at Pearl Harbor. In 1922-23, Commander Nimitz attended the Naval War College. Thereafter, in a series of promotions, he rose in rank and command. In 1933, as captain, he commanded a heavy cruiser. In 1938, as rear admiral, he assumed command of Battleship Division One. The following year he went ashore as a bureau chief with the function of assembling and training officers and enlisted men for naval expansion in the impending *World War II.

President Franklin D. "Roosevelt, following the December 1941 Japanese attack on * Pearl Harbor, appointed Nimitz commander in chief of the Pacific Fleet and subsequently of the Pacific Ocean Areas, entrusting to his command all American and Allied sea, land, and air forces in the north, central, and south Pacific. From his Pearl Harbor headquarters, Nimitz directed growing American forces in the 1942 carrier battles of the "Coral Sea and *Midway and in the reconquest of "Guadalcanal, victories that brought the southern and eastern advance of the Japanese to a halt and turned the tide of war.

In 1943, forces under Nimitz ousted the Japanese from the Aleutians and collaborated with Gen. Douglas *MacArthur's southwest Pacific forces in reconquering the Solomons and eastern "New Guinea. In 1944, the two commanders cooperated in a drive to the Philippines, MacArthur by amphibious advances along the New Guinea north coast, Nimitz by conquest of the Gilbert, Marshall, and Mariana islands and the Battle of the *Philippine Sea and the Battle of "Leyte Gulf, sea fights that virtually eliminated the Japanese fleet.

In 1945, Nimitz, wearing the five stars of his new rank

of fleet admiral, directed the invasions of "Iwo Jima and "Okinawa from his advanced headquarters on Guam and ordered the bombings and bombardments of Japan that preceded the Japanese capitulation. On the deck of the battleship *Missouri* he and General MacArthur signed the instrument of surrender on behalf of the United States.

Following the war, Nimitz served two years as chief of naval operations, then settled at Berkeley, California. He limited his public activities to making an occasional speech on behalf of the United Nations and serving as regent of the University of California. His health declining, the navy transferred him to more comfortable quarters on Yerba Buena Island in San Francisco Bay. Here he died 20 February 1966.

NITZE, PAUL H. (1907-). U.S. government official, author, educator. Early in 1950, as director of the State Department's Policy Planning Staff, Paul H. Nitze oversaw the drafting of a report, NSC 68, to President Harry S. Truman urging a general strengthening of U.S. armed forces to counter the threat of Soviet aggression. The outbreak of the "Korean War in June 1950 convinced many policymakers, including Truman, that the report had merit. It thus became for all practical purposes the basic blueprint for the ensuing Cold War military buildup.

Nitze's role in NSC 68 was only one of the many crucial decisions in which he participated during a public career spanning fifty years. Despite the Great Depression, Nitze prospered as a Wall Street bond trader in the 1930s, but came to Washington in 1940 at the request of his business partner, James V. Forrestal, to work part-time on the mobilization effort. In World War II Nitze served with the Board of Economic Warfare and as a director of the U.S. Strategic Bombing Survey. After the war, he joined the State Department and helped draft the 1948 "Marshall Plan legislation to rebuild war-torn Europe. Nitze left government in 1953, but returned with the Kennedy administration as assistant secretary of defense for international security affairs to become a key figure in U.S. policy during the Berlin Wall Crisis (1961) and the "Cuban Missile Crisis (1962). Though regarded as a "hawk" on most defense matters, he was a "dove" on Vietnam and regretted U.S. involvement in the "Vietnam War during the 1960s because it drained American resources and diverted attention from the growing problem of Soviet strategic nuclear power.

In the 1970s and 1980s Nitze turned his attention to nuclear "arms control and disarmament, first as a member of the U.S. delegation to the Strategic Arms Limitation Talks (SALT) between Washington and Moscow. Though instrumental in negotiating the 1972 Anti-Ballistic Missile Treaty, he lobbied against Senate ratification of the 1979 SALT II Treaty limiting offensive strategic launchers because he felt it made too many concessions to the Russians. Under President Ronald Reagan, however, he helped negotiate the 1987 ban on U.S. and Soviet intermediate range nuclear "missiles and participated in laying the groundwork for the 1991 Strategic Arms Reduction Treaty.

When not serving in government, Nitze was a highly successful businessman and a prolific writer on arms control, foreign policy, and strategic theory. He encouraged

closer ties between government and academia and was one of the founders in 1944 of what became the Johns Hopkins University School of Advanced International Studies, which now bears his name.

NIXON, RICHARD M. (1913-1994), congressman, vice president, thirty-seventh president of the United States. Richard Nixon became president in January 1969, when the era of American strategic superiority was waning and rising domestic discontent with the pace of reform and the U.S. involvement in Vietnam was fueling a political backlash. Nixon, working closely with his national security adviser, Henry "Kissinger, appreciated that the United States did not have unlimited resources or unlimited interests, and sought to redefine America's role in the world through a retrenchment of its global commitments. Nixon's accomplishments and reputation as a strategist are overshadowed by his resignation in 1974 over the Watergate scandal.

The centerpiece of Nixon's international strategy was to manage the Soviet threat by inducing Moscow to moderate its behavior in the world arena. To achieve this, he endeavored to engage the Soviet Union in a web of relations that would furnish Moscow with incentives to seek accommodation with the United States. Vital to this were the Strategic Arms Limitation Talks (SALT), which in 1972 resulted in an agreement to limit the deployment of strategic offensive "missiles and antiballistic missile systems. Although the interim agreement on ballistic missiles arguably was flawed, the "SALT Treaties paved the way for subsequent superpower nuclear "arms control and disarmament agreements.

Another cornerstone of Nixon's policy was his historic opening to Communist China. Nixon correctly perceived, where others did not, that for strategic reasons China would welcome an approach from the United States, and Nixon, the staunch anti-Communist, was comparatively invulnerable to partisan attacks of being "soft on communism." The president recognized that a rapprochement with the People's Republic of China would help to isolate North Vietnam—which the United States was attempting to force into a settlement of the "Vietnam War—and would confront the Soviet Union with the prospect of cooperation between its two greatest enemies, the United States and China.

Nixon's triumphant summit meeting in Beijing in 1972 and his visit to Moscow to sign the SALT Treaties a few weeks later marked the beginning of a period of detente ("easing of tensions"), in which Washington and Moscow sought to achieve accommodation and reduce the danger of nuclear war. Detente did not last, in part, critics have argued, because Nixon's policy lacked forceful disincentives to discipline Soviet misbehavior.

Nixon's principal electoral mandate was to end the war in Vietnam. He authorized the gradual withdrawal of the

500,000 American troops from South Vietnam and sought to negotiate a settlement that would not harm U.S. interests or credibility. U.S. draft calls and *casualties declined, but the war continued. To increase U.S. leverage, Nixon ordered the incursion into Cambodia in 1970, the massive bombing of Hanoi, and the mining of Haiphong Harbor to cut off Soviet aid. These actions were domestically unpopular and are extremely contentious, even though Nixon claimed that they were instrumental to reaching the settlement by which all American combat forces were withdrawn and all known prisoners of war freed by March 1973. Fulfilling a campaign promise, Nixon ended *conscription in 1973, transforming the U.S. military into an *All-Volunteer Force.

Nixon's Vietnam policy was and remains controversial. Some assert that he sold out the South Vietnamese government. Others argue that his attempt to negotiate conditions advantageous to U.S. objectives needlessly prolonged the war, for these were never attained, and the settlement eventually negotiated had been obtainable much earlier.

• Stephen E. Ambrose, *Nixon*, 3 vols., 1987-91. Herbert S. Parmet, *Richard Nixon and His America*, 1996. — Terry Terriff

The NIXON DOCTRINE (1969) was first introduced by President Richard M. *Nixon at an informal background press conference in Guam on 25 July. After more than four years of U.S. military intervention, beginning with President Lyndon B. *Johnson's extension of bombing into North Vietnam, Nixon proclaimed an ostensible reduction in Washington's future role in the former Indochina. According to the new approach advanced by Secretary of State Henry *Kissinger and the president, future military operations would be carried out principally by indigenous forces. Nixon was clearly attempting to reconcile the conflicting political and military needs that dictated resistance against a Communist takeover of all Vietnam, while at the same time signaling an "exit strategy," an eventual withdrawal of American troops from the prolonged *Vietnam War.

After nearly three decades of Cold War "containment," the president was eager to promote the revised emphasis as a way to preserve anti-Communist governments while minimizing the cost to American lives. He spelled out the Nixon Doctrine in detail on several occasions, most formally in a special message to Congress on 15 September 1970. Skeptics scoffed that it essentially prescribed a war of "Asians against Asians" and became the justification for the politically more palatable "Vietnamization" policy. Other critics alleged—as subsequent events would confirm—that it was inadequate for achieving what some still thought might be an American victory. The additional limitations of the Nixon Doctrine were confirmed by the character of international responsibilities after the end of the Cold War.

NON-PROLIFERATION OF NUCLEAR WEAPONS, TREATY ON THE (1968). This treaty prohibits the five countries that had * nuclear weapons by 1967—China, France, Great Britain, the Soviet Union (now Russia), and the United States—from giving them to other countries, and it prohibits all other countries that join the treaty from acquiring them. All countries with significant nuclear activities have joined except for India, Israel, and Pakistan.

The treaty requires inspection of significant nuclear activities in all member countries other than the five that had weapons in 1967. It has also become the cornerstone for international cooperation (not always effective) to prevent the export of nuclear-related materials for use in countries such as India, Israel, and Pakistan. Finally, it forms the basis for international efforts by the * United Nations Security Council and ad hoc groups of countries to prevent terrorists, or treaty members such as Iraq and North Korea, from acquiring nuclear weapons.

The treaty has created three growing international norms: no more countries should get nuclear weapons; the five that had nuclear weapons by 1967 should negotiate agreements to stop improving them and producing them and, ultimately, to get rid of them; and the five should not use their nuclear weapons against any member without such weapons unless that member attacks them with the assistance of a country that has nuclear weapons.

The treaty helped implement the first norm in Argentina, Australia, Brazil, Iraq, Kazakhstan, North Korea, South Africa, South Korea, Sweden, Switzerland, Taiwan, and Ukraine. Each of these countries once possessed nuclear weapons or had begun exploring how to make them. Each gave them up. In the case of North Korea, the norm may not yet be fully effective, but international inspections and negotiations continue. In the cases of India and Pakistan, which refused to join the treaty and tested nuclear explosives in 1998, the norm failed. Israel also refused to join the treaty and is believed to have nuclear weapons, though it has not tested or otherwise declared that it has them. In all three cases, international efforts to achieve compliance have not ended.

The second norm—negotiations on nuclear weapons—has had more effect than many realize. At the treaty's review conferences every five years beginning in 1975, members that do not have nuclear weapons have pressed hard for an end to all nuclear weapons testing and for further steps—particularly by Russia and the United States—to reduce their nuclear weapons. The *START Treaties to reduce American and Russian long-range nuclear *missiles were given an impetus as a result. At a conference in 1995, the five gained broad agreement to make the treaty permanent, but they had to promise to achieve a Comprehensive Test Ban Treaty by 1996 and to agree that the goal of the nuclear negotiations obligation was "eliminating" nuclear weapons. A Comprehensive Test Ban Treaty was signed by the end of 1996, but further cuts in long-range nuclear weapons beyond the START Treaties have not so far been negotiated. Future review conferences are expected to pressure the five to go further.

The third norm resulted from the demands of members without nuclear weapons that, if they were to continue abjuring them, the five should promise not to use such weapons against them. Each of the five has made that promise, though all but China say they retain the right to respond with nuclear weapons to an attack by a member

not having such weapons if assisted by a nation that does have them.

The treaty has gone beyond the original U.S. idea of preventing the spread of nuclear weapons to any additional countries, coming to symbolize, rather, an international determination to rid the world of nuclear weapons.

NONVIOLENCE is both an ethical tradition of conflict behavior and a historical method of resistance to coercion. Ethical nonviolence is rooted in the philosophies of Jainism, Buddhism, and Christian pacifists such as "Quakers and Anabaptists, all of whom hold human life inviolable. Nonviolence as method, however, has been guided not so much by ethical restraint as by practical necessity. Conscientious and pragmatic nonviolence have often overlapped in their historical development, but are conceptually distinct. In Gandhian nonviolence, they converged in a single movement.

Nonviolence combines numerous principles and techniques of individual and collective action. Civil disobedience, or breaking law on principle (Thoreau), and "conscientious objection to participation in war (Tolstoy) are perhaps the most influential. A third conceptual pillar is *satyagraha* or "firmness in truth" (Gandhi), the seeking of truth through nonviolent conflict. A range of nonviolent methods are commonly used in social conflict: the strike; the boycott; the fast or hunger strike; the sit-in or other physical obstruction; picketing; and marches. The theoretical foundation of nonviolence is the necessity of mass cooperation for exercising political power. Political scientist Gene Sharp's concept of power as a socially based form of political action has guided numerous theoretical analyses of nonviolence.

The increase in nonviolent action since 1900 has been a response to the growth of the state. As government's control over the individual expanded through taxation, military "conscription, colonial occupation, and targeting of civilians, so did nonviolent resistance to it. By the 1980s, when "nuclear weapons were threatening the very extinction of life on earth, tens of millions of persons were responding with nonviolent action.

Mohandas K. Gandhi was the first to use nonviolence in mass political action, to win India's independence from Great Britain. In fusing the ethic of nonviolence with the practice of mass noncooperation in the 1930s and 1940s, he created a model of empowerment that has inspired movements throughout the world. In the United States, the labor, civil rights, peace, and environmental movements all drew heavily on the Gandhian experience. Women suffragists were also early users of militant nonviolence. Alice Paul and her Congressional Union for Woman Suffrage (later the National Woman's Party) invented techniques of nonviolent action still in use today.

North American social history is replete with leaders and organizations inventing nonviolent action for peaceful change and war prevention: Jane "Addams and the

"Women's International League for Peace and Freedom; Abraham J. "Muste and the "War Resisters League; Walter Reuther and the United Auto Workers; Martin Luther "King, Jr., and his Southern Christian Leadership Conference; Dorothy Day and the *Catholic Worker*; Cesar Chavez and the United Farm Workers of America; Elizabeth McAlister and Daniel and Philip "Berrigan of the Plowshares movement; and Greenpeace. Some, such as American folk singer Joan Baez and the German Green Party leader Petra Kelly, transcended national boundaries as icons of a global nonviolence culture.

Latin American nonviolence expanded notably after 1970 in response to three historical forces: (1) militarization of the state to protect entrenched elites; (2) the spread of liberation theology in the Catholic Church; and (3) nonviolence training throughout the continent by Servicio de la Paz y Justicia (SERPAJ). Certain figures symbolized this flowering of nonviolence: the martyrs Archbishop Oscar Romero and the environmentalist Chico Mendes; and three Nobel Peace laureates, Oscar Arias, Rigoberta Menchu, and Adolfo Perez Esquivel.

Nonviolence is supported by training and research programs. One line of inquiry, into disciplined nonviolence as a means to resist military conquest, began with the British Commander Sir Stephen King-Hall in the late 1950s. The theory of civilian-based defense emerging from that research proposes nonviolent resistance as an integral part of a nation's security policy. Citizens would be prepared for it with the same planning and discipline used in military training. Nonmilitary defense theory has particularly influenced national governments adopting nonprovocative defense—a security policy with no offensive military capability to threaten neighboring states. Such a policy would deter attack partly through civilian readiness to resist it with mass noncooperation. Theorists prominent in this field include Gene Sharp, Adam Roberts, Anders Boserup, and Theodor Ebert. The governments of Sweden, Denmark, and the Netherlands have explored the feasibility of nonviolent defense.

The theoretical and practical significance of nonviolence is threefold: (1) it has stimulated the use of extra-institutional politics where formal institutions could not respond to the demand for change; (2) it addresses military institutions directly, as both a means to resist the militarization of national governments and an alternative or supplement to military security; (3) as political and economic power becomes more concentrated in governments and corporations, nonviolence offers an effective "weapon of the weak," providing for democratic empowerment and fuller political participation of low-power groups. Among those are women, who have been especially prominent users of nonviolence. As armed struggle becomes ever more costly, nonviolence presents itself as an alternative strategy for both social change and national defense.

NORIEGA, MANUEL (1936—), Panamanian general and dictator. A Creole born of humble origins in Panama City, Manuel Noriega was an opportunist who joined Panama's National Guard in 1962. As a protégé of Panamanian leader Omar Torrijos, Noriega took classes at the U.S. Army School of the Americas in the Canal Zone. In August 1970, he became commander of G2, the Guard's intelligence branch. G2 maintained close ties with U.S. Army Intelligence, the "Central Intelligence Agency, and the Drug Enforcement Administration (DEA). Soon after Torrijos's death in 1981, General Noriega became the most powerful man in Panama.

Though suspected by the DEA of collusion with Colombian drug lords, Noriega proved immensely useful to the United States. He guaranteed a safe haven for the shah of Iran, who went into exile in 1979; then, in 1983, he agreed to help the counterrevolutionary Nicaraguan Contras destabilize the Sandinista government. He also worked closely, though selectively, with the DEA—all the while enhancing his own power.

By late 1989, in the wake of the "Iran-Contra Affair, Noriega's usefulness as a security asset had ended. President George "Bush attempted various measures to undermine his regime and finally, following a contested election in Panama, sent in U.S. forces to overthrow the Panamanian dictator on the immediate grounds that Noriega had authorized hostile acts against U.S. military personnel. Subsequently, a U.S. court convicted Noriega on money-laundering and other charges related to drug trafficking. July 1992, he was sentenced to forty years in a U.S. prison.

NORMANDY, INVASION OF (1944). On the morning of 6 June 1944, a radio broadcast announced the start of the invasion of Normandy: "Under the command of General Eisenhower, Allied naval forces, supported by strong air forces, began landing Allied armies this morning on the northern coast of France."

But this was not the beginning of the operation. Its roots can be traced back to September 1941, when, after the British evacuation from Dunkirk in northern France, Winston S. "Churchill and the British chiefs of staff directed Adm. Lord Louis Mountbatten to begin planning for the invasion of Europe. This mission was transferred in March 1943 to British Lt. Gen. Frederick Morgan, who was appointed chief of staff to the Supreme Allied Commander (Designate). He assembled a joint British-American planning staff, which became known as COSSAC.

For another year, COSSAC continued to refine and develop plans for an assault landing in France. While the Pas de Calais appeared to be the logical target—closest to England, its beaches were easily defensible—the Germans had heavily fortified the area, and no large ports were nearby. Normandy had relatively undefended beaches and Cherbourg was an excellent port. Thus the choice was made.

Initially, it was hoped to make the landings in 1942, but over Russian objections the "North Africa Campaign was chosen instead. Despite American objections in 1943, a lack of landing craft and the need for troops for the Italian campaign postponed Operation Overlord, the code name for the liberation of northwestern Europe.

The Normandy invasion was a joint enterprise. In December 1943, Gen. Dwight D. "Eisenhower was named Supreme Allied Commander. He asked Gen. Bernard Law "Montgomery to be the ground force commander during the invasion phase. Sir Bertram Ramsay would be the naval commander; Air Chief Marshal Sir Arthur Tedder became Eisenhower's deputy and would coordinate the air effort.

Montgomery felt that the projected three- to five-division assault was inadequate for the task and the beaches were too far from Cherbourg (its capture essential to secure a flow of supplies). Eisenhower agreed. However, he lacked landing craft to expand the attack. The landing day was postponed from May to early June, allowing the accumulation of landing craft and aircraft to support an expanded assault and follow-up forces.

Two field armies would make the assault (see map of the Normandy invasion) Lt. Gen. Omar N. "Bradley's First American Army, consisting of VII Corps and V Corps, on the west and the Second British Army to the east. On the American beaches, the Fourth U.S. Infantry would assault on Utah Beach (V Corps). Behind Utah Beach, the U.S. 82nd and 101st Airborne Divisions would land to protect the west flank and secure causeways crossing the flooded area inland from the beach.

Meanwhile, Field Marshal Erwin "Rommel, commanding German Army Group B and responsible for repelling any invasion of northwestern Europe, had been feverishly strengthening the beach defenses. But the Allies' deception plan, Operation Fortitude, which included a phantom army near Dover, commanded by Gen. George S. "Patton, complete with false radio messages and inflatable rubber tanks, had convinced Hitler and his General Staff that the Allies would land at the Pas de Calais, the most direct route to Germany. This belief was so strong that when the Normandy landings occurred, they were considered diversionary, and important reinforcements—including *Panzer* divisions—remained idle in the north until long after the "D-Day landing.

The invasion started shortly after midnight on 6 June 1944, when units of the British Sixth Parachute Division landed and captured two bridges over the Orne River and Caen Canal. The other British and American airborne units were not so immediately successful. Low clouds, flak, errors in map reading at night—all conspired to scatter them widely. This led the Germans to believe the airborne attack a diversion, thus hampering their countermeasures. Most of the airborne units' objectives were eventually achieved.

Rommel's superior, Field Marshal Gerd von Rundstedt, commanding *Oberbefehlshaber West*, and responsible for the defense of Western Europe, at 0400 ordered two *Panzer* divisions to head for Caen. However, Hitler had kept personal control of the principal western reserve forces, and his permission had to be secured. This delay undoubtedly contributed to the comparatively easy landings on the British beaches.

In the American area, on Utah Beach, the landings went well. The enemy troops manning this portion of the West Wall (or Siegfried Line) surrendered after only three hours

and inflicted only 197 *casualties among the 23,000 men who came ashore on D-Day.

On Omaha Beach, a different story unfolded. Preliminary bombardment by heavy bombers was mostly ineffective as low-lying clouds led them to overshoot the targets for fear of hitting Allied assault troops. Many of the landing craft sank in heavy seas on their ten-mile run to shore. Only about one-third of the first landing wave reached the beach and practically none of the amphibious *tanks did. Ashore, men huddled behind the sea wall. The situation became so chaotic that at one point General Bradley contemplated withdrawing the troops and diverting succeeding assaults to other beaches. But by nightfall things had greatly improved. Individual acts of heroism, the initiative taken by small units, and the accurate fire and close-in support of Allied destroyers and other naval vessels suppressed enemy fire, enabling units to scale the cliffs and clear the enemy from the high ground. Thirty-four thousand troops landed that day, but at a high cost, for over 2,500 became casualties.

In the British sector the landings were successful, but one of the principal objectives, the strongly defended communications hub of Caen, was not captured for another month.

By the end of D-Day, more than 130,000 men had landed from the air and the sea at the cost of some 9,000 casualties. But the beachhead now had to be expanded to make room for supplies en route, airfields had to be built, the port of Cherbourg had to be captured and rehabilitated, and the lodgment area had to be made secure for the breakout to win northwestern Europe.

The U.S. VII Corps on 8 June attacked toward Cherbourg along the St. Mère Eglise-Montebourg highway, but stout German resistance with strong * artillery support slowed their advance. Although the attack to the north continued, the emphasis shifted to the west. The veteran 9th Infantry Division cut the west coastal road by the 18th, and on the 19th, it joined the Corps attack to the north.

The Cherbourg defenses, in a rough semicircle about five miles in radius, were reached by the 4th, 79th, and 9th Infantry Divisions by the evening of 21 June and by the 9th Infantry Division a day later. But it took six more days of hard fighting, assisted by naval bombardment, before organized resistance in the city ceased. By the end of June the area was cleared and the American units were moving south, where VIII Corps had been holding a line across the base of the peninsula.

The Germans had so wrecked Cherbourg Harbor that it would be many months before appreciable tonnage could be landed there. Meanwhile, two artificial harbors (code-named "mulberries") and over-the-beach landings would have to suffice. On 19 June, a storm hit the coast and wrecked the mulberries: the American one was damaged beyond repair and the British one put out of action for several weeks. Still, over-the-beach operations proceeded better than expected, and by the end of June, over 1 million men and supplies to sustain them had been landed.

The successful lodgment in Normandy provided the base for the breakout at *St. Lô on 25 July and the rapid clearing of German forces in France and Belgium. Had the invasion of Normandy failed, the defeat of Germany could have been delayed several years. This was a decisive battle in the history of the West.

NORTH AFRICA CAMPAIGN (1942-1943). Operation Torch, the invasion of French North Africa by American and British forces in November 1942, was the first major joint Allied offensive operation in World War II. It was the largest amphibious military operation undertaken until then. More than 500 American and British warships, troop transports, supply vessels, and landing craft took part. Over 100,000 troops, mostly Americans, sailed from the United States and Britain to Morocco and Algeria in the opening phase of the invasion.

The decision to invade North Africa ran counter to the U.S. War Department's desire to invade German-occupied France across the English Channel in 1943. The Soviet Union also wanted the West to open a second front. The British feared that a cross-Channel invasion would be premature and would lead to a slaughter on the beaches of France, while Allied control of the North African coast, the ultimate objective of Operation Torch, would expose what Winston *Churchill called the "soft underbelly" of occupied Europe. Facing pressure from President Franklin

D. *Roosevelt for a bold, uncostly military move in the European area before November congressional elections, and British objections to an early cross-Channel operation, U.S. Army Chief of Staff Gen. George C. *Marshall reluctantly agreed to the invasion of Vichy French-held North Africa.

Marshall picked U.S. Gen. Dwight D. *Eisenhower to be supreme commander, and British Adm. Sir Andrew Cunningham was chosen to be naval commander. They assembled forces, supplies, and naval and maritime support. Eisenhower also sent Gen. Mark *Clark on a secret submarine mission to negotiate with local Vichy forces not to oppose the landings. Beginning on 8 November, four days after the British stopped German general Erwin *Rommel at El Alamein in Egypt, the Anglo-American landings commenced with commando port assaults and nighttime beach landings. The Allies aided Free French rebels and overwhelmed Vichy French resistance, which was relatively light. The Vichy military commander, Adm. François Darlan, visiting Algiers, was captured and persuaded on 11 November to order a cease-fire. U.S. forces sustained 1,400

* casualties, 526 of which were fatalities. As a result of the invasion, Nazi leader Adolf *Hitler ordered the German Army to occupy Vichy France and rushed troops to Tunisia before the Americans could conquer it. On 14 February

1943, the U.S. II Corps, commanded by Maj. Gen. Lloyd Fredendall, was surprised in the Kasserine Pass by a German counterattack and temporarily thrown back. Fredendall was replaced by Maj. Gen. George S. *Patton, Jr., and his deputy, Maj. Gen. Omar *Bradley, and they resumed the offensive. The U.S. First Army and Gen. Bernard Law *Montgomery's British Eighth Army contained the Germans in Tunisia in April, and 250,000 German and Italian troops surrendered on 13 May 1943, marking the end of the North Africa Campaign. The U.S. casualties amounted to about 18,500.

NORTH ATLANTIC TREATY. See NATO.

NORTH ATLANTIC TREATY ORGANIZATION. See NATO.

NORTHWEST TERRITORY, MILITARY ACTIONS IN THE OLD (1783-94). In the 1780s, Indians and Americans in the Ohio Valley fought what amounted to a border war over the future of the region. War parties raided enemy villages, killing hundreds of people. The conflict involved neither major battles nor grand strategy. Still, encouraged by British officials in posts such as Detroit (which the British refused to surrender in violation of the Treaty of * Paris), the Miami, Shawnee, Delaware, and other Indians were able temporarily to stymie American expansion.

The U.S. government initially responded to this conflict by constructing forts along the Ohio River with the intention of intimidating both Indian and white *banditti* into peace. These actions failed to stop the raids, however, and pressure from settlers forced a reluctant government into military action.

In the fall of 1790, the Washington administration sent Brig. Gen. Josiah Harmar with 1,500 men, mostly militia, north from Cincinnati against Indian villages on the Maumee River. Harmar achieved his objective of destroying fields and homes. But on 18 October, the Miami chief Little Turtle ambushed a small party of Americans; other Indians attacked some of Harmar's men at present-day Fort Wayne, killing many regular troops, frightening the militia, and forcing Harmar to retreat.

A year later, the Americans tried another expedition, but the 1,400 men under the command of Maj. Gen. Arthur St. Clair never made it to the Maumee. On 4 November 1791, Indians ambushed and completely routed the army, inflicting a staggering 913 "casualties in the worst defeat ever suffered by an American army at the hands of Indians. Convinced that the losses were the result of inept leadership and a reliance on undisciplined militia, the Washington administration committed itself to restoring the military reputation of the United States with a major demonstration of power. To this end, Congress created the Legion of the United States in 1792.

In 1793, after devoting months to preparation, Maj. Gen. Anthony * Wayne began a methodical advance toward the Indian villages on the Maumee. On 20 August 1794, the Legion defeated about 1,000 warriors in a brief but violent action later dubbed the Battle of Fallen Timbers. As important, the retreating Indians found the gates of the nearby British post, Fort Miami, closed to them. Although willing to aid Indians in harassing the Americans, the British refused to risk war with the United States in order to save them.

A decisive military engagement, Fallen Timbers ended decades of struggle over the Ohio Valley. In the 1795 Treaty of Greenville, the Indians recognized the right of the Americans to settle the southern two-thirds of the Ohio Territory. In the same year, as part of Jay's Treaty, Great Britain agreed to abandon its forts on the southern shores of the Great Lakes. No less significant, the triumph of the Legion persuaded many white settlers in the Ohio Valley of the value of the federal government. In the eyes of both its

enemies and its own citizens, the Legion had secured the Ohio Valley for the United States.

NUCLEAR PROLIFERATION. See Arms Race: Nuclear Arms Race.

NUCLEAR PROTEST MOVEMENTS. Protest against *nuclear weapons began even before they were built. In 1913, the British writer H. G. Wells wrote a startling novel, *The World Set Free*, which depicted a war fought with "atomic bombs"—a conflict so devastating that humanity established a world government and abolished war. Leo *Szilard, a Hungarian physicist deeply impressed by Wells's novel, conceived the idea of a chain reaction in 1933, but sought to keep the process secret, thus ensuring that it did not fall into the hands of Germany's Nazi government. Nevertheless, in 1939, when scientists in Germany seemed close to a breakthrough, Szilard—by then a refugee in America—mobilized his mentor, Albert Einstein, to warn President Franklin D. *Roosevelt of this ominous development.

Although the Szilard-Einstein initiative helped launch the *Manhattan Project, the Anglo-American program to build the atomic bomb, many *atomic scientists viewed their development of the weapon as a deterrent to its use, presumably by Germany. Therefore, when Szilard and other scientists, principally at the project's Chicago Metallurgical Lab, recognized that it would be employed against a virtually defeated Japan, they urged higher authorities to forgo its use. In the Franck Report of June 1945 (named after the chemist James Franck and written largely by Eugene Rabinowitch), they argued that employment of the weapon would shock world opinion, begin an atomic armaments race, and undermine the possibility of securing an international agreement for nuclear *arms control and disarmament.

When the U.S. government went ahead with the atomic bombing of Japan, it created an enormous furor around the world, and especially in the United States. Whether or not they supported the U.S. government action, most Manhattan Project scientists recognized that the world now faced the prospect of total annihilation. In the fall of 1945, they established the Federation of Atomic Scientists—quickly changed to the Federation of American Scientists—a group that at its height had some 3,000 members. Two other new entities, the Emergency Committee of Atomic Scientists (a small group of prominent scientists headed by Einstein) and the *Bulletin of the Atomic Scientists* (edited by Rabinowitch), became close allies. Pacifist groups like the *Fellowship of Reconciliation, the *War Resisters League, and the *Women's International League for Peace and Freedom also worked to publicize nuclear dangers, as did the burgeoning world federalist movement. Arguing that people faced the prospect of "one world or none," they worked together to champion nuclear disarmament, usually through limitations upon national sovereignty that ranged from international control of nuclear weapons to world government.

Similar movements, often modeled on the American, emerged elsewhere—particularly in Western Europe, Canada, Australasia, and Japan. In addition, a Communist-led movement developed; unlike the other, nonaligned movement, it assailed Western (but not Eastern) nuclear policy. Its best known project was the Stockholm peace petition campaign, a massive antinuclear venture that purportedly drew 2.5 million signatures in the United States.

As the "Cold War advanced in the late 1940s and early 1950s, the nuclear protest movement lost much of the support it had enjoyed. Public opinion grew more hawkish and increasingly amenable to meeting Communist challenges with military might. Administration officials turned from fostering plans for disarmament to winning the "Korean War and developing the most destructive weapon yet: the hydrogen bomb. Buffeted by the Cold War and often confused with their Communist-led rivals, nonaligned nuclear disarmament groups declined precipitously in influence and membership. Even so, by publicizing the nightmarish quality of nuclear war, they did help to stigmatize the atomic bomb, thereby making it more difficult for governments to use it again in war. They also slowed the development of nuclear weapons programs in some nations and made them unthinkable in others.

A second wave of public protest against nuclear weapons began to emerge in 1954, in the United States and around the world. That year, when a U.S. H-bomb test at Bikini atoll sent vast clouds of nuclear fallout surging across the Pacific and irradiated the crew members of a Japanese fishing boat, the *Lucky Dragon*, it highlighted the dangers of nuclear testing. The power of the weapon also illustrated the vast destructiveness of nuclear war. In 1955, Einstein joined the British philosopher Bertrand Russell in issuing a widely publicized appeal to the leaders of the great powers to halt the nuclear "arms race. As pacifists and other antinuclear activists stepped up their protests against nuclear testing, in 1957 concerned scientists launched a series of Pugwash conferences (named for the original meeting site in Pugwash, Nova Scotia), bringing together scientists from both Cold War camps to discuss arms control and disarmament measures. That same year, Norman Cousins and other leading critics of nuclear testing formed the "National Committee for a Sane Nuclear Policy (SANE), whose startling antinuclear ads helped catalyze an organization of some 25,000 members, with chapters around the country. Meanwhile, in 1958, the chemist Linus Pauling released a petition, signed by 11,000 scientists from 49 nations (including 2,875 from the United States), urging the signing of a nuclear test ban treaty.

In contrast to the first wave of public protest against nuclear weapons, students' and women's groups played a very prominent role in this one. Organized in 1959, the Student Peace Union established chapters on dozens of college campuses, and in early 1962, staged the largest disarmament vigil yet seen at the White House. In 1961, women's peace activists launched Women Strike for Peace, which, like SANE, organized picketing, petitions, lobbying, and rallies to secure a test ban treaty and other multilateral measures toward nuclear disarmament.

Despite its remarkable efflorescence, the nuclear protest campaign began to fade after 1963. To a large extent, this reflected its success: the "Limited Test Ban Treaty had been signed (1963), the Soviet Union and the United States seemed on the road to detente, and many activists felt they

could return to their private concerns. This mood of relaxation was reinforced by the signing of the Treaty on the "Nonproliferation of Nuclear Weapons in 1968. Furthermore, nuclear disarmament activists were almost invariably peace activists, and with the Johnson administration's escalation of the "Vietnam War in early 1965, many shifted their focus to a vigorous campaign against American participation in that conflict. By this time, however, the nuclear protest movement had made important headway in altering government policy. Thanks to the widespread public clamor in the United States and around the world, it had contributed substantially to a Soviet-British-American moratorium on nuclear testing in 1958, to the decision of numerous nations to not develop or use nuclear weapons, and to the signing of the first nuclear arms control treaties.

In the late 1970s and early 1980s, the nuclear protest movement flared up once-again. The collapse of Soviet-American detente, the Soviet Union's deployment of SS-20 "missiles in Eastern Europe, the "NATO decision to deploy cruise and Pershing missiles in Western Europe, and especially the advent of the hawkish Reagan administration, with its glib talk of nuclear war, convinced millions of Americans that their lives were once more in peril. New groups like Mobilization for Survival and Physicians for Social Responsibility grew rapidly, as did older ones, like SANE, that had fallen into decay. In June 1982, nearly a million Americans flocked to a New York City rally against nuclear weapons—the largest demonstration in U.S. history. Meanwhile, there emerged a broadly gauged Nuclear Freeze Campaign. Designed to halt the nuclear arms race through bilateral action, it drew the backing of major churches, unions, and the Democratic Party. Despite the best efforts of the Reagan administration to discredit the Freeze movement, polls found that it garnered the support of 70 percent or more of the American public. In the fall of 1982, a majority of voters backed the Freeze in nine out of ten states where it appeared on the ballot. Although rejected by the U.S. Senate, a Freeze resolution passed the House by a comfortable margin and became a key part of the Democratic presidential campaign of 1984.

Although the nuclear protest movement ebbed substantially in the late 1980s, it could once again point to some important successes. To be sure, the Freeze proposal never became official U.S. policy and President Ronald "Reagan easily won a second term in the White House. Nevertheless, public policy began to shift noticeably. The administration, which had disdained to enter arms control and disarmament discussions with the Soviet government, suddenly started to pursue active negotiations. And when Reagan, to steal the thunder of antinuclear forces in Western Europe and the United States, made arms control and disarmament proposals, the Soviet government startled U.S. officials by accepting them. Part of this sudden accord reflected the shift in Soviet policy under the reform leadership of Mikhail Gorbachev. But Gorbachev too was influenced by Western disarmament groups, and even initiated a nuclear testing moratorium at their suggestion. The result was a burst of diplomatic activity that produced the "INF Treaty (removing U.S. and Soviet intermediate-range nuclear weapons from central Europe) and a number of other nuclear disarmament measures. As the editors of the *Bulletin of the Atomic Scientists* pushed the hands of their famous "doomsday clock" further back from midnight, the nuclear protest campaign deserved some of the credit.

NUCLEAR STRATEGY. See Strategy: Nuclear Warfare Strategy.

NUCLEAR WAR, PREVENTION OF ACCIDENTAL. The outbreak of accidental nuclear war has been a looming fear in both popular and governmental circles since World War II. American efforts to avert accidental nuclear war have focused on four possible scenarios: unauthorized use of *nuclear weapons; mechanical failure leading to detonation; false warning of imminent enemy attack; and misperception of an international incident or within an international crisis escalating to nuclear exchanges.

Avoiding unauthorized use of nuclear weapons is part of the larger issue of whether control of America's nuclear arsenal should rest in civilian or military hands. President Harry S. *Truman institutionalized civilian control in the 1946 Atomic Energy Act, fearing that in the event of crisis or war the military might use nuclear weapons without civilian approval. To some degree, civilian control of nuclear weapons eroded in the 1950s, as global stationing of nuclear weapons and desires for military flexibility encouraged greater delegation of nuclear control to the military.

By the end of the administration of President Dwight D. *Eisenhower (1953-61), civilians moved to reassert greater control and reduce the possibility of unauthorized use. In the late 1950s, the so-called "two-man rule" was installed, which required the simultaneous actions of two individuals to fire any nuclear weapon, thereby reducing the risk that a single deranged officer or unauthorized civilian would detonate a nuclear weapon. In 1962, most nuclear weapons were fitted with Permissive Action Links (PALs), which were essentially combination locks: entering the proper sequence of numbers was required to arm the warhead. PALs guard against unauthorized use by limiting the number of people who can physically detonate a nuclear weapon. Significantly, PALs were not installed on all nuclear weapons, naval nuclear weapons being the notable exception. Other policies have been implemented to reduce the risks of unauthorized use or mechanical accident, including the Personnel Reliability Program, which is designed to weed out unstable or unreliable individuals with nuclear weapons responsibilities, and the Enhanced Nuclear Detonation System, which provides mechanical safeguards to reduce the possibility of accidental or unauthorized detonation.

In preparing systems to warn of an enemy nuclear attack, American policymakers have pursued two goals: reducing the possibility that a nuclear attack on the United States would go undetected while at the same time avoiding false warnings of such an attack. The United States has invested substantial resources in warning systems, such as the DEW (distant early warning) line, a chain of radar installations across Alaska, Greenland, and Canada, which became operational in 1957 to detect a Soviet nuclear attack on North America. As the arms race escalated, American policymakers became increasingly concerned with the vulnerability of U.S. nuclear forces, worrying specifically that short warning of a Soviet nuclear attack would mean the destruction of U.S. nuclear forces before they could be used. Some critics argued that in response to these fears, the United States in the later years of the Cold War adopted a de facto policy of launch on warning (LOW), which called for American nuclear retaliation on the basis of only the warning of an impending Soviet attack, that is, before the confirmed detonation of Soviet nuclear weapons on American territory. Though the American military has taken some actions to reduce the probability of false warning of incoming nuclear attack through, for example, redundant systems, many argue that LOW introduces grave risks of accidental war, as nonmilitary events (such as a passing flock of geese) might be mistaken for an incoming nuclear attack, forcing a decision to retaliate before a warning could be confirmed. The dangers of LOW demonstrate that the two goals of a warning system, providing timely alert of an attack and avoiding false alarms, can be at odds with each other.

Decision makers have also been concerned that an international crisis or incident might inadvertently escalate to war. The United States has signed a number of international agreements designed to facilitate communication between nations to reduce the chances that one side will misinterpret the actions of another side as hostile or threatening. Most famously, a hot line providing direct communication between the United States and the Soviet Union was established after the *Cuban Missile Crisis (1962-63). It was used during the 1973 Yom Kippur War. Additionally, a number of confidence-building measures have been established to increase the transparency of each side's intentions and forces and to facilitate the resolution of minor but potentially dangerous incidents. Two examples are the 1971 Agreement on Measures to Reduce the Risk of Outbreak of Nuclear War and the 1972 Agreement on the Prevention of Incidents at Sea. The 1972 agreement was directed at the specific problem of naval encounters: during the Cold War, peacetime naval maneuvers of the two superpowers produced a number of incident*; that might have led to real armed clashes.

The end of the Cold War saw an acceleration of activity aimed at reducing the threat of accidental nuclear war. In 1991, the United States began to implement the Cooperative Threat Reduction (CTR) program to assure that nuclear weapons and radioactive materials in the former Soviet Union were handled safely and securely. The United States and Russia agreed in 1994 to "detarget" their nuclear forces, reducing the chances that an accidental missile launch would hit the other country and touch off a nuclear war. The United States also moved to expand its security dialogue with the People's Republic of China, in 1997,

gaining a Chinese-American Incidents at Sea agreement and establishing a China-U.S. hot line.

Significantly, scholars are divided on the usefulness of measures to prevent accidental nuclear war. Some point to successes in a number of areas; others argue that the risks of accidental or preemptive nuclear war are extraordinarily low; still others argue that some measures taken to reduce the risks of accidents are ineffective or may even cause potentially dangerous episodes. Advocates of this last position propose, for example, that attempts to build redundancy into nuclear weapons systems can produce excessive complexity and unexpected interactions that can generate incidents raising the risks of accidental nuclear detonation. Accidental nuclear war remains a frightening specter.

NUCLEAR WEAPONS. The possibility of creating nuclear weapons of almost unimaginable destructive power was first realized in the 1930s as physicists developed a fundamental understanding of the nucleus of the atom. A nuclear explosion is created when heavy nuclei are split—or *fissioned*—into several of their component parts that are smaller and more stable.

Impact of Nuclear Weapons. Nuclear fission is a fundamentally different process from chemical explosions that occur in conventional high-explosive or incendiary *bombs. In chemical explosions, larger molecular structures are broken apart and rearranged into smaller parts, but the individual atomic nuclei remain untouched. A chemical explosion produces a sudden release of energy that generates an explosive blast, whose resulting high air pressures and strong winds can crush and knock down nearby structures and people. In the case of early nuclear weapons based on the fission process, the energy release, which occurs in microseconds, is enormously larger because the nuclear bonds that hold nuclei together and are broken during fission are so much stronger than the chemical bonds that bind atoms into molecules. Since the nuclear forces are typically 100,000 to 1 million times stronger than the electrical ones responsible for molecular structures, the resultant energy releases are correspondingly larger.

The nuclear blast is so powerful that it can crush objects many miles away with high winds in excess of 150 mph generated at distances greater than a mile. The release of the enormous energy in a nuclear explosion leads to extremely high temperatures, comparable to those that occur at the center of the Sun, causing massive and deadly fires. As a measure of comparison, the temperatures generated by nuclear weapons are hundreds to thousands of times higher than the temperatures on the surface of the Sun, which heats the surface of the Earth from a distance of more than 90 million miles. Dangerous radioactive fallout

is also spread over large distances by the resulting nuclear radiation emerging with the nuclear debris.

The ability to release such enormous energy from single weapons, on a scale unparalleled in human history, profoundly alters the very nature of *war, as well as its consequences. An appreciation of the consequences of a nuclear explosion can be learned from the experience of the only nuclear weapons used in war, the atomic bombs dropped by U.S. air forces on Hiroshima and Nagasaki in 1945. These two weapons devastated two entire cities. They had yields of 15-20 kilo tons. That measure simply means that the energy release was the same as that from detonating 15,000-20,000 tons of TNT (TNT is an acronym for the chemical formula of dynamite). By way of comparison, the largest conventional bombs used in World War II—the so-called blockbusters used by the Royal Air Force (RAF)—detonated 10 tons (20,000 pounds) of TNT.

Those fission bombs of 1945 are no more than primitive versions of the first stage, or triggers, of modern nuclear weapons, whose yields range into the megatons, or millions of tons of TNT equivalent, and whose deadly devastating impact ranges over many miles. (One kiloton is equivalent to 2 million pounds of TNT; 1 megaton is equivalent to 2 billion pounds of TNT.) In modern nuclear weapons, such fission triggers are known as the *primaries*. They ignite a secondary stage by creating very high temperatures in order to generate still larger quantities of energy by driving together, or fusing, light nuclei into more stable ones. This is known as *fusion*. Such modern weapons are commonly referred to as *thermonuclear weapons*—or, more simply, *H-bombs*.

The effect of a 1-megaton thermonuclear weapon has an energy release 100,000 times greater than the largest 10-ton blockbusters of World War II; the area destroyed by blast would be several thousand times larger than that leveled by such blockbusters. Collateral destruction and *casualties due to fires and radioactive fallout would extend even further than the area destroyed by blast.

Soon after World War II, it was realized that the existence of nuclear weapons posed a new and fearsome threat to modern civilization and that it was vital to treat them differently from “conventional”—nonnuclear—weapons. Serious initiatives during the decade immediately following WWII tried to bring these terrifying new weapons under international control. These efforts failed as the confrontation between the Western powers and the Soviet Union and its allies grew into a cold war. Fueled by this dangerous competition during the 1960s, the individual nuclear arsenals of the United States and the Soviet Union accumulated to tens of thousands of warheads. In addition, France, England, and China acquired their own, albeit much smaller, nuclear arsenals. Furthermore, the newly developed delivery systems of intercontinental-range, and in particular, land-based intercontinental ballistic *missiles (ICBMs)—and long-range ballistic missiles on *submarines (SLBMs) moving about invisibly under the surface of the oceans—brought the threat of nuclear annihilation very close to home, less than thirty minutes away from a nation's borders.

Difficulty of Protection Against Nuclear Weapons. It also became clear before long that there was no known or prospective technology that could provide a defense against a determined nuclear attack. In contrast to previous wars, essentially nothing would be left of a large urban

"target"—its population and industry—if just one, or at most a few, nuclear warheads exploded over it. Witness the bombings of "Hiroshima and Nagasaki.

A defense would have to be essentially perfect to provide protection against nuclear weapons, and that is neither a realistic standard of performance today nor a prospective one for future military systems. In World War II, during the Battle of Britain, the RAF defense system managed to destroy no more than one in ten of the attacking planes. At such a rate, the German Air Force was reduced faster than it could replace its losses. At the same time, cities like London could put out the fires and rebuild after the damage. Human defenselessness is a basic fact of the nuclear age. It is also troubling since it denies one of the most basic instincts of the human race: to defend ourselves, our families, our friends, our vital interests. Recognition of the ineffectiveness of defenses against the almost unimaginable destructive potential of a massive attack by nuclear bombs led the United States and the former Soviet Union to acknowledge that their very survival was based on mutual "deterrence—ensuring that nuclear weapons were not used.

Basic Physical Processes in Nuclear Weapons. The first step in detonating a thermonuclear weapon is to ignite the high explosive that causes a shock wave to travel inward and compress the nuclear material the explosive surrounds, known as the *pit*. At the same time, a strong source of neutrons is activated to flood the compressed pit.

If the material in the compressed pit reaches a condition known as *criticality*, the neutrons initiate a strong fission chain reaction. This is the fission, or primary, stage of a thermonuclear explosion. In a chain reaction, an incoming neutron splits the nucleus of fissile material (either an isotope of uranium, U^{235} , that occurs in nature, or of plutonium, Pu^{239} , that is man-made), releasing at least two neutrons, which then run into other fissile material, producing more neutrons, which then run into other fissile material, and so on. Thus, in successive steps, or "generations," of fission, the neutrons will multiply: $2.2 \times 2.2 \times 2 \times 2, \dots$ After very roughly 100 generations, if the fissile material can be held together long enough, (i.e., for microseconds), enough nuclei will have fissioned and enough energy will have been created to generate an explosive equivalent to 10 kilotons or so of TNT.

Several years after the development of such first-generation fission bombs, weapons designers concentrated on improving their performance by using the material more efficiently. U.S. and Soviet weapons technology advanced rapidly after the first Soviet nuclear detonation, "Joe 1," in 1949. The biggest advance occurred when the process of fusion was introduced into the explosive process. Fusion, in contrast to fission, involves combining, or fusing together, several nuclei of the lightest elements, such as hydrogen isotopes, to form more stable heavy ones. High temperatures are required to ignite the fusion process effectively. This is because at high temperatures, individual nuclei acquire high speeds, and move sufficiently rapidly to push their way through their mutual electric repulsion and get near enough to each other to collide and "fuse" together. The new nucleus thus formed is generally more stable, leading to the release of a large energy, plus more neutrons. Fusion is the process fueling the Sun's burning.

Modern weapons with both fission and fusion stages are called *thermonuclear* or *hydrogen bombs*. In a thermonu-

clear weapon, the primary, or fission, stage creates the necessary high temperatures to ignite the fusion stage, which provides additional neutrons to initiate still more fission, thereby releasing much more energy. A thermonuclear weapon can be built with virtually no limit on the amount of fusion materials it contains. Such weapons generate explosions as large as tens of megatons of TNT, or the equivalent of billions of pounds of TNT. In thinking about the totality of destruction in a nuclear war waged with modern thermonuclear weapons of such enormous yield, it is well to keep in mind that many of the destructive effects of nuclear weapons were not anticipated, and were discovered with surprise by "atomic scientists when they were used or tested. This calls for great humility when it comes to predicting the consequences of nuclear warfare.

Since 1945, the total number of known nuclear tests, worldwide, adds up to some 2,000. A major purpose of testing has been to validate and confirm appropriate performance specifications for new weapons types designed in response to military needs formulated during the Cold War. Starting in the mid-1950s, U.S. weapons were designed and built "ready to go." They conserved special nuclear materials (SNM)—the fissile materials Pu^{239} and U^{235} —and were essentially "maintenance-free, ready to go at any time. "Ready" means that no *physical* changes or steps such as inserting the SNM had to be made in order to detonate a bomb. One merely had to launch and detonate the warhead by signal.

In response to growing worldwide concerns about radioactive fallout from continued nuclear testing, the United States, the Soviet Union, and the United Kingdom joined in 1963 in a "Limited Test Ban Treaty that forbade testing aboveground, in the atmosphere, underwater, and in outer space. Only underground testing was allowed. A further restriction on testing was negotiated in 1974, limiting the yields of underground tests to a maximum of 150 kilotons, roughly ten times the yield of the Hiroshima bomb. This so-called Threshold Test Ban Treaty was generally obeyed henceforth, though it was not ratified until 1990.

In 1992, progress in negotiated reductions in the nuclear arsenals, and further progress in reducing reliance on nuclear weapons after the end of the Cold War, led President George "Bush to rule out nuclear weapons tests for new warheads and to declare a nine-month moratorium on all nuclear testing. This moratorium was continued by his successor and has also been honored by Russia and the United Kingdom. On 11 August 1995, President Bill "Clinton announced U.S. support for negotiating a comprehensive test ban treaty in 1996. The treaty would be of unending duration, and would include, as do all such tests, a "supreme national interest" clause should unanticipated circumstances present compelling arguments for renewed tests. Such arguments might arise if there were serious reversals from the present progress toward reducing nuclear danger in the world, or if unforeseen technical problems arose over time in the enduring nuclear stockpile.

By the best current technical judgment, U.S. weapons appear to be safe, reliable, age-stable, and fully adequate for deterrence; but it will be a new challenge to maintain that confidence without being able to conduct tests that produce any nuclear yield. Under its recently formulated program for stockpile stewardship and management, the United States has accepted this challenge, following a

comprehensive scientific review of prospects and needs for its nuclear arsenal. So have the United Kingdom, Russia, France, and China.

On September 1996 President Clinton was the first world leader to sign the Comprehensive Test Ban Treaty at the United Nations in New York. Soon thereafter the other declared nuclear powers—England, France, China, and Russia—also signed, and as of November 1998 150 nations have signed the Treaty and twenty-one have ratified it. For it to go into effect it must be ratified by all forty-four nuclear capable nations, i.e., nations with nuclear reactors for research or for civilian energy production, in addition to those with nuclear weapons. A Comprehensive Test Ban after more than 2,000 tests over a 50-year period would be a tremendous achievement. Efforts to accomplish that goal are currently in progress, together with continuing efforts to reduce the size of the nuclear arsenals at the Strategic Arms Reduction Talks (START) underway between the U.S. and Russia.

NUCLEAR WEAPONS AND WAR, POPULAR IMAGES OF. From the dawn of the atomic age through the end of the Cold War, *nuclear weapons, nuclear testing, and fears of global thermonuclear war loomed large in the popular mind, profoundly affecting American culture. President Harry S. *Truman's announcement of the atomic bombing of Hiroshima on 6 August 1945 unleashed a wave of nervous media speculation about the new weapon. Editorial writers and radio commentators offered grim scenarios of atomic menace. In "The Thirty-Six Hour War" (19 November 1945), *Life* magazine described a missile attack on U.S. cities and presented graphic drawings of New York City reduced to smoldering rubble. John Hersey's *Hiroshima* (1946) moved beyond generalized images of a destroyed city to offer sharply etched narratives of six survivors' experiences.

Simultaneously, other media voices and cultural outlets, encouraged by Washington, took a more hopeful view, picturing a utopian future powered by limitless atomic energy. The advent of the bomb also generated an outpouring of atomic trivia as songwriters exploited the theme and hundreds of businesses from the "Atomic Taxicab Company" to the "Atomic Exterminators" appropriated the potent word. The 1946 U.S. atomic test at Bikini atoll in the Pacific inspired a French fashion designer to underscore the explosive effect of his new line of shockingly revealing women's swimsuits by calling them "bikinis," further expanding the lexicon of the atomic age. While jewelry makers advertised "atomic-inspired" pins and earrings, the General Mills Corporation in 1947 offered kids an "Atomic 'Bomb' Ring" for 50 cents and a Kix cereal boxtop.

In *The Day the Earth Stood Still* (1951), the best of the early atomic-inspired movies, benevolent space aliens

urged global cooperation as the only alternative to global annihilation. In general, however, cultural attention to the bomb diminished in the late forties and early fifties, superseded by the Cold War and by anti-Communist hysteria. But a series of U.S. and Soviet hydrogen bomb tests reawakened public fears, this time focused on the specter of radioactive fallout. From the mid-1950s through the early 1960s, as organizations such as the *National Committee for a Sane Nuclear Policy demanded a test ban, fallout worries permeated the mass media. Many science fiction stories, most notably Ray Bradbury's *Fahrenheit 451* (1953) and Walter Miller, Jr.'s, classic *A Canticle for Leibowitz* (1959), spun chilling fantasies of the nuclear future. Popular magazines such as the *Saturday Evening Post* warned of fallout dangers and a wave of Hollywood "mutant" movies exploited the issue. In *Them!* (1954), giant ants spawned from the New Mexico atomic test site go on a deadly rampage in their search for sugar. The unfortunate hero of *The Incredible Shrinking Man* (1957) gradually dwindles to microscopic proportions after his exposure to radioactive fallout.

The new medium of television, while mainly offering escapist fare, sometimes addressed nuclear fears as well. Science fiction TV shows of the fifties and early sixties such as *The Outer Limits* and Rod Serling's *The Twilight Zone* frequently featured stories related to nuclear war themes.

As for Hollywood, a few movies preached *patriotism and preparedness as America's best hope for nuclear-age survival. *Strategic Air Command* (1955), starring James Stewart and June Allyson, for example, celebrated the nation's armada of supersonic bombers capable of raining nuclear devastation on the Soviets. More typically, as in *On the Beach* (1959) and Stanley Kubrick's brilliant black comedy *Dr. Strangelove* (1964), filmmakers offered a far bleaker view of the nuclear arms race and its possible outcome.

Federal civil defense authorities, meanwhile, promised survival from nuclear attack through fallout shelters and citizen readiness. As chronicled in the later documentary *Atomic Café* (1982), this campaign too generated its share of sometimes bizarre cultural by-products. In one animated civil defense film, cheerful Bert the Turtle taught children to "Duck and Cover" if atomic bombs began to fall.

The *Limited Test Ban Treaty of 1963 and later arms limitation agreements such as SALT I (1972) again served for a time to moderate nuclear fear and its cultural manifestations. By the late 1970s, however, anxiety once more intensified, now focused not only on the superpowers' ever-growing nuclear arsenals but also on the spread of nuclear power plants at home. The film *China Syndrome* (1979), whose release coincided with a serious accident at the Three Mile Island nuclear power plant in Pennsylvania, helped crystallize the deepening opposition to nuclear power.

The military buildup and belligerent presidential rhetoric of the early 1980s intensified this resurgence of nuclear fear, triggering yet another round of activism and cultural attention to the bomb. While Jonathan Schell's *The Fate of the Earth* (1982) pondered the meaning of the potential end of all life, artists, poets, dramatists, and photographers also addressed the issue. Tim O'Brien's novel *Nuclear Age* (1985) and a new round of science fiction stories probed aspects of the nuclear reality and imag-

ined nuclear futures. The movie *War Games* (1983) drew upon computer technology to update the scary premise of *Dr. Strangelove*: a nuclear holocaust unleashed by technological systems that break free of human control. A 1984 ABC-TV special, *The Day After*, portrayed the effects of a nuclear attack on Kansas City. The complex reciprocal relationship between the nuclear arms race and popular culture was underscored in 1983, when President Ronald

*Reagan's futuristic *Strategic Defense Initiative (SDI) was immediately ridiculed as "Star Wars" by its critics—a derisive nickname drawn from a popular science fiction movie of the 1970s.

The Cold War's demise in the late 1980s brought decades of U.S.-Soviet nuclear rivalry to a sudden and unexpected close. The threat of regional proliferation and the long-term hazard of radioactive waste disposal remained, but the more apocalyptic nightmare of an all-destroying nuclear Armageddon faded from public awareness. As it did, nuclear menace largely vanished as a cultural motif as well. But for more than forty years, few arenas—from literature and the visual arts to advertising, TV, and the movies—had remained unaffected by the nuclear terrors and obsessions that were the unintended by-products of President Truman's fateful decision in August 1945.

NUCLEAR WINTER. Although there had been earlier antecedents, the widespread public debate about nuclear winter began in 1982 with the suggestion by Paul Crutzen, at the University of Colorado, and John Birks, at the Max Planck Institute, that a large-scale nuclear war could produce such conflagrations of forests that a smoke pall covering perhaps half the northern hemisphere would develop. This would absorb enough of the light from the Sun that there could be serious and prolonged reductions in photosynthesis and in temperatures over that part of the planet, resulting in catastrophic agricultural failure. The work was quickly picked up by R. P. Turco, O. B. Toon, T. P. Ackerman, J. B. Pollack, and Carl Sagan, who, on the basis of quantitative modeling, concluded that a large-scale nuclear war could be expected, mainly as a result of the burning of cities rather than forests, to cause temperatures to drop by 36° C. (65° F.) and to remain below freezing for several months. Their work, commonly referred to as the TTAPS study, provided the basis for a number of other publications that appeared in the next three years bearing Sagan's name and the appellation "nuclear winter," which he and Turco coined to describe the phenomenon.

Not surprisingly, these publications caused a considerable stir, given their wide circulation and some of the

apocalyptic visions presented: that a major nuclear exchange would produce "the greatest biological and physical disruption of the planet in its last 65 million years" (a period that included the four great ice ages) and that the number of survivors would be reduced to prehistoric levels (presumably a fraction of 1% of those now alive). All of this was buttressed by claims that the TTAPS results were insensitive to wide variations in assumptions about parameters used in modeling. In fact, the results were anything but robust, as subsequent studies would make clear.

There were basically two kinds of problems. First, TTAPS was based on the simplifying assumption that the burning of cities would produce an instantaneous homogeneous distribution of smoke over the entire northern hemisphere, when in reality it would take some days for such spreading to occur, during which time much of the smoke would likely be removed by natural processes. Moreover, the modeling took no account of the warming effects of the infusion of relatively warm air from oceanic and tropical areas to continental interiors. More refined later modeling that did take account of these phenomena, and used comparable assumptions about amounts and characteristics of the smoke from fires, led to radically smaller temperature effects.

Second, there were a number of uncertainties in key areas which, if resolved, could plausibly lead at one extreme to no significant climatic effects, or at the other, to effects as dire as those discussed in 1983, a range of outcomes largely conceded by Turco and Sagan in a characterization of five different classes of nuclear winter by 1989.

The nuclear winter controversy was perhaps as much about policy as about geophysics. Advocates of enlarged programs for *deterrence of nuclear attacks and for defense against them seized on the possibility of nuclear winter to buttress their case for such programs. In contrast, the most vocal proponents of the nuclear winter theory generally argued that it strengthened the case for reducing nuclear stockpiles and foregoing the development and acquisition of new *nuclear weapons; and some argued that even if there were doubts about the phenomenon, it would be wise to base policy on "worst-case analysis." Others argued that war involving enough nuclear explosions to trigger nuclear winter would likely have consequences so catastrophic, at least for the nuclear weapons states, as to overshadow the possibility of nuclear winter in concerns about policy. (And some of those skeptical about the more dire prognostications warned particularly against worst-case analysis being used as a basis for mitigative actions by countries not likely to be directly attacked, noting that such actions could well involve the use of scarce resources sorely needed for other purposes.)

By the early 1990s, nuclear winter was no longer a salient issue in geophysics or from a policy perspective, very likely because the geophysical case for it seemed so questionable; because the initiation of massive oil fires in Kuwait during the *Persian Gulf War did not lead to significant climatic effects, as some had predicted; and probably most important, because concern about large-scale nuclear attacks had largely dissipated with the end of the *Cold War.

NUNN, SAM (1938–), U.S. senator. Nunn was born in Perry, Georgia. After attending Georgia Tech, he enlisted as a seaman in the Coast Guard for a year's active duty, followed by several years in the reserves. Meanwhile, he graduated from Emory University, receiving a law degree (1962). In 1963, he served as legal counsel to the House Armed Services Committee, and then returned to the family farm to practice law in Perry.

In 1972, Nunn won the U.S. Senate seat formerly held by Richard Russell of Georgia, longtime head of the Armed Services Committee. He served on that committee (1973–96), and as chair (1987–94), becoming one of the most influential senators on military and arms control issues.

A conservative southern Democrat, Nunn was often at odds with liberal Democrats and Republicans. In the late 1970s, he urged major increases in "NATO's conventional firepower and advocated the neutron bomb and the adoption of national service. He was also a significant critic of SALT II. Building bipartisan alliances, Nunn obtained several key weapons systems and blocked the Clinton administration's plan for equal rights for "gay men and lesbians in the military.

Reflecting concerns in the military, Nunn initially opposed the idea of a ground war against Iraq in 1991, and he helped avert a military invasion of Haiti in 1994. For more than a decade, before he retired in 1996, Nunn was the dominant voice in the Senate on defense policy.

NURSE CORPS, ARMY AND NAVY. Both men and women served as nurses for the army in various capacities beginning in 1775, but it was not until 1901 that an official Army Nurse Corps was created as part of the Medical Department of the U.S. Army. The Corps was exclusively female. Distinguished contributions of women contract nurses during the "Spanish-American War provided the justification for this permanent female nurse corps. Although today's Corps is no longer exclusively female, its purpose endures: to provide nursing care for service members. The organization has a dual significance. It is the oldest military nursing service and the first military branch to admit women.

Army Nursing. When the United States entered World War I in 1917, there were only 403 army nurses on active duty. By November 1918, there were 21,460, 10,000 of whom were serving overseas. During the war, nurses worked primarily in base, evacuation, and mobile surgical hospitals in the United States, France, Hawaii, Puerto Rico, and the Philippines. They also provided care on hospital trains in France and transport ships carrying wounded home across the Atlantic.

More than 57,000 nurses served during World War II. In May 1942, after the Battles of "Bataan and Corregidor, sixty-seven army nurses became prisoners of war of the

Japanese. For the thirty-seven-month captivity, the women endured primitive conditions and starvation rations, but still they continued to care for the ill and injured. Nurses landed with troops in the "North Africa campaign on invasion day in November 1942. They also waded ashore at Anzio five days after initial assault landings.

Army nurses supported combat troops when President Harry S. "Truman ordered U.S. forces into Korea in June 1950. During the three-year "Korean War, approximately 550 nurses served abroad, the majority of them in mobile army surgical hospitals (M.A.S.H. units).

More than 5,000 army nurses served in Vietnam during that conflict. Evacuation by "helicopters brought the wounded to medical units located within minutes' flying time of the battlefield. Mobility and large numbers of severely injured patients characterized service in the "Vietnam War. Eight women nurses were killed in action.

During Operation Desert Shield-Desert Storm, approximately 2,200 nurses served in 44 hospitals within the theater of operations. Two of every three nurses in the "Persian Gulf War were from the U.S. Army National Guard or were army reservists. By the late 1990s, 4,200 active duty nurses were providing nursing care to soldiers, retirees, and their families.

Navy Nursing. An act of Congress established the Navy Nurse Corps on 13 May 1908. Soon thereafter, the first twenty nurses, later known as the "Sacred Twenty," reported for duty. Nurses were not new to the navy, however. During the "Civil War, several volunteer nurses served on the Mississippi River aboard *Red Rover*, a captured Confederate sidewheeler converted by Union forces into a floating hospital.

The Navy Nurse Corps remained a small organization until World War I, when it grew to a peak strength of 1,386 in 1918. Navy nurses served at hospitals in the United States, Britain, and France, and even with some army field units in France. No navy nurses died in action, but thirty-six succumbed to other causes.

In 1920, the first nurses reported to the hospital ship *USS Relief*. The Navy Nurse Corps shrank dramatically after the end of the war, averaging only 400–500 personnel during the 1930s.

Navy nurse involvement in World War II began immediately on 7 December 1941. Nurses aboard the hospital ship *USS Solace* in Hawaii treated the first "casualties of the Japanese attack on "Pearl Harbor. The Navy Nurse Corps reached its all-time peak strength with 11,086 nurses on active duty by 1945, serving at 40 naval hospitals, 176 dispensaries, and 6 hospital corps schools in the United States. Overseas, navy nurses served aboard hospital ships, participated in aerial evacuation of casualties, and were stationed at land-based facilities across the Pacific and throughout the Atlantic theater. The war prompted the navy to assign relative rank to nurses on 1 July 1942. In 1944, actual rank was established to last throughout the war plus six months. In April 1947, the Army-Navy Nurses Act established the Nurse Corps as a permanent staff corps of the U.S. Navy bringing permanent commissioned rank and equal pay.

In November 1964, male nurses entered the Navy Nurse Corps for the first time. Currently, they comprise 25 percent of the Corps' overall strength. The 1960s also saw navy nurses serving ashore and aboard hospital ships in Vietnam.

In 1972, the first Navy Nurse Corps officer, Alene Duerk, was appointed to the rank of rear admiral, becoming the first woman appointed to flag rank in the U.S. Navy. The tradition of excellence continues. In Operation Desert Shield/Desert Storm, navy nurses served on land and aboard two hospital ships. By the late 1990s, there were over 5,000 active duty and reserve nurses in the U.S. Navy.

NYE, GERALD P. (1892-1971). Born in rural Wisconsin, Nye spent fifteen years as a country editor in Wisconsin, Iowa, and North Dakota. A progressive Republican, he was appointed U.S. senator from North Dakota in 1925 to fill a vacancy; he won elections on his own in 1926, 1932, and 1938. During the 1930s, Nye was to the left of the New Deal on domestic policy. In 1934-36, he gained national

prominence as chairman of the Special Senate Committee Investigating the Munitions Industry. The committee probed into the close ties between the U.S. and Allied military and the arms manufacturers and financiers, focusing in particular on the Dupont and Morgan interests and their enormous profits in the World War I era, the so-called merchants of death. He unsuccessfully called for heavy taxation of war profits and governmental power to take over industries.

A strong isolationist, Nye sought to limit U.S. military defense to the western hemisphere, endorsing more air-power but curbing battleship production. Influential in the drafting and adopting of the *Neutrality Acts of 1935-37, he vigorously opposed President Franklin D. *Roosevelt's interventionist policies of 1939-41, speaking frequently for the America First Committee. So extreme was his rhetoric that in 1941 he called Britain "the greatest aggressor in modern times." He lost his Senate seat in 1944 in a three-way race.

OAS (est. 1948). The United States joined with the twenty Latin American nations to form the Organization of American States in 1948. During the 1970s, the English-speaking Caribbean nations were added, and Canada became a member in 1990. The OAS was established to resolve regional disputes and to promote democracy, human rights, and social and economic progress. The OAS charter also codified the nonintervention pledge of Franklin D.

* Roosevelt's "Good Neighbor" policy of the 1930s. The charter did, however, permit collective action by a two-thirds majority.

During the *Cold War, the United States largely bypassed the OAS, because Latin Americans refused to compromise the nonintervention principle in the name of anti-communism. Acting unilaterally, the United States covertly destabilized allegedly Communist governments in Guatemala (1954), Brazil (1964), and Chile (1970-73), and invaded the Dominican Republic (1965). At the time of the U.S. military involvement in the "Dominican Republic, President Lyndon B. "Johnson publicly repudiated the OAS charter, declaring in the Johnson Doctrine that the United States would not permit the establishment of a Communist government in the western hemisphere. During the 1980s, the Reagan administration withheld financial support from the OAS because members refused to support U.S. "guerrilla warfare against the Sandinistas of Nicaragua. OAS members also condemned President George "Bush's invasion of Panama (1989). To be sure, during 1960s, two-thirds of the Latin American nations had followed the U.S. lead and supported sanctions against Fidel Castro's Cuba, because the Cuban revolutionary meddled in the affairs of his neighbors. But by the mid-1970s, the majority of OAS members began to lift those sanctions.

In the post-Cold War era, the United States has shown renewed interest in the OAS on issues of democracy and human rights. In 1991, members developed a basis of action for when popularly elected leaders are overthrown, and the OAS subsequently imposed economic sanctions against Haiti when President Jean-Bertrand Aristide was forcibly removed from office by the Haitian military. In 1994, the United States again acted unilaterally in restoring President Aristide to power by military means, although the OAS did not formally denounce the intervention.

OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT. See Science, Technology, War, and the Military.

OKINAWA, BATTLE OF (1945). Landing day for Okinawa, the final land battle of the Pacific War, was Easter Sunday, 1 April 1945. The Landing force was the new Tenth Army under Army Lt. Gen. Simon Bolivar Buckner. He commanded two corps, XXIV Corps, with five army divisions, and III Amphibious Corps, with three Marine divisions, all told some 182,000 troops. In overall charge was Vice Adm. Raymond A. "Spruance, commander of the Fifth Fleet.

Okinawa, sixty miles long and from two to twenty-eight miles wide, is the largest and most important of the Ryukyu Islands. The 500,000 Okinawans were not then considered to be Japanese.

Japanese Lt. Gen. Mitsuru Ushijima commanded the Thirty-second Army, strength of 77,000 troops, who with naval forces and some 20,000 Okinawan conscripts provided about 100,000 defenders. Ushijima planned a defense in depth, with his main strength in the heavily populated south, and three major defense lines following east-west ridgelines.

Buckner landed his two corps, each with two divisions in the assault, across surprisingly undefended beaches near Hagushi village on the western side of the narrow waist of the island. The III Corps on the left and XXIV Corps on the right crossed the island almost without enemy contact. The Marines then turned northward and the army headed south. On 6 April, XXIV Corps ran into the outer rings of Ushijima's first major defense line running along Kakazu ridge.

Ushijima's plan was to delay his counterattack until much of the supporting U.S. invasion fleet of some 1,200 ships was crippled by massive combined sea and air action, including suicide kamikaze tactics. The first major kamikaze attack came on 6 April. Joining the air action, the giant 18-inch-gun battleship *Yamato* sortied from the home islands, but was destroyed by U.S. Navy aircraft. Ashore, Ushijima's companion counterattack, not launched until 12 April, was easily absorbed by XXIV Corps. Meanwhile, III Corps had overrun most of central and northern Okinawa. Buckner, to overcome Ushijima's stiffening resistance, began shifting the III Corps to the south.

Ushijima's second major counterattack, timed to coin-

cide with the fifth kamikaze attack, went off piecemeal on 3 May and accomplished nothing.

Buckner went forward with a two-corps attack on 11 May. Ushijima's second line, which passed through Shuri, was broken on both of his flanks. He elected to fall back to his third and final line on the southern tip of Okinawa.

Buckner launched his final large-scale attack on 18 June. The general was killed by a Japanese shell while watching the action from a forward observation post. Command of Tenth Army passed to Marine Maj. Gen. Roy S. Geiger of III Corps, who declared the island "secured" on 21 June. That same day, Ushijima committed ceremonial suicide. The last of the ten major air attacks came on 22 April. Next day, Gen. Joseph "Stilwell" arrived and took command.

Although liked by his subordinates, army and Marine, Buckner was considered an inexperienced commander. He was criticized by, among others, Administrative Spruance and Gen. Douglas "MacArthur" for his unimaginative and costly frontal assaults and his refusal to try a second amphibious landing on the southern end of the island, which might have broken the stalemate. Tenth Army "casualties were 7,613 killed or missing in action and 31,800 wounded. Close to 5,000 U.S. sailors died and as many more were wounded. Seven U.S. carriers had been badly damaged and many other smaller ships were sunk or damaged. Estimates of Japanese casualties ran over 142,000, including many hapless Okinawan civilians.

ON-SITE INSPECTION AGENCY. On-site inspection, a long-term demand of the United States for verification of nuclear "arms control and disarmaments agreements, was finally accepted by the Soviet Union under Mikhail Gorbachev in 1987. The verification provisions of the "INF Treaty of December 1987 between the United States and USSR authorized on-site inspectors to monitor and record the elimination of "missiles. Consequently, the Department of "Defense established a small, 40-person agency to conduct and receive INF Treaty inspections; more than 230 on-site inspections were conducted in the first year. In 1990, President George "Bush signed the Threshold Test Ban Treaty, the Conventional Forces in Europe Treaty, and the Wyoming Memorandum of Understanding on the Prohibition of Chemical Weapons, each stipulating on-site inspections. The On-Site Inspection Agency expanded from 40 to 250 people. American inspection and escort teams consisted of military officers, noncommissioned officers (NCOs), and civilian specialists. The officers had experience as military attachés, foreign area officers, and/or weapons specialists. The NCOs served as translators.

In July 1991, Bush and Gorbachev signed the START I Treaty; nine months later, twenty-seven nations concluded the Open Skies Treaty. Within a year, the United States had signed the START II Treaty (5 nations) and the Chemical Weapons Convention (153 nations). Each agreement in-

cluded provisions for extensive monitoring through on-site inspections. The On-Site Inspection Agency expanded to 760 persons between 1991 and 1994.

—Joseph R Harahan

OPERATIONAL ART is a twentieth-century concept dealing with the direction of military forces in conceiving and executing operations to attain strategic objectives. It involves joint and combined forces and apportioning resources to tactical units. Operational art forms a bridge between "strategy\ defining the political aims of a war, and " tactics, fighting the battles of a war. While not neglecting the strategic objectives of belligerents in war and their tactical doctrines, it concentrates on a level between them. For this reason, some analysts have seen its origins in the eighteenth-century idea of *campaign strategy*.

In analyzing operational art, it is helpful to conceptualize strategy, operations, and tactics as "perspectives on war" rather than the more accepted "levels of war." Conceptualized as levels, the strategic, operational, and tactical tiers invariably overlap, while if viewed as perspectives, the different analyses can be better outlined to complement one another.

As an example, one might consider the Allied invasion of "Normandy, France, in June 1944. The Allied strategic aim was to enter the Continent of Europe and conduct operations into Germany to destroy Berlin's armed forces. Viewed from this perspective, the endeavor was one of coordinating land, naval, and air forces; apportioning resources between them; conducting military and political "intelligence operations; promoting harmony between the Allied forces participating; and planning campaigns to be carried out over an extended period to destroy Germany's armed forces. From the perspective of the tactical land forces employed in the assault on the French coast, the task became, at its most basic, merely to get ashore, secure the beachhead, and survive until reinforcements were landed. Between these perspectives, the operational perspective included tasks such as apportioning resources to provide a balance between assault forces and follow-on reinforcements; providing for naval and air support of the landings; coordinating the massive "logistics requirements of the invasion; ensuring proper command and control to react to enemy actions; and planning the subsequent campaign for the breakout from the beachhead. Although the perspectives share some aspects, each clearly had definable tasks that are the primary responsibility of commanders at a given level. And commanders from each perspective have the task of apportioning resources; for example, the strategic commander must apportion resources among the Allied nations and their land, naval, and air arms of service, the operational commander among his various tactical units, and the tactical commander among his small units and their assigned beaches.

Soviet military theorists were the first to coin the term *operational art* and to analyze the concept, institutionalizing it by the mid-1920s. Some saw its genesis in the Russian civil war and World War I, while others saw it as an outcome of the Napoleonic Wars and the revolutionary

development of the *levée en masse*, when campaigns followed one another toward the attainment of a strategic goal.

U.S. thinkers began concentrating on operational art by the 1980s. They saw it as the purview of the theater commander, who must determine what sequence of campaigns would be necessary to accomplish the strategic goal and how resources should be apportioned to execute them.

OPERATIONS RESEARCH. In defense analysis, operations research uses statistics and mathematics to optimize the use of a weapon. To set up a *radar/fighter defense against *bomber aircraft, for example, the traditional method would be to draw advice from war-experienced experts or apply current military *doctrine. An operations researcher, however, starts with a numerical measure of effectiveness—perhaps the number of bombers expected to get through, or the warning time provided, or some combination. The next step is to analyze statistics from past systems, and feed these into a mathematical model combining scanning rates, the decision-making speed of radar operators, and the average number of operational fighters. The best design might be found by pencil and paper analysis, or a computer program that simulates the system under various attacks.

Operations research was first used widely in Britain in 1939-40 at the start of World War II. It spread to the United States, where it solved problems such as the placement of bomber-dropped naval *mines to destroy Japanese shipping. Another question involved a patrol plane coming upon a submarine on the surface—the submarine dives and the patrol plane must set an optimal detonation depth for its depth charge. Operations researchers also improved the likelihood that bombers would destroy an industrial target. They recommended reducing the size of a flight to about a dozen planes, assigning the best bombardier to the lead plane and have the rest follow his cue, and minimizing the time between successive *bombs released from each plane. Photo reconnaissance showed an approximately fourfold improvement.

Sometimes operations research has exposed an important simple truth, but sometimes it has oversimplified an essentially complex situation. Starting in the late 1960s, it figured in the public debate over antimissile defenses and the survivability of the Minuteman intercontinental ballistic missile. The problem was construed as Soviet *missiles destroying American missiles in their silos, but it became clear that the adversary would attack communications and control centers, and that U.S. policy was not to wait and “ride out” such an attack. The scenario of missiles attacking silos received attention partly because it was simple enough to solve.

Historically, there has been tension between the mathematical/scientific training of operations researchers and the military background of those implementing their ideas. In the early 1960s, officers generally resented Department of *Defense secretary Robert S. *McNamara's civilian whiz kids. Organizational savvy and the proven worth of the

method have bridged this gap, and today any major campaign, such as Desert Storm, in the *Persian Gulf War, would be preceded by extensive computer simulations.

OPPENHEIMER, J. ROBERT (1904-1967), physicist. Perhaps the most controversial scientist of this century, J. Robert Oppenheimer was awarded kudos in the 1940s for his contributions to the war effort and censure for allegedly betraying the country of his birth. Born in New York City and educated at Harvard and Göttingen, Oppenheimer earned his Ph.D. in 1927 and quickly became recognized as a leader in theoretical physics, simultaneously rising through the academic ranks at the California Institute of Technology and the University of California at Berkeley, and gathering large numbers of the best scientific minds in the United States to his seminars and laboratories. In so doing, he became the catalyst for the emergence of American theoretical physics as preeminent in the world.

At the National Academy of Scientists in 1941, Oppenheimer led a group of scientists in theoretical discussions of nuclear bombs. Although intensely ambivalent about the creation of such weapons of mass destruction, he was concerned that the Nazis might produce one first, so he accepted an offer from Gen. Leslie Groves to serve as director of a highly classified U.S.-led effort to build an atomic bomb. This effort, the *Manhattan Project, was headquartered at Los Alamos, New Mexico. Many *atomic scientists gathered there between 1942 and the first detonation of an atomic bomb on 16 July 1945.

Even though the dropping of atomic bombs on *Hiroshima and Nagasaki ended World War II and kept the Russians from invading Japan, Oppenheimer was overwhelmed by the devastation he had wrought. He called for a cessation of atomic research or for international guidelines on the use of atomic weaponry. Both during the war and later he became associated with Communist Party members and others with strong leftist political positions. Although no clear violations of security were ever proven, there had been instances of negligence and indiscretion. During the McCarthy investigations and purges of alleged Communists in the U.S. government in the 1950s, Oppenheimer lost his security clearance and was forced to resign from the seven atomic committees he chaired. He became director of the Institute for Advanced Study in Princeton and was later at least partially vindicated when President Lyndon B. *Johnson presented him with the Enrico *Fermi Award in 1962.

ORDER OF BATTLE refers to listings that count and categorize military forces in terms of unit type (e.g., armor, in-

fantry, brigade, division) and quality and quantity of armament. Sometimes order of battle *intelligence analysis* offers estimates of military units' "combat effectiveness by extrapolating from recent events. Units engaged heavily in combat might be rated less effective—because of recent personnel and equipment losses—than experienced full-strength units.

Order of battle information is crucial to battlefield success: a commander who is unaware of the number, type, and quality of opposing units risks disaster. Attacks are more likely to succeed if they are directed against inexperienced units or units weakened by combat. Movement of experienced units to a given sector can indicate that an attack is imminent.

Because of its importance, operational security and deception often focus on order of battle information. Before the invasion of *Normandy, France, in World War II, the Allies staged a massive deception operation, code-named "Fortitude South," to confuse German intelligence about the Allied order of battle. A variety of ruses were used—phony bases, rubber tanks, simulated radio traffic—to create evidence that a fictional formation, First United States Army Group (FUSAG), actually existed. Nominally "commanded" by George S. "Patton, one of America's best general officers, FUSAG was located in Dover and helped tie down German units in the Pas de Calais as real Allied units stormed ashore 170 miles southwest at Normandy.

Order of battle intelligence also can be controversial. During the "Vietnam War, analysts at the Military Assistance Command Vietnam (MACV) and the "Central Intelligence Agency debated the size and composition of enemy units operating in South Vietnam. The debate continued after the war and was the subject of a federal libel case—**Westmoreland V. CBS*—in 1985.

OSCEOLA (Maskôkî—Black Drink singer, ca. 1804-1838), Native American war leader. Osceola was born into the Tallassee tribe of Maskôkî speakers (called *Creeks* by the British), whose village was near present-day Tuskegee, Alabama. He was never a chief.

Dispossessed by Andrew "Jackson's settlement of the Creek War of 1813-14, he and part of his family migrated southward into the Spanish Floridas. His plight and passion captured the imagination of the U.S. press, which romanticized Osceola as a symbol of Indian resistance to forced removal. Acquisition of the territory by the United States in 1821 increased tensions, and the young warrior spoke vehemently against the treaties by which the United States sought to confine Florida Indians to peninsular reservations. Imprisoned for several days by U.S. Indian agent Wiley Thompson in 1835, Osceola determined to fight removal. Along with tribal leaders, he planned the opening gambits of the Second Seminole War.

On 28 December 1835, Osceola murdered Agent Thompson at Fort King (Ocala) as his compatriots were attacking a U.S. Army column under Maj. Francis Dade en route there. Two days later, he was one of the leaders of the Battle of the Withlacoochee, in which U.S. regulars and volunteers were routed by the numerically inferior Indian forces. He led warriors throughout 1836-37 although his health declined.

On 21 October 1837, Osceola was captured by U.S. troops, while under a white flag of truce, near St. Augustine, East Florida. He was transferred from Fort Marion (St. Augustine) to Fort Moultrie, South Carolina, where he died a prisoner on 30 January 1838.

P

PACIFICATION is a controversial and complex issue in American military history. It is controversial because it denotes U.S. policy toward hostile populations that are either the primary or secondary object of war itself. It is complex because it describes simultaneous military, political, and economic activities to protect, control, appease, or coerce civilians and to reform governments besieged by insurgency or external subversion. It can also refer to efforts to suppress anticolonial movements. Because it is overtly political and targeted at civilians, American officers have viewed pacification equivocally, sometimes treating it as a tertiary mission in a given campaign. Pacification policies have also served as a rallying point for American "peace and antiwar movements, even though these policies often produce less death and destruction than other military operations.

Depending on the nature of the insurgency, pacification can take a variety of forms. From a military perspective, it often involves protecting civilians from "guerrilla warfare depredations (confiscation of property, assassination, torture, and other forms of political coercion) or denying guerrillas access to material and psychological assistance provided by civilian supporters. Government control of the local economy through resettlement, disruption of traditional production methods, or other programs intended to deny civilian surpluses to insurgents weakens both the political appeal and the military capability of insurgencies. By disrupting the guerrillas' logistical infrastructure (i.e., the civilian population), the scope and intensity of an insurgency can be reduced. For police and intelligence operatives, pacification involves the identification and arrest of clandestine cadres that form shadow governments within civilian populations. These operations often involve the interrogation and detention of suspects, maintenance of databases on insurgent networks, or the provision of identification credentials to entire populations. Reform of besieged governments sometimes plays a part by addressing the economic and political grievances that fuel unrest. By reducing or eliminating the economic, social, and political inequities that motivate indigenous support of insurgents, governments can sometimes entice guerrillas and their supporters to abandon military activity and participate in reform.

For many Americans, the term *pacification* is linked to the Vietnam War. Pacification remains a key point in the debate over the sources of the U.S. debacle in Southeast Asia. Harry Summers has criticized U.S. policy for focusing too much on the struggle for the "hearts and minds" of the South Vietnamese peasant and for not destroying the source of the southern insurgency, which he locates in North Vietnam. By contrast, Andrew Krepinevich has sug-

gested that the U.S. military virtually ignored pacification, focusing instead on the "Big-unit war" against North Vietnam. Pacification also served as a source of interservice rivalry during the war. The Marine Corps' Operation Golden Fleece, an effort to deny the rice harvest to Viet Cong forces, and Marine Corps combined action platoons, which stationed small Marine units in Vietnamese villages, reduced Marine participation in large-scale search and destroy operations favored by U.S. Army officers.

American pacification efforts took on many forms and consumed enormous resources during the Vietnam War. In 1959, Ngo Dinh Diem's government launched a program to move South Vietnamese peasants into strong rural settlements named *agrovilles*. This initiative was followed in 1961 by the *strategic hamlet program*, shaped by Sir Robert Thompson, who had helped plan the successful British "counterinsurgency effort in Malaya in the 1950s. Because of mismanagement and conflicting priorities between the Diem regime, which wanted a mechanism to control the southern population, and its Western advisers, who saw physical security and prosperity as a way of winning peasant sympathies from the Viet Cong, both programs floundered. Building these settlements also relied heavily on peasant labor and produced much disruption of rural life, which increased village dissatisfaction with the Saigon regime. Both programs also failed to protect villagers from the Viet Cong. By contrast, one element of the strategic hamlet initiative, the *Chieu Hoi* ("Open Arms") program to offer clemency to insurgents, produced positive results throughout the war. Viet Cong defectors, commonly referred to as "ralliers," even served as "Kit Carson" scouts for U.S. forces.

In 1964, a revised pacification plan called *Chien Thang* ("Will to Victory") was implemented by the South Vietnamese and their American advisers. Based on the "oil-spot concept," *Chien Thang* was intended slowly to increase areas considered pacified. Military and paramilitary units would occupy a central village for a time, clear it of Viet Cong influence, then move on to an adjacent area. Pacified areas would thus spread out from a central village like an ever-expanding drop of oil on water. *Hop Tac* ("Victory"), which also began in 1964, was an effort to apply this oil-spot philosophy to the area surrounding Saigon. Again, this program failed to live up to expectations because of poor execution and a lack of support from conventional military units.

In the aftermath of the January 1968 "Tet Offensive, pacification was given renewed emphasis in U.S. policy. The efforts of many U.S. agencies that contributed to pacification were now coordinated by CORDS (Civil Operations and Revolutionary Development Support). Created

in 1967 by a Johnson administration eager to improve U.S. prosecution of the "other war" (pacification), CORDS was headed by Robert "Blowtorch" Komer, known for his determination and bureaucratic savvy. Komer's efforts at coordinating competing civilian programs with military operations yielded results. CORDS efforts to destroy the Viet Cong infrastructure (VCI) by identifying and arresting clandestine cadres in southern villages produced two infamous initiatives: ICEX (infrastructure coordination and exploitation), which was started in mid-1967 to support South Vietnamese police units; and Phoenix, which was started in 1969, to coordinate American and South Vietnamese military, intelligence, and police operations against the VCI. Although Phoenix was criticized as a thinly veiled terror and assassination program, its operations emphasized intelligence collection. Dead suspects were of no use in rolling up the VCI. After the war, Communist observers and American supporters of pacification both agreed that the Phoenix and the *Chieu Hoi* programs were effective, but that pacification had taken too long and had cost too much. The more important battle for the "hearts and minds" of the American public was lost long before the Communists' Great Spring Victory of 1975.

By contrast, in earlier wars American pacification efforts had twice been effective in the Philippines in the twentieth century. In the 1950s, CIA agent Edward G. *Lansdale, a U.S. Air Force officer with a background in advertising, organized an effective response to a revolt of the Communist faction of the Hukbalahap (a Tagalog acronym for "People's Anti-Japanese Army"). Working with the young and charismatic Ramon Magsaysay, who would eventually become president of the Philippines, Lansdale orchestrated a textbook pacification effort. Magsaysay launched reforms that curtailed military and landlord harassment of the peasantry; American aid was used to help satisfy the "land hunger" that motivated many Huks. When Huk leaders were rounded up in a raid of their Manila headquarters, reforms continued to reduce the economic and political concerns motivating rank-and-file Huks, slowly ending the insurgency.

Half a century earlier, Filipino resistance to the U.S. occupation of the archipelago following the *Spanish-American War was ended by harsher methods. After driving the Philippine Army from the field in a series of conventional battles, the U.S. Army ultimately suppressed guerrilla resistance by "concentrating" the rural population into specified areas. Destroying the guerrillas' rural food supplies and tax base, U.S. forces starved the nationalists into submission. The promise of limited self-rule also reduced some of the political motivation behind the guerrilla movement.

Almost from the beginning of the English North American colonies, colonists and later the U.S. government pacified Native Americans, who had been weakened by a horrific demographic shock produced by the introduction of Eurasian diseases. In pre-Revolutionary America, when European settlers and Indian nations were more evenly matched in military capability, pacification took the form of punitive expeditionary raids intended to drive Indian settlements away from areas populated by Europeans or to deny Indians the logistics needed to launch raids against colonists. Later, when westward migration, briefly interrupted by the *Civil War, brought American settlers and western Indian nations into repeated conflict, the U.S. gov-

ernment forced Indians onto reservations and fought to keep them there, making them dependent on government subsidies. Even though the reservation policy, intended to "civilize" Native Americans, destroyed traditional lifestyles, at the time it was often depicted as a humanitarian approach to the "Indian problem." By contrast, many settlers objected to humanitarian efforts advocated by eastern groups (e.g., "Quakers) and simply called for the extermination of Native Americans.

Pacification operations conducted by loyalist forces during the American * Revolutionary War were often brutal. British commanders, however, chose not to adopt a scorched-earth policy to combat the Revolution. Many British officers believed that a deliberate policy of brutality would drive "fence-sitters" to support the rebel cause.

Because pacification often involves the denial of economic or cultural independence to civilian populations or military intervention in the domestic politics of other nations, the policy conflicts with the political and philosophical principles that underlie American political culture. As a result, many Americans view U.S. pacification campaigns as dark chapters in the nation's history.

PACIFISM is the principled rejection of war. It has found expression in American history through individuals who acted upon basis of personal conscience and through groups who acted out of a corporate sense of peoplehood. Pacifism has involved the refusal to participate in war or military service, as well as organized activities to promote "peace and to give witness to the power of love in social and political relationships. Degrees of pacifist expression and commitment have varied widely, from a total renunciation of war by separatist religious sects to a general secular bias against militarism. Pacifism has had a role both at the sectarian fringes and at the public center of American life. By the broadest definition of the term—the desire to avoid war—in the words of John Dewey in 1917, "the American people is profoundly pacifist."

Some Native North American tribes had developed corporate pacifist traditions before contacts with the Europeans. In the early fifteenth century, Deganawidah, semi-mythical founder of the Iroquois confederacy, taught a gospel of disarmament, social cooperation, and the rule of law. Sweet Medicine, legendary founder of the Cheyenne, established a "Peace Chief" tradition that counseled chiefs to suffer nonviolently rather than to take violent revenge.

The Lenni Lenape (Delaware) had traditions of peacemaking and mediation which, together with the pacifism of William Penn and the Quakers, helped the colony of Pennsylvania for seventy years to avoid the scourge of war that afflicted Indian-white relations elsewhere.

The pacifist Quaker movement began in the mid-seventeenth century in the separatist wing of the Puritan dissent against the Church of England. The Quakers taught that all people, not just "the elect," could be saved and live a life of righteousness through the guidance of the "inner light" from God, without the mediation of priest or sacrament. The Quakers took the Bible seriously, especially the teachings of Jesus in the New Testament, but gave primary emphasis to the universal light within. William Penn made liberty of conscience and the renunciation of war central to his "Holy Experiment" in social and cultural pluralism in the Delaware Valley. Social order in Pennsylvania was not guaranteed by militia, imposed creeds, or social hierarchy, but by an ideal of social harmony and mutual forbearance among different groups. From the founding of Pennsylvania in 1682 to the withdrawal of Quakers from political control in 1750, this experiment evolved a set of pacifist-oriented social ideals and institutions that worked a lasting influence upon American life. After 1750, Quaker pacifism became a more marginal and perfectionist movement, but it remained a continuing source of humanitarian reform impulses for movements against slavery, militarism, and other social ills.

Among the groups Penn attracted to his colony were German-speaking pacifists of Anabaptist and Pietist origin, notably the Mennonites, Amish, and Dunkers (Church of the Brethren). The Mennonites originated in the left wing of the Protestant Reformation on the European Continent and held to a doctrine of two kingdoms that separated church and state. The state was "outside the perfection of Christ" and ordained by God to maintain order in the world. The church was a body of disciplined adult believers who literally followed the teachings of Jesus, including the commandment to love one's enemies. Mennonites and their cousins, the Amish, generally stayed aloof from politics. The Dunkers, of eighteenth-century radical Pietist origin, expressed a warmer evangelical piety than the Anabaptists, but also maintained a strictly disciplined church life of nonresistance, simplicity, and separation from the world. The Quakers, Mennonites, and Brethren eventually became known as the "historic peace churches." Other church and communitarian groups also developed pacifist stances based upon varying apostolic, eschatological, and reform visions (Shakers, Jehovah's Witnesses, Seventh-Day Adventists, Churches of Christ, Church of God in Christ, and others).

The classical republican political philosophy that guided the founders and leaders of the early American republic contained significant elements of pacifist antimilitarism. Classical republicanism, derived from scholars of the French Enlightenment and from English Whig opponents of monarchy, assumed that warfare resulted from the alliance of the ruling aristocracy with their national military forces. This alliance produced standing armies, which encouraged despotism and threatened the freedoms of the people. To maintain public order, classical republicans counted upon the superior virtue of citizens in a republic and upon the efficacy of well-regulated local militia. Classical republicanism, in its acceptance of militia and of de-

fensive wars, was far from absolute pacifism. But it was a "halfway pacifism" opposed to professional military training academies, to a standing army in peacetime, and to national military conscription in wartime. In the early American republic, it also informed peace initiatives such as President John Adams's decision for peace with France in the wake of the XYZ Affair (1799-1800) and President Thomas Jefferson's use of a trade embargo as an alternative to war (1808). Also in the classical republican tradition were rapid disarmament and reduction of the army after wars, strong opposition to military conscription in the Civil War and World War I, and alarm over the power of the military-industrial complex in the Cold War.

The first nonsectarian peace societies in the United States emerged in the wake of the War of 1812. In 1828, the local and state peace societies joined to form the American Peace Society. The peace societies were deeply religious and primarily Christian, believing that God was revealed in Christ, and that Jesus' ethic of love required the rejection of violence and war. The relationship of the peace reform to movements against slavery and for women's rights was especially important in this reform-minded era. In 1838, some radical pacifists, led by William Lloyd Garrison, formed the New England Non-Resistance Society and called for righteous people to separate themselves from an evil world, particularly the slave-owning South. The peace societies opposed the Mexican War (1846-48), but when the Civil War broke out (1860) they nearly all supported the North's military effort as a justifiable police action to end slavery and preserve the Union.

Between the Civil War and World War I, the pacifist-anarchist teachings of the Russian author Leo Tolstoy added a new dimension to the peace movement, even as the movement adapted to the new challenges created by urbanization and industrialization. Tolstoy taught a universal non-resistant gospel based upon a law of love common to all world religions. In the first decades of the twentieth century, the secular theme of "internationalism" became especially prominent, with proposals for international law and for arbitration of disputes. In 1910, the philosopher and psychologist William James wrote an influential essay, "The Moral Equivalent of War," which argued that the apparent opposites, killing and service, were both expressions of a universal impulse to heroic self-sacrifice. James's essay gave new psychological depth to pacifist thought and fostered alternative service programs to military service. Jane Addams, founder of the Women's International League for Peace and Freedom, envisioned benevolent social work on a grand scale as a means of achieving world peace.

Pacifism in the twentieth century addressed the problems of total international warfare and ultimately of a thermonuclear arms race. During wartime, the historic peace churches continued their conscientious objection to war and refused military service. The numbers of men who went to prison or to alternative service programs remained small, reduced through acculturation to American patriotism. But the peace church precedent of conscientious objection provided a wedge for massive challenges to the military draft during the unpopular Vietnam War, when the Selective Service System almost broke down. Some pacifists worked together with socialists and labor movement leaders in direct action for social justice—sometimes involving civil disobedience.

The nonviolent teachings and methods of Mohandas K.

Gandhi, expressed in the popular movement for Indian independence from British imperial rule, influenced American pacifists with their integration of personal and social ethics, their unity of means and ends, and their combination of Hinduism and Christianity. Martin Luther "King, Jr., adapted Gandhi's methods in leading the civil rights movement from 1956 to 1968 as head of the Southern Christian Leadership Conference. King's pacifism extended to opposition to the Vietnam War at a time when that stance seemed to threaten the civil rights coalition. A boycott on behalf of striking grape pickers in California, organized by Cesar Chavez, (1965-70), was a form of pacifist nonviolent direct action.

During the Cold War, pacifist activity waxed and waned according to recurrent crises in the competition between Communist powers and the West. The threat of atomic destruction produced a position known as "nuclear pacifism"—reflected in the "National Committee for a Sane Nuclear Policy, and held by people who could justify winnable or "just" wars but who in principle opposed nuclear warfare because of its consequences. Pacifist ideals gained expression through activist organizations as well as through the growing academic discipline of peace and conflict resolution studies. A government agency, the United States Institute of Peace, was founded in 1985. National problems of escalating violence led to creative new movements for peer mediation in public schools and victim-offender reconciliation programs in local communities. These new initiatives drew upon a long history of pacifist idealism in the American experience.

PALMER, JOHN McAULEY (1870-1955), U.S. Army officer, manpower specialist. Born in Carlinville, Illinois, Palmer was a U.S. Military Academy graduate of 1892 who served on the Indian frontier, in China, and in the Philippines. The Army Staff School at Fort Leavenworth broadened his horizons and led to service on the U.S. Army General Staff, where in 1915-17 he helped prepare plans for an American mass army and for its deployment overseas in World War I. Accompanying Gen. John J. "Pershing to France, he was the first chief of operations, "American Expeditionary Force. Following service as a brigade commander near Verdun, he returned to the United States as Pershing's emissary on the postwar reorganization of the U.S. Army. In this capacity he became special adviser to the

Senate Military Affairs Committee, where he helped write the Defense Act of 1920. He unsuccessfully advocated peacetime Universal Military Training. His wartime experience, however, led him to a lifelong belief in the efficacy of the "citizen-soldier, including the National Guard (the constitutional militia) and the reserve components (under army rather than state control).

After retirement as a brigadier general, Palmer wrote several books promulgating his views on the military manpower problem, especially *America in Arms* (1941). During World War II, his friend, chief of staff Gen. George C. "Marshall, called him to active service as an adviser.

PANAMA, U.S. MILITARY INVOLVEMENT IN. U.S. military involvement in Panama began even before the Central American nation won its independence from Colombia in 1903. With the 1846 Bidlack-Mallarino Treaty, the United States agreed to defend Colombia's rule over Panama in exchange for the rights of free transit across the isthmus. In order to uphold the treaty and to protect American interests in the region, U.S. forces landed in Panama as many as ten times before the turn of the century. In 1885, President Grover Cleveland dispatched more than 1,000 Marines and sailors to put down a nationalist uprising, thus launching the largest U.S. expeditionary force since the "Mexican War. The other interventions were usually smaller affairs, but their frequency as well as the regular presence of the U.S. Navy in Panamanian waters were harbingers of what would come in the next century.

American military and naval leaders had long dreamed of a Central American canal that would allow them to project U.S. power over two oceans using only one naval fleet. The lengthy voyage of the USS *Oregon* around Cape Horn during the "Spanish-American War strengthened their resolve to secure an interoceanic passage. Secessionist rumblings in Panama provided the opportunity. In violation of the 1846 treaty, the United States deployed warships and landed Marines in order to block Colombian troops from putting down the Panamanian rebellion. Panama became an independent nation on 3 November 1903, but the Hay-Bunau-Varilla Treaty penned two weeks later made the new republic a U.S. protectorate. In addition to the right to intervene militarily in Panama, the treaty gave the United States the right to build a canal through a ten-mile-wide "zone" leased in perpetuity. These generous concessions would be the major source of tension in U.S.-Panama relations for decades.

By the time the Panama Canal opened in 1914, the U.S. military had already established a firm foothold on the isthmus. A U.S. military administration presided over the waterway, which was guarded by U.S. ground troops, naval vessels, and coastal "artillery batteries. All "transportation and communication in the country came under the watchful eyes of the U.S. forces. This strong military presence served the dual function of defending the canal against interlopers from outside Panama and eliminating threats from within the country. The latter project came to dominate U.S. activities in Panama. At different times the

United States wielded its power to help disband the Panamanian Army, supervise elections, halt urban rioting, and pressure political leaders. The United States eventually renounced its right to intervene, but it had amply demonstrated a willingness to subordinate Panama to the needs of canal security.

The presence of the U.S. military in Panama reached its peak during World War II, when the United States operated 14 bases, established more than 100 defense sites, and stationed as many as 67,000 troops there. Although the canal remained physically unscathed, it would never again be the linchpin of American hemispheric strategy. While the Panamanians objected more vocally to the U.S. presence, Washington found the canal too narrow for the U.S. Navy's new supercarriers and too vulnerable to air and atomic attack. Postwar military involvement therefore included converting the Panamanian National Guard into a quasi-military force, training soldiers in jungle warfare, and maintaining intelligence operations in the region. U.S. forces were deployed when riots over which nation's flag would be flown in the Canal Zone erupted in 1959 and again in 1964. Although the canal itself became less vital to U.S. strategic interests, it remained a potent political symbol to both countries.

Exclusive control of the canal had once been axiomatic in U.S. strategic thought. But Washington began to reconsider its policy toward Panama in the aftermath of the 1964 flag riots. A new treaty signed in 1977 promised to turn over the canal to Panamanian control on 31 December 1999. Despite some resistance from elements within the defense community, the Pentagon officially endorsed the treaty and agreed to scale back its activities in Panama. To help stabilize the nation after the American withdrawal and to maintain an important pipeline to the Nicaraguan Contras in the 1980s, the United States funneled aid to the Panamanian Defense Forces (PDF; formerly the National Guard). When President George Bush decided he could no longer countenance PDF chief Gen. Manuel Noriega, who was accused of election fraud and drug trafficking, he launched the massive Operation Just Cause to capture Noriega in December 1989. The invasion resulted in hundreds of U.S. casualties and possibly more than 1,000 Panamanian deaths; it also made clear that the United States would not easily sacrifice its historic prerogatives over Panama and its canal.

PANAY INCIDENT (1937). An important, if short-lived, crisis in U.S.-Japanese relations occurred in the 1930s as Japan launched the Second Sino-Japanese War in July 1937. The Japanese had quickly conquered Beijing, Shanghai, and Nanjing, and blockaded the coastline. On 12 December 1937, Japanese warplanes sank the U.S. Navy's gunboat *Panay* on the Yangtze River, killing three Americans and wounding nearly thirty. In the daylight attack, many of the escaping survivors were repeatedly machine-

gunned. Three Standard Oil tankers being convoyed by the *Panay* were also sunk.

President Franklin D. Roosevelt's advisers believed Japanese officers in China had authorized the attack on the clearly marked ships, and the president and his cabinet considered an embargo and possible naval action. However, while condemning the attack, congressional and press opinion concluded that no vital American interests were involved.

When the foreign ministry in Tokyo soon offered a formal apology and agreed to U.S. demands for an indemnity of \$2 million, the crisis subsided, but it increased anti-Japanese sentiment in the United States and helped persuade the president to take a firmer stand toward Japan, including in 1938 imposing a "moral embargo" on the sale of aircraft to the Japanese military and increasing the U.S. Navy.

PARAMILITARY GROUPS. The Oxford English Dictionary defines the term *paramilitary* as "ancillary to and similarly organized to military forces." Almost all paramilitary organizations in American history developed in response to a threat of real or perceived violence from social groups or institutions. These organizations have varied from bands of frontier horse thieves to agencies of the U.S. government. Paramilitary organizations, both legal and extralegal, were based on the assumption that violence must be met with violence, mobilized either offensively or defensively, to protect a way of life. They have shared several characteristics. At its most basic, a paramilitary group was structured to resemble or imitate a command or military organization. Though it may have been hired or even organized by the state, a paramilitary group was not a direct extension of the state, differentiating it from a government's regular armed forces, militias, or police forces. Paramilitaries have varied in size from half a dozen to several thousand members, and maintained their structure and existence over an extended period of time, differentiating them from such ad hoc violent associations as lynch mobs, which disbanded after achieving their purpose. Paramilitary groups possessed a belief system to which their adherents subscribed, expressed in a constitution, manifesto, or a collection of articles in the most structured organizations. Some dressed in "uniforms or displayed a symbol (a flag or armband) for identity or to communicate their beliefs to outsiders. Some also included weapons or guerilla-style training, or identified with a geographic location where meetings and/or training took place.

One early category developed on the American frontier (from the late eighteenth century to the mid-nineteenth century), a product of the vigilantism that arose in response to the absence of law enforcement and social organization in those areas. Another grew up during the Civil War and Reconstruction, in response to both racial and political strife and the continued lack of effective law enforcement throughout the country. A third form, overtly political, emerged in the latter half of the twentieth century when militant groups, often engaged in ter-

rorist activities, pursued political goals on both the left and the right.

Paramilitary groups first arose in any number just before the * Revolutionary War. The Revolution spawned violent resistance to Britain organized in mobs by popular leaders. The structure of the patriot movement was thoroughly connected to Boston's associational or "club" life and to the patriot organizations themselves, including the Loyal Nine, which gave birth to and served as the executive committee for the Sons of Liberty in Massachusetts. Though the Sons of Liberty was not necessarily paramilitary itself, its members and other patriot leaders steered and "politicized" the activities of the numerous clubs, eventually directing them toward more organized violence for revolutionary purposes. Their crucial maneuver by the patriot leaders was to forge a bond between two of the most prominent Boston mobs, composed of lower-class workingmen and artisans, and to direct their hostility, previously aimed at each other, toward the British government. The resulting violence led to several organized riots (one during opposition to the Stamp Act of 1765 and another during the antustoms resistance of 1768) and finally to the evacuation of two British regiments after the *Boston Massacre (1770).

This loose model of one of the first paramilitary organizations in U.S. history served as a structural and ideological framework for organizations to follow, not only in other colonies before independence but later as well. The tradition of vigilantism became a sporadic feature of American life from the Revolution to about 1900. Sometimes called *regulators*, vigilantes were citizens who formed extralegal organizations to deal with the lawlessness and general disorganization that occurred during late revolutionary, Civil War, and Reconstruction times, and on the frontier. Vigilante movements could be identified by two basic characteristics: their regular organization and their existence over a defined, though sometimes short, period of time. They could be distinguished from more ad hoc mobs, including lynch mobs, by their structured nature and their semipermanence. Vigilante movements were often organized by prominent members of a community and reflected their social and moral values. Thus vigilantism could often be considered a socially conservative form of violence. Though vigilantes of the revolutionary period did contribute to the violence that spurred anti-British sentiment (one of the most prominent groups was the South Carolina Regulators, 1767-69, who became Whigs during the actual Revolution), the vigilante tradition became more firmly rooted in American history and imagination on the frontier, where pioneers and settlers were often organized into extralegal groups who rounded up, flogged, or quickly tried and sometimes hanged the outlaws who plagued these areas before effective law enforcement was in place.

Historians have counted 326 organized vigilante movements in the two centuries since U.S. independence: there may have in fact been at least 500. Their ideology was fourfold: the notion of self-preservation; the right to revolution; the idea of popular sovereignty; and the doctrine of vigilance against crime and disorder. Four waves of vigilantism occurred: in the early 1830s; the early 1840s; the late 1850s; and the late 1860s.

In the mid-nineteenth century, several kinds of legal organizations emerged, also in response to the absence of ef-

fective law enforcement and exclusive of the militias. The years 1844-77 saw the rise of the modern urban police system (in direct response to the urban riots of the 1830s and 1840s), but police departments were often undermanned, corrupt, or even incompetent. In the early 1850s, Allan Pinkerton started the Pinkerton National Detective Agency in Chicago. In lieu of a centralized, federal police agency, the Pinkertons essentially became an armed, private police force that could move across local, county, and state lines to deal with small- and large-scale criminal activities or industrial disruption. Pinkertons were trained to solve robbery and assault cases, protect railway trains from looting, break labor strikes, and even to aid the U.S. government against post office theft. From a force of less than a dozen men in 1860, the Pinkertons grew into a late twentieth-century organization of 13,000 full-time and more than 9,000 part-time employees.

One of the most worrisome aspects of frontier life for settlers was conflict with American Indians; several kinds of legal paramilitary organizations developed to defend against and attack Indians. The Comanches of Texas in the mid-1800s, themselves engaging in *guerrilla warfare, were so effective that ranging companies, federal troops, and finally the Texas Rangers were used to deal with the problem. The Texas Rangers (like the Arizona Rangers) were historically situated somewhere between a paramilitary organization and a police force created by the state government; they were mobilized for special circumstances such as Indian attacks and the extreme disorder of the southwestern frontier. The Frontier Battalion of the Texas Rangers, established in 1874, was a thoroughly professional paramilitary organization that was finally able to end the warfare between settlers and Indians in that year in a ruthless and bloody campaign.

The labor movement also led to some illegal organizations to combat terrible working conditions, low wages, and long hours during the expansion of the Industrial Revolution. Beginning in the 1870s, many laborers, from railroad workers to miners, used the strike as their major weapon against industry. Management often used lockouts and strikebreakers in response. These conflicts could lead to violence. The "Molly Maguires," a secret organization of Irish immigrant miners who attempted to unify labor in the coalfields of Pennsylvania throughout the early 1870s, fought their employers with terrorist tactics, engaging in intimidation and assassination. The Pinkertons were sent in to investigate and eventually break this particularly violent organization, and most Molly Maguire gunmen were tried and hanged in 1877. Pennsylvania industrialists employed a private iron and coal police, a paramilitary force, in the late nineteenth century.

One of the most powerful and well known extralegal paramilitary organizations has been the Ku Klux Klan (KKK). Three different waves of Klan activity each represented a phase of history and organizational ideology, though each also reflected some continuity in ritual and regalia. The first movement arose in the South during Reconstruction. This Klan was created by a group of Confederate *veterans as a secret social club in Tennessee in 1866 and grew in direct response to Reconstruction policy. The organization used violence and intimidation against blacks and white Republicans in the South to achieve dominance for the Democratic Party and white supremacy. Though it did not become centralized, the first Klan spread

throughout the South; it waned after elite sponsorship withdrew and the U.S. government sought to suppress the Klan under the Enforcement Acts (1870-71).

A second Klan emerging during World War I and in the 1920s was more widespread and composed of between 3 and 6 million followers. This Klan skillfully exploited racism and paranoia, particularly against the foreign-born, and spread throughout the South, Midwest, and West. It not only continued to use force and intimidation but began to wield considerable political power as well. The complex ideology of this more popular and politically adept Klan catered to notions of family and community values, the necessity of protecting the sanctity of the white race, and small-town America.

The third Klan, in the 1950s and 1960s, was a considerably less popular but no less racist, anti-Semitic, paranoid, and militant organization responding to changing race relations, particularly desegregation. The continual acts of "aggression and violence, including the murders of three civil rights activists in Mississippi in 1964, finally forced the federal government to take action. The KKK today remains dedicated to white supremacy and radical nativism and has ties to other Fascist and neo-Nazi groups, including the Aryan Nations and the Order.

Radical political ideology drove some terrorist paramilitary organizations of the extreme Left and Far Right in the late twentieth century. In the 1960s, two offshoots of the New Left Students for a Democratic Society, the Revolutionary Youth Movement and the Weathermen (later the Weather People and Weather Underground), engaged in deliberately violent acts against symbols of authority and U.S. policy in denunciation of social injustice and racism at home and abroad. In 1969 and 1970, the Weather groups staged riots in downtown Chicago, attacked "imperialist" targets like schools and police stations, and finally set off bombs in New York City and elsewhere, killing some civilians and some of their own members. Though the Black Panthers did not begin as a paramilitary organization, local urban police forces found the Panthers' militant separatist ideology and exhibition of weapons quite threatening, and police harassment eventually forced violent confrontations in such cities as Oakland and Chicago in the late 1960s and early 1970s.

Also on the radical Left, the Symbionese Liberation Army was a small (a dozen members) but radical and violent organization of the early 1970s composed of mostly middle-class university radicals with a revolutionary ideology that sanctioned bank robbery, murder, and kidnapping, including the abduction of one of the young members of the Hearst publishing family. Their rampage ended in Los Angeles in a shootout with a Los Angeles SWAT team in 1974. This group served as the archetype for other militant groups, including the Black Liberation Army, which also engaged in intensive terrorist tactics.

On the radical Right, extralegal paramilitary groups in the late twentieth century maintained an ideology based on white supremacy, anti-Semitism, and staunch "nationalism that gained national attention in the late 1980s and early 1990s. One of these, the Aryan Nations, based in Idaho, hosted national conferences to spread the propaganda of intolerance. This organization and others like it, including the Order and the Posse Comitatus, rallied not simply around racism but also the issues of gun control and government intrusion in American life, to which al-

most all these groups were radically opposed. These paramilitary organizations were part of a growing self-styled "militia movement" of the 1980s and 1990s, which made its opposition to gun control, its hatred of big government, and its defense of self-asserted "constitutional rights" the more public ideological message. Some of the most visible acts committed by individuals or groups who linked their ideology to this so-called militia movement included the bombing of the Alfred P. Murrah federal building in Oklahoma City in 1995 and the actions of the Montana-based Freemen, whose tax evasion and acts of intimidation instigated the federal government's retaliation and an FBI siege in 1996. Other militia groups also engaged in weapons and warfare training, called "paramilitary training," preparing for what they believed would be an apocalypse—a massive crackdown by the federal government or even a full-scale race war.

Despite the enormous variety of their views and membership, paramilitary groups have had an extensive, if sporadic, history in the United States, though their premises have changed with social and political conditions. The first most prominent groups were concerned with maintaining law and order: these included both the extralegal vigilante organizations and the legally sanctioned Pinkertons and Frontier Battalion. The second type arose in response to the social and political disruption of the end of slavery following the Civil War and massive immigration and urbanization in the early twentieth century. Extralegal organizations like the Ku Klux Klan emerged and then spawned similar organizations, which continued to exist in the late twentieth century. A third type, overtly political, has included the terrorist groups of the late 1960s to the 1990s. Rightist groups like the Aryan Nations and the modern Ku Klux Klan bridge two categories by combining racist orientation with ideologically driven activity in pursuit of political goals.

The United States was born in violent revolution, and developed through rapid territorial expansion, urbanization, industrialization, and immigration, frequently at times of limited or ineffective local and national law enforcement. These determinants may have contributed to the national characteristics of voluntarism/associationalism (seen in the tendency to join clubs or voluntary organizations) as well as vigilantism. Paramilitary groups may also be linked with specific periods of social and political unrest, and the perception on the part of the American people that federal and local government is incapable of or unwilling to respond to the needs of the general public. This perception, combined with a widespread ownership of guns and a pervasive belief in individualism and personal freedom, has provided the social, political, and historical impulses behind many paramilitary groups.

PARIS, TREATY OF (1783). The Treaty of Paris, signed on 3 September 1783, ended the American Revolutionary War and represented a major diplomatic triumph for the young nation. Following the decisive victory of the American and French forces at the Battle of *Yorktown (1781), the British recognized that they could not defeat the rebellious colonists on the battlefield. After a change of government brought in a ministry devoted to ending the conflict, the British opened talks with the delegates from the Continental Congress: John *Adams, John Jay, and Benjamin Franklin. The Americans declined the guidance of their French allies and negotiated their own settlement, signing the initial articles on 30 November 1782. The final document was agreed to by all parties in September 1783. The treaty recognized the independence of the United States, generously fixed its western boundary at the Mississippi River (a move that doubled the size of the United States), and gave the new country fishing rights off Newfoundland. The United States agreed to terminate reprisals against loyalists and to return their property.

The Continental Congress ratified the pact in 1784. Issues arising from the treaty would trouble Anglo-American relations in the 1790s, but the team of Adams, Franklin, and Jay had made the most of what their countrymen had won in the battles of the Revolution.

PARIS, TREATY OF (1898). The Treaty of Paris, signed on 20 December 1898, between Spain and the United States, ended one war and set the stage for another. Following the U.S. military victories at Manila Bay in May 1898 and in Cuba in early July, Madrid asked for an armistice that began in August. Peace negotiations followed in Paris, the main sticking point being the future of the Philippine Islands, a Spanish colony since 1564. President William *McKinley insisted that Spain cede sovereignty to the United States. The treaty gave the United States temporary control over Cuba (Congress had rejected annexation in the *Teller Amendment when it declared war) and actual possession of Puerto Rico, Guam, and the Philippines. Spain received \$20 million.

The U.S. Senate ratified the treaty in February 1899 by one vote more than the necessary two-thirds. By that time, some Filipino nationalists, angry at U.S. intentions, had launched attacks that opened the *Philippine War, which lasted several years, became a bitter guerrilla struggle, and ended in defeat for the native fighters. The Treaty of Paris marked the high tide of late nineteenth-century colonial-

ism in the United States. The euphoria of victory over Spain turned into significant popular unhappiness and doubt about a protracted war against the Filipinos.

PARIS PEACE AGREEMENT (1973). The "Agreement on Ending War and Restoring Peace to Vietnam," signed in Paris, 27 January 1973, concluded Americas direct military participation in the Vietnam War. Following a decade of conflict and abortive negotiations, only in October 1972 did North Vietnam signal readiness to accept a cease-fire, return U.S. "prisoners of war (POWs), and allow negotiations among the Vietnamese parties. President Richard M. *Nixon had been gradually withdrawing U.S. combat forces since June 1969 so that he could engage in detente with the Soviet Union and normalization of relations with the People's Republic of China. Nixon's aim was to reach an accord that would allow South Vietnam to defend itself in the hope that attacks from North Vietnam would lessen over time. The aim of the Communist government in Hanoi was to force the cessation of all U.S. military activity in order to position Communist forces (which had suffered severe losses in 1968-72) for renewed hostilities later.

"Backchannel" negotiations between Nixon's national security adviser, Henry *Kissinger, and the special adviser to the North Vietnamese Politburo, Le Duc Tho, took place in 1970-71. On 8 October 1972, Hanoi offered a draft in which, according to Kissinger, the North Vietnamese "dropped their demand for a coalition government" and for the removal of the South Vietnamese leaders. Nixon temporarily halted the bombing of North Vietnam. But Kissinger failed to convince South Vietnamese president Nguyen Van Thieu to accept the text or Hanoi's timetable. On 26 October, Kissinger declared that since Washington and Hanoi were close to a final agreement, "peace is at hand." He spoke also of further negotiations to accommodate Saigon's objections, but refused to elaborate. After Nixon was reelected, further talks with Hanoi led nowhere, convincing Kissinger to cable President Nixon to "increase pressure enormously through bombing and other means."

U.S. round-the-clock bombing, including the use of B-52 "bomber aircraft, began on 18 December. The attacks ended 30 December and negotiations resumed in early January 1973. On 27 January, the agreement was signed in Paris—although on separate pages in order to accommodate Nguyen Van Thieu's refusal to recognize the political status of Hanoi's arm in the South, the Provisional Revolutionary Government of the Republic of South Vietnam (PRG). President Nixon also secretly indicated to Hanoi that the United States was prepared to consider supporting a postwar reconstruction program, assuming the peace held.

The agreement provided for an immediate, internationally supervised cease-fire, the withdrawal of all foreign military forces from South Vietnam, the exchange of POWs, limitations on what military assistance could be provided to Communist and non-Communist forces in the South, and formation of a National Council of Reconciliation and Concord.

Kissinger and Tho were jointly awarded the Nobel Peace Prize for 1973, but the latter declined to accept it. The agreement met with skepticism both in the United States and in South Vietnam, where there was much bitterness that the United States had abandoned its ally. By the fall of 1973, the cease-fire was being violated on both sides, local Communist forces refused to cooperate in the search for U.S. soldiers listed as missing in action, and high-level U.S.-North Vietnamese contacts ceased. The Paris Peace Agreement was swiftly overtaken by a "postwar war."

PATRIOTISM, in the most elementary sense of the term (the word derives from the Latin *patria* or "fatherland"), suggests the loyalty that all citizens owe to their country or nation. With varying degrees of intensity, nearly all Americans claim to be patriotic citizens of the republic. But the term also has a narrower, more specific history, with sharper political implications. In the two centuries since the "Revolutionary War, patriotism has tended to shift from a left-wing to a right-wing cause.

The term first achieved prominence in Anglo-American politics during the second quarter of the eighteenth century. The British ministry of Sir Robert Walpole, which admitted only Whigs to office and castigated all Tories as disloyal to the Hanoverian dynasty, alienated a number of prominent Whigs, who took the name "Patriots" to distinguish themselves from the Tory opposition. But some prominent Tories, such as Henry St. John, Viscount Bolingbroke, saw an opportunity to create a combined Tory and Whig opposition strong enough to topple Walpole, and also appropriated the label "Patriot" for that goal. By 1750, even Frederick, Prince of Wales, claimed to be a patriot prince, an ambition he bequeathed to his son, who inherited the throne as "George III in 1760. To everyone invoking a patriot identity, the label implied placing loyalty to one's country ahead of personal interest or factional causes.

North American spokesmen jubilantly hailed the accession of George III as a "Patriot King," only to find that his ministers threatened their liberties through direct parliamentary taxation of the colonies. As the resistance movement gained coherence and grew more militant, its members called themselves "Sons of Liberty," "Whigs," and "Patriots." Their enemies were "Tories," who preferred the softer name of "Loyalists." The launching of American independence identified American patriots as republicans and enemies of monarchy, a radical position in the eighteenth century that would become associated with "left" politics during the French Revolution a few years later. That association persisted into the early national period. Democratic-Republicans called their opponents "Tories" and "monocrats" (champions of monarchy), not "Federalists." By 1800, the Federalists seemed to oblige them by increasingly refusing to celebrate the Fourth of July (they preferred Washington's Birthday as their national festival) and above all by refusing to read the Declaration of Inde-

pendence in public lest it offend Great Britain. Well into the nineteenth century, the term *patriot* retained these radical associations.

The "veterans' movements that followed the "Civil War probably marked a shift toward a more conservative definition of *patriot*. In the former Confederate states, secret paramilitary societies such as the Ku Klux Klan drew heavily on Confederate veterans and their younger kin to undermine Radical "Reconstruction through terrorist acts. They saw themselves as patriots committed to "redeeming" the South for white supremacy from "black Republican" rule. The Union counterpart was much less militant, but over time the veterans' group known as the "Grand Army of the Republic grew less eager to celebrate emancipation and more inclined to glory in the triumph of the Union, while agitating for bonuses and other veterans' benefits.

That trend has continued in the twentieth century. "Veterans' organizations, such as the "American Legion and the Veterans of Foreign Wars, have at times almost claimed a monopoly on American patriotism and have often questioned the loyalty of citizens who disagreed with their objectives. The word *patriot* was becoming strongly associated with the Right in politics, partly because the Left often advocated such internationalist causes as the republican side in the Spanish Civil War and decolonization movements after World War II, both of which also had strong Communist support.

The "Vietnam War sealed these identities. The Left opposed the war and tried to end it; the Right denounced such efforts as disloyal and appropriated all the symbols of American patriotism. By the 1972 presidential election, President Richard M. "Nixon, who had served in the U.S. Navy during World War II, but without seeing combat, successfully invoked his own patriotism while overwhelming his Democrat opponent, George McGovern, who had survived twenty-five missions as a bomber pilot in the European theater of World War II but never used his Army Air Force record to win votes in the campaign.

The label "Patriot," at least in its partisan sense, is recently shifting even further to the right. It has been actively appropriated by paramilitary militia movements around the country, which now seem to equate "Patriot" with white supremacy and a fierce hatred for most actions of the federal government. The ability to capture the label remains an important touchstone in American public life.

PATTON, GEORGE S. (1885-1945), U.S. Army general. A charismatic and flamboyant aristocrat, Patton excelled in training and leading soldiers into battle, obtaining the ut-

most from them, and employing them with audacity and speed against the enemy.

Descended from an old Virginia family and a pioneer Californian, Patton was born in San Gabriel, California. Afflicted with dyslexia as a child, he struggled to read and write and overcome his own feelings of worthlessness. After a year at the Virginia Military Academy, he graduated from West Point as a cavalry lieutenant in 1909. In 1910, he married Beatrice Ayer, daughter of a wealthy Boston family.

Patton was highly athletic as well as an outstanding fencer and horseman. In the Mexican Punitive Expedition in 1916, Patton served as an aide to John J. Pershing, upon whom he modeled himself. In 1917, when the United States entered World War I, Patton accompanied Pershing to France, took command of the U.S. Army's light tank brigade, and led it at St. Mihiel and the "Meuse-Argonne offensive, where he was wounded.

During World War II, Patton headed the I Armored Corps in the successful invasion of "North Africa in November 1942. After the American defeat at Kasserine Pass, Patton was given command of the II Corps in Tunisia in March 1943. He quickly restored morale and won the Battle of El Guettar.

Patton's Seventh U.S. Army and Sir Bernard Law "Montgomery's Eighth British Army undertook the invasion of "Sicily in July 1943. Despite a subsidiary mission, Patton dashed to Palermo, then seized Messina ahead of Montgomery. Competition between the two generals then and later was largely inspired by the media, which contrasted Montgomery's caution with Patton's aggressiveness, backed by his ivory-handled pistols and scowling face.

In Sicily, Patton physically abused two sick soldiers he mistakenly believed were malingering. For his loss of personal control, he was reprimanded by Dwight D. "Eisenhower, who subsequently elevated Omar N. "Bradley, Patton's immediate subordinate, to be Patton's immediate superior in command of the 12th U.S. Army Group for the invasion of "Normandy.

Patton was used in England to deceive Adolf "Hitler about the place of the cross-Channel invasion. After the American breakthrough at "St. Lô, Patton's Third U.S. Army became operational on the Continent on 1 August 1944, and drove rapidly eastward and then north seeking to encircle most of the German troops in Normandy. Stopped from closing the Falaise pocket, Patton's forces swept across the Seine River and northeastern France.

Reacting to the German counterattack at the Battle of the "Bulge in December 1944, Patton pivoted the Third Army 90 degrees to the north, an extraordinary maneuver, and relieved the surrounded American forces at Bastogne. In March 1945, Patton crossed the Rhine and headed across southern Germany. When the war ended, his advance units were in Pilsen, Czechoslovakia, and he was a full, four-star general.

An outspoken critic of the Soviets and of postwar U.S. policies toward Germany, Patton failed as head of the occupation of Bavaria and was reassigned to command the Fifteenth U.S. Army. On 9 December 1945, near Mannheim, he was fatally injured in an automobile accident. He was the most aggressive senior American military commander in World War II and respected by the Germans as the best.

PAX CHRISTI USA (1972-), an association of Roman Catholics committed to "nonviolence. Gordon Zahn, a sociologist and a Catholic conscientious objector during World War II, and Eileen Egan, an official in Catholic Relief Services, founded Pax Christi USA in 1972. They secured support from Bishop Thomas Gumbleton of Detroit and Bishop Carroll Dozier of Memphis, and then obtained affiliation with Pax Christi International. Pax Christi USA is organized in seven regions, with a national board, national assemblies, and a wide range of peace activities. By its twentieth anniversary in 1992, Pax Christi USA had over 12,000 members in 300 local chapters.

A turning point for the organization occurred from 1979 to 1982 under the leadership of Mary Evelyn Jegen, SND. She established a national executive council to establish policy, a newsletter, a press service, reflection/action groups, annual liturgies, vigils, and demonstrations. All of these activities kept the organization's aim of education for "peace in the forefront. She also maintained close contact with other Catholic groups as well as with broader "peace and antiwar movements, especially religious pacifist groups. While enabling all concerned Catholics to come together, she gradually moved the organization away from the "just war" tradition and toward "pacifism as the most viable Catholic attitude toward peacemaking.

Pax Christi USA's criticisms of U.S. government policies, particularly in the 1970s and 1980s, were more far-reaching than those of mainline Catholics and the hierarchy. They focused on three main areas: the draft (until its end in 1973); Central America; and nuclear warfare, "arms control and disarmament. Pax Christi USA also focused attention on the National Conference of Catholic Bishops' pastoral letter on war and peace issues. When *The Challenge of Peace: God's Promise and Our Response* was issued (1983), Pax Christi USA affirmed it as the strongest moral renunciation of nuclear war and weaponry by any Catholic hierarchy, and vowed to assume responsibility for making the letter and its teachings known and accepted by the broader Catholic community.

PEACE. Perhaps one of the most complex concepts in human history, peace has been used to refer to everything from "absence of war" to "equilibrium" to "a utopian state of spiritual and social harmony devoid of conflict." These widely differing images are indicators of essential differences in ideology, culture, and perceptions of history. Understanding peace requires an acknowledgment of these different contexts as well as a willingness to explore those meanings with which we are less familiar.

Ironically, the most familiar images of peace are perhaps the least helpful, as they consist of stereotypical assumptions that do not invite further examination of a complex

phenomenon. These highly idealistic images generally depict peace either as the condition that exists when wars are suspended or terminated, or, conversely, as a harmonious world devoid of conflict. At best, such images provide faint shadows of peace rather than illuminate its essence. More often than not, they serve to lessen any interest in peace as a desirable or achievable state, either by devaluing it (a simple interlude between wars) or by ascribing unattainable, utopian preconditions to it (a world in total harmony without conflict).

Shadows of Peace. In the West, a common understanding of peace originates from the Latin *pax*, meaning "a pact or settlement to deter or end hostilities." This meaning arises primarily in historical, political, and military contexts, which appear to be closely related. Given the fascination of Western historians with war, it is understandable that many continue to envision human history as a series of wars and respites from wars, and salient historical figures as warriors, military leaders, or heads of state who declare and prosecute wars against other states. Within this context, peace has come to be narrowly understood as the absence of war, the end of war, interludes between wars, or nonwar.

Accordingly, in American military history, the word *peace* essentially means "the absence of war." Thus, militaries fight wars to "win the peace"—to bring about periods of nonwar through the use of force. In military paradigms, peace is seen as an ultimate or ideal goal rather than a means to an end. Those engaged in such wars tend to believe theirs will be the last, that the subsequent nonwar period of peace will be enduring, or that moments of nonwar are only interludes that will ultimately give way to future wars.

Related to this is what the Norwegian peace scholar Johan Galtung has termed *negative peace*, that is, the absence of war and "direct" violence. Under this kind of peace, many forms of "structural" violence (indirect, institutionalized violence) such as economic exploitation, racism, sexism, oppression, hunger, and poverty still exist.

Such narrow notions of peace say nothing about what peace is—only what peace is *not*. And they describe what it is not in terms of something with which we appear to be quite familiar: violence and war. Among other conclusions, we might infer from this that our knowledge about peace is at best very limited, since we seek to define it in terms of what it is not rather than what it is.

Related to this is the idyllic image of a world without conflict, pain, suffering, and struggle. Yet at all levels of human existence—from the interpersonal to the global—peace includes, rather than precludes, conflict. Conflict is a basic fact of life; thus, a world at peace will be full of conflict. What distinguishes a peaceful world, among other qualities, is the extent to which unnecessary conflict is prevented and all other conflict is managed in nonviolent ways. This idyllic image often arises out of a fundamental confusion surrounding conflict and violence. *Conflict* and *violence* are not synonymous terms: conflict can be violent, but it also can be nonviolent; it can be destructive and painful, but it also can be constructive and useful. Clarification of these concepts allows movement beyond the normative fear of conflict and negative associations with it. The existence of conflict in the future then becomes an understandable and acceptable fact of life, and the idyllic image of peace becomes unnecessary and unrealistic.

Although these shadow images of peace seem antithetical (i.e., they could be easily juxtaposed at opposite ends of a continuum depicting ideological views of peace), in fact, they have much in common with one another. Both types attempt to define peace in terms of (1) what is missing rather than what is present; and (2) one or two basic components (e.g., violence and conflict).

Once outside (Western) historical, political, and military contexts, however, peace means much more than the absence of a specific phenomenon, which it is not. For many scholars in peace studies and peace research, peace is much more than not-war; it is much more than not-violence; and it is never seen as not-conflict.

Essential Peace. If, instead, we begin with equally valid definitions of *pax*—and with *pacific* (from the Latin *pacifico* and *pacificus*, and the French *pacifique*)—we see a different face of peace altogether: one involving reaching agreement by negotiation (as opposed to the use of force); mediation; reconciliation; amity; calm; tranquility; or order—even "rejecting force as a means of achieving policy objectives." Here it is important to acknowledge that peace can exist at every level of existence, from the intrapersonal (psychological, spiritual, etc.) to the global (political, sociological, environmental). Thus, generic definitions of peace become extremely problematic. Nonetheless, there is general agreement in peace research and peace studies on the broad parameters of peace.

Some peace researchers approach an understanding of what peace is by identifying the conditions necessary for it to exist. The following ideological and infrastructural conditions are not exhaustive by any means, but represent what many experts believe to be essential for peace to develop in the world: the presence of cultures of peace (vs. cultures of violence); the presence of justice (economic, social, and political); the shared democratic use of power (economic, social, and political) among people who govern themselves ("power with") rather than the governance of the many by the few who have "power over" the many; the presence of economic and ecological sustainability; the nonviolent (vs. violent) management and resolution of conflict; the development of common security that does not rely on the threat or use of violence; the pursuit of collective and individual ends through *nonviolence rather than violence; and the elimination of violence in all its myriad forms (including the "war systems" inherent in many nations). Each of these conditions requires a brief explanation.

The *presence of cultures of peace* refers to the social and cultural components (values, belief systems, ideologies, philosophies, theories, societal norms, etc.) that undergird and legitimate everyday life and the infrastructures we create to carry us into the future. Wars are not fought without ideologies that tell us that it is acceptable and justifiable to conduct them. The ubiquitous violence that exists in the media, in entertainment, in our schools, in our streets, and in our homes does not exist without belief systems that legitimate and encourage it. Similarly, peaceful relationships among individuals, groups, genders, classes, nations—as well as relationships between human beings and the rest of the nonhuman world—cannot exist without cultural values and ideologies that promote nonviolence, respect, and tolerance for everyone, especially those who are somehow different from us. In a culture of peace, for example, people would not be entertained by violence (nor would they seek to be entertained by it).

A fundamental ideological cornerstone of the violence surrounding us today is the idea that one's identity is primarily related to one's gender, race, national origin, political affiliation, economic status, religious ideology, or socioeconomic class. The result of this kind of *identity formation* is the grouping of people into "us" and "them." Once a person or an ethnic group or a country is a "them," they are less valuable, less important, and somehow less human than "us." This is the first step toward dehumanizing "the other," which in turn is the first step toward "aggression and violence. Cultures of violence inculcate ideologies that give rise to the formation of these kinds of mutually exclusive identities. Cultures of peace, on the other hand, would embrace "species identity" and other inclusive forms of identifications with humanity, which Elise Boulding and Robert Jay Lifton have so eloquently examined in their research and writings.

The *presence of justice* at all levels (economic, social, and political) refers to the ways in which individuals and groups are treated by society and one another. While *justice* is a highly debated term, there is little disagreement that peace can exist without it. In particular, this is true because the existence of injustice implies ongoing structural violence against certain peoples or groups. As Johan Galtung notes, the Greek *eirene*, the Hebrew *shalom*, and the Arab *salam* take us beyond the Roman *pax* to an understanding of peace that includes "justice." In this view, peace is not only the absence of all violence (including underlying structures of violence) but also the presence of justice (Galtung calls this *positive peace*).

The *shared democratic use of power* is relevant to all personal and social relationships, but especially to those in the arenas of governance, business, international relations, and global security. In his groundbreaking work *Three Faces of Power*, the American economist Kenneth Boulding identifies three basic forms of power ("threat," "exchange," and "integrative" power) and argues that integrative power is the most important of the three, as it is what gives rise to relationships of respect, love, friendship, and so on.

The *presence of economic and ecological sustainability* is essential because economic or ecological development that is not sustainable assumes dysfunctional levels of injustice and violence in the present moment and ultimately will lead to conflict, violence, and systemic imbalance. A peaceful world requires basic levels of security, which are ensured, in part, by stable economic systems and viable ecological relationships with the natural world.

The remaining four conditions fall within the category of *nonviolence*. While *nonviolence* can refer to anything (change, transformation, revolution) that happens not to be violent (as in the case of "nonprincipled nonviolence"), this term is used most often in peace studies to refer to the waging of conflict and the transformation of society through the power of active love. Mahatma Gandhi's nonviolence (*ahimsa* and *satyagraha*) was "the pursuit of truth through love." The strength of nonviolence emanates from an understanding of the origins of power: all power derives from the consent of the governed. The political scientist Gene Sharp carefully explains that known histories of successful nonviolent struggle and conflict resolution date back to the fifth century B.C.

Peace requires the nonviolent management and resolution of conflicts for many reasons, not least of which is found in the shadow of peace, which defines peace as the

absence of violence. *Violence* (from the Latin verb *violare*) means "to violate." Violence can be verbal, psychological, emotional, and spiritual—as well as physical. It can be collective as well as individual.

As Duane Friesen makes clear, to do violence to someone is to violate the integrity of that person. Gandhi saw life as one long "experiment with truth," wherein each person possesses a small piece of the truth and conflicts are the moments in which we learn from one another about our separate and collective truths. Waging conflicts violently, then, is the antithesis of being interested in the truth; it is a means to "win" a conflict temporarily—not to be right in the long run. For most in peace studies, violence cannot be seen as conflict resolution: it is, instead, only the violent waging of conflict for reasons that are legitimated by cultures of violence.

For the same reasons that nonviolent conflict resolution is necessary, peace also requires the development of nonviolent systems of common security; the nonviolent pursuit of collective and individual ends; and, ultimately, the elimination of all forms of violence, whether direct or indirect. Thus, for example, personal growth and individual success, interpersonal relationships, social change and transformation, and the conduct of international relations will need to be reenvisioned as nonviolent means and ends rather than accepted as status quo violent means and ends.

Peace Development. In the languages of Western culture, *peace* is a noun, not a verb. It is an object, a goal, a future state of being to be passively wished for and waited upon. No one "does" peace. Yet peace, like "war," requires intensive preparation, organization, training, and education. It also requires immense resources and commitment. Peace will not exist without being developed and built from the ground up.

Peace development requires leaders: those who can envision a world without violence and design its blueprints. Peace development also requires actors who will transform the elements of nonpeace into the fabric of peace. The shadow of peace assumes that geopolitical entities called *nation-states* are the fundamental units of analysis, and that the political and military leaders of these nation-states are the primary actors and leaders. The development of essential peace, on the other hand, is not limited to nation-states and their leaders. Rather, essential peace requires the effort of individuals, communities, local and regional governments, teachers, nongovernmental organizations, international nongovernmental organizations, networks, and the nontraditional loci of nonviolent power.

Since essential peace can exist at all levels of existence, from the spiritual to the global, the paths to its successful development are many: there is no one "right" path to peace and there is no one "right" leader who will take us to it. This awareness allows for everyone to contribute to the building of peace in their lives and in their communities. According to many Eastern religions and philosophies, peace at all levels of existence is interconnected. Therefore, the development of peace in one arena of the world may contribute to the development of peace in many arenas of the world.

PEACE AND ANTIWAR MOVEMENTS. Members of peace and antiwar movements have commonly seen their cause as the antithesis of military force and war. In the context of evolving social values and institutions, however, military and nonviolent responses to conflict and insecurity may also be seen in a dialectical relationship with one another. Both approaches have changed markedly during the past two centuries. Taken together, military and nonviolent approaches to conflict are interrelated facets of societal and cultural change. Considered separately, organized "peace efforts have affected military institutions, policies, and values by challenging specific conflicts and by advancing alternatives to war.

The legal terms of "conscription, the mobilizing of human resources for military ends, changed because of the exigencies of modern warfare and also in response to civilian pressures, first from religious groups and then from secular ones. Moreover, from mid-nineteenth century on, organized peace advocates in Europe and the United States helped to build constraints on the conduct of war into international law and to legitimate mediation and arbitration as alternatives to warfare. They challenged the cultural glorification and romantization of warfare, especially in the context of disillusionment following World War I. Some peace advocates opposed military-based imperialism. Many promoted international organization, hoping to secure change with order at the interstate level. Some of them endorsed collective military security under international auspices, and many promoted "arms control and disarmament in order to limit military confrontation. There were even experiments with alternative missions for the military. Finally, challenges from organized peace advocates affected public policy on specific wars, notably in the debates over intervention in World Wars I and II, and on the terms of withdrawal from Vietnam. In all these respects, the influence of citizen groups on policy governing war and military institutions has been conditioned by their organizational bases and rationales.

Peace and antiwar movements derive from at least three sets of complex historical phenomena with varying sources, principles, goals, and constituencies. Two of them have roots in the ancient and medieval world: modern peace advocacy, which inherited and adapted the "Just War" tradition, and absolute "pacifism as expressed in religious nonresistance. A third source of antimilitarism has been grounded in modern political economy.

Regional economic and political interests characterized opposition to some specific U.S. wars—New England Federalists in the "War of 1812, for example; northern Whigs in the "Mexican War of 1846-48; Northern Peace Demo-

crats and Southern Democrats in the "Civil War—but regional economic groupings were not against war per se, and they are not normally included in histories of peace movements. Some economic movements were very much related to organized peace advocacy, though: the free trade campaigns of Richard Cobden and John Bright; anti-imperialism in Britain and the United States; socialist class consciousness; and a pervasive suspicion of banking and business interests such as that which surfaced in the "merchants of death" rhetoric of the 1930s.

Nonetheless, the primary carriers of antiwar ideology and action have been religious nonresistants and internationalist peace advocates. In this regard, it is useful to delimit the word *pacifists*. Coined in Europe at the turn of the century, it originally referred to all those who sought to mitigate, limit, and eventually end warfare through various forms of "internationalism. During World War I, however, *pacifist* was increasingly narrowed to denote those who on grounds of principle refused altogether to sanction war or participate in it. The word retains that sense in common American usage, although the broader sense is sanctioned by dictionaries and is common in European usage. For the purpose of this essay, the broad program of creating alternatives to war is called *peace advocacy*, while *pacifism* is used in its narrower sense, as the rejection of war or military service altogether.

Such pacifism has characterized the so-called peace churches—the Mennonites, Brethren, and Society of Friends ("Quakers). They cultivated a religious commitment to refuse military service and to reject warfare, "aggression and violence being the way of the unredeemed world. Quaker principles including religious rejection of violence were broadly influential in eighteenth-century England and America. In 1815, following the Napoleonic Wars and the "War of 1812, religious nonresistance was given an institutional base in the London, New York, and Massachusetts peace societies. The constituency of the Massachusetts society was limited to Christian nonresistants, and it soon waned; the London and New York societies included a broad spectrum of peace advocates, and they endured. In the United States, the peace cause achieved national status when the "American Peace Society was formed in 1829 (although in fact it remained essentially northern). Indeed, Charles DeBenedetti interprets the peace movement as the longest continuous American reform movement.

Constraining Military Institutions and Missions. Twentieth-century U.S. military institutions and missions were to some extent constrained by organized peace advocacy and nonresistant pacifism, the clearest impact of which was with respect to the administration of conscription.

The nonresistance tenet of Quakers, Mennonites, Brethren, and members of some other sects had been tested during the "Civil War, and it divided them. In the Confederacy, conscientious objectors (COs) to military service were persecuted and deprived. In the Union, objection on the basis of religious authority was recognized through military exemption, subject to various conditions such as the payment of fines.

The World War I provision for COs under the Selective Service System was based on the Civil War precedent and on prevailing British policy. It was implemented, however, largely in response to pressure from the peace churches,

other pacifists, and the National Civil Liberties Bureau (subsequently "American Civil Liberties Union), which pacifists created. There were about 4,000 COs in World War I (about .001% of all men inducted). Exemption was limited to members of recognized sects and organizations in which war in any form was rejected on principle, and it applied only to combat service. Excluded were men whose principles forbade military service itself, whose position was based on a mainstream religious conviction or on secular principles, or who objected to a particular war but not necessarily all wars. Such men, if they persisted in their resistance, were confined in army camps or imprisoned, except for a small number who were furloughed for civilian work.

In anticipation of U.S. entry into World War II, conscription was modified, again largely in response to organized pressure from peace churches and other pacifist groups (aligned as the National Service Board for Religious Objectors). The government formed a working arrangement with them to administer Civilian Public Service projects for men whose objection was based on religious training and belief. They were assigned to projects of so-called national importance such as conservation, hospital service, and farming. The work projects were ill defined, and no provision was made for secular objectors or those who rejected the system of military service itself, so that the pacifist coalition experienced dissension and withdrawals. Still, Civilian Public Service administered camps and other service units for about 11,000 COs who came from some 200 religious bodies or had no religious affiliation.

After World War II, the peace churches and other pacifist groups lobbied for a broad, tolerant interpretation of "conscientious objection. They also led a mainstream coalition that defeated President Harry S. "Truman's proposal for universal military service. By that time, exemption from military service on the grounds of conscientious objection had become a legal right that subsequently was broadened by the courts to include both religious and secular principles. During the "Vietnam War, several pacifist organizations and some churches even endorsed so-called selective conscientious objection to specific wars (on the basis of Just War tradition), while thousands of men made the draft the focal point of demonstrable antiwar resistance. When President Richard M. "Nixon ended conscription in favor of a voluntary military, the decision was at least as much political as it was professional.

The history of conscientious objection most clearly registers the impact of religious nonresistance and absolute pacifism on the military institution of conscription, but it also illustrates the secularization of principled objection, the broadening provisions of the law, and finally the focusing of antiwar activism both on the legitimacy of a specific war and on military conscription in general.

Peace advocacy, a broader tradition than religious nonresistance, addressed the apparent anarchy of the nation-state system in an age of growing economic, intellectual, and political interdependence. Peace advocates came from the rising professional classes of the nineteenth and twentieth centuries. They focused on incremental steps to undercut the idealization of war, and they developed approaches to conflict that might eventually supplant warfare, in particular: international law including a law of war, mediation, arbitration, and international organization.

One approach was to restrict the conduct of war through international conventions. By 1873, when international law associations appeared (in large measure the work of peace activists), the laws of war had been defined in the 1864 international convention of Geneva. As subsequently revised and widely ratified, the "Geneva Conventions on warfare demonstrated that even when locked in battle, governments had a mutual interest in the welfare of their respective military and civilian personnel. Twentieth-century conventions proscribed specific classes of weapons (such as poison gas) and acts of war (such as massacre of the defenseless). The fact that such conventions have been violated only underscores the existence of international norms that influence military conduct. Wars of aggression were prohibited by the 1928 Kellogg-Briand Pact (which owed its existence to initiative taken by peace advocate and internationalist James T. Shotwell). Although widely denigrated as a futile gesture, the Kellogg-Briand Pact was cited along with other international law as grounds for the Nuremberg War Trials following World War II.

Related to international law was the process of arbitration, for which there was an international campaign before the Civil War. The idea acquired prestigious support in both the British Parliament and the U.S. Senate. Spurred by the arbitral settlement of the *Alabama* case (1872), the campaign expanded to other nations, notably Switzerland and France. Delegates to the intergovernmental Hague Peace Conference of 1899 drew upon plans articulated by peace and lawyers' associations when they endorsed mediation and arbitration in a "Convention for the Pacific Settlement of International Disputes" and created the Permanent Court of Arbitration. In the decade before World War I, arbitration was a rallying point for proliferating peace societies in Europe and America.

World War I dramatized the value of permanent international organization, and arbitration became the key to "League of Nations procedures for conflict resolution. This vision of the League was largely a result of organized peace advocacy, mainly British and American. Its charter invoked the threat of diplomatic, economic, and even military sanctions to ensure that nations would attempt mediation and arbitration before resorting to war. Those provisions predicated a change in military mission from unilateral to collective security. The change was not institutionalized by the United States, which rejected League membership, or even in Europe, where League members failed to link the pacific resolution of conflict to disarmament and collective security.

World War II was a consequence of that failure, and out of the "United Nations alliance there emerged a UN organization with strengthened collective security provisions. By the time they were invoked, however, the world had become polarized in a cold war, so that even the UN-sanctioned "Korean War was actually a U.S.-based alliance system. The experience of peacetime military alliances such as "NATO no doubt expanded the political dimensions of military command, while at the same time the United Nation experimented with limited "peacekeeping operations, sometimes in conjunction with initiatives from non-governmental organizations. By the end of the century, arbitration and mediation enforced with sanctions had become established procedures in international conflict—so much so that during the "Bosnian Crisis in the 1990s, U.S. troops were deployed within a multinational military force

to enforce a mediated settlement in a civil war in which *war crimes were explicitly recognized and condemned.

All this is to suggest that organized peace advocacy contributed to changes in the conduct of war and in military mission insofar as it helped to initiate and shape international law on the conduct of war, arbitration and other processes of conflict resolution, and international organization—including even the threat of collective force. This is not to suggest a simple cause-and-effect relationship, but rather to note that citizen activism has been one of the factors shaping modern international and military systems.

Constraining Foreign and Military Policy. Peace and antiwar movements have constrained U.S. policy on the use of military force in at least three respects: intervention in foreign wars; disarmament and arms control; and unilaterally initiated warfare. In a political context, modern peace advocacy must be distinguished from "isolationism. Both peace advocates in the general sense and progressive pacifists have been overwhelmingly internationalist insofar as they advocated U.S. leadership in economic and peace efforts; but when faced with the prospect of war, they have divided between neutralist nonintervention and reluctant support for military forces. In any case, the controversy over U.S. intervention in World War I established the rationale and organizational basis for subsequent peace and antiwar campaigns.

By 1914, there was an established peace movement in the United States that was part of an international phenomenon. Its leadership came primarily from middle-class professionals; but a major sponsor and chief financial constituency was the business community, which provided backing for groups like the American Peace Society, the *Carnegie Endowment for International Peace, the World Peace Foundation, and active local peace societies in New York and Chicago. Those groups had friends in the foreign policy establishment as well as in business. Many of them avoided controversial measures like Theodore *Roosevelt's enlargement of the navy, and supported arbitration, conciliation, and international law. They were internationalists who valued order and stability on a world scale, which they thought would come through good management: commerce and communication, cultural understanding, the cultivation of mutual interests, and a prudent use of power.

The fury with which Europe was swept into war in 1914 profoundly shocked these peace advocates. A few of them concluded with Hamilton Holt, editor of *The Independent*, a progressive journal of the time, that internationalism needed an authoritative international base, which they promoted through the Association for a League to Enforce Peace (1915). Most established peace advocates avoided political issues, however, especially the question of intervening in the European War. When the country did intervene, the established movement overwhelmingly supported what was billed as the "war to end war."

The resulting vacuum of leadership left space for new peace leaders. They were progressives accustomed to political action, who viewed the informed middle class as their primary constituency, and who included outstanding women reformers like Jane *Addams and Lillian Wald. They proposed to end the war through mediation, and they resisted the sharply increased military budget recommended by President Woodrow *Wilson. The campaign for mediation was promoted especially by the Woman's

Peace Party (1915) in active cooperation with European women (the basis for the "Women's International League for Peace and Freedom, 1919). The idea was for the United States to lead a neutral bloc of nations in a standing offer to mediate a peace settlement. Meanwhile, the American Union against Militarism (1915) coordinated a political campaign against President Wilson's military preparedness program, arguing that preparation for war would make military intervention more likely. Two other constituencies completed the new peace advocacy: absolute pacifists from mainstream denominations joined the American "Fellowship of Reconciliation (FOR, 1915), while the Socialist Party of America articulated a strong antiwar position. A coalition of these elements tried to rally opposition to intervention as late as the spring of 1917. The political significance of this politically active coalition was to reinforce American "neutrality by reconciling it with an internationalist orientation and to distinguish military intervention from other forms of engagement abroad.

In wartime, the new progressive peace advocacy was reduced to absolute pacifists, many of whom found refuge in the FOR, and adamant socialists whose antiwar position gave their opponents an excuse for political persecution. Even nonpacifist critics of war policies became politically vulnerable and socially alienated. Thomas Knock has concluded that the wartime administration alienated those very constituencies, like progressive peace advocates and socialists, whose support Wilson needed to carry the League of Nations to victory.

The significance of the antiwar movement of 1914-19, then, was twofold. In the first place, the establishment-oriented prewar peace movement became divided between what might be called conservative and liberal internationalists: the former supported commercial and cultural involvement abroad but clung to political unilateralism; the latter advocated membership in the League of Nations and the World Court. This division was carried into the politics of the postwar era. Secondly, organized peace advocacy acquired a progressive leadership that distinguished military intervention from internationalism per se and created an organizational base for politically oriented pacifists.

That base became operational in the context of the Washington Conference on Naval Arms Limitation (1921-22). Pacifists and peace advocates formed the National Council for Prevention of War (1921) as an agency for information on the conference, and it became an ongoing lobby on disarmament and peace issues. In turn, it developed a citizen network that included constituencies like the League of Women Voters, Future Farmers of America, church denominations, and the YMCA-YWCA, as well as peace groups. The Women's International League for Peace and Freedom, although part of the National Council, put its own lobbyist (Dorothy Detzer) on Capitol Hill. Public pressure was generated against military spending and for international disarmament efforts such as the League-sponsored conference of 1932. Separate committees mobilized opposition to military training in schools and colleges. Thus, peace advocates acquired a political role in the 1920s. Their influence was proportionate to their unity of purpose, however, and the constituent groups in the movement differed sharply over the priorities of the League of Nations, the World Court, international law, disarmament, and peace education.

That changed in the next decade. Beginning with the

Japanese invasion of Manchuria in 1931, war threatened Asia and Europe, while the nations that dominated League policy proved unable to coordinate a collective security response. In consequence, the various elements of the U.S. peace movement forged a common front that briefly united liberal internationalists with progressive pacifists.

Pacifists in the National Council, Women's International League, and FOR played key roles in organizing and popularizing the 1934 Senate investigation of the munitions industry's role in World War I (the Nye Committee), thus tapping into a longstanding populist identification of foreign war with special interests. The following year, the progressive pacifists mobilized political support for strict neutrality legislation. They also gained the initiative in the Emergency Peace Campaign (1936-37), a coalition forged with liberal internationalists of the League of Nations Association (which succeeded the League of Nations Non-Partisan Association in 1929). The basis of the coalition was a platform that included legislation to constrain special interests, reforms to open up and stabilize the world economy, closer cooperation with the League of Nations, and strict neutrality (an impartial embargo against trade and credit on all belligerents). Strict neutrality was valued by pacifists, who hoped that it would prevent U.S. military intervention, and by liberal internationalists, who assumed that it would assure the League powers of U.S. noninterference with strong collective security measures. Once more, then, neutralism was coupled with internationalism to define U.S. military policy. Strict neutrality legislation was adopted in 1935 and refined two years later.

By 1937, the Emergency Peace Campaign was breaking apart. Liberal internationalists like Clark Eichelberger and James T. Shotwell had grown increasingly uncomfortable with strict neutrality and absolute pacifism. In 1938, they broke with pacifists over the proposed Ludlow constitutional amendment for a referendum on war. Creating their own political coalition, they campaigned against that legislation, for neutrality revision, and after 1939 for all aid to the European Allies "short of war." In 1940, their group coalesced into the Committee to Defend America by Aiding the Allies. For a brief time, on the other side, pacifists found themselves uncomfortably aligned with isolationists such as the America First Committee; by 1941 pacifists had largely left the political arena to strengthen their own non-resistant communities for wartime trial, especially regarding COs.

Thus, in order to understand the divisions and realignments over national policy on the use of military force in the decade before 1941, it is necessary to appreciate several things: the distinction within the peace movement between neutralism and isolation; the shift of liberal internationalists from neutralism to wartime alliance (hopefully short of military deployment); and the resulting brief alignment of pacifist internationalists with isolationists, from which pacifists withdrew. Above all, it is important to remember that the policy debate was carried on within the broad peace movement, and that the League of Nations wing consciously functioned as a political ally of the Roosevelt administration, from at least 1939 on.

The political role of liberal internationalists extended into wartime because the administration explicitly relied on them—as by then a well-organized coalition—to build public consensus for a United Nations organization. Growing out of the military exigencies of the UN alliance,

the United Nations was thus subject to both the geopolitical apprehensions of political leaders and, in some measure, the internationalist expectations of a citizen peace movement. Moreover, much of the public hope invested in the United Nations was transferred to a new and Western alliance, NATO, as the United Nations became polarized in the "Cold War."

Public support for arms control and disarmament was generated by a resurgent peace movement that grew out of the nuclear "arms race" fueled by the Cold War. This took place in two phases: the test ban movement of 1957-63, and the Nuclear Freeze Campaign of the early 1980s.

The test ban movement grew out of concern over the radioactive fallout from the atmospheric testing of "nuclear weapons" by the United States, the Soviet Union, Britain, France, and China. It was initiated by "atomic scientists who challenged the sanguine assurances of the Atomic Energy Commission. As public apprehension rose, liberal internationalists like Norman Cousins joined progressive pacifists like Abraham J. Muste in the "National Committee for a Sane Nuclear Policy (SANE, 1957). SANE mounted a strong program of national education and mobilized support for an international ban on the atmospheric testing of nuclear weapons. Meanwhile, some pacifists applied techniques of direct, nonviolent action with which they had experimented in race relations since 1942: they sailed into Pacific testing zones, picketed tests in the United States, and demonstrated at weapons-producing sites and elsewhere—not only against nuclear testing but for disarmament.

The test ban campaign lost a measure of focus when the Eisenhower administration and the Soviet Union put unilateral moratoriums on testing; but it continued to add organized public constituencies, notably women and young people. Those constituencies were activated when testing was resumed by both sides early in the Kennedy administration, soon under the threatening cloud of the "Cuban Missile Crisis. Norman Cousins personally helped pave the way for the negotiated treaty of 1963 banning atmospheric testing, and Kennedy recruited the SANE network to mobilize public support for ratification.

Nearly two decades later, and despite arms control agreements initiated by the Nixon administration, attempts to achieve detente between the Soviet Union and the United States broke down. A new round in the spiraling nuclear arms race began under President Jimmy Carter and accelerated sharply under Ronald Reagan. Large-scale protest gathered force in Europe, while in the United States a coalition of peace groups backed the idea of a mutual, verifiable freeze in nuclear weapons. Although coordinated by a national organization, the Nuclear Freeze Campaign, the freeze reflected grassroots activism that was elicited by growing public awareness of the destructive realities of a nuclear exchange. An important result of the Nuclear Freeze Campaign was to provide essential political support for arms control, which had been greatly weakened early in Reagan's administration. A second consequence was the existence of informed resistance to Reagan's "Strategic Defense Initiative, itself quite possibly a response to the popularity of the Freeze; and a third was to lay the groundwork for enthusiastic public support of the disarmament initiatives eventually worked out between Presidents Gorbachev and Reagan.

The "Vietnam War presented a different case of antiwar

opposition from the conflicts involving European Allies in the two world wars. It was different because, although initiated by the U.S., the 1965 air war against North Vietnam and the direct, massive engagements of U.S. troops in the South were not preceded by a period of extensive national debate. It was different in that national policy was challenged on a large scale during wartime.

After an initial period of strong public support, Lyndon B. Johnson's administration faced growing, sullen resistance that became active political opposition in 1968. Richard M. Nixon entered office as a peace candidate. Despite his withdrawal of U.S. troops under the policy of "Vietnamization," the fact that he continued the war through 1972 and in some respects expanded it into Laos and Cambodia elicited further organized opposition on the home front. Both presidents sought the support of the political center, and each attempted to push antiwar opposition to the political margin. Both administrations treated the Vietnam antiwar movement as an alien force, despite the repetitive conclusion from major intelligence probes that even the movement's radical wing was independent of foreign or Communist direction. The unresponsiveness of the Johnson administration and active harassment under Nixon strengthened tendencies toward confrontational politics within the antiwar movement. Nonetheless, the political contest increasingly shifted from the streets to the Congress, as antiwar efforts were invested ever more in electoral politics and lobbying.

Opposition accompanied every step of the escalating war in Vietnam. It represented a shifting, unstable coalition of political, pacifist, and cultural currents in the 1960s. Still, the various parts of the coalition espoused one or more of five positions on the war: (1) that it was unfeasible, the cost not being justified by U.S. interests, and the United States not being able to impose self-government on Vietnam; (2) that it destabilized the region and distanced U.S. allies; (3) that the support of repressive government in the South undermined U.S. ideals and interests; (4) that in some measure it represented the arrogance of imperial wars; and (5) that its level of destruction was immoral. Opposition to the war varied greatly in rationale and tactics.

At its core, the organized antiwar movement clustered around two poles. One was a very tenuous alliance of the surviving Old Left, a youthful New Left, and direct-action pacifists who folded opposition to war into their various agendas (for the Socialist Workers Party the war was a single issue, but they aligned with the diversified Left anyway). Their tactics included political confrontation: large-scale demonstrations, draft resistance, and civil disobedience; they attracted something of the counterculture, and the resulting media coverage largely stereotyped the whole movement in their image. This wing crested in 1968-69 and quickly declined thereafter. The other pole was an informal coalition of liberals with a single-issue antiwar focus. They were the initial source of "teach-ins" in the spring of 1965, and in the next few years they attracted numerous constituencies—from religion, labor, health care, sciences, and business. Their tactics were public education and debate, petitions, lobbying, and electoral politics. Increasingly, this wing of the movement moved into mainstream politics, into the Congress and the 1968 and 1972 presidential elections. In so doing, it lost a measure of visibility because the dominant media image of antiwar effort

was street politics. Associated with the liberal wing, however, were growing antiwar veterans' groups—notably the Vietnam Veterans Against the War—that achieved a good deal of credible visibility by their public campaigns.

The movement cannot itself be credited or blamed for the withdrawal of public support from at least 1968 onward. It did, however, keep before the public the issue of whether the war in Vietnam was morally or practically acceptable. It probably exacerbated popular anxiety about social and cultural instability and linked it to the war. Taken quite seriously by Johnson and Nixon, organized opposition may well have elicited some of their duplicity and extralegal harassment. Certainly, it strengthened the congressional role in policymaking. In all these respects, antiwar protest helped to provide a check on the prosecution of war essentially on the terms of the executive branch.

About two decades later, in the 1980s, a fresh, largely grassroots coalition emerged in solidarity with Central American liberation movements, especially in Nicaragua, El Salvador, and Honduras. There were national organizations, notably the Committee in Solidarity with the People of El Salvador, or CISPIES (1980-81), which lobbied effectively with the Congress; but these were supplemented by a loose network of innumerable citizens' groups having contacts in Central America. Often the transnational contacts were along professional lines—farmers, lawyers, educators, editors, religious leaders, and politicians. The Solidarity movement, it was called, thus indicating its main focus and grassroots base.

This movement, and its lobbying agents, challenged the Reagan policies of aggressive support for the Nicaraguan Contras to overthrow the Sandinista revolution, and for the largely military government in El Salvador, which was fighting a revolutionary challenge. The history of the U.S. Solidarity movement has yet to be written; but it seems reasonably clear that it contributed significantly to congressional checks on presidential initiatives that were essentially, if covertly, military. In contrast to this, unilateral military force was employed suddenly and briefly in Panama and Grenada, perhaps on the understanding that quick closure would preclude political debate. Public discussion did foreshadow the Persian Gulf War against Iraq; even so, military strategy there was designed to control information and avoid protracted engagement, and the war ended relatively quickly.

"No more Vietnams!" That phrase connotes positions that range from no more military intervention abroad to no more military operations subject to public debate and political pressure. In either case, it suggests the extent to which military institutions and missions are responsive to citizen pressure in a democratic society. Insofar as peace and antiwar movements have contributed to public attitudes and values, to alternative means of resolving international conflict, or to political constraints on the conduct of warfare, to that extent they have proved relevant to American military history.

PEACE HISTORY. See Disciplinary Views of War: Peace History.

PEACEKEEPING. One consequence of the end of the *Cold War and the demise of the Soviet Union was a burst of joint efforts aimed at resolving armed conflicts. Between 1990 and 1994, fifteen international peacekeeping operations were initiated through the *United Nations. At their peak in 1994, there were over twenty such active operations.

Modern peacekeeping efforts began with the *League of Nations, which employed military forces twice in Germany, in Upper Silesia (1921) and in the Saar (1935). One of the first UN efforts was the United Nations Special Committee on the Balkans (UNSCOB). Emphasizing fact finding and mediation, it also employed "peace observation," with military observers who reported on the conflict to the General Assembly. The first mission employing more than a few military personnel was the United Nations Truce Supervision Organization (UNTSO), operating in the Middle East since 1948.

Early UN operations received such descriptive labels as *peace observation* and *truce supervision*. The term *peacekeeping* was coined by Canadian prime minister Lester Pearson for the United Nations Emergency Force deployed in the Middle East after the 1956 Arab-Israeli War. It was developed to distinguish this larger operation (which deployed 3,600 personnel in military units) from individual observer missions such as UNTSO.

In the early 1960s, the controversial United Nations Operation in the Congo (ONUC), an unprecedentedly large operation, strained the "peacekeeping" concept and the strength of the United Nations. In part as a result, peacekeeping operations underwent a period of retrenchment until the late 1980s. One exception was the 1981 start of the U.S.-manned Multinational Force and Observers (MFO) in the Sinai, the product of the *Camp David Accords. Despite its non-UN origins, it serves as an example of a "chapter six" of the UN Charter, featuring military forces—with the consent of belligerents—monitoring the implementation of an established truce.

In the late 1980s, the member states, through the United Nations, started a new series of peacekeeping operations.

Many of these missions (particularly in Namibia and Cambodia) were very complex, and covered activities ranging from civilian police through election administration and refugee resettlement.

In the 1990s, operations were undertaken in which the central tenets of "classic" peacekeeping (consent by all parties and the restricted use of force by peacekeepers) no longer seemed appropriate. These operations, including the UN and U.S. military involvement in *Somalia and the former Yugoslavia, were mounted in the face of ongoing conflicts. The terms *peace enforcement*, "*muscular*" *peacekeeping*, and "*chapter seven*" *operations* reflect U.S. political and military concerns, and imply more aggressive ideas about the use of force. The American domestic debate over such a U.S. role has generated a new dynamic: as operations (rightly or wrongly) were judged failures in domestic debate, new labels were invented to distance new missions from past failures. Operation Joint Endeavor, begun in 1995 in the former Yugoslavia, was called a "peace implementation" mission, not because its tasks are unique but because the mission had to be differentiated from past efforts. The frequently changing labels applied to these operations reflect the lack of consensus within the United States about how to—and indeed whether to—conduct such operations.

PEA RIDGE, BATTLE OF (1862). The Battle of Pea Ridge, 6-8 March 1862, resulted from a *Union army campaign to clear Missouri of Confederate forces during the Civil War and to begin a major offensive down the Mississippi River valley. Brig. Gen. Samuel R. Curtis's Army of the Southwest drove Maj. Gen. Sterling Price's Missouri State Guardsmen from southwestern Missouri into northwestern Arkansas in February 1862. Reinforced by Brig. Gen. Benjamin McCulloch's division and placed under the command of Maj. Gen. Earl Van Dorn, the entire Confederate force was designated the Army of the West. With 16,500 men, Van Dorn attacked Curtis's 10,250 men. Limited fighting occurred on 6 March as Confederate units harassed a Union detachment marching from Bentonville to join Curtis at Pea Ridge. On 7 March, Van Dorn completely outflanked Curtis's army and attacked in two columns, cutting the Federal line of communications. Curtis changed the front of his entire army from south to north.

Fierce fighting occurred on two separate battlefields: McCulloch's division was crushed near Leetown village; McCulloch and his immediate subordinate were killed,

nearly destroying the chain of command. Near a hostelry called Elkhorn Tavern, Price's division almost crushed Col. Eugene Carr's Federal division in the bloodiest fighting of the battle, but Carr held firm. After concentrating his army that night, Curtis drove off the remainder of Van Dorn's men on 8 March. Curtis's victory was the turning point of Union efforts to dominate the Trans-Mississippi region. Van Dorn's army was transferred east of the Mississippi River, and Curtis marched across Arkansas, nearly capturing Little Rock. Pea Ridge, which Southerners named the Battle of Elkhorn Tavern, involved the Confederate use of Native American troops, with Cherokee recruits scalping several *Fédérés*. The Confederate "casualties were 2,000; Union losses, 1,384.

PEARL HARBOR, ATTACK ON (1941). The Japanese surprise attack on the U.S. Navy's base at Pearl Harbor and on Oahu in the Hawaiian Islands on Sunday morning, 7 December 1941, destroyed much of the American Pacific Fleet and brought the United States into World War II. What President Franklin D. "Roosevelt called a "day which will live in infamy" led Congress to declare war on Japan on 8 December.

The attack followed the decision of the government of Premier Hideki "Tojo that the Roosevelt administration would not abandon China and Southeast Asia to the Japanese military nor continue to supply Tokyo with oil and other vital supplies. Thus, while negotiating with Washington, Tokyo also planned a major Japanese offensive into British Malaya, the Dutch East Indies, and the American Philippines.

The major opposing naval force in the Pacific would be the U.S. "Navy, which had moved to its forward base at Pearl Harbor in May 1940. As part of the Japanese offensive, Adm. Isoroku "Yamamoto, commander in chief of the Combined Japanese Fleet, devised a secret plan for a preemptive air strike against the American fleet in order to give Japan time to fortify its newly conquered territories.

It was an extremely risky gamble—projecting a naval task force composed of six of Japan's nine "aircraft carriers 3,400 miles across the northern Pacific without discovery or major loss. The strike force, commanded by Vice Adm. Chuichi Nagumo, was composed of two fleet carriers, two converted carriers, and two light carriers, along with two "battleships, and a number of "cruisers, "destroyers, and support ships.

Between 10 and 18 November, Nagumo's ships left separately from Kure Naval Base, assembling 22 November by the Kurile Islands. The force departed on 26 November. To avoid detection, it followed a storm front and maintained strict radio silence, while Tokyo used signals deception from other sites to disguise the true location of the carriers. Consequently, although the U.S. Navy was monitoring Japanese naval radio traffic (they did not break the naval code until 1942), naval intelligence did not know where Japanese carriers were but knew that they had gone on radio silence on earlier deployments.

The United States had secretly broken the Japanese diplomatic codes in a system called "MAGIC, and the few authorities in Washington who were informed of them understood that relations between the two countries had reached a final crisis as the Japanese envoys received Tokyo's last negotiation offer and were told to destroy their code machines and deliver the proposal to the secretary of state on Sunday morning, 7 December. Americans saw Japanese naval vessels and troops ships headed south in the China Sea. But while recognizing that war might be imminent, Washington and Pacific commanders did not know whether this would include an attack on American territories; if it did, they assumed it would be on the Philippines. So did the two American commanders on Oahu, Rear Adm. Husband E. Kimmel, commander in chief of the U.S. Pacific Fleet, and Lt. Gen. Walter Short, U.S. Army commander in Hawaii. Both considered sabotage from among the sizable Japanese population to be the main threat in Hawaii.

On 7 December, Nagumo's force arrived 275 miles northwest of Oahu, and at 6:00 A.M. it launched the first attack wave, consisting of 49 bombers, 40 torpedo planes, 51 dive-bombers, and 43 "fighter aircraft; this was followed by a second wave of 54 bombers, 78 dive-bombers, and 36 fighters. The first wave arrived over Pearl Harbor at 7:55 A.M. (1:20 P.M. in Washington, D.C.), and the attack continued until 9:45 A.M.

While Japanese fighters strafed the Army Air Corps' planes at Hickman Field, the torpedo planes and dive-bombers attacked the navy ships. Along Battleship Row, the *Arizona*, the *California*, and the *West Virginia* were sunk; the *Oklahoma* capsized; the *Nevada* was grounded; and the three others were damaged. (The Japanese had secretly developed aerial "torpedoes that could operate in such shallow water and "bombs that could penetrate deck armor.) In all, the Japanese attack sank or disabled nineteen ships, including all eight battleships, three light cruisers, three destroyers, and several support vessels. At the airfields, 164 planes were destroyed and 128 damaged. Among American sailors, Marines, and soldiers, "casualties were 2,335 killed, along with 68 civilians, and 1,178 persons wounded.

Yamamoto's plan called for a third wave to destroy the repair facilities as well as the storage tanks containing 4.5 million gallons of fuel oil. But despite losing only twenty-nine planes, Nagumo feared a counterattack and turned for home.

News of the surprise attack at Pearl Harbor shocked Americans, ended the prewar isolationist-interventionist debate, and unified the country. Yamamoto had misjudged the effect on a previously divided public. His attack, which was an extraordinary tactical success, failed in its larger military goal of destroying the U.S. Navy in the Pacific. Although the battleships were damaged, Nagumo's failure to destroy the repair yards enabled the Americans eventually to return six of the eight battleships and all but one of the other vessels to active duty (the wreckage of the *Arizona* remains there today as a monument). The fuel reserves enabled the remainder of the fleet to continue to operate, and failure to destroy the submarine base allowed "submarines to play a major role in the Pacific War.

Equally important, the two aircraft carriers normally based at Pearl Harbor—the *Lexington* and the *Enterprise*—were undamaged. Escorted by heavy cruisers and de-

stroyers, they were out delivering planes to Midway and Wake Islands.

Later on 7 December (8 December, Far Eastern Time), the Japanese launched assaults on British forces in Hong Kong and in the Malay peninsula, and U.S. forces on Midway Island, Guam, and the Philippines, where the Japanese also caught American planes on the ground.

The Pearl Harbor attack led to eight investigations between 22 December 1941 and 15 July 1946, to establish responsibility for the disaster. On 24 January 1942, a presidential commission headed by Supreme Court Justice Owen J. Roberts attributed the effectiveness of the Japanese attack to the failure of the military commanders in Hawaii, Admiral Kimmel and General Short, to institute adequate defense measures; it found them guilty of "dereliction of duty."

The Roberts Commission concluded that there had been enough advance warnings for the local commanders to have been on the alert instead of maintaining Sunday routine. Among these were reports to Kimmel in March and August 1941 from the Army Air Corps' commanders and the naval aviation commander in Hawaii indicating the possibility of a Japanese naval air attack from that direction and on a Sunday morning (reports that Kimmel filed away). In addition, as the crisis with Japan had mounted, Washington, on 27 November, notified Kimmel and Short, and all other Pacific commanders, that the Japanese ships and troops were moving south and that war was imminent (although the Hawaii commanders assumed on their own that this meant they should be alert to sabotage). More directly, about 4:00 A.M. on 7 December, the American destroyer *Ward* spotted a Japanese midget submarine trying to enter Pearl Harbor, although it did not report the sighting until it sank the submarine at 6:40 A.M., and even then the army was not informed. Finally, at 7:10 A.M., the new Opana *radar station on Oahu picked up a large blip approaching from the northwest, but the control center concluded erroneously that it was a flight of B-17 *bomber aircraft due in that morning from the mainland, even though those American planes would be arriving from the northeast.

Kimmel was relieved of his command and succeeded on 17 December by Adm. Chester *Nimitz, and both Kimmel and Short were forced into retirement. During the war, the army and navy held several inquiries. Some held the two local commanders derelict in their duty; others concluded that they were simply guilty of errors of judgment. But all left some questions unanswered, and the controversy continued.

After the war, a joint committee of Republicans and Democrats from both houses of Congress held an investigation from 15 November 1945 to 15 July 1946, which obtained additional testimony and previously classified information about the deciphering of the Japanese diplomatic codes and monitoring of naval radio traffic. In the committee's final report, the minority Republicans tended to criticize the Roosevelt administration, the service secretaries, and Gen. George C. *Marshall, the army chief of staff, for misjudgments, interservice rivalry, and poor communication; the majority Democrats blamed Kimmel and Short, although for errors of judgment rather than dereliction of duty. Like its predecessors, the congressional inquiry failed to resolve who was ultimately responsible. Kimmel and Short were never court-martialed. Short

died soon after the investigation; Kimmel lived until 1968.

Although new evidence continues to emerge, particularly about intelligence gathering by the United States and the Allies, no credible evidence has been produced to support the conspiracy thesis of a few writers that Roosevelt had foreknowledge of the attack and "allowed" it to occur so that he could take the United States into World War II. Nor have the president and his subordinates ever been shown to have been guilty of misconduct. No solid evidence has yet emerged to support a recent allegation that British intelligence was reading the Japanese naval code JN25 in 1941 and that, therefore, Prime Minister Winston S. *Churchill knew of the impending attack.

The overwhelming scholarly opinion from the American perspective views the Pearl Harbor attack as an unforeseen tragedy. Scholars have stressed the difficulty in extracting *in advance* the relevant information from masses of intelligence data. Most accounts also note the communication problems caused by interservice and interdepartmental rivalries. Recent evidence has added the FBI, which unfortunately downgraded information from a British double agent, Dusko Popov, who reported that Berlin had asked him in 1941 to obtain detailed information about Pearl Harbor. Nor was information supplied to Kimmel and Short about the reports of spies at the Japanese Consulate in Honolulu transmitting detailed information about ship deployments at Pearl Harbor.

Many scholars also emphasize the distortion of the interpretation of data caused by preexisting perspectives in December 1941; the American underestimation of the Japanese operational ability; and the overriding belief that the targets of Japanese attack were in the western Pacific and Southeast Asia. Indeed, these were the main targets of Japanese *expansionism.

PEARL HARBOR NATIONAL MONUMENT. Located at the Pearl Harbor Naval Base at Oahu, Hawaii, the overturned hull of the sunken battleship USS *Arizona* is one of the most important American memorials to World War II in the Pacific. On 7 December 1941, in the attack on *Pearl

Harbor, Japanese bombers sank the 1912 battleship with a direct hit on its forward ammunition magazine. Within minutes, the ship rolled over and sank in the shallow harbor; many of the crew were entombed in the wreckage. In 1949, the Hawaiian territorial government's Pacific War Memorial Commission made the ship's wreckage the focal point of efforts to create a permanent monument to the dead at Pearl Harbor. A year later, the U.S. Navy attached a flagpole to the protruding mainmast of the sunken ship and erected a temporary floating platform over the vessel.

In 1958, Congress authorized the commission to raise private funds for a memorial, which was completed four years later. Designed by Alfred Preis, it consists of a 180-foot modernistic building that straddles part of the exposed hull of the *Arizona*.

During the "Cold War, U.S. leaders used the *Arizona* memorial to emphasize military preparedness and the need to guard against a similar surprise attack. Controversy remained, however, over how to interpret Japanese responsibility for the war, as well as tension over whether the memorial would encourage continued animosity between the United States and Japan. In 1991, on the fiftieth anniversary of the Pearl Harbor attack, President George "Bush, himself a naval veteran of the Pacific War, delivered a major address at the memorial urging support for American military preparedness but also stressing the need for friendly relations between the two countries.

PENINSULAR CAMPAIGN. See Seven Days' Battle (1862).

PENN, WILLIAM (1644-1718), religious leader, pacifist, social philosopher, and colonial proprietor. Born in London the son of Adm. William Penn, conqueror of Jamaica, and Margaret (née Jasper) van der Schuren Penn, young William was given a rigorous classical education evident in his adult writings. He entered Oxford in 1660 but was dismissed for refusing to attend chapel, an early example of his religious rebellion. He studied theology briefly at a Protestant seminary in France, then read law at Lincoln's Inn, London, for a year. Managing the family estates in Ireland, he became converted in 1667 to Quakerism, a radical, pacifist, Protestant way of thought. He zealously published books and pamphlets, was repeatedly jailed, but never ceased advocating liberty of conscience, which could only be realized through an official policy of tolerating dissent. A pragmatic young man, Penn sought to defend his fellow "Quakers through official channels, using the courts and becoming involved in politics. Resented by some older, purer Friends and facing a fading Whig cause, Penn turned to America to institutionalize his religious and political principles. Charles II granted him proprietorship of Pennsylvania in 1681 in part to repay a loan by Penn's father to the crown, but also to help fill a sparsely populated gap on the Atlantic seaboard.

In visits to America, Penn set up his "holy experiment," which included peaceful relations with the Indians. Subsequently, Penn was caught between the demands of the

English government and Scotch-Irish frontier dwellers for military support and the intransigence of the Quaker Pennsylvania legislators. Pennsylvania had no militia until 1755. His own commitment to "pacifism was evident in his publication of *An Essay towards the Present and Future Peace of Europe, by the Establishment of an European Dyet, Parliament or Estates* (1693).

PENNYPACKER, GALUSHA (1844-1916), youngest general in the Union army. Born near Valley Forge, Pennsylvania, Pennypacker grew up in the house that George "Washington had used as his headquarters. When the Civil War broke out, the sixteen-year-old youth gave up reading law and joined a Chester County militia company as a private. The 97th Pennsylvania Volunteer Regiment was organized in August 1861; Pennypacker joined and was elected a captain.

Pennypacker and the unit participated in the Siege of "Fort Wagner at Charleston, and subsequently in actions at Swift Creek, Drewry's Bluff, Chester Station, and Green Plains, where Pennypacker, appointed a lieutenant colonel in April 1864 at age nineteen, was wounded three times. In August 1864, he was appointed colonel in command of the regiment, and the following month was given a brigade, which he led in operations around Petersburg and Richmond. He was wounded again in an assault on Fort Gilmer.

On 15 January 1865, in the Union attack on Fort Fisher near Wilmington, North Carolina, Pennypacker led the first troops in a charge over the parapet and personally planted the flag of the 97th Pennsylvania Volunteers on the wall. At that moment, he was hit in the side by a bullet and severely wounded. The colonel was caught by Sgt. Jephtha Clark (great-great-grandfather of editor in chief John W. Chambers). Hospitalized for ten months, Pennypacker was awarded the Congressional Medal of Honor for bravery in capturing the fort. In June 1865, the twenty-year-old colonel was promoted to brigadier general, becoming the youngest general in the "Union army. After the war, Pennypacker served in the South and then the West as a colonel of infantry in the U.S. Army until his retirement in 1883 at thirty-nine.

The PENTAGON is the building that houses the U.S. Department of "Defense, located in Arlington, Virginia, just across the Potomac River from Washington, D.C. As the name indicates, it is a five-sided building, composed of five concentric pentagons interconnected by corridors.

The Pentagon was constructed by the U.S. "Army Corps of Engineers between 1941 and 1943 to consolidate various offices in the War Department, which was expanding rapidly during World War II. Covering an area of thirty-four acres, with four stories aboveground, the reinforced

concrete building was designed to provide 5 million square feet of floor space for 40,000 employees. When completed, the Pentagon was the world's largest office building. In 1947, it became the headquarters of the newly established Department of "Defense. The term "the Pentagon" often refers to the Defense Department.

PENTAGON PAPERS (1971). On 13 June 1971, the *New York Times* began publication of a secret Department of "Defense history of Vietnam War decision making commissioned by Defense Secretary Robert S. "McNamara toward the end of the Johnson administration. Leaked by former Defense Department analyst Daniel "Ellsberg, who believed the revelation might alter the course of the war, the story outraged President Richard M. "Nixon, already suspicious of the press, particularly by threatening the president's hoped-for opening to China. As Nixon's national security adviser, Henry "Kissinger, observed in his memoir, *The White House Years*, "Our nightmare was that ... the massive hemorrhage of state secrets was bound to raise doubts [in Peking] about our reliability." When the *Times* declined to suspend further publication on its own, Nixon's lawyers won a temporary restraining order from the 2nd Circuit Court in New York. At that point, Ellsberg approached the *Washington Post*, which picked up and ran the story. Nixon's lawyers sued again in the District of Columbia Circuit Court but failed to demonstrate any substantial damage to national security and lost. On 23 June, they appealed to the Supreme Court, which agreed to review the case in an unprecedented Saturday morning sitting. In the end, the Court likewise found in favor of the newspapers, but despite widespread public belief it set no solid precedents in support of freedom of the press by doing so. Ruling that prior restraint of the press imposed a heavy burden of proof, which the Nixon administration had failed to carry out, it left the possibility open that the government or the military might pursue similar litigation in the future with greater success.

PEQUOT WAR. See Native American Wars: Wars Between Native Americans and Europeans and Euro-Americans.

PERIODICAL PUBLICATIONS ON WAR AND THE MILITARY. The appearance of professional or occupational periodicals is usually a sign that a field has matured. This has certainly been the case for military and defense journals in the United States. From a slow and fitful start in the early days of the republic, serial publications devoted to war and the military have evolved into a number of forums that cover diverse aspects of this broad topic. Unlike other periodicals that cover trades or professions, military publications (which comprise the bulk of this category) are not the prime vehicles that formulate theories and major advancements. Rather, they explain and disseminate of-

ficially determined policy. Debate then takes place over details and implementation. These journals also can be a means of spreading specialized military information to the general media.

Prior to the "Civil War, military journals were short-lived. A small and dispersed officer corps, rudimentary mail and "transportation systems, and a core belief that talented men could rapidly master the arts of war created an insurmountable barrier to successful periodicals. The first American military journal, *Military Repository*, set the pattern. It was created during a short-term interest in military affairs in 1796 and folded the following year. A number of similar efforts met the same fate during the "War of 1812. The most successful publication of the antebellum era was the *Army and Navy Chronicle*, which lasted from 1835 to 1844. It was a reflection of a "military enlightenment" of the 1830s. No military periodical appeared during the "Mexican War.

The Civil War saw the rise of several military journals. The large number of new officers created a need for publications that covered military operations and provided basic instruction and counsel for these civilians in uniform. Several addressed this audience, the most prominent being the *Army and Navy Journal* (now the *Armed Forces Journal International*, *AFJI*). This publication quickly gained the confidence of senior officers and was the only such periodical to continue after the war. It settled into a routine of covering congressional appropriations, military deployments, and the social aspects of officers' lives.

The next spurt began in the 1870s. Officers in the army and navy began to address the basic tenets of their profession by forming societies. Their journals, following the model of the British *Journal of the Royal United Service Institution*, provided sounding boards for these officers' thoughts. The U.S. Navy was first in 1874 with the *U.S. Naval Institute Proceedings*, followed in 1879 by the U.S. Army's *Journal of the Military Service Institution*. The army's branches quickly began producing their own periodicals, such as *Cavalry Journal*, which weakened a desire for a "one-army" voice. Both uniformed and civilian writers also addressed military topics in mainstream publications.

War had two contradictory effects on these publications. Small editorial staffs of regular officers were quickly depleted by the demands for more pressing activities. On the other hand, the influx of thousands of new dues-paying officers who were "encouraged" to join the branch societies rapidly filled the associations' coffers. New publications arose, addressing the concerns of wartime volunteers and conscripts. The most popular enlisted ranks' periodicals have been *Yank* (World War II) and *Stars and Stripes* (both world wars and the postwar period to the present).

The post-World War II period ushered in a golden age of American military and defense journals. Each year between 1945 and 1985 saw the establishment of at least one periodical devoted to war and the military. This development was the direct result of the Cold War. The United States was fielding a large permanent military establishment for the first time in its history, creating a substantial audience in uniform and in industry. Three main sources continue to meet the needs of this readership.

The largest is the military establishment itself. The Department of "Defense and its various military bodies have created a number of publications. Most attempt to disseminate official doctrine, impart useful career information,

and inculcate an esprit de corps. Some address the concerns of a particular branch, such as *Infantry*, while others provide information to all the ranks of a single service, such as *Airman*. Of special interest are the journals of the various war colleges (*Parameters*, *Naval War College Review*, *Airpower Journal*, etc.), which provide a scholarly venue for uniformed and civilian authors. Aside from these, most of the government periodicals contain limited criticism of official policy. Over the years, there have been attempted cutbacks of service-sponsored periodicals from both the congressional and executive branches, but the publications have endured. In fact, emerging trends spawn new journals, such as *Joint Forces Quarterly*.

Professional organizations are the smallest sources of defense and military journals but arguably the most influential. These groups either form around the major services, such as the Air Force Association (*Air Force*), or activities, such as the Armed Forces Communications and Electronics Association (*Signal*). Their journals display an independence of thought and often reflect what the services actually feel about policies and developments. Many associations have corporate membership, providing a conduit for the views of defense contractors. Unlike their government counterparts, which cannot receive advertisements, these magazines are filled with promotions for the latest products and services of the *military-industrial complex.

"Independent" publishers form the final source of military journals and are the most diverse. Commercial publications such as *Aviation Week and Space Technology* and *Defense News* usually emphasize military equipment and the related aspects of the federal budget. As with their association counterparts, these commercial magazines carry defense contractor advertisements, sometimes in conjunction with special editorial sections that deal with the * weaponry being advertised.

There are some exceptions. The first are the tabloid newspapers of the Army Times Publishing Company (*Army Times*, *Air Force Times*, and *Navy Times*), which provide articles that uniformed personnel need to succeed in their careers—information on pay, promotions, education, benefits, and so on. Founded during World War II, this company was so successful that it usurped the role that *Armed Forces Journal International* had played. For its part, *AFJ* in the late 1960s successfully repositioned itself to cover defense policy issues in a lively format. It has been joined by a few other commercial publications, notably those of the British Jane's Publishing Company.

Military history journals have a solid niche in popular and academic publishing. Titles aimed at a general audience such as *Military History*, *World War II*, *Vietnam*, *Naval History*, and *MHQ* have received an enthusiastic popular reception. More scholarly offerings such as the *Journal of Military History* and *Air Power History* have been well received in the academic community. The focus of the commercial and academic journals has been on modern (since 1400) Western military history.

The Civil War has generated a myriad of publications that address the interests of its devotees. In the decades that followed the war, most showed a decidedly regional bias, such as *Confederate Veteran*. Almost all of these journals had ceased by the Great Depression, but the war's centennial in 1961 sparked a popular interest that has not

flagged. *Civil War History* is a well-respected academic journal that covers not only military topics but all aspects of the "middle period" of American history. *Civil War Times Illustrated*, *The Blue and the Gray*, and *America's Civil War* service an apparently insatiable popular market. There are a wide variety of specialty Civil War serials, such as *Lady Reenactor* and *Civil War Token Journal*.

Over the years since World War I, and accelerating with the intellectual ferment during the Robert S. McNamara era at the Department of Defense, several independent scholarly journals joined the war college and branch journals in examining wider military and defense issues. Periodicals with a social science emphasis, such as Harvard University's *International Security* (political science) and the Inter-University Seminar on Armed Forces and Society's *Armed Forces and Society* (sociology and political science), have established scholarly niches.

The final group of independent publishers consists of those dealing with *peace and *arm control and disarmament issues. Such publications generally arise in periods before or after conflicts and are usually organs of *peace and antiwar movements. The Cold War amplified this phenomenon: a wide variety of peace and disarmament publications appeared, ranging from the semischolarly *Bulletin of the *Atomic Scientists* to the tabloid *Ground Zero*. A related type has been produced by organizations devoted to peace studies, such as *Journal of Conflict Resolution* (University of Michigan), *Peace and Change* (Peace History Society), and *World Affairs* (*American Peace Society). There is not much cross-fertilization between the peace journals and the rest of the military publications, a reflection of the lack of middle ground between their sponsors.

PERRY, MATTHEW (1794-1858), naval diplomat and reformer. Perry entered the U.S. Navy in 1809 as midshipman under his brother, Oliver Hazard Terry, then served on the frigate USS *President* during the *War of 1812, and was wounded when it exchanged fire with the *Belvidera*. In the 1830s, Perry became a leader in the movement to improve naval education and training and to have the navy adopt * steamships. During the * Mexican War he directed attacks on Frontera, Tabasco, and Carmen in 1846, and after assuming command of the Home Squadron in March 1847, Perry conducted the U.S. Army's amphibious landing at Veracruz; he also supervised the capture of Tuxpan and the blockade of Mexico's east coast.

After the war, in his famous expedition to open the closed society of Japan, Perry led four U.S. warships into Tokyo Bay on 8 July 1853 and delivered an invitation from President Millard Fillmore to the emperor to open relations with the United States. Returning in February 1854, he signed the Treaty of Kanagawa, providing for friendship and limited trade between the two nations. Ill health overtook the man known as "Old Bruin"; he returned to the

United States and spent a year writing his account of the mission before retiring from the navy. Perry died in New York City on 4 March 1958.

PERRY, OLIVER HAZARD (1785-1819), U.S. naval officer. Born of a naval family, Perry served as a midshipman toward the end of undeclared naval war with "France (1789-1800) and as a midshipman and acting lieutenant during the "Tripolitan War (1801-05). After being promoted to lieutenant, he helped enforce the embargo, which prohibited American ships and goods from leaving port, and protected the American coast from "privateering. During the "War of 1812, he directed construction of a small fleet on Lake Erie, and on 10 September 1813, used it decisively to defeat a British squadron at Put-in-Bay. The Battle of Lake Erie secured for the United States control over the lake and changed the balance of power in the western theater of operations, but now is best remembered as the occasion of Perry's report to Gen. William Henry Harrison: "We have met the enemy and they are ours." That same year Perry provided naval support for Winfield "Scott's capture of Fort George, and aided Harrison in the reoccupation of Detroit, as well as at the Battle of the Thames. In 1814, he played a minor role in the defense of the Chesapeake Bay area when the British invaded the region. He died of yellow fever in 1819 while on a naval and diplomatic mission in South America. A younger brother, Matthew C. Perry, led the naval expedition that opened Japan in 1853.

PERRYVILLE, BATTLE OF (1862). The largest Civil War battle fought in Kentucky occurred near Perryville on 8 October 1862. The engagement climaxed a campaign begun when "Confederate army forces entered Kentucky earlier that summer. Confederate commander Braxton "Bragg mistakenly believed that he faced one Union corps at Perryville, but there were actually 58,000 Federal troops in the area. For his part, Union Gen. Don Carlos Buell erred in believing that Bragg's entire force was in his front.

Bragg took the initiative by ordering his 16,000 men into action in the early afternoon. The main blow fell on the Federal left, where a corps commanded by Alexander McCook was shattered and driven back nearly a mile until Union reinforcements and nightfall ended the carnage. Despite this tactical success, Bragg decided to withdraw after belatedly learning that he confronted the bulk of Buell's army. Bragg's army took over 3,000 "casualties; "Union army totals exceeded 4,000. The Confederates retreated first to Harrodsburg and shortly thereafter into Tennessee. Buell was soon replaced as Union commander by William S. "Rosecrans, but the Confederates had little to celebrate in the wake of Perryville. The hard fighting done there proved strategically inconsequential, and Bragg's boldly conceived Kentucky invasion failed.

PERSHING, JOHN J. (1860-1948), commander of the American Expeditionary Forces (AEF) in World War I, graduated from the U.S. Military Academy in 1886. Cavalryman Pershing served in various Indian campaigns in the West and then became professor of military science at the University of Nebraska in the 1890s, where he took a law degree and thought of another profession. But he stayed in the army and in the black Tenth Cavalry.

Staff assignment to army headquarters in Washington, D.C., in 1896 was followed by appointment to the tactical staff at West Point in 1897. There, Pershing's discipline and his African American regiment earned him the nickname "Black Jack" among the cadets.

In the "Spanish-American War, Pershing distinguished himself in Cuba. Sent to the Philippines in 1899, he led important expeditions against hostile Moros. In 1905, Captain Pershing became military attaché in Tokyo and observed the Russo-Japanese War.

These services induced President Theodore "Roosevelt to promote Pershing to brigadier general in 1906. Becoming governor of the Philippine Moro province in 1909, he subdued the warlike people by 1913. While at Fort Bliss, Texas, Pershing lost his wife and three daughters in a fire at San Francisco's Presidio, 27 August 1915—only his son, Warren, survived.

Throwing himself into work, Pershing led the Punitive Expedition into Mexico in pursuit of Francisco (Pancho) Villa's irregulars in March 1916. Pershing did not capture Villa but did drive away his bands and restore peace to the border. In February 1917, Major General Pershing and his troops were withdrawn from Mexico.

With America's entry into World War I, April 1917, President Woodrow "Wilson bypassed several more senior officers and selected Pershing to command the American Expeditionary Forces. Given wide authority by Wilson and Secretary of War Newton D. "Baker, Pershing was to build a separate American army as soon as possible.

Pershing's duties in France were heavily managerial. He had to organize, train, and supply an army that finally numbered more than 2 million men. He waged two wars—one against the Germans, the other against Allies who tried always to siphon his men into their woefully depleted ranks. Pershing stressed "open warfare" tactics in training, as opposed to the "trench warfare favored by the Allies. Historians argue whether he was right, but when the western front broke open in late 1918, events seemed to validate his program. There is no doubt that his discipline, organization, and iron will made the AEF a vital factor in the final victory. Pershing thought the Allies should push on to Berlin, convince Germany of defeat, and perhaps forestall another war, but he accepted Wilson's decision for an armistice in November 1918.

Congress created the rank of "General of the Armies" for Pershing in 1919. Pershing accepted a five-star insignia but declined the option of wearing it. He served as chief of staff of the U.S. Army from 1921 until his retirement from the service in 1924.

The PERSIAN GULF WAR (1991) was caused by Iraq's invasion of Kuwait on 2 August 1990, and had two major phases. The first phase was Operation Desert Shield—a largely defensive operation in which the United States and Saudi Arabia rushed to build up the defensive forces necessary to protect Saudi Arabia and the rest of the gulf, and the United Nations attempted to force Iraq to leave Kuwait through the use of economic sanctions. The United States then led the UN effort to create a broad international coalition with the military forces necessary to liberate Kuwait, and persuaded the United Nations to set a deadline of 15 January 1991 for Iraq to leave Kuwait or face the use of force.

The second phase, known as "Desert Storm," was the battle to liberate Kuwait when Iraq refused to respond to the UN deadline. The fighting began on 17 January 1991 and ended on 1 March 1991. The UN Coalition liberated Kuwait in a little over six weeks, and involved the intensive use of airpower and armored operations, and the use of new military technologies. The Gulf War left Iraqi leader Saddam "Hussein in power, but it destroyed nearly all of Iraq's conventional forces and allowed the United Nations to destroy most of Iraq's long-range "missiles and chemical weapons and capabilities to develop "nuclear weapons.

Desert Shield. Saddam Hussein almost certainly saw the seizure and annexation of Kuwait as a means of solving Iraq's economic problems, of greatly increasing Iraq's share of world oil reserves, and as a means of demonstrating that Iraq had become the dominant power in the region. Kuwait was capable of adding at least 2 million barrels a day of oil to Iraq's exports of roughly 3.5 million, and offered the opportunity to double Iraq's total oil reserves, from 100 billion to 198 billion barrels (representing nearly 20% of the world's total reserves).

Although he continued to negotiate his demands on oil revenues and debt relief from the Persian Gulf Arab nations, Saddam Hussein ordered his troops to the Kuwait border in July 1990, built up all of the support capabilities necessary to sustain an invasion, and then ordered his forces to invade on 2 August 1990. Kuwait had not kept its forces on alert, and Iraq met little resistance. It seized the entire country within less than two days; within a week, Iraq stated that it would annex Kuwait as its nineteenth province. Iraqi forces also deployed along Kuwait's border with Saudi Arabia, with more than five Iraqi divisions in position to seize Saudi Arabia's oil-rich Eastern Province. Saudi Arabia had only two brigades and limited amounts of airpower to oppose them.

Saddam Hussein may have felt that the world would accept his invasion of Kuwait or would fail to mount any effective opposition. However, Saudi Arabia and the other gulf states immediately supported the Kuwaiti government-in-exile. The Council of the Arab League voted to condemn Iraq on 3 August and demanded its withdrawal from Kuwait. Key Arab states like Algeria, Egypt, and Syria

supported Kuwait—although Jordan, Libya, Mauritania, the Sudan, and the Palestine Liberation Organization (PLO) supported Iraq. Britain, France, the Soviet Union, and most other European nations as well as the United States, Canada, and Japan condemned the invasion. U.S. president George "Bush announced on 7 August that the United States would send land, air, and naval forces to the gulf.

Equally important, the end of the "Cold War allowed the United Nations to take firm action under U.S. initiative. On the day of the invasion, the Security Council voted 14-0 (Resolution 660) to demand Iraq's immediate and unconditional withdrawal from Kuwait. The United States, Britain, and Saudi Arabia led the United Nations in forming a broad military coalition under the leadership of U.S. Army Gen. H. Norman "Schwarzkopf that deployed the military forces necessary to enforce the United Nations' sanctions and to defend Saudi Arabia. This was the defensive military operation code-named "Desert Shield."

On 29 November 1990, the United States obtained a Security Council authorization for the nations allied with Kuwait "to use all necessary means" if Iraq did not withdraw by 15 January 1991. Key nations like the United States, Britain, France, Egypt, Saudi Arabia, Syria, and several others began to deploy the additional forces necessary to drive Iraq out of Kuwait.

In 1990-91, the United States deployed a total of 527,000 personnel, over 110 naval vessels, 2,000 "tanks, 1,800 fixed-wing aircraft, and 1,700 "helicopters. Britain deployed 43,000 troops, 176 tanks, 84 combat aircraft, and a naval task force. France deployed 16,000 troops, 40 tanks, attack helicopters, a light armored division, and combat aircraft. Saudi Arabia deployed 50,000 troops, 280 tanks, and 245 aircraft. Egypt contributed 30,200 troops, 2 armored divisions, and 350 tanks. Syria contributed 14,000 troops and 2 divisions. Other allied nations, including Canada, Italy, Oman, Qatar, and the United Arab Emirates deployed a significant portion of their small forces.

Iraq responded by building up its military forces in the Kuwait theater of operations to a total of 336,000 troops and a total of 43 divisions, 3,475 battle tanks, 3,080 other armored vehicles, and 2,475 major "artillery weapons. This buildup on both sides made full-scale war steadily more likely and triggered a number of political debates within the West and the Arab world over the need for war. The most important of these debates took place within the United States; largely because of President Bush's political leadership, the Congress, after Bush gained UN endorsement, requested such authorization on 8 January 1991. On 12 January the House of Representatives by 250 to 183 and the Senate by 52 to 47 voted to authorize the use of force.

Though a number of new efforts were made to persuade Iraq to leave Kuwait in late December and early January, Saddam Hussein refused to withdraw under any practical conditions. Baghdad also continued to expand its military capabilities in Kuwait and along the Iraqi border with Saudi Arabia, and continued its efforts to convert Kuwait into an Iraqi province. As a result, the UN Security Council voted to ignore yet another effort to negotiate with Iraq. On that date, 15 January 1991, President Bush ordered the military offensive to begin.

Desert Storm: The Air War. The Gulf War began early in the morning on 17 January when the United States

exploited its intelligence and targeting assets, cruise missiles, and offensive airpower to launch a devastating series of air attacks on Iraqi command and control facilities, *communications systems, air bases, and land-based air defenses. During the first hour of the war, U.S. sea-launched cruise missiles and F-17 stealth aircraft demonstrated they could attack even heavily defended targets like Baghdad.

Within three days, a mix of U.S., British, and Saudi *fighter aircraft had established near air superiority. In spite of Iraq's air strength, UN air units shot down a total of thirty-five Iraqi aircraft without a single loss in air-to-air combat. Although Iraq had a land-based air defense system with some 3,000 surface-to-air missiles, the combined U.S. and British air units were able to use electronic warfare systems, antiradiation missiles, and precision air-to-surface weapons to suppress Iraq's longer-range surface-to-air missiles. As a result, Coalition air forces were able rapidly to broaden their targets from attacks on Iraq's air forces and air defenses to assaults on key headquarters, civil and army communications, electronic power plants, and Iraq's facilities for the production of weapons of mass destruction.

Victory in the air was achieved by 24 January, when Iraq ceased to attempt active air combat. A total of 112 Iraqi aircraft fled to Iran, and Iraq virtually ceased to use its ground-based *radar to target UN aircraft. This created a safe zone at medium and high altitudes that allowed U.S. and British air units to launch long-range air-to-surface weapons with impunity. The UN air forces were also able to shift most of their assets to attacks on Iraqi ground forces. For the following thirty days, UN Coalition aircraft attacked Iraqi armor and artillery in the Kuwaiti theater of operations, as well as flying into Iraq itself to bomb Iraq's forward defenses, elite Republican Guard units, air bases and sheltered aircraft, and Iraq's biological, chemical, and nuclear warfare facilities.

Iraq's only ability to retaliate consisted of launching modified surface-to-surface Scud missiles against targets in Saudi Arabia and Israel, which had remained outside the war: forty Scud variants against Israel and forty-six against Saudi Arabia. U.S.-made Patriot missiles in Israel shot down some Scuds, but although the United Nations carried out massive "Scud hunts" that involved thousands of sorties, it never found and destroyed any Scud missiles on the ground, which demonstrated the risks posed by the proliferation of mobile, long-range missiles.

Iraq's Scud strikes could not, however, alter the course of the war. Iraqi ground forces were struck by more than 40,000 air attack sorties; U.S. authorities estimated that airpower helped bring about the desertion or capture of 84,000 Iraqi soldiers and destroyed 1,385 Iraqi tanks, 930 other armored vehicles, and 1,155 artillery pieces before the United Nations launched its land offensive. They also estimated that air attacks severely reduced the flow of supplies to Iraqi ground forces in Kuwait and damaged 60 percent of Iraq's major command centers, 70 percent of its military communications, 125 ammunition storage revetments, 48 Iraqi naval vessels, and 75 percent of Iraq's electric power-generating capability.

Desert Storm: The Land War. By 24 February 1991, airpower had weakened Iraq's land forces in Kuwait to the point where the UN commander, General Schwarzkopf, felt ready to launch a land offensive. Early that morning,

UN land forces attacked along a broad front from the Persian Gulf to Rafha on the Iraqi-Saudi border. This attack had two principal thrusts: a massive, highly mobile "left hook" around and through Iraqi positions to the west of Kuwait to envelop the elite Republican Guard; and a thrust straight through Iraq's defenses along the Kuwaiti border designed to fix the forward Iraqi divisions.

The "left hook" was carried out by a mix of U.S., British, and French armored and airborne forces. The armored VII Corps deployed four armored divisions, one of them British, for the main thrust. Its western flank was protected by the U.S. XVIII Airborne Corps, composed of three U.S. divisions—the 82nd Airborne, the 101st Air Mobile, and the 24th Infantry (Mechanized)—and the French 6th Light Armored Division. They advanced toward the Iraqi cities of Salman, west of Kuwait, and Nasiriya on the Euphrates River, and attacked in an arc to the northeast toward the main routes of communication leading north from Kuwait toward Basra in Iraq. French forces led the attack toward the Iraqi lines of communication along the Euphrates. U.S. armored, mechanized, and attack helicopter forces advanced rapidly toward Basra in the leading edge of the "left hook." British forces guarded the U.S. flank and attacked to the northeast across the gorge of al-Batin along the Iraqi-Kuwaiti border.

The other thrust—directly north through the Iraqi positions along the Kuwaiti border—was carried out by the I Marine Expeditionary Force, and an all-Arab corps composed primarily of the Saudi Army and Egyptian units. These forces rapidly penetrated Iraq's forward defenses and advanced so swiftly that Iraq's shattered ground forces in Kuwait could only launch scattered counterattacks. As a result, the allies rushed toward Kuwait City, Wafrah, and Jahrah.

Though some Iraqi Republican Guard units fought well, the bulk of Iraq's army consisted of poorly trained conscripts with low morale and little motivation. Many Iraqi troops fled after putting up only brief resistance and others were taken prisoner. As a result, UN forces reached their major objectives in Kuwait in half the time originally planned. At the same time, the Coalition continued its air attacks, dropping a total of 88,500 tons of ordnance. U.S. and British air units used 6,520 tons of precision-guided weapons and destroyed or damaged 54 bridges. These attacks helped to end the war by cutting off Iraqi land forces from the roads along the Tigris River north of Basra, although UN forces did not have time to encircle fully or cut off all Iraqi forces, or to use airpower to destroy the retreating Iraqi forces around Basra.

By 26 February, Coalition land forces were in Kuwait City, and U.S. forces had advanced to positions in Iraq to the south of Nasiriya. Many of these advances had taken place at night and all occurred in spite of major rainfalls, substantial amounts of mud, and weather problems hampering the ability to provide air support. These advances effectively ended the war.

Baghdad radio announced on 26 February that all Iraqi forces would withdraw from Kuwait in compliance with UN Resolution 660. A day later, President Bush declared that the United States would halt military operations early in the morning of 28 February, a week after the land offensive had begun. A cease-fire was negotiated on 3 March and formally signed on 6 April. Iraq agreed to abide by all the UN resolutions.

The Aftermath of the War. The Gulf War achieved the United Nation's original objectives of liberating Kuwait while producing remarkably one-sided losses. Iraqi military casualties totaled an estimated 25,000 to 65,000, and the United Nations destroyed some 3,200 Iraqi tanks, over 900 other armored vehicles, and over 2,000 artillery weapons. Some 86,000 Iraqi soldiers surrendered. In contrast, UN forces suffered combat losses of some 200 personnel from hostile fire, plus losses of 4 tanks, 9 other armored vehicles, and 1 artillery weapon. U.S. battle deaths among the 532,000 Americans included 122 from the army and Marines (35 to "friendly fire") and 131 noncombat fatalities. The navy losses were 6 and 8; in the air force 20 were killed in action and 6 in other deaths. The allied forces of 254,000 suffered 92 combat deaths. Although Coalition aircraft flew a total of 109,876 sorties, the allies lost only 38 aircraft versus over 300 for Iraq. This was not only the lowest loss rate in the history of air warfare but a lower loss than the normal accident rate in combat training. The terms of cease-fire were designed to enable UN inspectors to destroy most of Iraq's remaining missiles, chemical weapons, and nuclear weapons facilities.

The Gulf War reshaped the face of modern warfare. It demonstrated a dramatic increase in the importance of joint operations, high-paced air and armored operations, precision strike systems, night and all-weather warfare capabilities, sophisticated electronic warfare and command and control capabilities, and the ability to target and strike deep behind the front line, marking what might be the beginning of a revolution in military affairs. It also demonstrated the growing importance of the mass media in shaping the conduct of operations, and the need to carefully consider collateral damage, "casualties, and the impact of instant TV coverage of military operations.

The Gulf War did not, however, bring stability to the gulf or drive Saddam Hussein and the Ba'ath Party elite from power. Indeed, he suppressed Kurdish and Shi'ite rebellions in 1991. In 1998, Iraq still had the largest army in the gulf region. It seemed to retain some long-range missiles, some ability to deliver chemical weapons, and most of its prewar biological weapons capability. Though it had lost most of its nuclear weapons production facilities, it retained much of its nuclear weapons technology. Baghdad was also able to launch terrorist activities against Kuwait and drive most of the UN mission in Iraq out of the country. Iraqi agents plotted to assassinate President Bush when he visited Kuwait on 14-16 April 1993, and Iraq conducted a major military buildup near the Kuwaiti border in October 1994.

The failure to drive Saddam Hussein from power, and Iraq's actions since the war, have led many to argue that the United Nations should have expanded its war-fighting objectives and invaded Iraq to force Saddam Hussein from power. Some military analysts have argued that even a few days of additional fighting would have proved decisive in overthrowing Saddam Hussein. There is no way to resolve such debates, but it seems unlikely that a few days of additional fighting would have done more than kill more Iraqis, since many of the Republican Guards had already escaped to the north of Basra and half the Iraqi Army and most of Saddam Hussein's security forces remained intact. Expanding the goals of the war might have driven Saddam Hussein from power, but it might also have caused an Iraqi civil war and divided the country, led to bloody urban war-

fare, and forced a lengthy UN occupation of a sovereign and hostile state. Instead, the United Nations maintained economic sanctions and an embargo on military supplies against Iraq for years after the Persian Gulf War.

PETERSBURG, SIEGE OF (1864). The Siege of Petersburg, Virginia, began in June 1864 when the Union Army of the Potomac, led by Maj. Gen. George Gordon "Meade but closely supervised by Lt. Gen. Ulysses S. "Grant, crossed the James River after failing to destroy Confederate Gen. Robert E. "Lee's Army of Northern Virginia during a series of battles from the Wilderness to Cold Harbor. From 15-18 June, the *Fédérés* made repeated efforts to seize Petersburg, an important railroad center twenty miles south of Richmond. When these failed, Grant initiated siege operations, which continued until 2 April 1865.

To some extent the term *siege* is a misnomer, since the Union forces neither surrounded the city nor made systematic attempts to breach its defenses by regular approach. Instead, Grant used the trench system to hold an extended line economically while he dispatched mobile forces to cut the three railroads that connected Petersburg with the rest of the Confederacy. Lee used the trenches in identical fashion to send mobile forces of his own to block these ventures. To keep Lee on his toes, however, Grant occasionally resorted to direct attacks on the Petersburg defenses.

The most famous of these attacks was the Battle of the Crater (30 July 1864), when Union forces exploded a huge mine beneath a Confederate earthwork called Elliott's Salient. The mine shaft, 511 feet long, ran to a point 20 feet under the enemy work, and when finished, was packed with 8,000 pounds of black powder that when detonated created an enormous crater 30 feet deep. But the subsequent Union infantry assault was wretchedly coordinated, and counterattacking Confederate troops quickly sealed the breach.

Other major actions during the siege included the Battles of Reams Station (25 August 1864) and New Market Heights (28-30 September). These and other engagements were costly but indecisive. By early 1865, however, their incremental effect was to stretch Lee's lines near the breaking point. Aware that a powerful additional Union army under Maj. Gen. William Tecumseh "Sherman was thrusting northward through the Carolinas, Lee understood that when Sherman arrived, the situation would be hopeless. Therefore, on 25 March 1865, he attacked Fort Stedman, hoping to force Grant to contract his line enough so that Lee could slip away to the south, join a scratch Confederate force in eastern North Carolina, and stop or destroy Sherman's army. This desperate bid resulted only in the loss of 5,000 sorely needed infantry. On 1 April, Union forces finally crushed the extreme western end of Lee's line at the Battle of Five Forks. Lee then made preparations to evacuate Petersburg, but a general Union assault in the predawn hours of 2 April severely punished his army before he could get away. Richmond fell once Lee's army left Petersburg. Closely pursued by Grant, Lee surrendered a week later at Appomattox Courthouse. "Casualties for the ten-month siege totaled about 42,000 Union troops and 28,000 Confederates.

PHILIP, or Metacomet (also known as King Philip) (c. 1640-1676), Wampanoag sachem and leader in "King Philip's War. Son of the powerful Massasoit, who had helped early Plymouth Colony survive, Metacom accepted the English name Philip when he replaced his deceased brother as the Wampanoags' principal sachem in 1662. His resistance to English territorial expansion and judicial authority offended Plymouth officials, who subjected him to accusations and humiliating rebukes before 1675, when Wampanoag warriors launched the raids that escalated into King Philip's War. The operational role that he played in this costly struggle is not clear; several capable leaders were involved in the guerrilla action that stunned the New England colonies. Philip did travel long distances through the forests, encouraging bands from various Algonquian tribes to join the desperate rebellion. A mixed force of Indians and English militiamen finally killed him in 1676. According to eyewitness Benjamin "Church, an Indian executioner making a speech over Philip's body said that "he had been a very great man and had made many a man afraid of him." Even in defeat, Philip remained a fearsome symbol of Native American resistance and military prowess.

PHILIPPINES, LIBERATION OF THE (1944-45). The assault on the island of Leyte on 20 October 1944, toward the end of World War II, marked the beginning of the reconquest of the Philippines. Military and naval chiefs in Washington had not shared Gen. Douglas "MacArthur's determination to return to the Philippines, but the logistical realities of the Pacific War gave weight to his demand that the U.S. colony be liberated and that Luzon (rather than Formosa) be seized as a base for further operations against the Japanese home islands. On 8 September 1944, the "Joint Chiefs of Staff authorized the Leyte invasion, and on 3 October they acknowledged that an attack on Luzon would follow.

Shielded by Adm. William F. "Halsey's Third Fleet and Vice Adm. Thomas C. "Kinkaid's Seventh, Lt. Gen. Walter Krueger's Sixth Army (X and XXIV Corps) of MacArthur's Southwest Pacific Area command streamed ashore against light opposition on 20 October. MacArthur and his aides waded ashore, fulfilling his 1942 pledge, "I shall return." Convinced that the naval Battle of "Leyte Gulf (24-25 October) had seriously weakened the Americans, the local Japanese Army commander, Lt. Gen. Suzuki Sosaku, slipped 45,000 reinforcements onto Leyte. The fighting dragged on into early 1945, far longer than MacArthur had expected, and inflicted heavy "casualties: 3,504 Americans dead and 11,991 wounded. Perhaps 50,000 Japanese died on Leyte.

Japanese resistance, heavy rains, and unsuitable terrain

limited Leyte's development as a major air and supply base and delayed the Luzon landing, originally scheduled for 20 December 1944. Japanese suicide planes had made their first devastating appearance at Leyte Gulf and now struck hard at ships leading the Luzon invasion force, sinking or seriously damaging eighteen vessels. The Sixth Army (now comprised of I and XIV Corps) landing at Lingayen on 9 January 1945, however, went unopposed.

The depletion of Japanese air and naval power in the defense of Leyte convinced Gen. Tomoyuki Yamashita, commander of the 14th Area Army in the Philippines, that he could no longer contest American landings. He divided his soldiers into three groups and positioned them in the mountains of northern, eastern, and western Luzon. The Japanese were to make the enemy conquest of Luzon as costly and time-consuming as possible.

MacArthur had justified the Luzon operation by arguing that the island's central plain, ideal for base sites, and Manila's port facilities could be seized within six weeks. He urged Krueger forward, despite his subordinate's concern that Yamashita might counterattack along the Sixth Army's overextended flanks. A "flying column" of the First Cavalry Division reached Manila's northern suburbs on 3 February, and 37th Division troops entered the city the following day. The 11th Airborne Division had been approaching Manila from the south. By 11 February, American troops encircled the city.

Yamashita had not intended to defend Manila, but the commander of naval forces in the city, Rear Adm. Sanji Iwabuchi, was determined to do so. To limit damage and civilian casualties, MacArthur forbade the use of air strikes against Japanese positions in the old walled city and concrete government buildings, but he acquiesced in the use of "artillery. In the month-long battle to retake the now devastated capital, more than 1,000 Americans died. Few of the 17,000 Japanese defenders survived, and civilian deaths totaled 100,000, victims of Japanese "atrocities and American bombardment.

While the U.S. Sixth Army turned its attention to the still substantial enemy forces on Luzon, Lt. Gen. Robert Eichelberger's Eighth Army swept the central and southern islands of Japanese troops. Isolated and poorly equipped, Yamashita's soldiers posed little threat to the buildup of American forces on Luzon in preparation for the planned invasion of Japan, but lengthy and difficult fighting remained to neutralize the 14th Area Army. More than 300,000 Filipino guerrillas assisted the army in this task. They gathered intelligence, ambushed enemy soldiers, and mopped up remnants of the Japanese forces. In all, the liberation of the Philippines cost the U.S. Army 13,884 killed and 48,541 wounded. Japanese military and civilian dead numbered over 250,000, and 114,010 others still remained to surrender at the end of the war on 15 August 1945.

PHILIPPINES, U.S. MILITARY INVOLVEMENT IN THE began with Adm. George *Dewey's stunning victory over the Spanish Pacific Fleet in the Battle of *Manila Bay on 1 May 1898, at the beginning of the *Spanish-American War. The situation was complicated by the presence of a Filipino colonial rebellion, which declared independence from Madrid and created a national government under the leadership of Gen. Emilio *Aguinaldo. Both Americans and Filipino nationalists besieged Manila, but the Spanish surrendered to the U.S. forces, which excluded Aguinaldo's forces from the capital.

President William *McKinley decided to ask Spain to cede the Philippines to the United States in the Treaty of *Paris (1898). Annexation was opposed by most Democrats and some Republicans, but supported particularly within the Republican Party for a variety of reasons, commercial as well as strategic. At Manila, fighting, largely provoked by the U.S. commanding general, Elwell S. Otis, broke out between American and Filipino forces on 4 February 1899, two days before the U.S. Senate narrowly ratified the treaty annexing the archipelago.

The *Philippine War lasted from 1899 to 1902. Conventional unit warfare the first year, resulting in heavy Filipino casualties, was succeeded by substantial *guerrilla warfare until Aguinaldo was captured by Frederick Funston in 1901. *Atrocities occurred on both sides in the guerrilla war.

The U.S. military commander, Gen. Arthur MacArthur, who succeeded Otis in May 1900, continued to hold executive power even after a commission headed by federal Judge William Howard Taft arrived and began exercising legislative authority in September 1900. When Gen. Adna Chaffee relieved MacArthur in July 1901, McKinley transferred executive authority from MacArthur as military governor to Taft as civil governor. One of the civil government's first moves was to establish a Philippine Constabulary, consisting of American officers and Filipino enlisted men to maintain order in pacified areas while the U.S. Army and *Philippine Scouts and Constabulary concentrated against the guerrilla bands.

American enthusiasm for formal overseas colonies diminished after the war, in part because of the price of more than 4,000 American deaths and 20,000 Filipino soldiers killed, along with a huge number of civilian * casualties. American farmers worried over competition from Filipino produce while U.S. Army officers felt increasingly vulnerable in defending these distant islands against Japanese expansion. By 1907 a Philippine legislature, dominated by *independistas*, controlled the archipelago's internal affairs, and only the timing of full independence divided America's two main political parties. The Jones Act (1916) promised independence as soon as the Filipinos were ready.

But under the Republicans, progress slowed. From 1921 to 1927, the appointed governor general was U.S. Maj. Gen. Leonard *Wood, who ruled with a heavy hand. The Great Depression and the Democratic administration of Franklin D. *Roosevelt led in 1934 to the Tydings-McDuffie Act, which provided for a ten-year transition to Philippine independence under a commonwealth government. Manuel Quezon was elected commonwealth president in 1935.

With the growing threat from Japan, Quezon sought to build up the Philippine military. With President Roosevelt's permission, Quezon hired recent U.S. Army chief of staff Gen. Douglas *MacArthur (son of Arthur Mac-

Arthur) as a military adviser with the rank of field marshal, the only American ever to hold that title. When the Japanese invaded the islands in December 1941, they overwhelmed both the U.S. and the Philippine military. General MacArthur and Quezon left before the surrender of the besieged American forces on the island fortress of Corregidor in the Battle of *Manila Bay. Three years later, despite the jia'y's plan to bypass the Philippines, MacArthur obtained Roosevelt's permission to liberate the archipelago, and in October 1944 he and American troops waded ashore after the Battle of *Leyte Gulf. Less than a year after the end of the war, the Philippines was granted independence on 4 July 1946.

Particularly because of the *Cold War, the American military presence continued in the Philippine Republic. Americans provided assistance to President Ramon Magsaysay (1953-57) and others in the suppression of the Communist-led Huk rebellion (1946-54). In 1947, the United States was granted leases on several military bases there, including Clark Air Base and the U.S. Navy base at Subic Bay. President Ferdinand Marcos (1965-86) renegotiated those leases, and, at the urging of President Lyndon B. *Johnson, sent a battalion of Philippine Army Engineers to South Vietnam.

In the post-Marcos era, President Corazon Aquino (1986-92) survived the most serious attempted coup against her, in December 1989, through the help of U.S. military aircraft. The end of the Cold War made the U.S. military bases in the Philippines less crucial. As Filipino opposition to them mounted and the Philippine legislature increased its demands for lease renewals, the eruption of Mt. Pinatubo in June 1991 covered Clark Air Base with volcanic ash, and the Philippine Senate rejected a proposed treaty, the U.S. Air Force and U.S. Navy abandoned the bases they had held for nearly a century.

PHILIPPINE SCOUTS AND CONSTABULARY. Challenged by the climate and terrain of the Philippines and by the linguistic diversity of its inhabitants, the U.S. *Army recruited Filipino collaborators into its ranks soon after the outbreak of the *Philippine War in 1899. Organized into companies commanded by American enlisted men holding local commissions, these Philippine Scouts after the war garrisoned isolated parts of the islands, freeing American soldiers to concentrate near Manila. Provisional Scout regiments took the place of U.S. troops withdrawn for service in World War I. Financial constraints made these regiments the mainstay of the garrison thereafter. Raised from a peacetime strength of 6,000 to 12,000 early in 1941, the well-trained and long-serving Scout units proved to be the greatest obstacle to Japanese victory on Bataan during World War II. After the liberation of the

* Philippines in 1944-45, the organization was reformed and considerably enlarged. These "New Scouts" performed

garrison duty in the western Pacific until disbanded following Philippine independence on 4 July 1946.

Filipinos had been eligible for Scout commissions since 1901, and in 1908 the U.S. Congress authorized West Point to accept Filipinos. But when it became evident that routine promotions would lead Filipinos to command regular officers, the army ceased commissioning Filipino officers (1933).

The Philippine Constabulary was the Philippine government's national police force, established in August 1901. The constabulary's initial duties were similar to those of the Scouts: suppressing bandits and the remnants of guerrilla forces. Under the command of U.S. Army officers until 1917, the constabulary was headed thereafter by Filipinos. Although its law enforcement duties came to predominate over its military functions, the constabulary formed the nucleus of the Philippine Army, created in 1936, and contributed the Second Regular Division to the Bataan campaign.

PHILIPPINE SEA, BATTLE OF THE. Much larger than the Battle of *Midway and the Battle of the *Coral Sea combined, the Battle of the Philippine Sea was the largest carrier duel of World War II. The invasion of Saipan on 15 June 1944 brought out the Japanese Mobile Fleet, under Vice Adm. Jisaburo Ozawa, to seek a "decisive" battle with the Americans. Ozawa's fleet was formidable—9 carriers, including the big new armored-deck *Taiho*; 450 planes; 5 *battleships; 13 cruisers; and 33 destroyers. But Ozawa was saddled with inexperienced and ill-trained air groups.

Ozawa's operational plan, A-GO, envisioned fighting in the Palau and western Carolines because the Japanese Navy was short of refined fuel. If the Americans attacked the Marianas, the Japanese would use 172 land-based aircraft in the Marianas, along with planes flown from the home islands through Iwo Jima, and the Fleet would use unprocessed Borneo fuel.

Indeed, the battle took place off the Marianas. On 11 June, the Americans attacked Saipan, wiping out a third of the enemy planes there. Vice Adm. Raymond A. *Spruance's Fifth Fleet covered the landings. His main striking force, Task Force (TF) 58, under the command of Vice Adm. Marc A. Mitscher, included 5 task groups, 15 carriers with 902 aircraft, 7 fast battleships, 21 cruisers, and 67 destroyers. Backing them up were seven old battleships and their screening cruisers and destroyers responsible for shore bombardment. Eight escort carriers carrying 201 planes were assigned to the Saipan invasion, while another 3 "jeeps" with 93 aircraft aboard were available from the Guam invasion force.

American "submarines spotted Ozawa's ships leaving Tawitawi on the 13th and again on the 15th as they exited San Bernardino Strait into the Philippine Sea. The Japanese Mobile Fleet was again spotted on the 17th by the submarine *Cavalla*. That afternoon, Mitscher proposed to move west and flank the Japanese. Spruance concurred, but also issued his own aggressive plan, urging his forces to destroy the Japanese Mobile Fleet completely. But worried about a diversionary attack, the next day Spruance reconsidered; he directed TF 58 to advance westward, but to retire eastward at night so that the Japanese could not flank

him and attach the American transports invading Saipan.

The Battle of the Philippine Sea opened on 19 June, as Ozawa launched 197 aircraft against the Americans, a force larger than Admiral Nagumo had sent against Midway. But in 1944, the odds heavily favored the Americans. Shortly before 10:00 A.M., Japanese planes were picked up on *radar 140 miles away. The ensuing battle became known as the "Marianas Turkey Shoot." Ozawa started the day with 430 carrier aircraft and 43 floatplanes, and launched 355 carrier planes and 19 floatplanes. Only 130 returned to the Mobile Fleet. To the 244 planes that Ozawa lost should be added 50 more land-based aircraft. The Americans lost only twenty-two "fighter aircraft in dogfights or to flak over Guam; nine more planes were lost operationally or on search missions. Fifty-eight aircrewmembers or sailors died.

Ozawa's losses were not just over TF 58. The *Cavalla* sank the *Shokaku*, which took over half of her crew of 2,000 and 9 planes with her. Another submarine, the *Albacore*, hit Ozawa's flagship, the big new *Taiho*, with one torpedo. Poor damage control and the volatile Borneo fuel she used proved fatal. She took almost 1,700 men of her crew of 2,200, plus another 13 planes, to the bottom.

Shortly before 4:00 P.M. on the 20th, searchers finally sighted Ozawa's ships 275 miles from TF 58. It was a long way to fly and night would fall before the planes could return to their carriers. But Mitscher launched 240 aircraft, of which 14 aborted. The rest pressed on and were over the Mobile Fleet by 6:30 P.M. In growing darkness, the Americans attacked, damaging several vessels and sinking three, the carrier *Hiyo* and two oilers. Besides the need to attack quickly because of low fuel, the attackers' apparent lack of success was a result of the fact that only 24 of the 54 Avengers engaged carried "torpedoes. Nevertheless, Japanese carrier aviation was finished for the remainder of the war. Ozawa had just 35 planes left out of the 430 he started with two days before.

The flight back to TF 58 at night and the recovery of the planes was as chaotic as the attack on the Mobile Fleet. Because many planes were almost out of fuel, Mitscher ordered his ships to turn on their lights to guide his aviators in. Of the 226 planes that reached the Mobile Fleet, 99 were lost. Only about 17 went down in combat; the rest succumbed to ditchings and deck crashes. Thanks to extensive search and rescue efforts, only forty-nine aircrewmembers were lost.

The victory brought little satisfaction to the U.S. Navy. Some critics blamed Spruance for wasting the opportunity to destroy the enemy fleet. Others defended him stoutly. Nonetheless, no one can deny that the Japanese Mobile Fleet had been grievously hurt and its aviation arm never recovered from the losses sustained in the Philippine Sea.

The PHILIPPINE WAR (1899-1902) was a direct result—an almost inevitable aftermath—of the "Spanish-American War. After a U.S. "Army expedition captured Manila

on 13 August 1898, Spain ceded the Philippine archipelago to the United States in the Treaty of "Paris. Seeking to reconcile the Filipinos to American rule by political and social reforms, President William "McKinley ordered a policy of "benevolent assimilation." But Filipino nationalists, who had been fighting for independence since 1896, proclaimed the Philippine Republic on 21 January 1899, with Emilio "Aguinaldo as its president. The Republican Army, a disparate collection of volunteers, conscripts, and former Spanish soldiers, maintained a semisiege over the 12,000 U.S. soldiers in Manila; on 4 February a skirmish between patrols escalated into heavy fighting.

For the remainder of 1899, the war was a conventional conflict between the American and Republican armies. Although Filipino troops often fought with great personal courage, they were poorly armed and abysmally led. Within the first three months, Maj. Gen. Elwell S. Otis's brigade columns swept the countryside in a thirty-mile radius of Manila and captured the republican capital of Malolos on 31 March. Aguinaldo proved an indifferent general, unable either to control his subordinates or to delegate authority; his leadership was further compromised by his complicity in the assassination of his rival, Gen. Antonio Luna. The U.S. Army, however, undermined by the discharge of volunteers whose enlistments expired with the end of the Spanish-American War and ravaged by sickness and fatigue, could not hold territory or sustain an offensive. Only after a five-month hiatus could Otis launch a three-pronged attack into north-central Luzon; the Republican Army melted away and Aguinaldo barely escaped. By February 1900, virtually every important town in the archipelago lay under the U.S. flag.

From December 1899 until its official termination on 4 July 1902, the war continued as a series of localized campaigns of "counterinsurgency and "pacification. Conceding that his partisans could not prevail on the battlefield, Aguinaldo proclaimed a policy of continued resistance through "guerrilla warfare. Henceforth, the insurgents were to avoid open battle and rely on irregular tactics and intimidation; the American public, faced with a long and brutal war, would reject McKinley in the forthcoming 1900 election and choose the antiannexationist William Jennings "Bryan. Beyond this, there was little central direction. Aguinaldo remained in hiding, and leadership devolved upon provincial warlords such as Miguel Malvar in Batangas and Vicente Lukban in Samar. Leading small partisan bands, local chieftains relied on consanguinity and terror to maintain clandestine control over the residents of American-occupied towns and thereby gain food, shelter, and information. Their guerrillas became adept at harassment, firing on army patrols and then blending into the population.

The U.S. High Command was slow to recognize the depth of the resistance. Convinced the war was over, Otis reorganized the army for occupation duties, breaking up his brigade commands and stationing them in dozens of towns throughout the archipelago. He supported McKinley's policy of benevolent assimilation, ordering his officers to establish local governments, restore trade, build schools, and otherwise demonstrate America's good intentions. Otis's successor, Maj. Gen. Arthur MacArthur, was alert to the guerrilla threat but lacked the manpower or administrative support to combat it. In the absence of suitable instruction from Manila, garrison and provincial comman-

ders began to develop their own pacification policies. With impressive resourcefulness, they devised new tactics, learned how to sustain military operations in the jungles and mountains, created intelligence networks, and formed working alliances with Filipinos. The war became a series of regional struggles, differing greatly from island to island and even village to village.

In December 1900, bolstered by reinforcements and McKinley's reelection, MacArthur instituted a comprehensive pacification campaign aimed at disrupting the connections between the guerrillas and their civilian supporters. American forces, often aided by Filipino auxiliaries, accelerated military operations, attacking guerrilla strongholds and destroying supplies. Military courts imprisoned, deported, or executed those who continued to resist; collaborators received pardons and often were given positions in the civil government. Defections and surrenders increased, especially after Brig. Gen. Frederick Funston's daring capture of Aguinaldo in March 1901. By July, when William H. Taft became governor, only a few provinces remained under military control and the war appeared all but over.

The massacre of an American infantry company at Balangiga, Samar, on 28 September 1901 provoked severe countermeasures. Brig. Gen. Jacob H. Smith, urging one subordinate to make Samar a "howling wilderness," conducted a brutal campaign that inflicted terrible hardships on the population. In southern Luzon, Brig. Gen. J. Franklin Bell destroyed crops, harried guerrillas with soldiers and Filipino auxiliaries, and confined much of the population within protected zones. By April 1902, the last important guerrilla leaders had surrendered; on 4 July 1902, President Theodore "Roosevelt declared the "insurrection" over.

In some respects the war was one of the least costly the United States ever fought. Army "casualties were comparatively light: between 4 February 1899 and 4 July 1902, 1,037 soldiers were killed in action, 2,818 were wounded, and a total of 4,374 died of all causes. Postwar disorder took years to suppress; sporadic military campaigns against bandits, rebels, and Muslim tribesmen, or Moros, continued until 1913.

From its inception, the American conquest was highly controversial. The government and imperialists claimed annexation was necessary for both economic and humanitarian reasons. Arguing that the Filipinos were incapable of self-government, they portrayed Aguinaldo as a Tagalog bandit and his supporters as criminals or dupes. A small but vocal group of anti-imperialists condemned the war as immoral and unconstitutional; they accused American soldiers of looting, arson, and torture. The public supported annexation, although revelations of isolated "atrocities by U.S. soldiers caused some outrage in 1902. Recent scholarship has focused on the regional nature of the war: it emphasizes the resourcefulness of the guerrilla tactics and army countermeasures—a diversity that made this conflict unique.

PHOTOGRAPHY, WAR AND THE MILITARY IN. The perfection of the daguerreotype process by 1839 brought the new science of photography to a stage the modern viewer would recognize: the formation by the physics of light, and its development by the chemistry of silver, of an image on a more or less permanent, portable surface. During the 1840s, the science came from France and England to America and immediately found acceptance amid much experimentation, foreign and domestic, with variations of chemistry and surface. Portraits, landscapes, and architecture, the most frequent early subjects of photography, had obvious military counterparts. There is no record that anyone set out systematically to photograph the scenes and participants in the *Mexican War (1846-48). However, several images exist by chance, depicting groups of U.S. soldiers in camp or en route.

James Robertson and Roger Fenton of Great Britain began the systematic photography of war with their work in the Crimea (1854-55) and at the British staging grounds at Constantinople. Having an eye to commercial sale as well as period sensitivities, they photographed no dead bodies, concentrating instead on soldier groups, officers' portraits, and both close and panoramic views of camps and battle sites. Some photographs, published in periodicals as engravings, fueled a rancorous public debate over army conditions and an inefficient London administration.

In 1854, *The Practical Mechanics Journal* asserted that cameras could ensure "undeniably accurate representation of the realities of war and its contingent scenery, its struggles, its failures and triumphs." The art debate of the day, in general, was between photographic accuracy and painterly license, yet the statement also foreshadowed the ongoing debate over the objective versus subjective depiction of war and its emotions.

By the outbreak of the * Civil War, photography was fully established as an art form and documentary record. Images, both negative and positive, existed on paper, glass, and metal in many variants, and while not yet a do-it-yourself process, original photographs were within the financial reach of many Americans. They could be printed in books and newspapers only as some form of line engraving until the invention of the halftone printing plate in the 1880s, but thousands of original prints were for sale by dealers. Mathew B. Brady, one of the most astute and successful prewar photographers, was already offering his Gallery of Illustrious Americans, including military heroes. In the two decades of photography thus far, the technological curve had risen steeply and quickly, so that images were sharp and clear and workmanship careful even where composition was often unsophisticated. Family portraits could be proudly displayed; they had special meaning in an era of strong family values and high mortality, especially of children. Indeed, some photographers advertised a specialty in pictures of the recently deceased.

Many citizens had limited visual access to their vast country, and a high curiosity, coupled with *patriotism, values, and sentimentality, made for a strong market in war-related imagery. Civil War photographers were of three types. A few practiced their craft while in uniform, such as Andrew Russell, who enlisted in a New York regi-

ment in 1862 and became a photographer of installations, architecture, and battlefield landscapes for the U.S. Military Railroads. His work, lost for years amid that of Brady, only regained its proper identity in the 1980s.

A second group consisted of camp photographers, professionals either unknown or with limited name recognition, who toured camps on pass to do soldier portraits to send home. Tolerated for their contribution to entertainment and troop *morale, they produced an immense quantity of work, often in the form of cartes-de-visite. These were taken as a series of single negatives on a glass plate coated with wet collodion, printed on paper, and cut apart into rectangular pictures modeled on the calling cards of the day (not unlike modern sports cards). The format was so popular it became the vehicle for mass-producing collectible images of generals and politicians.

Mathew Brady was the best known of the prominent commercial photographers who added war scenes to their formal print catalogues. Among others were Alexander Gardner and Timothy O'Sullivan, who worked for Brady before becoming independent in 1863. These men worked on battlefields and in dangerous situations, yet their bulky equipment limited them. Slow exposure times and the absence of movable shutters precluded photography of infantry assaults and cavalry charges in favor of more static scenes. The photographers were not at all squeamish about dead bodies, and some of the best known death studies were compositionally enhanced rather than depicted as found. This fact, however, seems never to have diminished the attraction of pictures like Gardner's "Home of a Rebel Sharpshooter" from Gettysburg. Civil War work was popular for a time but interest soon waned, and *Gardner's Photographic Sketch Book of the Civil War*, published in 1866, was a commercial failure. The modern photo historian William Frassanito has identified hundreds of Civil War images and rephotographed the identical scenes as they look at present.

Major improvements in photographic equipment between 1865 and 1930 brought only limited improvements in the depiction of war and military subjects. Civil War photographers working in the West posed soldier groups in routine surroundings. Edward S. Curtis did outstanding portraits of Indian warriors. The short-lived *Spanish-American War produced much that was reminiscent of the Civil War, as well as two new categories. Marching soldiers now actually marched, but the charge up San Juan Hill was still beyond the limits of clarity. And the availability of small hand cameras—the famous Kodak box—led to snapshots by troops in the field and especially by mischievous sailors prowling the decks. World War I, lengthy, grim, and brutal though it was for soldiers and civilians alike, did not produce a long roster of well-known photographers or a group of memorable individual images. The official work is simply that; the journalistic work was highly controlled; and much of the whole is anonymous, repetitive, and lacking in dimension. Just before the Italian invasion of Ethiopia (1935), Alfred Eisenstaedt, using the new photo essay concept, did a noteworthy series on the harshness of life there, and from the Spanish Civil War (1936) came American photojournalist Robert Capa's remarkable but oft-doubted "Moment of Death."

By any standard, the photographic legacy of World War II is enormous in quantity and importance. In the most photographed war in history, through countless millions

of images, photographers brought the use of photography for combat-related purposes to the highest level yet. The interpretation of aerial and reconnaissance images became a vital specialty within high-level command staffs. Of American wars, more World War II imagery circulates in the collectible fine art photography market than from any other conflict. Not only is this work highly evocative and expressive but it also exhibits the meticulousness of style, composition, and craftsmanship that typified the fine art photography of the 1930s and 1940s. Established artists like Eisenstaedt, Margaret Bourke-White, Dorothea Lange, Horace Bristol, Lou Stoumen, Peter Stackpole, Carl Mydans, and many others produced significant war-related work. They succeeded because they were able to combine fine art and documentary styles in a single vision.

Volunteers and draftees alike who had basic photographic knowledge often found themselves in assignments where they could use their skills. The U.S. Navy had a separate rating for photographers; the army and Marines grouped them with other technical personnel. Their work became commingled with that of countless others and identified upon publication only as "official" photography. Anonymity oft repeated equals fame of sorts, as in the familiar image of the destroyer USS *Shaw* exploding at Pearl Harbor, taken by an unknown navy photographer.

In 1942, the well-known New York photographer Edward Steichen, a reserve officer and World War I veteran, at age sixty-three was recommissioned in the navy and authorized to recruit a team of men to receive commissions and photograph the Pacific War. The group, which included Fenno Jacobs, Wayne Miller, Horace Bristol, Victor Jorgensen, Charles Kerlee, Bruce Gallagher, and Paul Dorsey, made the war personal and immediate by concentrating on the enlisted men and junior officers they met while deployed with carrier task forces or on captured islands. Steichen supervised the processing, printing, and media release of the pictures, which were vital links binding war front to home front.

Many photojournalists served with American forces as civilians but were subject to military censorship. World War II was America's most heavily censored war, at least until its final year. The popular newsreel theaters showed live action footage, but the first photograph showing dead American troops where they fell—George Strock's picture of three soldiers on the beach at Buna, New Guinea—did not appear until September 1943. There had been earlier photos showing blanket-covered bodies and flag-draped caskets. *Life* published the Strock photo with a careful editorial to prepare Americans for the shock, fearing a negative effect on morale. The caution was unnecessary. Americans accepted the photo and those to follow.

Home front activities to support the war effort not only utilized official photos supplied by the Office of War Information and other agencies but also produced a variety of published images. War bond drives required advertising and posters, which in turn led to photo contests. One in 1943 invited citizens to submit snapshots on the theme "The American Boy Under Japanese Rule." This kind of informal imagery at home had its counterpart in war zones. As the war progressed, personal cameras were more and more numerous, especially among American troops in Europe after D-Day. In the visual imagery of the war are thousands of snapshots of buddies, prostitutes, townspeople, bombed cities, and landscapes. At the opposite end of

the scale are the great well-known compositions, usually by professionals, such as Joe Rosenthal's picture of the second flag-raising by the Marine Corps on Iwo Jima; Alfred Eisenstaedt's picture of a sailor kissing a nurse in Times Square on V-J Day; and W. Eugene Smith's image of a soldier carrying a small baby found under a rock on Saipan.

The aftermath of the war remained in the public eye for a long time. One of Steichen's crew was among the first cameramen to see the devastation of Hiroshima. Margaret Bourke-White accompanied American troops who liberated concentration camps. One after another, photo essays depicting the conduct of life amid physical and economic ruin appeared in news magazines.

Korea—in a war that Americans tolerated but did not support as enthusiastically as World War II—came across visually as bloody, freezing, and endless, with little of traditional glory and much of individual suffering for American Marines and soldiers. The Vietnam War, brought live into homes every night both as jungle fighting and urban rioting, offers the best modern example of how blurred and indistinct are the various categories of war scenes, first defined for the Crimean conflict by *The Practical Mechanics Journal*. The visual record became not merely documentation of what was happening but advocacy for what ought to happen. A tight composition of the sweat-streaked face of a teenage Marine, if perhaps a study in courage, also got captioned "Bring Him Home" by war protestors. What may have happened ten minutes before the frame, and in fact defined the frame, is lost in projection of the future. The increasing political complexity of late twentieth-century warfare has a profound effect on its visual record.

Two other realities are also at work. The nightly news emphasis on violence and death at home inures the viewer to scenes of distant combat, even by Americans in brush-fire wars. And the virtual disappearance of the uniform from city streets and depots as a consequence of the Vietnam War has created a distance, both visual and real, from the American people. The boy next door of World War II is now, along with so many other photographic subjects, a part of history.

PITCHER, MOLLY (1744?/1754?—1832), Revolutionary War heroine. The legend of "Molly Pitcher" is based at least in part on the actions of Mary (Molly) Ludwig Hays McCauley; the nickname may have applied to her alone, or

may have been used collectively to describe all female "camp followers" who assisted the "Continental army."

The daughter of German immigrants who settled in New Jersey, by 1769 Mary Ludwig was a servant of Dr. William Irvine in Carlisle, Pennsylvania. In that year she married a barber, John Casper Hays. He initially served in Col. Thomas Proctor's First Pennsylvania Artillery (1775-76), then reenlisted, in January 1777, as a private in Dr. (now Col.) Irvine's Seventh Pennsylvania Regiment. Sometime later, Mary joined him in camp.

On 28 June 1778, Mary Hays made a name for herself in the Battle of "Monmouth, in New Jersey. She had been carrying buckets, or pitchers, of water to her husband's "artillery crew, when he fell wounded, she replaced him at the cannon, helping to serve the gun for the remainder of the engagement.

John Hays died several years later, and Mary Hays married another veteran, John (possibly George) McCauley, around 1792. After being widowed a second time and experiencing increasing financial difficulties, she petitioned for a soldier's widow's pension; the Pennsylvania legislature on 21 February 1822 instead awarded her a \$40 annuity in recognition of her own services during the Revolution. After her death she became a legendary figure, and a monument was later erected at her burial site in Carlisle.

PITTSBURGH LANDING. See Shiloh, Battle of (1862).

PLAINS INDIAN WARS (1854-90). The wars between the Indian tribes of the Great Plains and the U.S. "Army grew out of the westward movement of Americans. The territorial accessions of the "Mexican War of 1846-48, followed by the discovery of gold in California, set off a migration across the plains that ended only in the final decades of the nineteenth century as farmers and stockmen began to occupy the plains themselves. Plains warfare, however, centered mainly on securing the transcontinental travel routes and protecting travelers rather than actual residents from Indian aggressions. Indian hostility arose from resentment over the inroads of travelers on such Indian resources as game, timber, and grass. Typically, the major wars with the Plains tribes followed treaties negotiated by government commissioners that bound the Indians to settle on a designated reservation. The military was then called in to make them go, or to make them return once they had moved, discovered the misery of reservation life, and bolted.

The Plains tribes that fought the United States most intensively were the Sioux (Lakota), Cheyenne, and Arapaho on the northern plains and the Cheyenne, Arapaho, Kiowa, and Comanche on the southern plains. All these tribes had traditions of constant warfare with other tribes—the Sioux and Cheyennes against the Crows and Shoshones, for example. Thus, military operations occurred against a backdrop of constant intertribal fighting, with Indians often serving as scouts or auxiliaries for the federal troops.

Army and Indian warred in different styles. The army maintained a system of forts at strategic locations and fielded heavy offensive columns burdened by slow-moving supply trains. The Indians fought with hit-and-run tactics that exploited environmental factors and avoided open engagement unless the risk was small. The individual warrior excelled over the typical regular in virtually every test of combat proficiency, but in open battle this was offset by military organization, discipline, command, and firepower. In general, the army prevailed when the Indians abandoned their orthodoxy and fought by white rules, or when commanders abandoned their orthodoxy and fought by Indian rules.

After the Mexican War, Indian wars erupted along the Oregon-California Trail, the Santa Fe Trail, and the various trails across Texas. Sioux and Cheyennes slipped into hostilities in 1854-55. Near Fort Laramie, the Grattan Massacre of 19 August 1854, caused by the imprudent actions of a young officer, led to Brig. Gen. William S. Harney's campaign of 1855. At the Battle of Bluewater, 3 September 1855, Harney destroyed a Sioux village and killed Chief Little Thunder. To the south, Kiowas, Comanches, and Cheyennes threatened the commerce with Santa Fe and raided deep into Texas.

The "Civil War years intensified fighting, with federalized volunteer units replacing the regulars. The Minnesota uprising of 1862 spread west into Dakota Territory, where Sioux resented gold seekers crossing their homeland to newly opened mines in western Montana. In the summers of 1863, 1864, and 1865, Brig. Gen. Henry H. Sibley and Brig. Gen. Alfred Sully fought successful engagements with the Sioux. Most notable was Sully's victory over "Sitting Bull and Inkpuduta at the Battle of Killdeer Mountain, 28 July 1864.

On the central plains during the summer of 1864, Indian unrest threatened the trails from the east to Denver, Colorado, and led to the tragic and treacherous attack by Col. John M. Chivington on Black Kettle's Cheyenne village at Sand Creek, 29 November 1864. Sand Creek set off a general war that spread over the plains country in 1865. A three-pronged offensive on the northern plains directed by Brig. Gen. Patrick E. Connor failed when columns encountered bad weather and ran out of supplies.

With the end of the Civil War, regulars returned to the plains. Red Cloud's Sioux closed the Bozeman Trail to the Montana mines and besieged the three forts erected to protect travelers. On 21 December 1866, warriors wiped out an eighty-man force under Capt. William J. Fetterman near Fort Phil Kearny, Wyoming. The following summer, however, in the Wagon Box and Hayfield fights, new breech-loading rifles helped beat back massed Indian assaults. The Fort Laramie Treaty of 1868 ended the Red Cloud War and provided for abandoning the three forts along the Bozeman Trail.

On the southern plains, a war in 1868-69 forced Cheyennes, Kiowas, and Comanches to new reservations. The highlight of this conflict was the Battle of the Washita, 27 November 1868, in which Lt. Col. George Armstrong "Custer fell on the Cheyenne village of Black Kettle, who had survived Sand Creek but now died. In 1874, these tribes, discontented with reservation life, fled to the west. The Red River War of 1874-75, featuring operations by Col. Nelson A. Miles and Col. Ranald S. Mackenzie, ended warfare on the southern plains and along the Texas frontier.

On the northern plains, new tensions arose as railroads aimed for the Sioux country and gold was discovered in the Black Hills, part of the Sioux reservation. The Great Sioux War of 1876 resulted, as the army sought to force Sitting Bull, *Crazy Horse, and other chiefs to go to the reservation. Three columns converged on the Sioux hunting grounds under Brig. Gen. George Crook, Brig. Gen. Alfred H. Terry, and Col. John Gibbon. Riding with Terry was Custer and his Seventh Cavalry Regiment. On 25 June 1876, Custer attacked a great village of Sioux and Cheyennes on Montana's Little Bighorn River. He and the force under his immediate command, 212 men, were wiped out. The Custer disaster so stunned Americans that large armies took the field, and by the spring of 1877, most of the Sioux and Cheyennes had surrendered. Sitting Bull sought refuge in Canada, but gave up in 1881.

The Red River War and the Great Sioux War ended major warfare on the Great Plains, although fighting went on elsewhere in the West until the final surrender of the Apache *Geronimo in 1886. One final bloodletting occurred at the Battle of Wounded Knee, South Dakota, on 29 December 1890. This was hardly war, however, but rather a spiritual revival that blew up in unintended and unexpected violence. Wounded Knee was the last important encounter between U.S. soldiers and American Indians and coincided with the passing of the western frontier.

PLATT AMENDMENT (1901). In 1901, U.S. Senator Orville Platt introduced an amendment to the U.S. Army appropriations bill specifying several conditions for the American military evacuation of Cuba. The two key provisions of the Platt Amendment, first proposed by Secretary of War Elihu *Root, required that Cuba cede territory for American military and naval bases and also grant the United States the right to intervene in the island to preserve order, life, property, and liberty. In Congress, even proponents of Cuban independence like Senators Joseph Foraker and George Hoar supported the amendment, which President William *McKinley signed into law on 2 March. In early June, the Cuban Constitutional Convention acceded to American demands, and the amendment came to regulate Cuban-American relations until it was abrogated in 1934.

The Platt Amendment addressed a fundamental problem for the expanding United States. In 1898, the U.S. government had pledged under the *Teller Amendment to withdraw from Cuba once Spain had been defeated in the *Spanish-American War. But after the U.S. military victory, Washington wished to maintain the strategic gains of 1898 and did not trust the Cubans to establish a government friendly to American interests. The Platt Amendment resolved this contradiction by in essence making Cuba a U.S. protectorate. However, the amendment also poisoned Cuban-American relations and encouraged U.S. * expansionism in the Americas in the early twentieth century.

POLITICAL SCIENCE. See Disciplinary Views of War: Political Science and International Relations.

POLK, JAMES K. (1795-1849), eleventh president of the United States. Born in Mecklenburg County, North Carolina, on 2 November 1795, Polk moved to Tennessee with his family in 1806, and graduated from the University of North Carolina. He studied law and was admitted to the bar in 1820. An active Jacksonian Democrat, he served in Congress from 1825 to 1839, was speaker of the house and later governor of Tennessee.

In 1844, Polk—known as “Young Hickory”—was elected president. He entered the White House with a clear and aggressive foreign policy agenda, and as president he employed the threat of war and war itself as instruments to achieve his territorial objective: the West Coast and especially its ports.

The United States annexed Texas in 1845, and Polk provoked the *Mexican War a year later by making use of a climate of hostility, existing border disputes, and Mexican unwillingness and inability to accept U.S. offers to purchase its northern provinces. Polk proved to be a determined, tough, and successful commander in chief. Although he lacked military experience or training, he made many key military decisions and played a direct role in organizing and planning the war effort. Despite opposition from Whigs and some Democrats, Polk never wavered in his determination to use the war to acquire the territories of New Mexico and upper California.

Polk was not a popular president with his contemporaries. He was intensely partisan and had a proclivity for secrecy and evasiveness. He was constantly at odds with his two Whig generals, Zachary *Taylor and Winfield *Scott. Moreover, the Mexican War proved unpopular in the Northeast, and territorial expansion into the Southwest was a highly controversial political issue. Polk, however, is generally recognized as the first effective wartime president. Unlike James *Madison during the *War of 1812, Polk aggressively employed presidential power to conduct the military effort and achieve administration war goals, thus setting an example upon which Abraham *Lincoln would expand during the *Civil War.

PONTIAC (c. 1720-1769), Ottawa war leader. Championed as the “great chief” who headed *Pontiac's Rebellion, Pontiac's significance lies in the way he reflected, rather than created, intertribal militancy following the Seven Years' War.

Sources first mention Pontiac at Fort Duquesne (Pittsburgh) in 1757, but definitively he appears in the record only in May 1763. Foiled in his attempt that month to surprise and capture British Fort Detroit, Pontiac and his multiracial allies besieged it until October. Pontiac may have directed, though he certainly did not lead, the successful attacks on the British forts Sandusky (Ohio) and St. Joseph (Michigan). These actions inspired frontier raiding,

the elimination of seven other British posts by July 1763, and the Delaware and Shawnee siege of Fort Pitt.

By late 1763 and throughout 1764, Pontiac endeavored to draw support from French garrisons in Illinois. Failing again, he retreated with the British at Detroit in July 1765, confirming peace at Oswego a year later.

By 1768, his reputation among Ottawas had fallen and he became an exile in lower Illinois. There, at Cahokia in April 1769, perhaps in retaliation for his killing of an Illinois Indian in 1766, a Peoria clubbed and stabbed Pontiac to death.

PONTIAC'S REBELLION (1763-66). This multiracial assault on British western posts after the * French and Indian War resulted from several factors: trade disputes; the Delaware Prophet's millennial teachings; Gen. Jeffrey "Amherst's termination of customary gift distributions to Indians; settlers' encroachment; and the new British forts.

The Ottawa war leader "Pontiac opened the conflict on 9 May, attacking Fort Detroit with warriors from several tribes. The 120-man garrison held out under Maj. Henry Gladwin, but Indians soon captured six forts and forced the abandonment of Fort Edward Augustus. Senecas took two other forts, Venango and Le Boeuf; Le Boeuf's garrison escaped to Fort Pitt, joining the command of Capt. Simeon Ecuyer, to fight off further Indian attacks. At one point, Ecuyer tried to weaken the besiegers by distributing small-pox-contaminated blankets during a parley, which may have caused an epidemic.

In the next phase, fighting centered on the supply lines of Detroit and Fort Pitt. Indians inflicted heavy losses on the British in a surprise attack at Point Pelee, Ontario (28 May), and won a signal victory at Devil's Hole near Niagara Falls, 14 September, when 300-500 Senecas overwhelmed 2 British companies and a convoy, killing 72. Nonetheless, the British armed vessels *Huron* and *Michigan* retained control of Lake Erie, bringing reinforcements to Detroit between June and November, and sustaining the post until the Indians raised their siege. Indians attacked Col. Henry Bouquet's relief force of 460 men at Bushy Run (5 August). Bouquet reached Fort Pitt, but his 110 casualties prevented him from beginning offensive operations.

The final phase began in 1764, when Colonel Bouquet led 1,200 men into the Delaware heartland in October, securing the release of 200 captives and a promise of peace. Pontiac failed to secure assistance from the remaining French garrisons in Illinois and finally sought peace in late 1764. Hostilities were formally concluded at Oswego, July 1766.

The war exacerbated Indian-hating in the colonies, as both the resort to smallpox at Fort Pitt and the "Paxton Boys" massacre in 1763 of twenty peaceful Indians in Pennsylvania show. The British promised to enforce the Royal Proclamation of October 1763 prohibiting colonization west of the Appalachian ridge, and restored the prewar patterns of trade and gift giving. Indians ceded no extensive lands, and the British reestablished none of their abandoned forts. Some 450 British regulars and

provincials lost their lives. Indian and settler losses remain unknown.

PORTER, DAVID DIXON (1813-1891), American admiral. Born in Chester, Pennsylvania, Porter was the son of David Porter, naval hero in the "War of 1812. A midshipman in the U.S. Navy at sixteen, young Porter commanded his first ship at thirty-three during the "Mexican War. In the "Civil War, he became one of the leading commanders in the "Union Navy. In April 1862 during the "Siege of New Orleans, he led a flotilla of twenty-one small gunboats each with a 13-inch heavy mortar, which bombarded the forts guarding the narrow channel, enabling Adm. David "Farragut's fleet of warships to get upriver and successfully besiege the city itself. During the following year, Porter, in charge of the gunboats, ironclads, and supply ships on the Mississippi north of Vicksburg, aided Gens. Ulysses S. "Grant and William Tecumseh "Sherman in their long and ultimately successful Siege of "Vicksburg (1862-1863) and establishment of Union control of the entire Mississippi River. Promoted to rear admiral—after Farragut, the second in U.S. history to hold that rank—Porter assumed command of the North Atlantic Blockading Squadron and the naval portion of two joint land-sea expeditions in the winter of 1864-1865 against Fort Fisher, guarding the port of Wilmington, North Carolina. After Gen. Benjamin F. "Butler failed in his assault, Gen. Alfred Terry succeeded with the support of Porter's sizable fleet, which bombarded the fort and sent 2,000 sailors and marines to join 8,000 soldiers in storming the parapets, achieving the only successful large-scale amphibious attack against a strongly fortified position in the Civil War. After the war, Porter served as superintendent (1865-1869) of the U.S. Naval Academy. He was promoted to vice admiral (1866) and full admiral (1870) on the death of Farragut. The two officers, aggressive and successful in their coordinated efforts with the "Union Army, were the leading Union naval commanders of the Civil War.

The POSSE COMITATUS ACT (1878) prohibited use of the U.S. Army to aid civil officials in enforcing the law or suppressing civil disorder unless expressly ordered to do so by the president. Southern Democratic members of the House who resented widespread use of federal troops during "Reconstruction introduced the law. Some northern congressmen supported the law due to the army's role in suppressing disorders during the 1877 railroad strike.

In the past, soldiers had occasionally served as posses to assist U.S. marshals or judges without reference to the president. During the 1850s, U.S. Attorney General Caleb Cushing ruled that U.S. marshals could call upon federal soldiers, Marines, and sailors to help enforce the Fugitive Slave Act in the North. Such troops performed similar

duties when called on by territorial governors in Kansas and Utah. Regulars routinely acted as posses during Reconstruction in the South, particularly during election disorders. Troops suppressing the 1877 railroad riots took orders from state governors and even municipal officers.

Use of federal troops as a posse comitatus placed them outside the military chain of command and the commander in chief's direct authority. Too often the practice turned regulars into policemen serving the interests of locals directly involved in the disputes provoking disorder. Army officers welcomed the Posse Comitatus Act and the new regulations it engendered, for they felt more comfortable performing their duty safely within the chain of command. The provisions of the act have governed army regulations and civil disorder doctrine to the present.

POST TRAUMATIC STRESS DISORDER. See Aggression and Violence; Combat Trauma.

POTSDAM CONFERENCE (1945). On 17 July 1945, Josef "Stalin, Harry S. "Truman, and Winston S. "Churchill (who was replaced on 28 July by Clement Attlee) met for eleven days at Potsdam near Berlin. They faced two related issues: ending the war against Japan and restructuring Germany and Eastern Europe.

Germany ranked high on everyone's list of problems. Truman's goal was to create principles to guide the proposed Allied Control Council in preparing for unification of Germany. Stalin was concerned about reparations and Germany's border with Poland. Accepted were the American principles, including denazification, demilitarization, and democratization, and the Soviet desire for the Oder and Neisse Rivers as Germany's eastern border. Agreeing on reparations was difficult and was resolved only at the end of the conference by a formula calling for each power to take reparations from its zone, with the Soviets receiving some from other zones.

As for Japan, Stalin agreed to Soviet entry into the war by mid-August, while Truman informed Stalin in vague terms about a new weapon to be used against Japan, but failed to specify that it was an atomic bomb. At the end of the meeting, Truman and Attlee issued the Potsdam Declaration, calling upon Japan to surrender unconditionally or face destruction.

Specifics about reparations and issues of Soviet-occupied Eastern Europe were deferred to a newly created Council of Foreign Ministers, which was to draft the peace treaties. This allowed general agreement, and left each power partially satisfied. Much was left undone, and the Big Three's ability to cooperate and work toward similar postwar goals was still unknown. Potsdam remains a transition point as the former Allies moved from World War II to the "Cold War.

POWELL, COLIN (1937-), twelfth chairman of the "Joint Chiefs of Staff (JCS). Born 5 April 1937 in the Harlem section of New York City and raised in the South Bronx, Colin L. Powell, the son of Jamaican immigrants, rose to become the first African American chairman of the JCS. After his 1958 graduation from City College, New York, where he had been a member of the "ROTC, Powell received a commission in the regular army.

As a young officer in the recently integrated army, he had opportunities for leadership not then generally available to blacks in segregated civilian society. He received accelerated promotions to major and colonel, and in 1979 became at forty-two the youngest general then in the army.

A turning point in Powell's career was his 1972 selection as a White House Fellow. Assigned to the Office of Management and Budget, he learned firsthand the workings of the federal bureaucracy and met individuals who later played key roles in his career. He served in the Office of the Secretary of Defense during both Democratic and Republican administrations, and in 1983 became military assistant to the secretary. Appointed President Ronald "Reagan's deputy national security adviser in 1987, he soon became national security adviser.

Selected by President George "Bush, Powell became chairman of the JCS on 1 October 1989. In addition to being the first African American, he was the first ROTC graduate and the youngest man to hold the position. Powell was also the first chairman to serve his entire tenure under the 1986 "Goldwater-Nichols Act that made the chairman, rather than the corporate chiefs, the nation's principal military adviser.

During his four years in office, Powell made full and unprecedented use of the chairman's enhanced authority. He directed the reorientation of U.S. military strategy at the end of the "Cold War and introduced the concept of a "base force" that reduced the size of the armed forces while maintaining U.S. superpower status. He played a central role during the 1991 "Persian Gulf War. The army's experience in Vietnam, where he served two tours, profoundly affected Powell's approach to the use of military force. He advocated deploying U.S. forces in combat only for clear political objectives, and then applying overwhelming force to achieve quick victory.

Powell's active exercise of the chairman's authority greatly strengthened the position. As a result, his tenure became the subject of press and scholarly debate about the proper role of the military in policy formulation.

PRECISION-GUIDED MUNITIONS (PGMs) are generally characterized as weapons with terminal guidance systems. In addition to "smart" bombs, the term is applied to a wide variety of weapons, from air-to-air and air-to-ground "missiles to wire-guided "torpedoes.

One of the most enduring images of the "Persian Gulf

War of 1991 are the videotapes played on CNN and other news networks of "smart" bombs in action. These tapes showed, from bomb-mounted TV cameras, the munitions rapidly and accurately approaching their targets, followed by the picture turning black and then into static when it hit. This popular memory persists despite the fact that a mere 9 percent of the bombs dropped by the Americans during the conflict were of the "smart" type. Weapons such as these fall into the category of precision-guided munitions.

Despite the publicity surrounding the "smart" bomb, antitank weapons are the type most associated with precision-guided munitions. The Soviets had the best early success in the 1960s with their AT-1, AT-2, and most of all the AT-3 "Sagger" antitank missiles. The United States had its start with anti-armor PGMS in the 1970s with the first generation of TOW (mbe-launched, optically sighted, wire-guided missile), ushering in a period of emphasis on PGMS. These two weapons systems saw their first widespread use in combat during the 1973 Yom Kippur War. Egyptian units equipped with Soviet AT-3s destroyed 180 of 290 Israeli * tanks in just one day of combat on the Sinai front. By the conclusion of the seven days of fighting, Israel had lost 420 tanks—25 percent of its inventory. This devastating result would not go unnoticed by military theorists.

The paramount driving force behind the development of PGMS is efficiency. The massive bombing campaigns and artillery barrages of World War II caused a great deal of collateral damage, but very often failed to destroy the intended target. The actual objectives of many of these attacks could have been neutralized using only a fraction of the explosive tonnage delivered, but the lack of an accurate delivery method required the use of "area bombing" with a large tonnage of munitions. This technique, along with specific targeting of civilians in "terror bombing" campaigns, was at best morally questionable. Furthermore, the belief that bombing would break the enemy's spirit to fight seems to have been unfounded.

The measurement used to determine bombing efficiency is known as *circular error probable* or CEP. The CEP is the radial distance from a target inscribing an imaginary circle with an area large enough so that 50 percent of the bombs dropped fall within it. The CEP during World War II was 3,300 feet; in the * Vietnam War and the Persian Gulf War, it was 6 feet.

The drawback with PGM is cost. A iron "dumb" bomb or an unguided rocket is much less expensive than a precision-guided bomb or missile. Concerns about the costs and reliability and the expenditure in training with these munitions were the subject of congressional hearings in 1984.

Although the Persian Gulf War of 1991 brought headlines to "smart" bomb PGMS, such weapons had been used by the United States five years before in a 1986 raid on Libya and nearly twenty years earlier in Vietnam. Primitive PGMS had even seen some use by Germany in World War II. It was in the Vietnam War, however, that PGMS saw their first success. One of the early PGMS was the navy's "Walleye" electro-optic guided bomb (EGOB). The Walleye is little more than a TV camera mounted on the weapon's nose. As the munition descends, the television relays the bomb's view to a monitor viewed by a weapons officer who remotely steers the bomb electronically by controlling its tail fins. A U.S. Air Force approach, developed by Col. Joseph Short and Weldon Wood of Texas Instru-

ments, involved laser energy. Known as "Paveway," this laser-guided bomb (LGB) involves an attacking aircraft that finds a target via a TV camera and then fires a "Pave Knife" laser designator to "paint" the object to hit. The bomb then follows the beam through a laser seeker unit. This technique required only a single aircraft, but when used against targets in North Vietnam, it was found to be more effective for two aircraft to conduct attacks. One would locate and designate the target while the other dropped the bomb. The first successful PGM attacks in North Vietnam using both Walleye and Paveway-type munitions were against the Paul Dornier Bridge and Than Hoa Bridge in April and May of 1972.

The social and political ramifications of PGM—especially bombs and missiles—has been significant. Post-Gulf War punitive raids on Iraq, strikes on Serbian positions in Bosnia, and the 1998 U.S. retaliatory raids on terrorist facilities in Afghanistan and the Sudan have all been carried out with PGMS in order to minimize damage to civilians and risk to U.S. service people. "Standoff" weapons fitting into the PGM category provide the United States with the means to strike adversaries from a distance with little or no risk to U.S. forces.

PRINCIPLES OF WAR. *Objective, Offensive, Mass, Economy of Forces, Maneuver, Unity of Command, Security, Surprise, and Simplicity* are the principles of war most often found in military manuals. They have been a part of strategic thinking since China's war philosopher, Sun Tzu (500 B.C.), admonished commanders to *surprise* the enemy by making a noise in the west and striking in the east.

A modern list was developed around 1800, when Napoleon Bonaparte began fighting his way across Europe. Under the influence of the Enlightenment and its credo that life was governed by rational laws, some scholars tried to translate military strategy into a precise science. Prussia's Heinrich von Bülow (1757-1808), for instance, declared that triangle-based geometries governed all military maneuvers and therefore all strategic decisions.

Yearning to repeat Sir Isaac Newton's discoveries, Antoine Henri *Jomini (1779-1869) suggested that all operational decisions could be rationally determined. After joining the French Army and fighting in several major campaigns, including Napoleon's war against Russia (1812), Jomini ascertained that battle successes were often based on a few pre-engagement principles.

In *The Art of War* (1838), Jomini outlined several Principles of War, of which three were essential. First, keeping in mind the military objective, one should carefully select a theater of war that provides all the offensive advantages. Second, before engaging the enemy, rivers, mountains, and other topographical features must be used to gain added leverage. Third, the enemy must be maneuvered into a vulnerable position; one should then launch a massive and concentrated attack upon this critical point.

Jomini, who lived to be ninety years old, witnessed the rapid rise of railroads, telegraph, and other technologies. Yet, claiming that his precepts were perennial truths, he shunned these advances. He argued that his principles had brought victories to Hannibal, Caesar, and Napoleon; therefore, no matter how warfare changed, they would

always prevail. Like other Enlightenment philosophers, Jomini tried to reduce war—a very complex human phenomenon—to a rational science.

In the first part of the nineteenth century, the American military thinker Dennis Hart Mahan introduced Jominian logic to the United States after spending four years in France analyzing Napoleonic warfare. Mahan joined the U.S. Military Academy in 1830, and for the next forty years taught engineering and operational strategy to a host of future Civil War generals. Robert E. Lee, Henry W. Halleck, George B. McClellan, and other commanders became very familiar with Jominian concepts.

Both as a student and as one of West Point's commandants, General Lee was aware of Jomini's principles, and when the opportunity arose, he applied them. For example, during the Battle of "Chancellorsville—outnumbered nearly two to one—Lee reconfigured his forces to block the Union army's left and center flanks. Then, finding the enemy's critical point, he sent Gen. "Stonewall" Jackson around the Union's right and successfully defeated them. Chancellorsville was reminiscent of the way Jomini described Napoleon's use of these same maneuvers in the Marengo campaign in Italy of 1800.

During the latter half of the nineteenth century, Jomini's theories became popular at the U.S. Naval War College. Dennis Mahan's son, Alfred T. Mahan, joined the college in 1885 and a year later became its president. From this pulpit, he lectured and wrote about a blue-water strategy that included frequent references to Jomini's principles. Never divide the fleet, Mahan admonished. Seek out your opponent and strike him down in an overwhelming display of massive and concentrated seapower.

Among naval officers, Mahan's seapower themes remained popular well into the twentieth century. During World War II, operational plans called for the U.S. Navy to concentrate its fleet in the mid-Pacific and defeat the Japanese Imperial Navy in decisive Mahanian-style sea battle. For the most part, not until the demise of the Soviet Navy in the late 1980s did the U.S. Navy begin looking beyond Jomini and Mahan for other strategic concepts.

On occasion, strict adherence to the Mahanian principles proved to be unproductive. During the Battle of Leyte Gulf (1944), Adm. William F. Halsey elected to sail his main fleet from the San Bernardino Straits and throw it, in mass, upon the Japanese carriers, which proved to be decoys. In an effort never to divide the fleet, Halsey vacated San Bernardino, allowing a second Japanese force to sail through the straits, defeated surprisingly by a small if aggressive U.S. force.

During the early twentieth century, the Principles of War slowly became an essential part of the military's lexicon. British Gen. J. F. C. Fuller, in an attempt to establish a science of war, was one of the first to codify Jomini's postulates into short, easy to understand concepts. Writing in various military journals, Fuller helped popularize their use.

Urged on by the rise of corporate scientific management, American officers also searched for new ways to make warfare subject to a rational analysis. Thus, in the 1920s, for the first time, the War Department included these principles in its training manuals. Because they were practical, logical, teachable, and above all easy to test, the principles quickly became preferred classroom topics. Today, these lessons remain an important part of the military's educational process.

Despite their popularity, some claimed the principles were not adequate in explaining war. Prussia's Karl von Clausewitz affirmed that any attempt to rationalize war into postulates was flirting with fantasy. War, he said in his unfinished work *On War* (1830), was too involved with immeasurable moral and other factors to be reduced to a science. Two centuries later, America's Bernard Brodie observed that the principles provided an inappropriate insight into war's ambiguities. Too often, they were simply bantered around as high-sounding slogans.

Finally, a few scholars claimed that violation of the principles has prompted more successful operations than when they were rigidly observed. Had Halsey not insisted on concentrating his fleet leaving San Bernardino Strait undefended, for example, he might have prevented a vicious Japanese attack against American escort carriers off Samar Island. Despite criticisms, the Principles of War remain popular because they provide strategic planners with some basic considerations.

PRISONER-OF-WAR CAMPS, CIVIL WAR. Before 1861, Americans had never had to face the problem of internment of large numbers of captured enemy soldiers. British and Hessian soldiers had been exchanged or sent to farms on the frontier. The Civil War abruptly changed that situation. In four years of fighting, over 409,000 men became prisoners of war. That figure is at least four times more American soldiers captured than in all of the nation's other wars combined.

Neither side knew how to address the problem; neither made a concerted effort to do so. In place of badly needed attention and compassion were inexperience, clumsiness, and indifference. Suffering and the neglect of prisoners of war were present in both Union and Confederacy. Prison camp administrations were patchwork systems usually manned by second-rate officials. Lack of resources was an impairment; so were inadequate facilities, overcrowded conditions, and general mismanagement. The few efforts at prisoner exchange during the war were bungled and short-lived.

Of the 150 compounds established in the North and South, 25 could be termed major prisons or prison camps. Each had the same characteristics: poor food, lack of sanitation, often callous guards, and inadequate protection from the elements. Such ills produced epidemic outbreaks of sickness, malnutrition, mental depression, and—for thousands of helpless men—slow but certain death.

Totally divorced from the outside world, Civil War prisoners endured an unchanging routine. They arose from whatever bedding they had at dawn, answered roll call, and received something to eat. The rest of the day passed in

boredom. A second meal came in late afternoon, along with another roll call. Then the men waited for some degree of sleep to blot out reality. Each succeeding day was the same.

No prison had sufficient medicines. Physicians were in short supply and not always attentive to enemy soldiers. Since many of the men had been captured because they were too wounded or sick to escape, and since prison life offered no curatives for recovery, death was a daily occurrence in every Civil War prison. In all, 56,000 captured soldiers perished in the crude compounds of the North and the South.

The two most infamous Civil War compounds went into operation in 1864, when prison authorities should have learned from mistakes and omissions earlier in the war. The South's Andersonville prison (officially known as Camp Sumter, Georgia) was the largest of all. It began receiving inmates before construction was completed. Some 52,300 Federal enlisted men were sent there; more than 13,200 perished from disease, exposure, and lack of medicines.

In the North, at a prison camp for Confederates at Elmira, New York, such scourges as diarrhea and pneumonia killed almost one-fourth of the captured soldiers (of 12,123 inmates, 2,963 died) over the course of the prison's twelve-month existence.

During and especially after the Civil War, each side pointed fingers of guilt at the other. Subsequently, hundreds of "memoirs of prison life" flowed from printing presses as soldiers (many seeking disability pensions) vied in converting questionable facts into dramatic fiction. As a consequence, no aspect of the bitter Civil War has triggered more accusations, more violent passions, and more unresolved controversy than the mistreatment of captured Billy Yanks and Johnny Rebs.

PRISONERS AND CAPTIVES OF WAR, COLONIAL. Prisoners were taken in all North American wars, but contrasting values affected their capture, treatment, and cultural roles. Treatment of captives was a barometer of conflict and change in Indian, European, and colonial martial values.

Indian warriors regarded being taken prisoner as synonymous with death. Captives usually belonged to their individual captors, so a capture ended participation in a raid. Despite some tribal amalgamations and notable adoptions to replace specific dead, comparatively few adult male prisoners were incorporated into communities, and some were ritually tortured to death. Women and young captives were readily adopted to rebuild declining populations, but wholesale adoptions could be divisive, as when Huron adoptees outnumbered native Mohawks after 1650. Ransom and sale of captives to white slavers gradually transformed Indian taking of prisoners into a spasmodic but valuable trade for societies as disparate as the Abenaki and the Cherokee.

Initially, all European intruders captured Indians as in-

formants, hostages, slaves, curiosities, or potential interpreters. Once intercultural warfare began in America, Europeans readily applied the brutal attitudes their wars of religion had encouraged toward prisoners seen as heretics or heathens. Although Christians had a well-developed sense of noncombatant status, they seldom afforded it to Indian women and children. European settlers captured few Indians, rarely adopted them or even held them for exchange, and usually spared combatants only when they could be sold profitably into slavery. As "White Indians" became more numerous than "Red Europeans," most interpreters, traders, and cultural brokers were whites.

After 1755, to the consternation of most colonists and Indians, European regulars introduced the "honors of war" to some American battlefields. Under these new rules, those enemies who surrendered were to be taken prisoner, fed, housed, and guarded, while waiting to be exchanged. Colonial societies had treated European officers this way, but "farmed out" captured soldiers to earn their keep while awaiting exchange. The European professionals also allowed surrendering garrisons deemed valiant to keep their weapons, kit, and battle flags, sometimes releasing them in return for promises not to fight for a specified length of time. Colonials and Indians found these new conventions unprofitable and incomprehensible, resulting in "violations" like the "massacre" at Fort William Henry (1757).

British and French colonials gradually conformed to the humane new martial system, often without enthusiasm. Indians, whose warfare was increasingly deemed comparable to that of European irregulars, were similarly excluded from the "honors of war." Indians found new British demands for the return of all prisoners, a precondition for peace after 1760, particularly oppressive because they regarded the adoption of prisoners as permanent.

Colonial accounts of Indian captivity became popular, using Christian metaphors to demonize Indians and reinforce prevailing definitions. Hundreds of surviving accounts have provided historians and anthropologists with valuable, if coded, information about Indian cultures.

PRISONERS OF WAR. *This essay consists of three articles that examine different aspects of the history of prisoners of war. U.S. Soldiers as POWs describes the treatment of American servicepeople as POWs from the Revolutionary War to the present. Enemy POWs examines the history of how enemy prisoners of war have been treated during America's wars. The POW Experience uses narratives written by American POWs, particularly in recent times, to help understand the experience of modern American POWs.*

PRISONERS OF WAR: U.S. SOLDIERS AS POWs

Although in ancient times wartime captives who were not rich enough to be held for ransom were usually enslaved as laborers by the victors as laborers, by the early modern era, with the emergence of centralized states and regular, professional armies, the practice had changed to regular exchange of prisoners, either during or after war.

In the * Revolutionary War (1775-83), although higher-ranking officers were usually exchanged during the war, the majority of soldiers were not. Because the British government considered the Americans rebels and refused during the war to recognize the Continental Congress as a sovereign government, captured American fightingmen were often treated like criminals. American sailors or seamen from privateers were imprisoned in Britain, sometimes accused of piracy. The majority of American prisoners of war (POWs), however, were soldiers who were confined under wretched conditions in floating British prison hulks around New York City. Many died, some escaped, but few accepted British offers to switch sides. Survivors were exchanged after the war. No accurate count was made, but perhaps more than 18,000 Americans became POWs. During the *War of 1812, the legal status of the United States and its servicemen was not an issue; American POWs were generally treated properly and were repatriated following the peace.

The * Texas War of Independence (1836) proved particularly brutal. Viewing Texans as rebels, the Mexican leader Gen. Antonio Lopez de *Santa Anna refused to take prisoners. Texans captured at the Battle of the * Alamo and at Goliad were executed.

During the * Mexican War (1846-48), although native Texans captured serving with the U.S. *Army were executed as rebels, the Mexican treatment of other North American POWs was fair and humane.

The *Union army and the *Confederate army in the *Civil War were modern mass armies of citizen soldiers. In modern wars of intense *nationalism and mass citizen armies, civilians identified more closely with the *citizen soldier than with the hired professional. Furthermore, the stakes of war became less subject to compromise. Consequently, the practice of prisoner exchange during hostilities declined. During the Civil War, at first, Union and Confederate POWs were regularly exchanged; in 1863, the Union army issued General Order Number 100, *The Rules of Land Warfare*, detailing regulations for treatment of POWs and enemy civilians in occupied territory. In 1864, however, because prisoner exchange was helping to sustain the Southern war effort and because the Confederacy refused to recognize former slaves serving as African American soldiers in the Union army, Gen. Ulysses S. *Grant stopped the regular exchange of POWs. Consequently, both sides were swamped with POWs.

In all, there were some 220,000 Confederate POWs in the North and 211,000 Union POWs in the South, and the makeshift Civil War *prisoner-of-war camps became notorious on both sides. A total of more than 50,000 Union and Confederate POWs died on both sides. After the war, a U.S. military commission convicted the commander of the camp in Andersonville, Georgia, Capt. Henry Wirz, for the maltreatment and death of 14,000 Union POWs. Although probably guilty of inefficiency rather than the conspiracy for which he was convicted, Wirz was hanged in 1865, the only Confederate official to be executed.

By the time of World War I, the major powers had agreed to the *laws of war, which included the treatment of prisoners of war. Drawing on the U.S. Army's 1863 regulations, delegates at the * Hague Peace Conferences (1899, 1907) agreed that each other's POWs should receive decent treatment. After the *Spanish-American War of 1898, the United States quickly repatriated thousands of cap-

tured Spanish soldiers, and the Spanish returned their limited number of U.S. POWs. In contrast, the *Philippine War (1899-1902) eventually degenerated into *guerrilla warfare, and * counterinsurgency measures were taken in which prisoners on both sides were sometimes tortured and killed.

The enormity of World War I overwhelmed the major powers with millions of POWs. However, since most of the American fighting occurred only in the final months of the war, just 4,120 American soldiers wound up in German POW camps. U.S. diplomats and the American *Red Cross sought successfully to ensure decent treatment. Only 147 American prisoners died in the German camps, most of them from previous wounds.

By contrast, World War II was characterized by the mistreatment and even murder of Allied prisoners and civilians by Germany—especially on the eastern front—and by Japan throughout Asia and the Pacific. This led to the post-war trial and execution of some German and Japanese officials and military officers for *war crimes. The 1929 Geneva Convention further elaborated details for treatment of POWs. While subjecting many captured civilians and others to slave labor, torture, or death, Nazi Germany usually treated American (and West European) military POWs within the Geneva rules.

Before December 1944, the majority of American soldiers held in *Stalags* (German POW camps) were captured airmen. In the ground war, only a few G.I.'s were captured before December 1944, but in the surprise German Ardennes offensive, known as the Battle of the *Bulge, thousands of Americans were surrounded and captured. In the Malmédy massacre in Belgium, eighty-six captured G.I.'s were executed by a German SS unit on 17 December. During the bitter winter of 1944-45, the Germans force-marched thousands of Allied POWs across the country in an attempt to keep them from the armies invading from the east and west. Several thousand American POWs in the east were therefore liberated by the Red Army and held for a while, after the German surrender on 8 May 1945, and through the *Potsdam Conference in July, although they were eventually repatriated before the end of 1945. Of the 93,941 American POWs held in the European theater during the war, only 1 percent died in captivity, most of them from combat wounds.

In contrast, Japan's treatment of POWs was brutal. Influenced by the military, Tokyo had not signed the 1929 Geneva Convention, and Japanese military leaders instilled in their soldiers the belief that surrender was a betrayal of the emperor and a disgrace to the individual and his family. Pursuing a policy disdainful of Allied servicemen who surrendered, the Japanese military treated Allied POWs viciously. Some POWs, such as captured American airmen who bombed Japan, were beheaded. The majority of American POWs had been captured when the Japanese conquered the Philippine Islands in the winter of 1941-42.

In the infamous Bataan Death March of April 1942, some 78,000 American and Filipino POWs led by Gen. Jonathan *Wainwright, many already starving and weak from malaria, were beaten, clubbed, and bayoneted as they were forced to walk sixty-five miles with little or no food, water, or shelter to the prison camp near Cabanatuan. Between 7,000 and 10,000 people died or were killed on the march. (After the war, Japanese Gen. Masaharu Homma was held responsible and executed. In the Philippines,

homage is paid annually to the American and Filipino victims on Bataan Day, 9 April, when Filipinos rewalk parts of the death route.)

After the Americans began the liberation of the "Philippines in October 1944, the Japanese put surviving POWs onto ships to take them to Japan as hostages. There were orders to kill them if the Americans invaded the home islands. Nearly 4,000 American POWs died in unmarked transport ships sunk by American planes or "submarines, but others survived the journey in filthy holds to be worked in mines and other hazardous facilities in Japan until the Japanese surrender in August 1945. (Indeed, after the emperor's call for surrender, several dozen captured American airmen were beheaded by imperial military units in Japan.) Of the 25,600 American POWs held in the Pacific during the war, 10,650 or nearly 45 percent died, most of starvation and disease since they were worked incessantly and given little food, clothing, shelter, or medical treatment.

In the postwar era, despite the trials in Nuremberg and Tokyo of Germans and Japanese for war crimes, several Communist states refused to accept the 1949 Geneva Conventions, which further developed the laws of war. In the "Korean War (1950-53), North Korean forces executed many G.I.'s in the field, their bodies later recovered with their hands tied behind their backs. A report to Congress in 1954 concluded that this was a deliberate tactic of psychological warfare. Many more Americans were captured during the winter of 1950-51 when "United Nations forces retreated following the massive Chinese intervention.

Of the more than 7,000 Americans captured by the Communists during the Korean War, only 3,800 returned alive. An estimated 1,000 were murdered, and at least another 1,700 died of sickness and malnutrition. When the Chinese Communists took control, the prisoners' physical conditions improved slightly, but they now underwent indoctrination efforts. Under torture, a number of American airmen "confessed" to germ warfare and other atrocities. Twenty-one Americans and one Englishman renounced their citizenship and decided to remain in China following the armistice in 1953. Although only one out of every twenty-three American POWs was ever suspected of serious misconduct, the so-called "brainwashing" of POWs who denounced the United States led to a public outcry. In 1954, President Dwight D. "Eisenhower issued Executive Order 10631, prescribing a code of conduct for American POWs designed to forge captive Americans into a unified community through a common standard of behavior.

In the "Vietnam War (1965-73), North Vietnam and the National Liberation Front in the South refused to consider any requests from the International Red Cross Commission regarding POWs. In effect, Vietnamese Communists viewed American servicepeople as having been criminals before they were captured and thus as without the status of POWs. In the ground war in South Vietnam, some Americans were shot while trying to surrender. Others were taken north to POW camps. Many of the navy and air force aviators captured during the bombing of North Vietnam were held in a prison known sarcastically as the "Hanoi Hilton." Most of the POWs suffered considerable mental and physical abuse and some were tortured, but only a few agreed to issue anti-American propaganda.

Between 1964 and 1972, of the known American POWs

held in North Vietnam, 114 died in captivity. After the "Paris Peace Agreements (1973), 651 POWs returned to American control. However, the status of over 2,000 Americans missing in action (MIAs) and the question of whether the Socialist Republic of Vietnam had retained some American POWs remained controversial for years afterward.

During the "Persian Gulf War (1991), although Iraq, like the United States, had signed the 1949 Geneva Conventions, Saddam "Hussein refused to allow the International Red Cross Commission to inspect Iraq's POW facilities. In captivity, the twenty-three American POWs, including two female soldiers, suffered physical mistreatment that ranged from sexual abuse of the women to electric shocks and bone-breaking for the men.

PRISONERS OF WAR: ENEMY POWS

Four principles have guided American treatment of enemy POWs: military customs and tradition of the time; internal American military law such as the *Rules of Land Warfare* (1863 to the present); international agreements on the "law of war such as the Hague (1899) and Geneva Conventions (1929, 1949); and, most important, American responses to the practical dynamic that if one side treated its prisoners humanely, the other side was expected to do the same so far as its means allowed.

The first European POWs taken in the British colonies were French prisoners, who, according to custom, were either paroled or exchanged for British or colonial military prisoners held in French Canada. (Indian prisoners, if taken at all, were often sold into slavery before the "Civil War, or afterwards, like "Geronimo, made prisoners for life.) The Americans took more than 16,000 British, Hessian, and loyalist POWs during the "Revolutionary War. Officers were exchanged; enlisted men were generally sent to work on farmland in the frontier, particularly in western Pennsylvania. Captured loyalist became political prisoners and were sent back to their own regions for internment. All prisoners were released by 1783; some assimilated into American society, especially expatriate Hessians; others, including loyalists, returned to England or settled in Canada. During the Revolution, despite the lack of formal British recognition of American POW status until 1783, few enemy POWs perished in American captivity. In the *War of 1812, POW status was recognized and Americans

kept enemy POWs under similar conditions to the way that Americans were kept by the British.

During the "Mexican War (1846-48), the U.S. "Army took over 40,000 Mexican POWs, most of whom were paroled in the field. The practice of field parole survived in the first year of the Civil War but proved impractical. Both sides established a system of facilities: Union camps held more than 220,000 Confederates, and the Confederacy held more than 211,000 Union soldiers. In practice, both sides paroled prisoners until 1864. Although Abraham "Lincoln issued General Order 100, *Rules of Land Warfare*, to the "Union army in 1863, over 56,000 Americans on both sides died in captivity, mainly in 1864-65. In the "Spanish-American War (1898), thousands of Spanish troops who surrendered in Cuba, Puerto Rico, and the Philippines were returned home upon the conclusion of hostilities.

Only a handful of German POWs, mostly merchant marine and political internees, were held in the United States during World War I. In Europe, the American Expeditionary Force held over 40,000 German POWs by November 1918; all were freed in 1919. In World War II, the U.S. Army held more than 325,000 German, 50,000 Italian, and 5,000 Japanese Army POWs (the last mostly Koreans and Formosan drafted to work for the Japanese Army) in some 500 prison camps in the United States. The militant Bushido Code required Japanese soldiers to commit suicide rather than surrender until the emperor himself ordered his armed forces to surrender in August 1945.

Treatment of enemy POWs in the United States was proper, just, and humane, and generally consistent with the 1929 Geneva Convention. The most significant problem for American authorities was distinguishing between kind of Axis prisoners: political opportunists, German nationalists, nonpolitical POWs (mostly draftees), and dedicated Nazi Party members, who did distinguish among the other three groups. A total of 1,000 German POWs escaped, but most were soon returned by the FBI, military, or local police, and the last German POWs sailed for Europe in July 1946. American military intelligence initiated programs directed toward reeducation and denazification.

After Germany's surrender in May 1945, Allied powers established a vast system of POW camps for millions of surrendered German soldiers known as "Disarmed Enemy Forces" (DEF). Spread along the Rhine Valley, the meadow camps operated by the American Military Police were filled beyond capacity, and large numbers of former German soldiers, already weakened from long combat and diminished rations, died of starvation, exposure, and disease. By 1947, realities of the "Cold War descended on Europe, and the American occupation discharged most DEFs except for members of the SS, SD, Gestapo, and others held for "war crimes trials.

During the "Korean War, the largest prison facilities for North Korean and Chinese POWs were on Kojé and Pongam-do Islands south of the mainland. In Korea, Cold War issues changed American policy from accepting forced repatriations of all POWs to admitting defectors as political refugees. In May and June 1952, the "United Nations Command witnessed the results of that policy change: Communist resisters in the camps staged one of the most successful uprisings in POW history. Rioting lasted for nearly two months. The Americans answered with force and also began separating Communist and non-Communist prisoners upon arrival. No real solution was ever

found, and only the 1953 armistice ended disputes over POW conditions and treatment on both sides.

In the Vietnam War, especially from 1965 to 1971, thousands of Viet Cong and North Vietnamese soldiers fell into American hands. If North Vietnamese soldiers were captured in uniform, they were protected by the 1949 Geneva Convention with oversight by the International "Red Cross, and repatriated in 1973 after the Paris peace accords. Ho"Ver, a political war raged and more than one prison system operated in secret on both sides. Special units like the Province Reconnaissance Unit (PRU) arrested civilians suspected as Communist Party members and incarcerated these political detainees without habeas corpus or international inspection in notorious conditions such as those at Con Son Island.

Following the "Persian Gulf War in 1991, captured Iraqi soldiers fell into two categories: those who participated in a failed rebellion against the dictator Saddam Hussein, and those who helped him repress their country's minorities. With recent wartime experiences in mind, American authorities conducted rigorous screening of thousands of Iraqi POWs to determine which ones would likely suffer political retribution and imprisonment following repatriation. Many of those POWs were granted political asylum.

PRISONERS OF WAR: THE POW EXPERIENCE

American POW experiences began in the colonial past and continue as part of the human legacy of war. For three centuries, American POWs have examined their experience by writing personal histories that search for a sense of social, legal, historical, and personal order in the midst of captivity. In a corpus of American literature, POWs' accounts reveal cultural conflicts of ideologies, international conflicts in law, and stressful human tensions that require life-or-death choices. They also ask ethical and moral questions.

Former POWs often wrote accounts in which they reflected on their experiences as a chaotic hell on earth. These are our best guides to the POW experience. Simple and unadorned, POW narratives contain anecdotal evidence of brutality, torture, stress, and a strong sense of moral outrage. More important, they contain readily identifiable political, social, religious, or military purposes. With a strong sense of mission, some POWs like Ethan Allen during the "Revolutionary War designed their stories to generate both emotional response and renewed commitment to armed political struggle. Other POWs followed the Puritan jeremiad model and reinforced the power of religious faith. Modern POW literature such as the accounts of the war in Southeast Asia by James N.

Rowe, *Five Years to Freedom* (1971), Dieter Dengler, *Escape from Laos* (1979), and James B. Stockdale, *In Love and War* (1984), bear witness to an experience that affected not just the authors but an entire class of Americans whose human rights were denied in wartime. In effect, POW narratives lie beyond the documented statistical histories of war; instead, they tell highly personalized, extremely painful stories about a world consisting of seven commonly recurring events that structure experience and give it meaning.

Precapture guides the reader through personal memories before the POW experience took place. The POW identifies the core value systems—family, comrades-in-arms, God, institutions, country—that later help to establish and maintain the will to survive. *Capture* describes how, where, and when the POW was taken by the enemy. The victim can be man or woman, a civilian caught in the battle's center or in the throes of a political crisis, an individual soldier, sailor, or an entire military garrison that was forced to surrender as a unit. This event dramatizes the battle's loss: a person has nothing more than the moment at hand in which to make decisions. All is lost but life itself, and one's future depends on luck and the whim of one's captor. The *long march* describes the dangerous journey from the place of capture to the place of permanent internment, with intermittent stops along the way. The experience removes the outer layers of the prisoner's cultural veneer as POWs are executed for such trifles as wanting water, walking too slowly, or falling down.

POWs describe the *prison landscape* as the permanent prison facility where chronological time stood still. Simple affairs of life are transformed into time-marked events. Food becomes an obsession, and no POW forgets the cell, filth, rats, or the hunger. In *resistance or assimilation*, the POW begins to understand his or her captors better. No longer stereotypes, captors become real people who demand absolute obedience. POWs describe physical torture and psychological pressure made to change their way of thinking, or at least to change their overt behavior. As a result, many POWs undergo deep personal transformations when they are confronted with basic decision making. Beginning this process as one person, the POW ends it as another.

POWs describe *release* as the happy-sad return (or attempted return through escape) to the world from which they came. Escape takes place in this phase of the experience; however, most escapees suffer recapture and receive severe punishment for their efforts. Consequently, there are ever-intensifying social, ethical, and moral conflicts among POWs about the efficacy of escape, especially when the well-being of the entire captive community is at stake. This phase focuses also on the joy of anticipation, the oddities of renewed personal freedom, and the shock of homecoming.

The *lament* allows the POW to reflect on and grieve for what was lost in captivity. As witness bearers, most narrators grieve the cost of the sacrifice in terms of the loss of those who died needlessly or who suffered greatly. POWs also grieve the loss of irreplaceable time—especially time away from home, family, and cultural institutions that put them into another unique class where they have more in common with other POWs than with those people closest to them.

Each scenario contains varied examples of what POWs view as dramatic events that reinforced or destroyed the

will to live. Capture is usually individual, whereas long marches tend to be group events. The act of resistance takes place as both a group and an individual event, depending on the nature of the captivity. Interrogation and torture are individual acts of resistance. Assimilation, if it occurs at all, tends to be an individual decision. Escapes are usually individual or small-group ventures, whereas *release/repatriation* are often group experiences. POWs, once part of a community of prisoners, become individuals again after their repatriation, alone with their memories, but with little support from those other POWs on whom they depended for so long. The lament gives them the opportunity to grieve for the time wasted in captivity; for the material opportunities lost over time; and most often for the dead.

For individual POWs, the act of writing about their experience often serves as a catharsis for personal feelings, an ethical forum to tell the world what happened to them and why. Most important, in their expressions of outrage, POWs serve their respective communities as witnesses against willful and often illegal acts of inhumanity. Because writing a memoir terminates an extended act of violence that nearly consumed them, they also achieve a sense of closure. The common denominator remains the moral judgments that test an individual's ability to withstand the unexpected when the chips fall about as low as they can go.

PRIVATEERING. Throughout the seventeenth and eighteenth centuries, Great Britain, Spain, France, and other European powers augmented the power of their navies on the high seas by mobilizing businesspeople to fit out their own vessels as warships. Americans continued to dispatch such private warships during the * Revolutionary War and the *War of 1812. European and American officials supported privateering because it threatened enemy commerce inexpensively; European and American merchants sent out vessels, aboard which thousands of mariners served, in hopes of making patriotic windfall profits. American privateering expanded in each imperial conflict. As Britain's New World possessions matured into populous, prosperous provinces, privateering became America's leading contribution to Britain's war efforts. Disrupting an adversary's commerce continued to dominate American naval thinking well into the nineteenth century because of the prohibitive cost of building a battle fleet comparable to Britain's Royal Navy.

Privateering has often been confused with *piracy*, but there were major differences between them. Privateering was a legal enterprise, conducted under state licenses called *letters of marque and reprisal*; governments subjected it to increasing regulation as it grew in scope and importance. Piracy, on the other hand, was a capital crime that European states had largely eliminated by the early 1700s. There was also a substantial difference in the types of people who

participated in each endeavor. Some of the most important merchants in Europe and America invested heavily in private men-of-war, whereas piracy principally attracted disgruntled sailors and other marginal people.

Privateering had played an important role in the founding of England's New World empire. The Caribbean exploits of John Hawkins and Francis Drake prompted interest in colonization among England's governing circles. Walter Raleigh partially financed his Roanoke settlement by privateering expeditions against the Spanish, and indeed selected the site because it seemed to offer an ideal privateering base. Similarly, in 1607, the Virginia Company employed a veteran privateering captain, Christopher Newport, to convey settlers to Jamestown.

Privateers operated within the political economy of mercantilism, which recognized the expansion or protection of a nation's trade as a legitimate purpose of war. Acquisitive impulses did not have to be suppressed, but could be harnessed to increase national wealth and inhibit the enemy's ability to wage war simultaneously. Hence the inability of Britain, Spain, and the other European powers—and later the United States—to afford the staggering expenditures necessary for powerful navies prompted the rise of privateering.

Large seaports dominated American privateering because only the major cities possessed the requisite resources. Privateering voyages required entrepreneurial ability, shipping, and manpower. Experienced merchants, men unafraid of risk and who commanded sufficient capital to acquire, arm, and victual a strong vessel, were as necessary to successful cruises as skilled captains, whose reputations could attract large crews. Once a privateer captured an enemy merchantman, the owners' business skills were again crucial, because no income was earned until the prize was condemned in a vice admiralty court and the vessel and cargo were sold at a profit. Business correspondents, warehouse facilities, and market information were all necessary for success.

In addition to business skills, shipping and manpower were also more available in the larger ports. Although some vessels were constructed specifically for privateering, most private men-of-war were converted merchant ships; thus, ports with substantial merchant fleets could dispatch more privateers than their smaller neighbors. Because privateers captured and did not sink their prey, large crews for boarding parties were essential, and the principal ports more easily supplied the necessary numbers of men. All these factors made Newport, New York, Boston, Philadelphia, Baltimore, and Charleston centers of American privateering during the colonial and early national periods.

American privateers hunted the Atlantic from Newfoundland to the Spanish Main, but concentrated on the Caribbean, where the pickings were richest. American warships captured thousands of vessels, earning investors, captains, and crews substantial income; successful privateers generated profits of nearly 150 percent during the eighteenth century.

From the sixteenth century through the early 1800s, so long as naval fleets could not control wartime shipping lanes, privateering dominated Atlantic maritime conflict and exerted a major influence on commerce. Privateering disappeared only when steam power ended the age of fighting sail. Steam warships were simply too costly to be owned by private investors. Although the European pow-

ers signed a treaty ending privateering only in 1857 and a few private warships saw action in the American Civil War, privateering largely ended at the conclusion of the War of 1812.

PROCUREMENT: OVERVIEW

Military procurement necessarily stands apart from the mainstream of the American economy. This owes partly to the uniqueness of much military equipment, which requires special design, development, and production facilities, and partly to the military's mobilization needs, which often dictate maintenance of reserve production tooling and supplies. Uniqueness has grown more significant with the advance of technology, and especially with the American military's Cold War push for technological superiority. Military mobilization needs have grown less important with the invention of nuclear weapons, which made a long conventional war inconceivable, and with the development of conventional weapons too complex to be produced rapidly in any case.

Neither of these factors explains why the American military buys even simple things in complicated ways, however. While reports of \$465 hammers, \$10,000 coffeemakers, and sixteen-page technical specifications for sugar cookies prompt cries of fraud or stupidity, more often they result from the fact that defense is a public good, financed by a large federal bureaucracy dispensing public money advanced by a pluralistic political process.

Historically, military procurement has involved three major sets of arrangements, in proportions that have changed over time. The simplest arrangement has involved the purchase from commercial vendors of commercial items, perhaps slightly modified for military use. This was the principal mode of military procurement in the early years of the republic, when military technology differed little from the muskets and saddles people normally owned. The procurement challenge then lay in meeting the military's need for large production quantities and interchangeable parts. As weaponry has grown more

sophisticated, the military has moved to other modes of procurement. But today's military still buys office supplies, computers, and some motor vehicles from commercial vendors.

The development, production, and maintenance of military equipment has also been carried out by government-owned laboratories, arsenals, and depots. The "arsenal system" originated early in the 1800s and grew over the following century into an elaborate array of specialized facilities. Arsenals contributed production techniques as well as weapons; work on mass-production techniques at the Springfield and Harpers Ferry arsenals, for example, contributed to the nation's initial industrial development—an early example of so-called spin-off, wherein defense research produces items of commercial value.

But the arsenals also became famous for their stodginess and resistance to technologies they did not themselves invent—the "not-invented-here" syndrome. As technology became more important to military power, the arsenals came under increasing attack. Most of the original arsenals were closed in the twentieth century. Although some labs and depots still operated, these too were disappearing, or at least shrinking in size, as the defense budget fell and the military services "outsourced" such activities to private firms or operators. Although a new set of government-owned facilities grew up during and after World War II to develop and build nuclear weapons, with the end of the Cold War the nuclear weapons facilities too were shrinking and scrambling for new missions.

The most pronounced break with the older arsenals came in the years just after World War I, as the services sought to explore the new aircraft technologies demonstrated during that war. Government arsenals were unable to keep up with these relatively fast-moving technologies; in the time it took a government facility to draw up specifications for a new aircraft engine, for example, still newer models would render those specifications obsolete. The army and naval air arms thus turned to the era's aircraft entrepreneurs, who were eager for government contracts to help finance their fledgling companies. Contracting procedures were complex and never wholly satisfactory, since the exploratory nature of the work made it almost impossible to specify costs in advance, or to run formal competitions against established specifications. Thus, there was far more prototyping than actual production of aircraft in the interwar years. Still, almost all of the aircraft used during World War II were prototyped by private aircraft firms before the war began.

The Cold War saw a massive expansion of this mode of military procurement, stemming partly from the importance of aircraft and missile procurement and partly from the presumption that these firms were far more innovative than the arsenals. In the 1960s, for example, Secretary of Defense Robert S. McNamara forced the army to shift from what remained of its arsenals to private contractors for much of its procurement. During the Cold War, military procurement came to be highly concentrated in such large aerospace giants as Boeing, Lockheed, and General Dynamics; normally, the top twenty-five defense contractors won nearly half of all procurement dollars awarded annually. It was this form of military procurement that President Dwight D. Eisenhower referred to as the "military-industrial complex."

What worried Eisenhower was the political clout such

firms seemed to wield. The pioneer aircraft entrepreneurs excelled at lobbying Congress as well as designing innovative aircraft, and thus managed to pull down more than half of all military research and development money allocated in the years between World Wars I and II. Lobbying activities grew in the 1950s. Although the arsenals had always maintained close ties to their local legislators, commercial firms could lobby more aggressively. They could also spread the award of subcontracts widely, at least partly to seek broader political support on Capitol Hill. Although the literature on defense contractors questions the effectiveness of these tactics—permanent installations like arsenals or depots seem always to have had more clout with legislators—there is no denying a political dimension to defense contractors' activity.

The political nature of their market slowly shaped these "private" firms into a form more properly labeled "quasi-socialized." Lacking the competition or price signals found in a real market, and facing steadily growing government regulation, defense firms generally acquired layers of bureaucracy that mirrored the military bureaucracy they served. Commercial firms owning defense facilities have tended to keep these divisions quite separate within the firm, for example, if only because defense accounting techniques differ substantially from those used commercially. More important, the military's drive for technological superiority slowly pushed many defense firms to levels of technical sophistication well beyond what could be marketed commercially. As defense spending fell in the wake of the Cold War, few defense firms were able to "convert" to commercial production except by simply buying commercial subsidiaries. Thus, the nation's defense giants sold out (General Dynamics), purchased their way into commercial sectors (Rockwell), or merged into huge defense conglomerates (Lockheed-Martin, Northrup-Grumman).

Americans want these firms to be both efficient and creative. But no one can measure their efficiency, since no one knows what the world's best fighter aircraft or tank "should" cost (although one credible study comparing the cost of U.S. and European military aircraft concluded that American weapons cost more but performed better). On the other hand, these firms have clearly been creative; in the nineteenth century, U.S. military technology often lagged behind Europe's; during the Cold War, it moved into first place worldwide in many categories. Overall, Americans seem to have paid a premium for premium technology.

Yet it remains to be seen whether the dominant Cold War mode of military procurement can handle the challenge posed by modern information technologies. Like aircraft technologies in the 1920s, today's electronics technologies have military utility but are advancing much faster than the established procurement apparatus can handle. Thus, the commercial world now leads the military in many electronics sectors, and defense procurement reform seeks to forge links from its own process over to commercial electronics firms. Procurement routines are deeply ingrained and difficult to change, of course, raising questions about whether such reform will succeed. If it does, it will shift the mode of military procurement back toward the early years of the republic: the purchase of military technologies from commercial vendors.

PROCUREMENT: AEROSPACE INDUSTRY

The relationship between the U.S. aircraft industry and the military has always been close. Fixed-wing piloted flight was technologically demanding and required large sums of capital. Early inventors turned to the military services for markets, and the U.S. Army Signal Corps ordered its first craft from the Wright brothers in 1908. Although American capabilities lagged behind those in Europe, the U.S. government spent \$350 million during World War I to produce 14,000 military airplanes. It also created the National Advisory Committee for Aeronautics (NACA) to explore aircraft science and advise the military.

Military patronage produced an unusually cooperative structure in the early aircraft industry. The government engineered the formation of the Manufacturers Aircraft Association to moderate ferocious competition and avoid patent battles that might delay wartime production by pooling patents and sharing plane-making methods. After World War I, orders collapsed by over 80 percent. The association successfully pressed for government sponsorship of airmail services and an infrastructure of airports, weather reporting, and flight control, as well as continued military contracts to develop new aircraft. During World War II, President Franklin D. "Roosevelt's call for 40,000 aircraft led to the expansion of small companies like Boeing, Douglas, North American, Consolidated (later General Dynamics), McDonnell, and Grumman by tenfold or more. Aircraft accounted for more than 12 percent of all U.S. wartime manufacturing output.

After World War II, when aircraft orders plunged from a peak of \$16 billion to \$1 billion, the aircraft industry campaigned vigorously with the newly independent U.S. Air Force for a public commitment to air defense systems, expansion of domestic and international air transport, and the preservation of a strong aircraft manufacturing industry. Close ties with military strategies were relied upon to help shape military markets and government notions of defense necessities. Some scholars have argued that this "technology push" contributed to the development of the "arms race of the Cold War.

Contracts ballooned in the Cold War and were welcomed by economists advocating "military Keynesianism" to achieve full employment via public spending. Competition between the piloted bomber and the ballistic missile groups within the air force, and between army and navy bids for "helicopters and their own "fighter aircraft, resulted in the production of a broad array of aviation weapons systems, which kept most of the major aircraft companies in business. In 1958, NACA became the National Aeronautics and Space Administration (NASA), with huge additional projects for the industry. The size, speed, and aggressiveness of the industry's development led President Dwight D. "Eisenhower in 1961 to warn the nation about the dangers of a permanent "military industrial complex."

The renamed "aerospace" industry has been favored by this de facto but unofficial industrial policy. The military acted as the underwriters of aerospace development after World War II, encouraging development of the jet engine and the communications satellite. In 1989, the "Pentagon paid for 82 percent of the aerospace industry's research and development effort and purchased 65 percent of its output. As a result, aircraft remain the nation's strongest manufacturing export, and U.S. companies dominate the world market for commercial as well as military aircraft. Since the end of the Cold War, the industry has undergone deep retrenchment, consolidating into fewer and larger firms (Northrop-Grumman, Lockheed-Martin), and relying more heavily on arms exports.

PROCUREMENT: GOVERNMENT ARSENALS

As industrial products, weapons have unique requirements: production rates must radically increase in times of war and rapidly decrease in peacetime; cost, although a significant factor, matters less than uniformity, precision, and performance; manufacturing often involves a mix of mass and batch production uncommon in commercial markets. To meet these special demands, the U.S. government sometimes maintained its own production facilities—armories for small arms, and arsenals for guns, carriages, powder, and other equipment.

Why should government compete with private industry? Critics argued that lower production costs at arsenals represented unfair competition (for they need not make a profit), while conversely, higher costs represented inefficiency. Proponents of arsenals pointed to government production as a "yardstick" to gauge costs in private industry, and to arsenals' ability to nurture costly new technologies for long periods. Military arsenals, as state-owned factories in a capitalist system, have historically raised problems over the government's relationship to technology.

Prior to 1794, the U.S. Army procured arms solely from private contractors, an arrangement that proved expensive and unreliable. Following the "War of 1812, Congress placed the Army Ordnance Department in charge of production at five government-owned arsenals of construction, Allegheny (Pittsburgh); Frankford (Philadelphia); Washington D.C.; Watervliet (upstate New York); and Watertown (outside Boston); and at the two armories, Springfield (Massachusetts) and Harpers Ferry (Virginia). These establishments operated as a cross between industrial plants and military facilities: managers and executives were ordnance officers (usually trained as engineers) but the workforce was civilian. Officers had duties similar to industrial managers but with no worries of marketing, sales, or profits and losses. Thus, they could focus their efforts on production, efficiency, and technical management. Ordnance officers tended to rotate through their assignments every few years, but workers remained at the arsenals for much longer periods. Hence the core of technical and manufacturing expertise resided in highly skilled machinists and workmen. This "armory practice," through a diffi-

cult but steady path, laid the foundations of the so-called American System of Manufacturing, which became key to the late nineteenth-century era of large-scale industrialization. By the 1850s, the armory system, characterized by highly mechanized precision production, manufactured rifles with genuinely interchangeable parts—a goal inventor Eli Whitney had promised forty years before but could not deliver. Government-owned manufacturing facilities provided a stable institutional environment for technology to mature over several decades, despite uncertain economic returns.

This slow, expensive development process proved essential to meeting the Civil War's unprecedented demand for arms, especially with the loss of the Harpers Ferry Armory in 1861. Between 1860 and 1865, the Springfield Armory produced over 800,000 weapons, more than it had produced in all its previous 67-year history. This accomplishment depended on extensive subcontracting to private firms, made possible by the armory's hard-earned expertise with interchangeable parts. When the war ended, the entire system shrank substantially, but the private contractors had been seeded with the American System. Many failed for lack of government business, but others applied the new manufacturing techniques to sewing machines, typewriters, agricultural equipment, business machines, and even bicycles, thus spurring the great wave of American mass production.

Despite these feats, the armories and the arsenals were often subject to criticism. Because of their unique organization, they tended to focus innovative energies on production and not on design, hence the Ordnance Department's often remarked failure to introduce breechloaders or repeating rifles for the common soldier in the Civil War. This technical conservatism owed less to narrow-mindedness than to the Ordnance Department's appreciation for the difficulty of producing new weapons in large numbers. Still, the austerity of the post-Civil War military budget induced stagnation. By 1900, the U.S. Army's small arms were at least a decade behind those of European militaries, which depended on private companies like Krupp and Vickers for new technology. Even in production, the arsenals could not keep up. In the early twentieth century, ordnance officers introduced new techniques, such as *scientific management*, to streamline operations, but they ran headlong into political and labor opposition. Arsenals, unlike private industry, were subject to congressional oversight, and arsenal workers, unlike their counterparts in companies, could seek redress of their grievances by appealing to political patrons.

World War I caught the arsenal system unprepared, and only heavy reliance on weapons from the British and French saw the United States through the critical period of mobilization. While the Ordnance Department learned important lessons from the experience, peacetime budgets between the world wars meant that it could do little to implement improvements. Still, the army did accomplish some critical procurement planning during the 1930s, with the consequence that production ramped up more smoothly for World War II, although greatly aided by America's delayed entry into the war. By the 1940s, the increasing complexity and scientific sophistication of weapons tended to favor government laboratories and private companies instead of the older arsenals. Even with small arms, the armory had difficulty introducing new

technology; the debacle over the M-16 rifle resulted in the closing of the Springfield Armory in 1968. During the Cold War, the military gradually came to rely on large, diversified corporations, what some analysts have called "private arsenals." These institutions have proven technically innovative, if expensive, the government having lost the arsenals' yardstick function. The end of the Cold War, however, highlighted one great advantage of the arsenal system, conspicuous in its absence: the ability to cut back rapidly in peacetime.

PROCUREMENT: INFLUENCE ON INDUSTRY

In the United States after World War II, a "military-industrial complex" developed, quite unlike its counterparts in other advanced industrial countries. A distinctive set of firms in a select set of industries emerged as dominant suppliers to the Pentagon, and in turn were beneficiaries of a de facto industrial policy. During World War II, the Pentagon appropriated the strongly centralized and strategically planned New Deal state apparatus, creating a permanent security state that endured throughout and even beyond the Cold War. Traditional "hot war" suppliers such as the auto and machinery industries turned their sights back on commercial markets following the war, but the newly expanded aircraft, "communications, and electronics (ACE) industries remained dependent upon military markets for both research monies and sales.

The ACE complex centered on a set of firms that subsequently climbed the ranks of the Fortune 500 biggest corporations—aerospace companies like Grumman, Rockwell, Northrop, General Dynamics, and Lockheed, and communications/electronics firms like Hughes, TRW, and Raytheon. Boeing, successful in both commercial and military markets, was an exception. As commercial shipbuilding declined, shipyards like Newport News, Bath Iron Works, Litton, and Todd also became increasingly defense-dedicated. In a market that operated as a bilateral monopoly (defined as one buyer and one seller, each dominating its "side of the market"), these firms flourished under military patronage and were kept afloat by "follow-on" procurement practices. Pentagon oversight practices generated a specialized business culture that stressed high performance and timeliness over cost-consciousness, rendering military contractors increasingly ill-equipped to compete for commercial sales.

During the early postwar period, advances in jet engines, navigation and guidance systems, and new forms of rocket propulsion yielded significant technologies for the commercial sector, giving American aircraft, communications, and electronics industries a head start in international competition. Through the end of the century, U.S. net exports remained dominated by these sectors plus arms and agricultural goods. Increasingly, however, the esoteric nature and exorbitant cost of military

requirements curtailed spin-off, while commercially oriented economies like Japan and Germany were able to capitalize on U.S. defense-underwritten inventions in electronics, robots, and computers.

In the past few years, scholars have begun to question the contribution of the Cold War military-industrial effort to the American economy. Consuming more than \$4 trillion since the 1950s, on average 5 percent and 7 percent of GNP annually, much of it deficit-financed, the military-industrial complex has siphoned off a large portion of the nation's scientific and engineering talent and its capital investment funds. The relatively poor postwar performance of American auto, metals, machinery, and consumer electronics industries can be attributed in part to this relative starvation of resources and the absence of similar industrial incentives.

Its costliness has been exacerbated by the spatial segregation of much of the complex from the traditional industrial heartland, inhibiting cross-fertilization and requiring new public infrastructure in "Gunbelt" cities and areas such as Los Angeles, San Diego, Silicon Valley, Seattle, Colorado Springs, Albuquerque, and Huntsville. The dependency of these firms, industries, and regions on the Pentagon budget has made it more difficult to adjust to post-Cold War realities, especially with associated geopolitical shifts in political representation.

PROCUREMENT:

MILITARY VEHICLES AND DURABLE GOODS INDUSTRY

The maxim, "In war the best is always the enemy of enough," describes the U.S. Army's experience with the wagon and truck industries. The army has relied historically on a mix of large public arsenals, armories and depots, and a number of civilian producers to meet its needs. But procurement of wagons and trucks, its primary transport vehicles, has never followed that pattern. During the nineteenth century, American wagon makers were a mature industry—high-volume manufacturers of quality goods—with sufficient political power to prevent the establishment of competing public production facilities. (American automobile manufacturers occupied a similar position in the twentieth century.) Following the "War of 1812, the Quartermaster Bureau, which procured most of the army's general-purpose vehicles, established standard specifications for wagons and bought them from large private wagon makers like Studebaker, Espenschied, and Murphy. After 1840, certain assemblies and parts like wheels and axles were interchangeable, but industry practice was to adapt off-the-rack commercial lines to military demands. They were not the best wagons to be had, but they were good enough, and could be procured in time and in sufficient numbers to meet military needs.

Between 1906, when the army began to experiment with motor transport, and 1937, there were two attempts to modify those traditional procedures. In 1913, the Quartermaster Bureau developed a working relationship with the new Society of Automotive Engineers (SAE), and in

mid-1916, a team of Quartermaster, Ordnance, and SAE specialists designed a fleet of standardized, noncommercial military trucks that the government attempted to place in production after entering the war in 1917. The idea was to contract components throughout the industry and assemble the trucks at central locations. Only the 3-ton Standard B "Liberty" truck reached production before the armistice. Resistance to an independent design was widespread in the automobile industry. Manufacturers like the Four Wheel Drive Company, Marmon, Reo, White, and Ford argued that their own commercial models were sufficient, and often refused Liberty B contracts. Parts and sub-assemblies from less experienced manufacturers would not interchange. Assembly of completed vehicles was slow to get underway, and as a result, the American Expeditionary Forces were forced to use much Allied equipment. In comparison with the British and French, the Americans were often short of truck transport.

After the war, the Quartermaster Bureau complained that it had not been able to get the kind of trucks it needed from private producers and spent over a decade designing its own Quartermaster Standard Fleet. The automobile industry insisted that its trucks were adequate and lobbied successfully to prevent the introduction of the Quartermaster designs. A compromise in 1937 brought a return to traditional practices. The army set general standards and specifications, and truck makers—General Motors, Dodge, Studebaker, Ford, and others—supplied "modified commercial" vehicles like the 2.5-ton general-purpose truck ("Deuce and a Half") in quantities sufficient to meet wartime needs, while specialized producers like Mack, Diamond T, and Reo built 4- and 6-ton trucks and semitractors. (Ironically, Willys-Overland, according to many the original developer of the 1/4-ton General Purpose Vehicle "Jeep," built relatively few of these wartime vehicles itself, allegedly because of its modest engineering and production capability.) Ultimately, American industry produced approximately 3 million military trucks during the war, and Gen. George C. Marshall asserted in 1945 that American truck transport, especially the Deuce and a Half and the Jeep, was "the greatest advantage in equipment" the United States possessed.

Since 1945, the practice of building on industry strength to supply general-purpose vehicles economically and in adequate quantity has remained most effective. But military-industrial institutional memories have, on occasion, failed. Again, specially designed trucks like the complex low-pressure-tired, flex-bodied, mid-engined, deafening "GOER" (built by Caterpillar) have proved less successful than anticipated, and off-the-rack vehicles have not held up well. It remains to be seen whether the specially designed "Hummer"—a stocky, wide-stanced, low-profile, state-of-the-art vehicle built of space-age materials and intended to replace the Jeep—will secure a place in the civilian market sufficient to reduce its costs of production.

PROCUREMENT: MUNITIONS AND CHEMICAL INDUSTRY

The chemical industry has been strategically important to the U.S. military since World War I. As late as the "Spanish-American War in 1898, the only military explosive was

black powder, the ancient Chinese mixture of charcoal, saltpeter (potassium nitrate), and sulfur. Only a year later, the British employed two powerful new chemical-based explosives, smokeless powder and picric acid, in the Boer War in South Africa. Smokeless powder, made from nitro-cellulose obtained by reacting cotton fibers with nitric acid, was a powerful propellant that did not generate the smoke that previously had revealed the firer's position. The second new explosive, picric acid, was used as a high explosive in artillery shells; it was derived from chemicals that are found in coal and had been used as a yellow dye for textiles. By the beginning of World War I, the Germans developed another high-explosive compound, trinitrotoluene (abbreviated as TNT), which soon became the most widely used high explosive.

The American military, especially the navy with its large-gunned *battleships, had been experimenting with smokeless powder and high explosives since the 1890s. The Dupont Company, the nation's leading producer of black powder and dynamite, had worked with the army and navy on smokeless powder. Dupont hoped to transfer the skills it had acquired in nitrating glycerine to make dynamite to nitrating cotton to make smokeless powder. When World War I began in 1914, Dupont was the only company in the United States that manufactured smokeless powder. Over the next several years, Dupont and a few other American companies—most notably, Hercules, split off from Dupont in an antitrust suit settlement—built large new plants to supply the Allies with smokeless powder. In two years Dupont sales increased from \$25 million to \$318 million and profits soared from \$5.6 million to \$82 million. Dupont used these profits to diversify its business into dyestuffs, plastics, and paints.

When the United States entered the war in April 1917, the government made contracts with Dupont and other companies on terms much more favorable to the purchasing agency than the desperate Europeans had received. Dupont even built two huge smokeless powder plants for the government in Tennessee and Virginia. Many other smaller chemical companies, such as Dow Chemical and Allied Chemical, grew and prospered by producing chemicals used to make high explosives and poison gases during the war.

The mutual dependence of the American munitions industry and the Allies in World War I led some critics in the mid-1930s to attribute American participation in the war to the influence of the munitions industry on the U.S. government. After Senate hearings chaired by Gerald *Nye of North Dakota, Congress passed a series of *neutrality acts prohibiting the sale of munitions to belligerent nations.

When the United States entered World War II, the now mature American chemical industry became a key component of the arsenal of democracy. It turned out explosives in much greater quantities than in World War I; contributed new materials such as nylon and synthetic rubber; and played a critical role in building atomic bombs. The synthetic rubber project was critical to the war effort because the Japanese had cut off the supply of natural rubber from Asia. Within two years, a massive government-sponsored cooperative program, including oil, chemical, and rubber companies, established a new synthetic rubber industry. In the *Manhattan Project, companies such as Dupont, Union Carbide, and Tennessee Eastman helped construct and operate the nuclear materials plants at Oak Ridge, Tennessee, and Hanford, Washington. In the 1950s, the government contracted with Dupont and Dow to build

and operate nuclear facilities at Savannah River, South Carolina, and Rocky Flats, Colorado.

[See also Industry and War; Nuclear Weapons.]

—John Kenly Smith

PROCUREMENT: NUCLEAR WEAPONS INDUSTRY

The "nuclear weapons industry developed after the end of World War II at facilities built for the *Manhattan Project. The industry soon spread to seventeen isolated sites across the United States. These sites became the main economic support for their host regions, and this in turn created continuous political pressure for nuclear weapons spending.

The early U.S. lead in nuclear weapons began to disappear in the 1950s as the Soviet Union built a nuclear force of its own, patterning its research laboratories and early delivery systems directly on U.S. sites and models. For the next thirty years, the United States and the USSR engaged in a massive nuclear arms race that pumped huge sums of money into the U.S. nuclear weapons complex. The total amount paid by the United States for nuclear weapons from 1940 through 1996 was almost \$5 trillion in 1996 dollars. This spending made nuclear weapons one of the two most expensive government projects in the history of the United States (the other being Social Security).

After *START I was ratified and nuclear testing stopped, the weapons production complex shrank to four sites by 1998: warhead pits are developed and produced at Los Alamos National Laboratory in New Mexico and Livermore National Laboratory in California; the remaining warhead parts are produced at Sandia National Laboratory in New Mexico, and warheads are assembled at the Pantex plant in Texas. This put significant economic pressure on the remaining sites in the nuclear production network, and a number of those sites—Oak Ridge (Tenn.), Savannah River (S.C.), the Idaho National Engineering Laboratory (Idaho), and Hanford (Wash.)—attempted to salvage a nuclear mission by using or reprocessing nuclear materials for other applications such as energy production. None of these attempts is economical and each would require major government subsidies to survive.

With the continued ban on nuclear testing and likely future cuts in nuclear warheads, the remaining nuclear weapons facilities and the regions in which they reside are threatened with large job losses. In response to these threats, the weaponeers in the national laboratories, in conjunction with their political representatives, proposed a new program to manage existing warheads and to design and computer-test new ones. This "Science-Based Stockpile Stewardship" program was funded in 1998 at an annual level equal to two Manhattan Projects.

Environmental and safety pressures from federal and local sources, as well as loss of mission for the nuclear weapons industry, have caused the remaining sites in the nuclear weapons complex to concentrate on cleaning up the massive amounts of nuclear waste produced during the *arms race. As a result, about \$4.5 billion was spent in 1998 to clean up contaminated sites. Massive amounts are also dedicated to building storage sites in New Mexico and Nevada for nuclear waste. These cleanup and storage programs will eventually consume hundreds of billions of dollars and are expected to continue for forty years. At many sites they will provide as much employment and economic stimulus as the original weapons programs that created the waste.

PROCUREMENT: ORDNANCE AND ARMS INDUSTRY

Since the 1790s, the American army has procured ordnance through a mixed system of government and private manufacturers. Anxious to have a domestic source of weapons, it established early government arsenals to turn out muskets. These arsenals produced only a small quantity of weapons when the nation faced possible war with France in 1798. As a result, the army contracted for additional firearms from private entrepreneurs. Only a few of the manufacturers completed their contracts, but a precedent had been established for utilizing the private sector to supplement government production.

In the first part of the nineteenth century, the army adopted a policy of expanding its arsenals and of retaining private firms on a long-term basis. The Ordnance Department evolved an ideology of uniformity in the manufacture of arms in both arsenals and private firms that developed and spread the principles of the so-called "American System of Manufacturing," characterized by mass production of standardized interchangeable parts and tighter management control and supervision.

In the *Civil War, because of the rapid buildup of the

* Union army, government arsenals and private contractors were unable to meet initial goals, forcing the army to purchase firearms in Europe. By 1863, however, the combination of profitable contracts for private firms and increased production at arsenals enabled domestic production to exceed demand. After the Civil War, government contracts for weapons were practically suspended and the army depended upon its arsenals.

In the two world wars, the army relied heavily on private firms for its weapons once its arsenals lacked the capacity to meet the demands of modern war and it was not deemed wise to build expensive huge arsenals for war production that would largely stand idle in peacetime. During *World War II, private arms firms like the Winchester Company and the Remington Arms Company were major suppliers of weapons, as were firms not usually involved in arms production like the Chrysler Corporation, the General Electric Company, the General Motors Corporation, and the Singer Sewing Machine Company.

During the 1960s, the Department of *Defense, in an effort to end the long-standing rivalry between combat soldiers and military technicians by separating design and doctrine development from production, drastically reduced the army's own production capacity. Since then, the army has relied primarily on a group of quasi-public industrial suppliers for weapons (the army still produces weapons today at the Rock Island, Illinois, and Waterville, New York, arsenals). These suppliers, such as the General Dynamics Corporation and the United Defense Company, while private corporations, often use government-owned equipment and depend heavily on government contracts.

The mixed system has generally worked well in ordnance procurement. Government arsenals set production standards, improved production methods, trained technicians, and provided data on costs, while private firms con-

tributed improved designs and production methods and the industrial base for large-scale production in wartime. But in recent years the expanded reliance on private firms has prompted concern that undue pressure can be exercised in favor of special economic interests in the selection of weapons.

PROCUREMENT: SHIPBUILDING INDUSTRY

The shipbuilding industry includes new construction as well as modernization, overhaul, and repair of existing ships. Naval warships average a thirty-year life, while commercial ships may last longer. Most ships require several major overhauls or modernizations during this lifetime.

The first commercial ship built in America was a 30-ton bark in 1607, and the first oceangoing vessel was launched in 1631. Mercantilist England saw New England as a source of naval stores and fishing. Because the colonies had all the natural resources required to build ships, they soon became England's major provider. By 1750, there were more than 125 shipyards in America producing faster ships at costs 30 to 50 percent less than in England.

The indigenous shipbuilding industry was also fueled by local demand for fishing boats, water transport between colonies, and delivery of American raw materials and produce to England and the Caribbean to exchange for needed manufactured goods. Tobacco, cotton, molasses, and then slave trade all helped sustain the industry, as did the China trade after 1783.

Robert *Fulton produced the first commercially viable steamboat in 1807, and by 1820 steamships were crossing the Atlantic. The first iron hull was floated in 1825, but American shipping and shipbuilding peaked in 1855 and then began a decline broken only by wartime spending programs during the *Civil War and the *Spanish-American War.

As vessels turned from the graceful clipper ship of the 1850s to steel, the competitiveness of U.S. shipyards declined because the Europeans took this new technology more seriously than the Americans. U.S. iron works put their energy and innovation into building railroads. Consequently, the price of American steel never became internationally competitive, and shipyards languished. Shipbuilding had spectacular growth in the 1890s and early 1900s because of large navy orders for the new steel-hulled "Great White Fleet," coupled with commercial fleet replacement. The decline set in again rather quickly, however.

World War I caused a major rush to build the "bridge of ships" to Europe. Established firms were booked solid with warships, while new yards were started to undertake a crash merchant fleet building program. Bureaucratic delays were such that most of the ships (80%) were completed after the war was over. Postwar depression dropped prices and shipbuilding stagnated as idle commercial ships became common and warships were limited by the *Washington Naval Arms Limitation Treaty of 1922.

The almost sixty years following the Civil War offered

minimal hope for a sustained revival in shipbuilding. It was obvious that political leadership would not consider expending massive public funds to support an American-flag merchant fleet. This required shipbuilders to fall back on naval warship production.

Spasmodic congressional intervention with subsidies beginning in 1924 was required to build even a few commercial ships. In preparation for World War II, a second "emergency" shipbuilding program, the Liberty ships, was begun in 1939. Some 4,732 easy-to-build and simple-to-operate maritime ships were built between 1942 and 1945. A major naval shipbuilding program lasted from 1938 to 1945. A massive movement of labor to shipyards on the East, West, and Gulf Coasts was undertaken to complete this effort successfully.

At the end of World War II, the United States owned 60 percent of the world's tonnage, yet decline of the merchant marine began immediately. By 1948, the sale of 1,746 ships to U.S. and international operators had been completed. During the "Cold War, a 1970 law authorized subsidies for building 300 new merchant vessels over the next 10 years, but a world economic slump driven by rising oil prices hindered this program, and only 83 ships were delivered.

Even new technologies and designs pioneered in the United States could not make American yards competitive for commercial ships because of high material and labor costs (outmoded shipyard processes) in construction and exorbitant operating costs. South Korea, Japan, and Taiwan developed highly automated shipyards that U.S. industry simply could not match. Nevertheless, American shipyards were busy during the 1980s, as President Ronald "Reagan presided over one of the largest peacetime expansions of the navy in U.S. history.

PROCUREMENT: STEEL AND ARMOR PLATE INDUSTRY

(1865-1918). The battleship era between the "Civil War and World War I brought about an intensification of business-government relationships, the origins of what some historians term the "'military-industrial complex" or "command economy." Intense interaction between naval officials and leading steelmakers was necessary to procure the latest and most effective armor, especially when its possession was a necessity for major warships. Certainly, no private-sector market existed for huge steel plates up to 22 inches in thickness, costing fifteen to twenty times more than steel rails. America's building of a "Great Power" navy, then, required its mastering this technology. However, government incentives given to private steelmakers fanned Populist and Progressive criticism of big business. In these ways, armor procurement became entwined with debates about the nation's foreign and domestic policies.

The armor trade resulted from successive waves of technical change in shipbuilding and steel manufacture. While Britain began building large iron ships in the 1840s, and there were iron gunboats in the Civil War, most American warships were constructed of wood through the 1860s. In the 1870s, the U.S. Navy's Ordnance Bureau found itself unable to obtain the heavy, rifled, breech-loading steel guns then finding favor in Europe. At the navy's behest,

Midvale Steel became the country's leading manufacturer of ordnance steel. In the next decade, large appropriations for steel warships extended the navy's scope of interaction with private industry.

Multi-million-dollar contracts for steel armor plate began with Bethlehem Iron in 1887 and Carnegie Steel in 1890. Initially, the navy helped these two private firms transfer the necessary armor-making technology from France and heavy forging technology from England. The two steel companies soon found it indispensable to hire ex-naval officers (and at least one sitting U.S. senator) to deal effectively with the U.S. government. Finally, the two companies effected a pact of splitting contracts and maintaining high prices, extended to Midvale after its entry into armor plate in 1903. Proponents of the early "military-industrial complex" thesis such as Benjamin Franklin Cooling also cite a series of congressional inquiries about high armor prices and recurrent public scandals about low armor quality. Furthermore, there was a massive procurement following the "Spanish-American War (armor contracts increased fivefold between 1898 and 1900), which could be seen as an instance of a command economy.

The already byzantine politics of armor received an outlandish international twist after 1895, just as Anglo-German antagonism entered a critical phase. Until this time, the great power navies simply chose one of three types of armor; none could be proven definitively superior. But in the mid-1890s, a clearly superior armor was developed whose glass-hard face shattered incoming shells. This armor was invented in America by Hayward A. Harvey, improved in Germany by the Krupp concern, and came to be controlled by an international patent pool based in London (1895-1912). Precisely during the peak years of the global naval arms race, then, warships of all the great powers used the same armor.

From 1887 to 1915, the U.S. Navy purchased from the Bethlehem, Carnegie, and Midvale steel companies a total of 233,400 tons of armor plate (85% of which came after 1898) costing \$102 million, and from 1916 to 1920 an additional 121,000 tons of armor plate costing about \$65 million. The 1916 Naval Expansion Act authorized a government armor plant to limit private profit. It was built at Charleston, West Virginia, but its first 60-ton armor ingot was not cast until 1921, and it was closed by the Republican administration of Warren Harding. The proper significance of armor plate is to be found not in the battleship itself (which was largely rendered obsolete by the submarine, aerial warfare, and naval disarmament treaties of the 1920s), but in the characteristic entanglement of public and private entities concerning the promotion and procurement of new military technologies.

PROPAGANDA AND PUBLIC RELATIONS, GOVERNMENT. *Propaganda* is a deliberate attempt to persuade people to think and then behave in a manner desired by the source; *public relations*, a branch of propaganda, is a related process intended to enhance the relationship

between an organization and the public. Both, in turn, are related to *advertising*. Bill Backer, in *The Care and Feeding of Ideas* (1993), suggests that advertising and propaganda are half brothers. An advertisement connects something with human desires; propaganda shapes the infinite into concrete images.

Propaganda has always been a strategy of government and the military. It has always been part of military recruitment, albeit in an earlier era restricted to colorful uniforms or military parades. Propaganda has always been a necessity for any government actively seeking to mobilize its citizens. The American Revolution, for example, would have been inconceivable without making the case for revolution generally known. Thomas Paine's pamphlet *Common Sense* (1776) sold perhaps 500,000 copies in a country with 3 million inhabitants. Nearly four score and seven years later, "Lincoln freed the slaves." It does not trivialize the *Emancipation Proclamation to remember it partly as a piece of political propaganda, originally restricted by Abraham *Lincoln solely to those parts of the South already under Union control. The proclamation was more than a statement of government policy toward slaves; its promulgation assisted the recruitment of black soldiers and helped deter British recognition of the Confederacy, and as such, it served military ends.

Not surprisingly, propaganda came of age in World War I, as all major combatants created agencies to regulate and censor the flow of information, aid in recruitment, and sell the moral validity of the war effort to those on the home front and battlefield. The most effective recruiting device for the American military in World War I was arguably James Montgomery Flagg's recruiting poster, "Uncle Sam Wants You." American war propaganda was shaped through the efforts of President Woodrow * Wilson's Committee on Public Information, headed by journalist George Creel. A Speaker's Bureau (a pre-radio necessity) of 75,000 "Four-Minute Men" visited schools, churches, and other public places, combining up-to-the-minute news from the battlefield with brief patriotic appeals to support the war effort.

The war saw the emergence of pejorative connotations that have surrounded the concept of propaganda up to the present. Instead of realizing the close relationship among morale, education, and propaganda, Americans considered propaganda a synonym for government lies, and that interpretation has remained to today.

The 1920s saw the emergence of public relations, a term first used in 1807 by Thomas * Jefferson in a message to Congress. Edward L. Bernays introduced *public relations counsel* in his *Crystallizing Public Opinion* (1923), and the decade saw the general acceptance of the profession by business and government, if not by every military commander.

New Deal America institutionalized propaganda and public relations within American society. President Franklin D. * Roosevelt promoted his policies directly through public press conferences and "fireside chats," radio addresses to the American people. His promotion of the

* Lend-Lease Act and Agreements in 1940-41 is an example. At a press conference in December 1940, Roosevelt introduced the idea of giving away war material to those fighting Nazi Germany with a simple analogy: "Suppose my neighbor's house is on fire and I have a length of garden hose . . . I n a "fireside chat" two weeks later, the

president invoked a larger moral purpose: "America must be the great arsenal of democracy." Here was the selling of policy using the talents of the propagandist and public relations counsel.

The documentary filmmaker Pare Lorentz made films for the New Deal about social problems—the Dust Bowl and flooding in the Mississippi Valley—both depicting natural disasters as the result of unchecked individual actions, both offering the New Deal as uniquely capable of solving physical or natural disasters through enlightened state policies. Roosevelt's appeal to those better off than the "one-third of a nation ill-housed, ill-clothed, ill-fed" was documented by photographers of the Farm Security Administration (FSA), whose depiction of rural poverty helped justify federal relief programs and made people aware of the role of photography in public relations campaigns.

The military got the picture. During *World War II, the army's Bureau of Public Relations did a better job of managing news from the battlefield than a competing civilian agency, the Office of War Information (OWI). All newsreel footage shot in various theaters of war was first subject to military censorship; and all photographs were subject to censorship, particularly if they showed the faces of American dead.

Army Chief of Staff George C. *Marshall commissioned Hollywood director Frank Capra to explain the war to millions of soldiers in a series of seven hour-length orientation films entitled *Why We Fight*. The first, *Prelude to War*, was released in 1942; an eighth film, *War Comes to America, Part II*, survives only as a final shooting script. Capra's propaganda films divide the world neatly into forces of light and darkness; enemy footage is reedited to make clear the dangers of totalitarianism. Though the precise impact of the films is hard to gauge, the *Why We Fight* series was the most elaborate statement of war aims produced by any part of the federal government in World War II.

The *Cold War proved a boom time for informational materials aimed at the hearts and minds of the "captive" peoples of Eastern Europe. The Voice of America, created in 1950 to broadcast controlled information to countries "behind the Iron Curtain," was soon joined by Radio Free Europe and Radio Liberty. The United States Information Agency (USIA) became a separate agency of Cold War propaganda in 1953; the end of the Cold War has also meant that the USIA is to be reunited with the Department of State, reflecting its lesser importance, or perhaps the realization that official messages are more successfully transmitted through nongovernmental agencies. In the 1950s, the USIA produced a large number of informational films, shown generally in 16mm in nontheatrical distribution with foreign-language soundtracks; it also sponsored libraries of American literature in USIA branches all over the world. Cold War radio and television broadcasting still survives as Radio Marti and TV Marti, broadcasts from Miami sponsored by the *Central Intelligence Agency and intended to undermine Fidel Castro in Cuba.

The *Vietnam War showed the problems of military information management in an unpopular war, one ostensibly free of overt censorship of civilian news organizations, though military *helicopters were certainly not obliged to take hostile newsmen (and women) wherever they wished to go. The biggest source of complaint was the military's contribution to President Lyndon B. *Johnson's handling

of the war, the so-called "credibility gap." The discrepancy between official optimism and what reporters saw as "actual" battlefield failure led the official Vietnam Joint United States Public Affairs Office to hold daily afternoon briefings for news representatives, soon derisively known as the "Five O'Clock Follies." * Pentagon spokesmen reported astronomical numbers of enemy dead—always far higher than the numbers of Americans killed. Nowhere was less done to coordinate military battlefield information needs with the citizens' right to know than in these ill-conceived briefings. Indeed, it might seem in retrospect that Daniel Boorstin's book *The Image* (1962) in which the "pseudo-event"—a non-event that occurs primarily in order to be reported—was tailor-made for the information handed out at the "Five O'Clock Follies."

The Vietnam War taught lessons to the military about the value of censorship, overall management of the news, and the need for more sophisticated public relations personnel. The 1991 "Persian Gulf War reflected these changes. Media coverage often missed what was actually happening, contributing to battlefield victory by reinforcing Saddam "Hussein's (incorrect) belief that the main Allied Coalition attack was sure to come through Kuwait City from the gulf, instead of around fixed desert positions. News management now seems a well-established military policy, even if at the cost of absolute freedom of the press; it also underscores a new importance of propaganda and public relations to the military commander.

As Philip M. Taylor points out in his *Global Communications* (1997), in October 1995, the U.S. "Air Force created its first Information Warfare Squadron (the 609th Squadron, stationed in South Carolina). Enemies today target civilian airlines; they slip bombs into checked luggage; today's terrorists can also engage in chemical, biological, or electronic warfare and be capable of greater destruction than an entire regiment in the field, impervious to attack by conventional armed troops. Accordingly, one now sees the addition of Information Warfare to the military arsenal. No longer is there a clear dividing line between public information and military psychological operations; "infowar" entails all of the following: command and control warfare, intelligence-based warfare, electronic warfare, psychological warfare, computer hacker warfare, economic information warfare, and cyberwarfare. In such an interconnected military environment, one can predict a vastly enhanced role for propaganda and public relations, a decline in the disdain with which many hold such practitioners, and a realization that the military commander becomes ever more dependent on the weaponry of an electronic world—a world in which one side's disinformation is another's information; one side's "flack" another's public relations officer.

PSYCHIATRY, MILITARY. Most psychiatric illness among soldiers in the eighteenth and nineteenth centuries was called *nostalgia*. In the early nineteenth century, Baron Dominique Larrey, Napoleon's chief surgeon, had treated nostalgia by subjecting soldiers to an interesting, predictable training regimen featuring gymnastics and music. In 1862, Surgeon General William A. Hammond tried unsuccessfully to limit nostalgia in the "Union army by screening out teenagers, the recruits thought to be most susceptible. Twenty years after the war, Hammond wrote that nostalgia could best be treated with a program similar to Larrey's and conducted close to the soldier's unit.

Early in World War I, the term *shell shock* emerged to describe the array of psychiatric symptoms soldiers manifested. French and British psychiatrists learned that the symptoms were not the result of a physical shock to the central nervous system, but were psychological reactions to combat experiences. They also learned that the further a psychological casualty was removed from the front, the more intractable his condition became.

Thomas Salmon, surgeon general of the U.S. "Army, concluded that soldiers perceived that it was better to be sick than a coward, and shell shock offered an honorable way out of combat. Once evacuated, it became progressively more essential psychologically for the soldier to persevere in his symptoms. Salmon organized psychiatric services for the "American Expeditionary Forces along four principles: *proximity*—treat psychiatric casualties close to the battle zone; *simplicity*—treat with rest, food, and a shower; *immediacy*—begin treatment at once; and *expectancy*—assure the soldier that he would soon return to his unit. Baron Larrey's regimen was resurrected.
